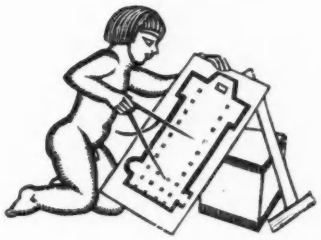
THE ARCHITECTS' JOURNAL



WEDNESDAY, JULY 1, 1931

NOT THE LAST OF THE HUMANISTS

SIR EDWIN LUTYENS very rarely discloses in the written word his opinions upon the changes which are apparent in the newly emerging forms of architecture; they have been offered to the world at large only through the medium of his completed works. This should be enough, and no one who has seen his work either here or in India can be in any manner of doubt as to his attitude. But he has delivered himself of his opinions in an article in *Country Life* that may be discussed with profit.

Sir Edwin is a traditionalist in the best sense. Which is to say that he receives his stimulus for design and for construction from materials that have been tested by time and used in a manner to which long habit has brought familiarity. The story of his training and practice bears witness to his deep knowledge of traditional building, which knowledge has given him a language that has rarely failed to express his wit and genius.

His case against modern architecture, put into a nutshell, is that it is unfriendly, has no wit or humour, and though it may be vital, is without the grammar of style, is unco-ordinated, crude. Some further extension of his criticism involving the use of such words as "electric drills," "combustion engines" and the "proletariat" he would be obliged to omit from a description of what is best in modern architecture.

If we are to compare Sir Edwin's own work with modern architecture, then it is of the best work we must speak, and here it must be said that only too little of what has been produced in England can hope to illustrate the direction in which modern architecture is tending. For that we must go to Germany, Sweden and France, where we will find work in which the materials of today have been used logically, and with a loving sense of their fitness for their purpose, to make buildings of an excellence and in the end a humanity not less eloquent than those that are the products of Sir Edwin's generation.

It is natural to imagine ourselves the last of the humanists, for have we not lived? And are we not living? And what are humanists but artists; men of sensibility and culture? These are not dying from the earth.

Some of the more flamboyantly modern buildings which Sir Edwin Lutyens uses to mark his thrusts have served to obscure the steady re-analysis of architectural form made under the stress of conditions that must inevitably sever us from much that we have loved in the past. The scientific study of materials, mechanics, such subjects as acoustics, illumination and so on, have not utterly destroyed the past: though many think it and talkers say it at every meeting. It is rather that we have been given access to new knowledge that enables us to see truths which, once knowing, we must express. It is not easy. Modern architecture is, indeed, without a highly inflected style. Its grammar is as yet simple. All this makes it difficult of access, for the reason that much logic and reason must precede design.

For the same reason it produces at its best a purer and a more concentrated expression, from which there is no cause to exclude either wit or humour, those rare guests.

If we but take a modern theatre or concert-room, built in the knowledge of acoustics, lighting, and new possibilities of construction, it is impossible to imagine that we may fall back with any hope of salvation upon the traditional forms or manner of building from which Sir Edwin has derived his strength. We must inevitably think of new problems, and they will as surely be solved by new and as yet unfamiliar forms. These forms will become familiar with use, and we shall use them with greater freedom and sureness. But before that time has been felt to arrive we shall have created style. We will no longer be the so-much-abused *modernists* with whom the "humanities" have died.

A SHRINE OF LEARNING

A photographic study of the central block of Tuke building, from the quadrangle, Bedford College for Women, University of London, Regent's Park, N.W., opened on Wednesday last, June 24, by H.M. The Queen. The new building, designed by Maxwell Ayrton, completes the College and is an addition to the work of Basil Champneys. Among the more important features of the addition are the assembly hall, lecture room, observatory, and inorganic and physical chemistry laboratories. Accommodation is provided for the following departments: academic, social studies and economics, psychology, geography, inorganic and physical chemistry and physics. Further views appear on pages 7 to 10.

NEWS & TOPICS

THE SPIRIT OF DUBLIN

THE President of the R.I.B.A. advised well when he told Dublin architects to seek their inspiration at home, for Dublin is full of good stuff. Its heyday, when Gandon built largely, produced a mass of domestic architecture of an extraordinarily high level. Much of this has now degenerated into the slums that provided a setting for Sean O'Casey, but some remains upheld in good estate. And the spirit of that building Dublin might very well revive in this day of Irish regeneration. Georgian Dublin could not have been built without the co-operation of the Wide-street Commissioners. Appointed by Parliament, they were the first scientific town-planners, laying out spacious streets, squares and open spaces upon which rose the splendid public buildings and grand town mansions of the Irish aristocracy.

THE FOUNDLING SITE APPEAL

The Foundling Site Appeal Committee are very wise in making a more determined effort to save a part of the Foundling site when it appears to be impossible to save all. If we can retain enough to make one open space of eleven acres by joining up to the gardens of the adjoining squares, the major object will have been achieved and the integrity of the seventeenth-century plan preserved intact. The price of £320,000 asked for the portion seems to me to be high, considering that the site has proved to be in other respects a white elephant, and I very much hope that negotiations will be less a matter of idealists *versus* business nuts, and just a trifle more matter of fact. It seems likely that the Boroughs of Finsbury and Holborn will come into it generously with the L.C.C. behind them, especially as the King and Queen have shown their approval by a donation of £150 towards the funds for acquisition and sums of £1,000 and £2,000 have also been anonymously subscribed.

THE LINEAR CITY

While Dr. Raymond Unwin devises means of checking ribbon development, I see that his schemes of local traffic roads are quoted in a Spanish pamphlet as having been lifted from a plan of town building called "the Linear City." The Linear City is a sort of super arterial road: the main artery: the only artery. It may stretch from Madrid to Barcelona, from there to Marseilles, and on to Moscow, for all there is to stop it. I cannot say what particular virtues are claimed for the Linear City, because my Spanish is faulty, and for no other reason. I am sure its supporters claim virtues in plenty. One thing I marked in reading the pamphlet, and that was a little picture of a tram-car, which I saw was to run down the eternal axis of the Linear City. It was then I noticed that the development company also owned the trams. I thought that last fact placed the idea within the comprehension of the ordinary man.

THE LAND TAX

Mr. Snowden made quick work of the Town Planning Institute delegation that waited on him recently, but I still cannot see how the tax can be justified on principle. It has been made more palatable by all sorts of exceptions, many of which may please the town planner where before he was frightened; but in whatever manner its rigours are tempered it still remains an additional tax upon a type of thrift common to very estimable classes of the community, and—it may be only the thin edge of the wedge. This tax represents a call for cash by a Government badly in need of it, for one may remember how much stress was laid on the point of its eliminating ribbon development and so on, which was so much red-herring when the land question is looked at broadly. The only justifiable tax on land values in this highly-taxed country would be a tax on values increased by town-planning or other agency and collected for redistribution on an equitable basis.

THE N.L.P. AT HOME

The thousand or more guests of the National Physical Laboratory were received on Tuesday of last week by Sir Gowland Hopkins, President of the Royal Society, Sir Richard Glazebrook, and the Director, in the lofty high-tension building, against a background of fearsome high-tension coils, capable of delivering 1,200,000 volts. Inactive they were sufficiently awesome, but I found it almost terrifying when the current was led out to a standard in the open and flashed across about three feet of insulators—artificial lightning in fact. Such things as this and the Froude Laboratory, containing the 550 ft. Yarrow water tank, wherein scale models of ships' hulls in wax are towed, and data of their resistance, etc., are obtained, are bound to be matters of common interest. But there were also exhibits with a direct bearing on the pursuit of architecture. In the new physics building—a straightforward affair of brick, which had been opened that morning—there was some interesting apparatus adapted for measuring noise—the aeroplane is apparently still the loudest mechanism invented by man—and means of measuring the amount of water vapour in fogs was also exhibited.

*

But probably the records of air pressure on a house in varying wind conditions were of the greatest practical interest. At Manchester there is an actual house from which one set of figures was obtained. At Teddington a very small-scale model of the building was prepared and subjected to winds in one of the several wind tunnels which are available for all kinds of wind-pressure experiments. It was interesting to note the slight variations between the two sets of curves thus obtained. The mass of work carried out at the laboratory may be judged by the fact that a staff of 700 persons is employed; and the work has saved its cost over and over again in manufacturing industries.

REASONS FOR THE DECAY OF CRAFTSMANSHIP

I wonder whether any of those who lament the decay of craftsmanship and who contrast the modern workman's methods with those of his predecessors, have ever considered where it is that the modern gets his standards? Probably most of us would answer such a question by saying that the young tradesmen follow the example set by older men and dictated by their employers, the builders. That would be true but, also, it would be inadequate. There are three other educative [*sic*] influences—(1) the technical schools, where young men are taught by a half-baked

instructor, known as "a practical man," whose methods result in structures which stand up but which are lacking in every refinement of design or trace of good craftsmanship; then there is (2) the cheap handbook, often written by the chief of a technical school, who suffers from all the drawbacks of never having had proper architectural training or experience of good building, and to whom the "practical men" and their ways seem entirely satisfactory; last (3) there is the cheap trade journal, made up of snippets, of articles written by incompetent persons who paraphrase or perpetrate travesties of standard works, and of plans and drawings of "neat" bungalows and villas, which incorporate the latest stock detail of the builders' merchant. These are all absorbed by the budding tradesman, and their fruit is seen in every tawdry dwelling and showy bungalow. In fact, the stream of knowledge once more is polluted at its source. The remedy? Why, to begin at the other end, by ceasing to build filters down-stream, but by stopping poisoners up above.

"SAFETY ZONES" IN EARTHQUAKE-RIDDEN HOUSES

It has been decided to commence rebuilding operations within the next few months at Napier and Hastings, the two New Zealand cities that were practically ruined by earthquake a few months ago. It is possible (if not probable) that both these cities will again be threatened, and as concerns houses that are to be re-erected, a precaution against injury to the occupants has been suggested by an Australian architect, Mr. Liscombe, now in London. His idea is to construct a small internal section of the building sufficiently strong to withstand the collapse of the main structure around it, and to remain intact itself, thus acting as a "safety zone." He points out that, in many cases, a serious earthquake is preceded a few moments earlier by tremors which do very little harm, other than cause panic—an almost certain result, when the individual imagines himself to be in surroundings which, in a matter of seconds, will inevitably be destroyed, and where any one spot is no safer than any other. But if such a safety zone were near, he would have time to reach it, and the risk of injury would be minimized. It has been said that the majority of casualties are caused by the fall of material, loosened by violent vibration. In the case of a residence, the occupants would come together in the safety zone; which is desirable, because, apart from the giving of mutual assistance, they could later unite their efforts in removing debris to free themselves.

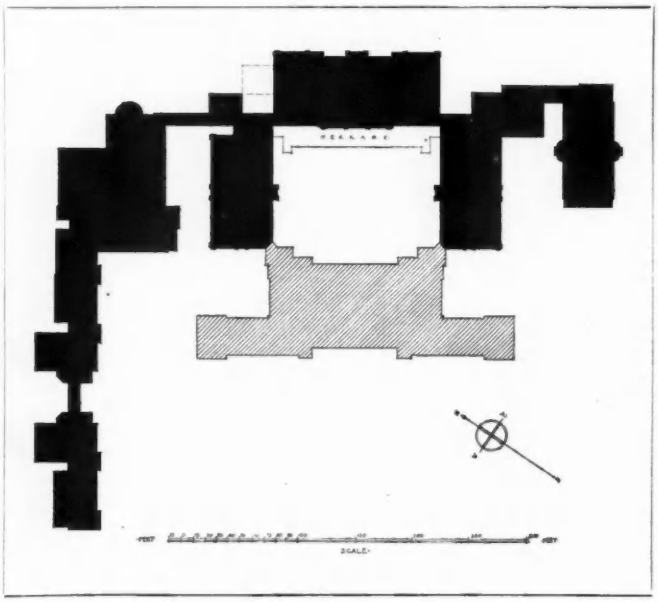
★

In a letter, recently sent to the Secretary of the N.Z.I.A. at Wellington, Mr. Liscombe enclosed a small sketch-plan showing suggested construction details. As a typical case, the end of a passage or lobby, about 6 ft. in length, was considered. It was almost a box, with one end and part of a long side (equivalent to the width of the passage) left open. It was of reinforced concrete, enclosing a rectangular frame of light steel members. Openings were omitted in two adjoining walls, and in these, together with the ceiling, were placed diagonal members braced in both directions (each pair being at right angles to the other two, a system possessing the maximum rigidity should the safety zone become dislodged). For footings, a single steel joist was placed at either end, and these extended considerably under the normal floor. The box was to be constructed entirely separately from the main building, with the normal walls abutting upon it. As a precaution against fire, switches controlling the electric supply were to be placed at this point.

★

It would be for the architect to place this shelter as centrally and conveniently as possible, and as far away as reasonable planning would allow from chimney stacks or other weighty objects which would fall and damage it, or injure people approaching it. It would be very inconspicuous, as its visible surfaces could be treated similarly to those of the general finish, and it would possess a false wood floor. The position and purpose of such "safety zones" would be defined by some significant sign agreed upon. As regards cost, their erection should not be prohibitive, being only an initial outlay. Actually, it would replace a considerable amount of normal material.

ASTRAGAL



Block plan of Bedford College for Women, Regent's Park, N.W., showing, in hatched lines, the disposition of the new extension, erected from the designs of Maxwell Ayrton, and illustrated on the following four pages. There are now over 600 students at the College, not including those who attend inter-collegiate courses, and over 220 are residents.

TUKE BUILDING

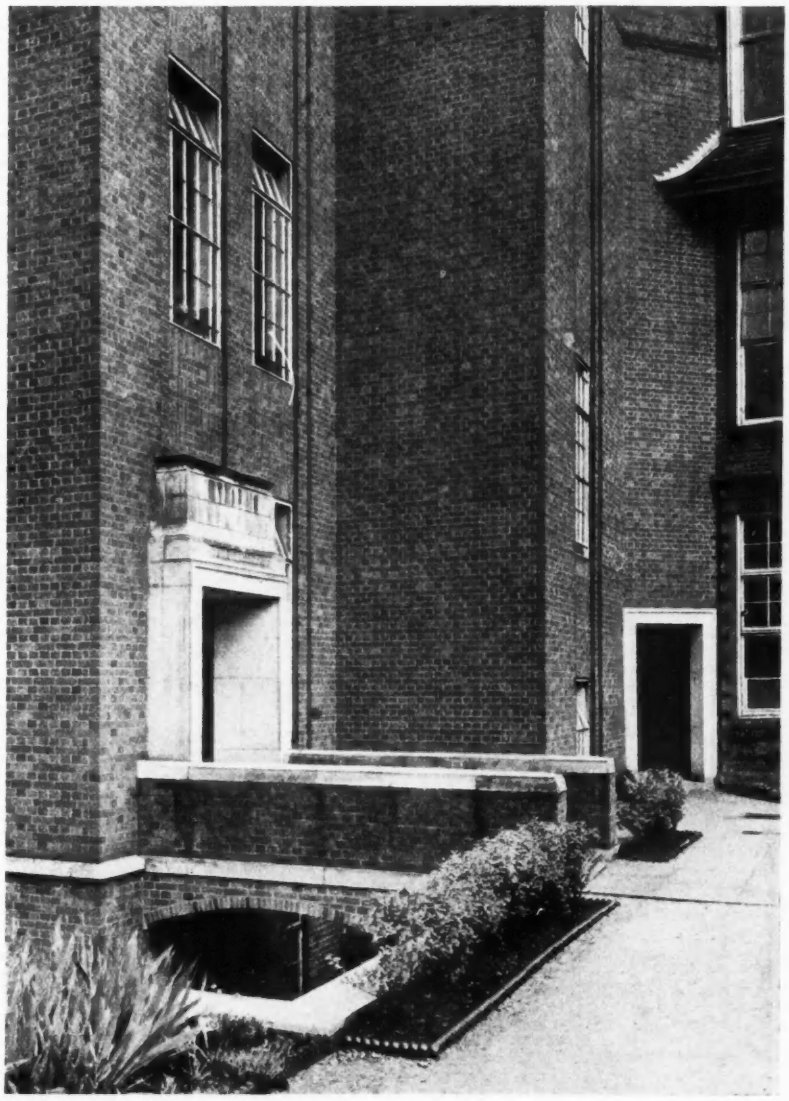
Bedford College for Women

DESIGNED BY MAXWELL AYRTON

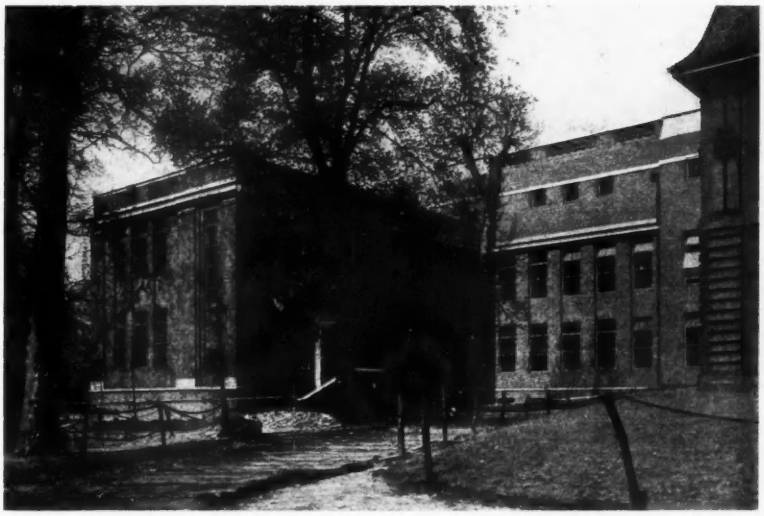
ON Wednesday last, June 24, H.M. the Queen performed the opening ceremony at Tuke Building, Bedford College for Women, University of London, Regent's Park, N.W. Her Majesty was received outside the building by the Most Hon. the Marquess of Crewe, K.G., P.C., G.C.V.O., and by Dr. Scott Lidgett, Vice-Chancellor of the University of London; and inside by Sir Wilmot Herringham, K.C.M.G., C.B., Chairman of the Council of the College and Miss Jebb, Principal of the College. In the reception room Her Majesty was received by Sir Hildred Carlile, BT., C.B.E., President of the Extension Fund, the Lady Cynthia Colville, Chairman of the Extension Fund, the Countess of Iveagh, C.B.E., M.P., Hon. Treasurer of the Extension Fund, and Miss Tuke, Principal of the College from 1907 to 1929, and after whom the new building has been named. Among those who had the honour of being presented to Her Majesty were Mr. Maxwell Ayrton, the architect for the new building, Miss O. Monkhouse, M.B.E., Secretary of the College, and Messrs. B. C. Aldous, of Messrs. F. and H. F. Higgs, the contractors; A. Petty, the clerk of works; B. L. Mitchell, the general foreman; G. Penny, foreman bricklayer; and T. Blake, ganger navvy.

The history of the building of the college is of interest in showing the rapidity of its advancement as an important branch of the University of London. In 1913 the new buildings designed by Mr. Basil Champneys were commenced, at which time it was considered that they would be sufficient to meet all future development, and it was understood that upon their completion South Villa should be demolished. However, the increase in numbers and in the scope of the College rendered this impossible, and later temporary buildings had to be erected in addition to the continued use of South Villa.

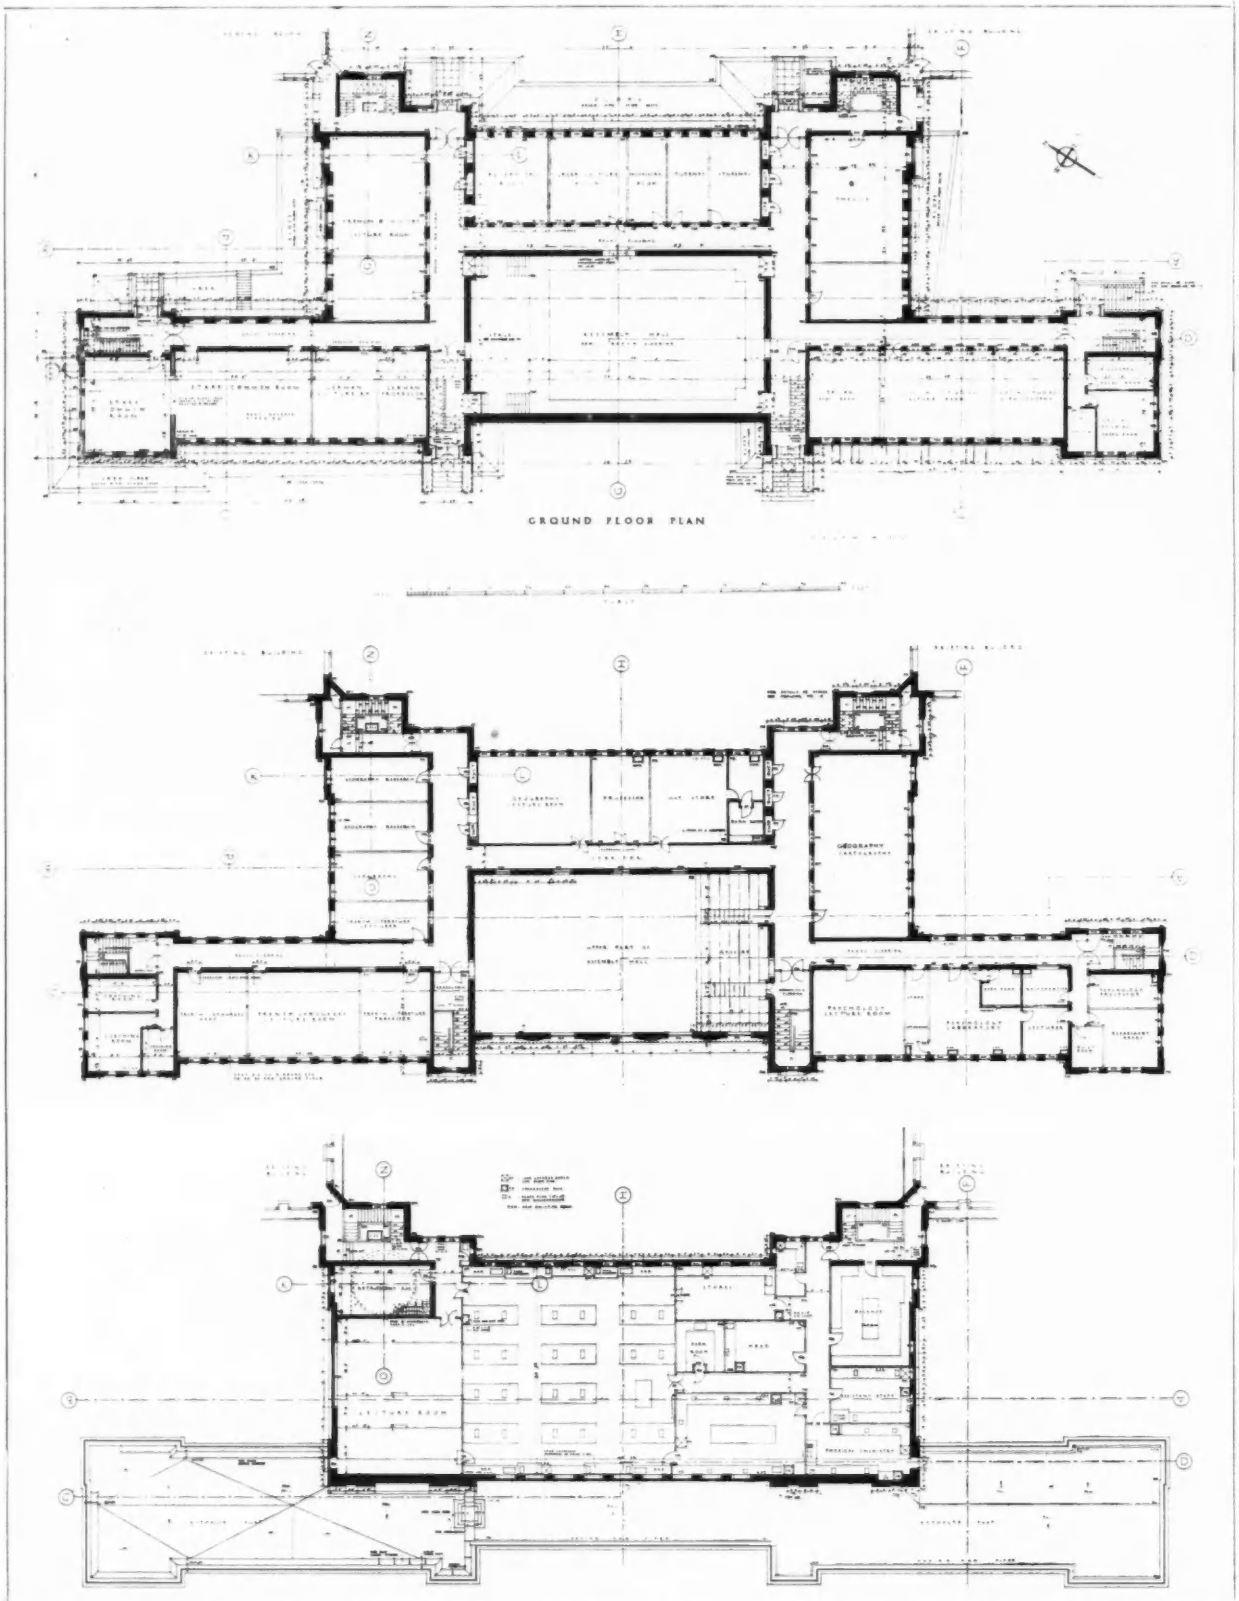
The new Tuke building has now replaced these and the College is complete. The general layout of the plan was naturally largely influenced by the existing buildings, but still more so by the necessary restrictions of the lease under the Crown.



Doorway in the north-west corner of the quadrangle. The smaller splayed door leads to the older building.



South end showing, on the right, the junction with the older building. The whole of the buildings are faced in multi-coloured brick with Portland stone dressings. The college was founded in 1849.

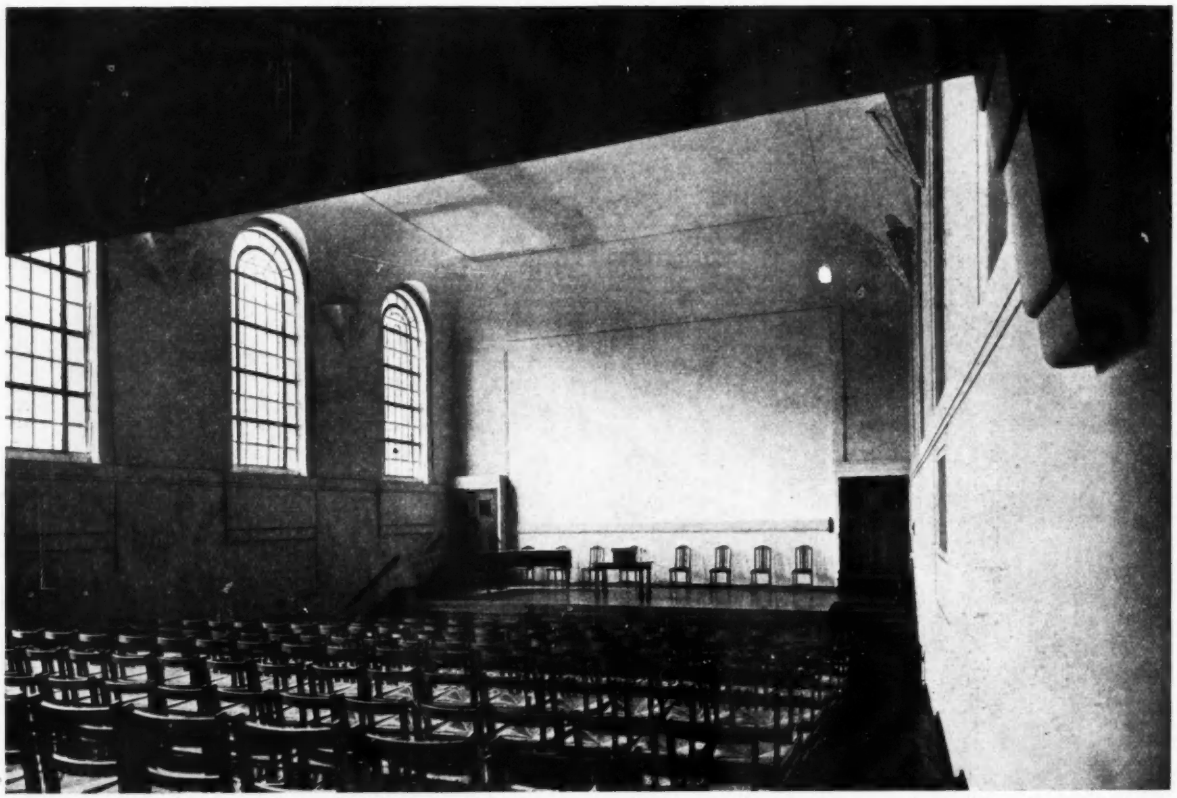


Tuke Building, Bedford College for Women, N.W. [*By Maxwell Ayrton.*

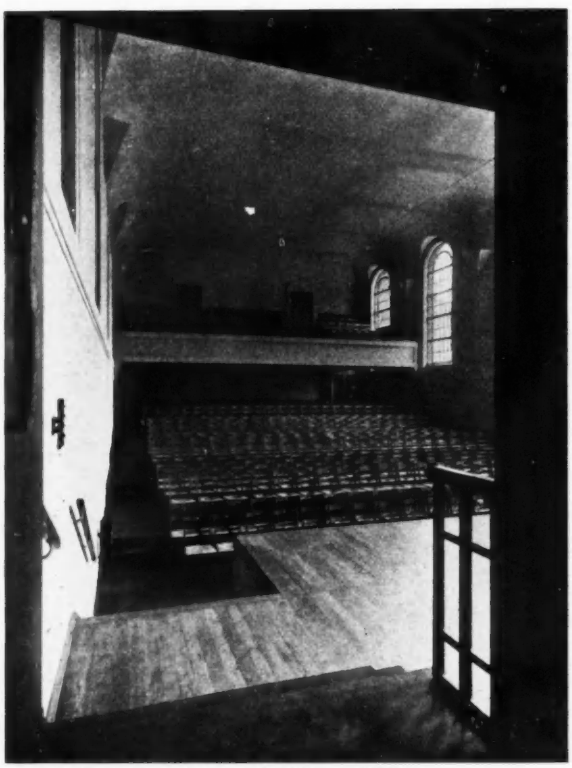
Ground-, first- and second-floor plans. Tuke building can be entered through both wings of the original building at each floor level and also by six external entrances with staircases at each point, two of which serve the second floor.

Tuke Building, Bedford College for Women, N.W.] [*By Maxwell Ayrton.*

The height of the main, south-west, front was restricted, by the terms of the lease, to 38 ft. in the centre and 35 ft. for the wings, which limited these portions to ground and first floors only. To overcome this difficulty a total height of 49 ft. was eventually allowed for the building subject to the third floor being set back some 24 ft. from the main façade.

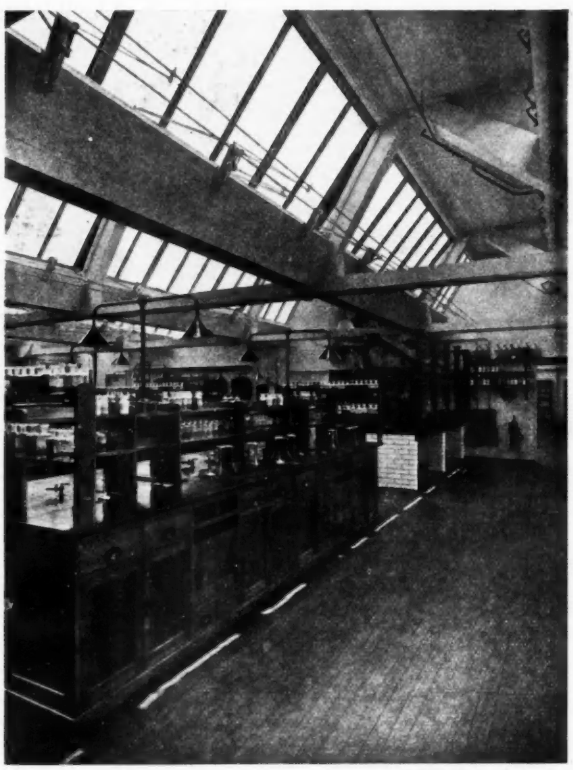


In the assembly hall the stage is fitted with a movable proscenium and with complete arrangements for electric and stage lighting, operated by a switchboard sunk below the stage. The wall is specially prepared as a screen for projection of magic lantern slides.



Tuke Building, Bedford College for Women, N.W.]

The assembly hall, looking towards the gallery. It has seating accommodation for 600 and, with the gallery, extends through two floors, a height of 25 ft.



[*By Maxwell Ayrton.*

The inorganic chemistry laboratory is equipped with electrical heating apparatus, roof and side lighting, and special methods of ventilation to ensure a clean and healthy atmosphere.

"THE SCHOOL IN THE WOOD"

Whaley Thorns, Derbyshire

DESIGNED BY
G. H. WIDDOWS

The south side of the north block, showing the open type of veranda adopted for sunny aspects. At the end is seen the assembly hall building; on the left, the cookery room.

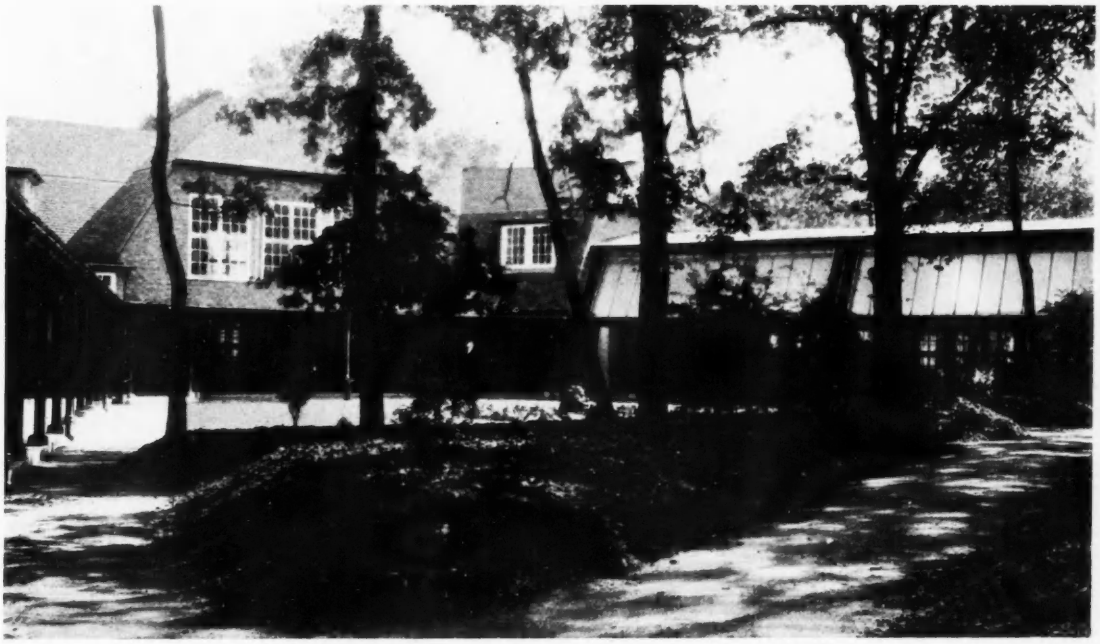
The south end of the assembly hall. As will be seen from the drawing reproduced on the following page, the ground plan is of a splayed type identified with open-air schools.

THE open-air school at Whaley Thorns, Derbyshire, of which photographs and plans are herewith presented, follows the usual type which the architect has evolved, and of which an example—Staveley School—appeared in THE ARCHITECTS' JOURNAL for September 24, 1930. Situated near Mansfield, the site consisted of four acres of spinney, and care was taken only to fell the minimum number of trees to make room for the buildings required to accommodate some 340 girls. From its delightful position, the school has earned for itself the name of "The School in the Wood."

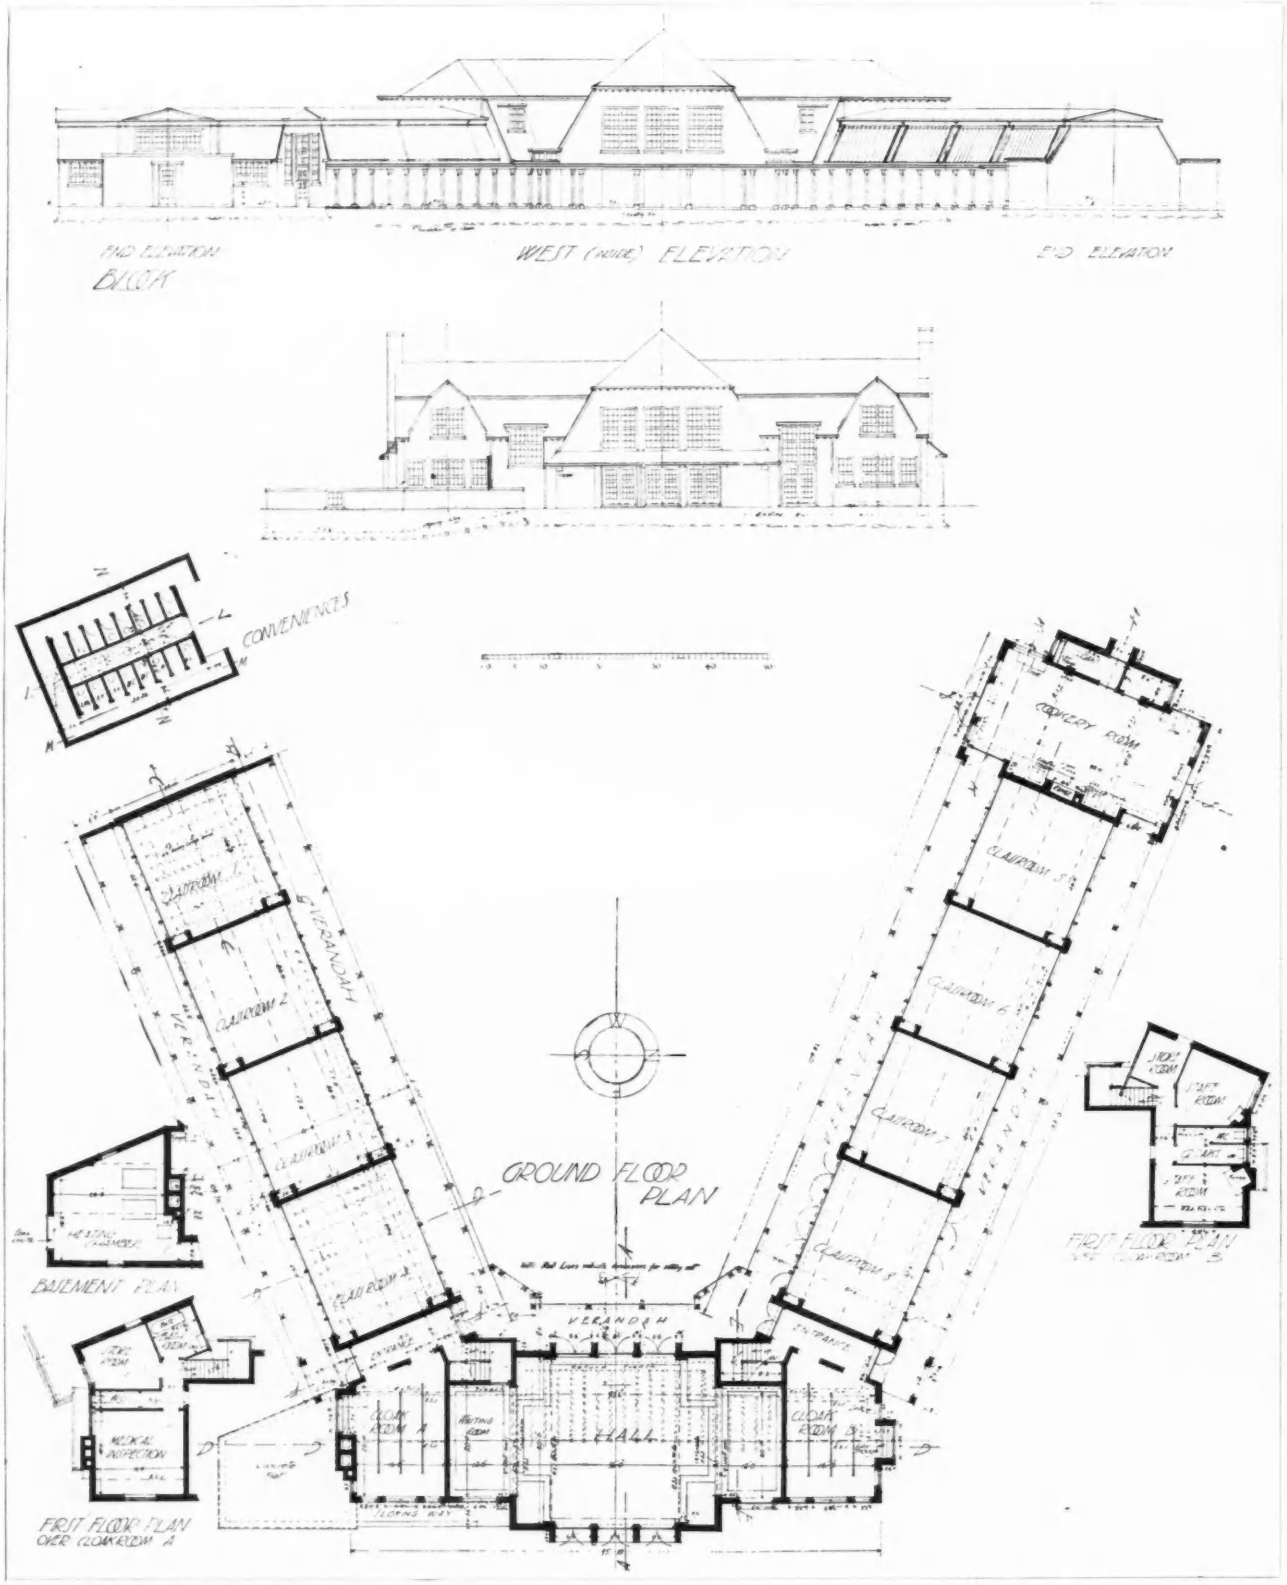
The plan, of blocks in splayed arms, with an assembly hall unit at their convergence, furnishes six rooms each for forty scholars, and two each for fifty. The building is of brick, with a roof of hand-made, sand-faced tiles. The principles of lighting and ventilation are those with which some readers will already be familiar, and others will grasp them from the illustrations, which indicate the types of open and closed verandas adopted according to aspect.

In the assembly hall unit—the hall itself is adapted for stage performances—are also quarters devoted to domestic science and to medical inspection, with store, bathroom and w.c. attached.

The ground enclosed by the two arms has been laid out with footpaths, banks with shrubs, grass, and, in the midst of the grass, a fish-pond and fountain. This layout of the grounds, and the painting, were carried out by the works department of the Derbyshire County Council. The contract price of the buildings themselves was £21,854.



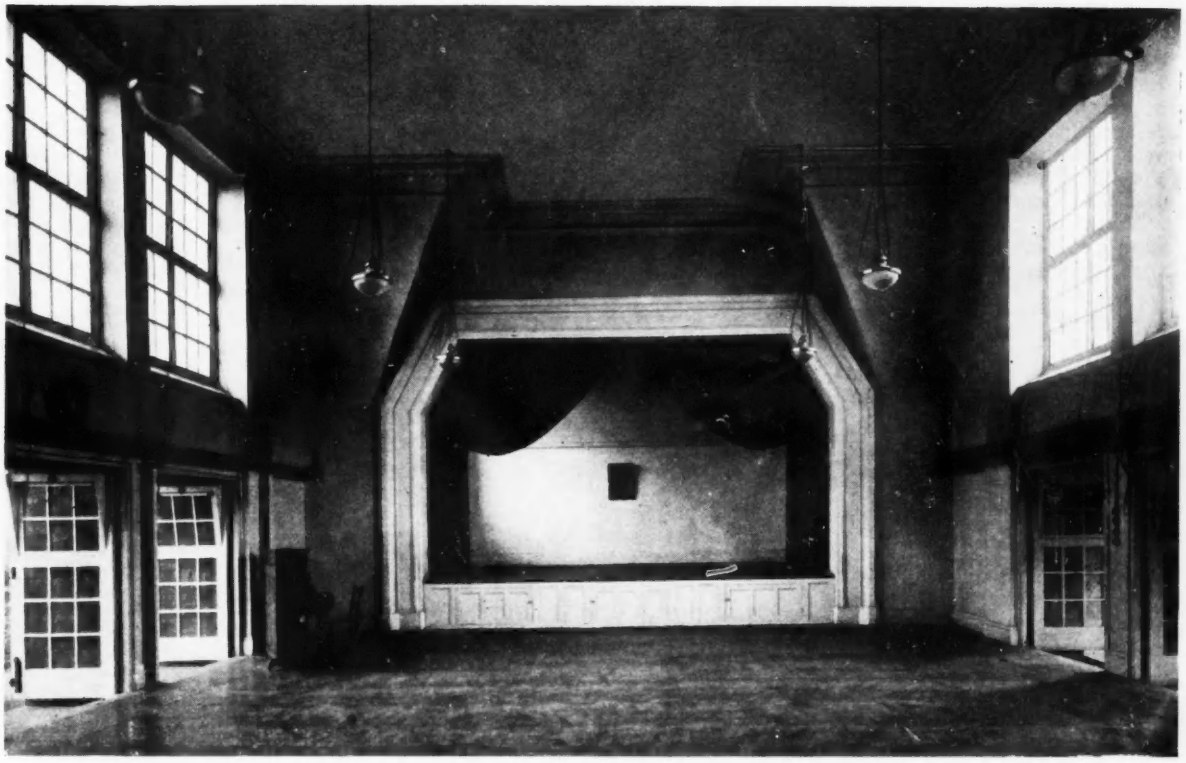
The north side of the south block. This shows, in contradistinction to the typical southerly front, shown above, verandas entirely protected from cold winds by sash windows and patent glazing.



Whaley Thorns School, Derbyshire.]

The west elevation; east elevation; and ground plan. The first-named shows the entire span of the frontage, including the splayed blocks, with the assembly hall unit at its centre. In the space between the arms the ground has been laid out as a water garden.

A portion of the east elevation and the south end, showing the assembly hall, on the right. In all the exterior photographs reproduced, the wooded character of the charming site, from which the school has been popularly christened, is indicated.

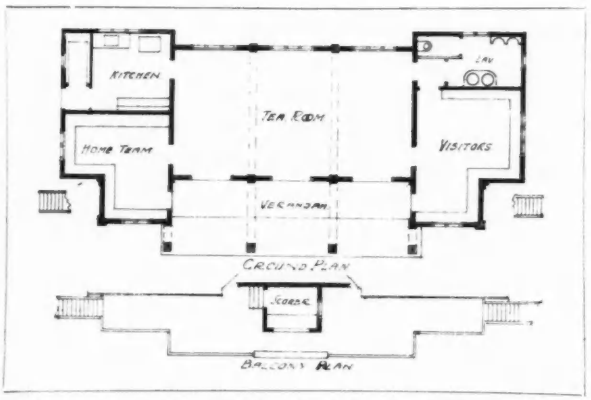


[*By G. W. Widdows.*

An interior view of the assembly hall, looking towards the platform, which has been arranged and fitted with curtains, etc., to make it adaptable for theatrical performances. There is accommodation within the range of buildings for 340 girls in 8 rooms.

SPORTS PAVILIONS AT MILL HILL SCHOOL

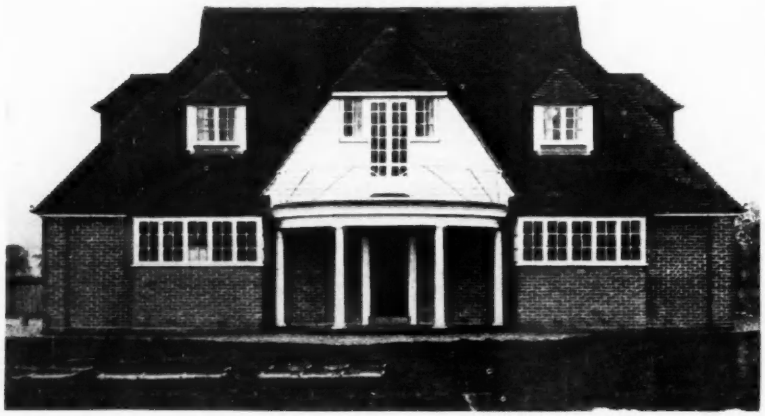
DESIGNED BY R. S. BALGARNIE WYLD



The main front of the cricket pavilion; and the ground-floor and balcony plans. The building is timber framed and weather-boarded on a brick base, with hand-made sand-faced tiles used for the roof. The weather-boarding is painted a cream colour; the columns supporting the scoring balcony and the joinery are white, and the shutters green.

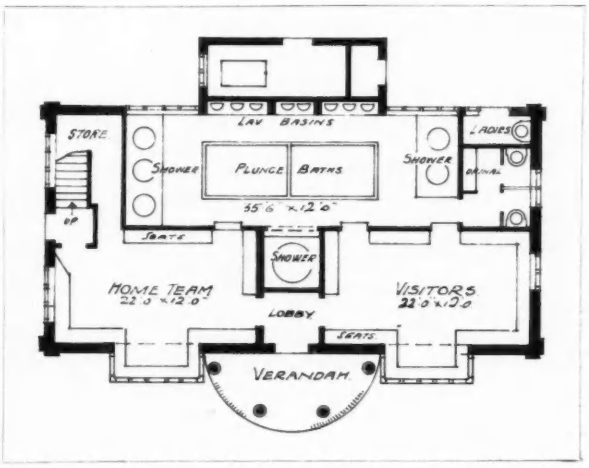
THE two sports pavilions at Mill Hill School, here illustrated, afford an excellent idea of the diversity of planning required for the dressing accommodation, etc., for players participating in our two national games—cricket and football.

The cricket pavilion was erected on somewhat marshy soil, which necessitated a concrete raft being laid for the foundations. The predominant feature of the planning is the large tea-room, which gives on to a veranda and is flanked on one side by the home team's dressing-room and the kitchen; on the other by the visiting team's dressing-room and the lavatory accommodation.



The main entrance front of the Old Millhillians Rugby Football Pavilion. The walls are built of Luton grey bricks, and the roof is covered with sand-faced tiles.

The pavilion in Headstone Lane, Mill Hill, was erected for the Old Millhillians Rugby Football Club. Here, the plan fulfils admirably the purposes of the building, with a generous provision of washing arrangements—a necessity for thirty tired players after a match on a muddy field!



A view of the Old Millhillians Rugby Football Pavilion, showing the entrance to the home team's dressing-room; and the ground-floor plan. The first floor contains a large tea-room, committee-room and a kitchen.

Bernard Whistlow, F.R.I.B.A. : An Autobiography : vi

I TURN CLERK OF WORKS

BY KARSHISH

(H. B. CRESWELL)

I SAID good-bye to Grig when I had been with him nearly seven years. At that time he had not much work, and was loaded down to the scuppers with pupils, for as fast as he jettisoned one he shipped another: I had fallen into a groove of making half-inch and inch details and doing a good deal more for Grig's pupils than Grig was doing for me; I felt the need of experience in other offices, for Grig's practice was almost solely concerned with churches and private houses; and I also wanted to travel.

In bidding good-bye to Grig's office I must say a word of farewell to those I have spoken of as sharing my life there, and whose diverse destinies are a comment on my own.

Tubal, after four years with Grig, prevailed with an aunt to commission him to build her a house, and promptly set up in practice on the strength of her confidence. He engaged an assistant who, he told us, was "better than Zaza"; and he took great credit to himself for designing a house the main elevation of which exactly reproduced an authentic example of Queen Anne at Salisbury. His aunt did him even a greater kindness shortly afterwards by dying and leaving him a competency; following which he married a rich wife; forsook architecture in favour of squirearchy; and now spends his time going about the grounds of his house in Berkshire in a bath chair drawn by a white donkey.

Poor Yeice made a mess of things. Out of mingled folly and misplaced generosity, and in the absence of any sympathetic relations with his father, he secretly made what is called a rash marriage. The marriage, and the whole of the circumstances leading up to it, were known to everyone in the office except Grig, and Tubal was witness at the ceremony; and although the marriage was not so rash as to discourage Yeice from taking his wife with him when he went home for his summer holiday, nor from putting her up in a hotel in the adjoining town from which she visited at her mother-in-law's under her husband's name as a member of a remote collateral branch of the family, and afterwards went to stay in the house on that footing, disaster followed discovery a few months later. The authority of fathers over their sons' alliances was implacable in old families even in those recent times, and poor Yeice's pupilage ended and he was more or less disowned. His capacities were limited; his ideas of the meaning of work inadequate; his wife an encumbrance: his only resources were his personal charm, his social standing and his family connection, and he certainly made the most of them. He must have had some kind of guardian angel to enable him to carry on; and it was the kind of guardian angel that could arrange a chance meeting for him in the street with Zaza at a moment when Zaza was on his way to the bank to deposit his monthly cheque. Ten pounds was the sum Yeice borrowed, and he did it in such a way as to flatter Zaza by his condescension in accepting the loan. I was sufficiently in Zaza's confidence to observe his gratification at having so well played his part in an intimate understanding between gentlemen, and to note also the dispersion of that gratification. The poor little man could afford to be a gentleman for only a very few weeks; but it was characteristic of him that when he had completely surrendered the position by three times writing to Yeice for the money without getting it, he showed no indignation, but a hushed astonishment only. The end of poor Yeice's troubles came when he enlisted in the Imperial Yeomanry and was killed in the South African war.

Chichester, contrary to our ideas of him, proved to be among those whom the gods are inclined to love. The second winter I was at Grig's he was away from the office with a cold, and afterwards began coughing. The persistency of this cough—which resembled a sheep's—was forced upon us by Garston's echoing it from his end of the room in protest of what he considered merely a tiresome habit; but in February Chichester came no more, and we heard he was at Davos. He returned in June plumped out and sunburnt, but fell away in the autumn and we saw his tall gaunt figure no more. He had had another hæmorrhage and, on recovery, was banished to California, where, in high altitudes, he still lives an open-air life.

Potts, by most meritorious application covering many years, at last passed the examination of the Royal Institute and was elected an Associate. He achieved this by disposing of one or two subjects each time he sat—like breaking bottles at a shooting-gallery, Garston told him—and afterwards set up a wooden office in the yard of a suburban railway station, where he practised as house agent, coal merchant and architect; married; became after many years chairman of the Urban District Council and, when at last he died, the account of his funeral was advertised in the posters of the local weekly paper. In his particular sphere, and from his own point of view, Potts's career was a complete success. He realized his wildest dreams.

Zaza, after bettering himself in various offices, obtained the post of chief assistant to a leading firm of architects in Sydney, and took out a brand-new wife to share his success.

As for me, I spent three gorgeous months with Garston making measured drawings and sketches at Christchurch, Wimborne, Romsey, Salisbury and Wells, some of which were afterwards published in the "A.A. Sketch Book"; and under Garston's leadership poaching—as I am afraid it was—the Test and the Avon, and doing certain other things that I ought not to have done but which, in looking back, I do not regret. I then returned to London and got a job at two pounds a week in the office of a city architect of hotels and public-houses, whose practice made it necessary for him to go out to lunch at half-past twelve and return, squiffy, at three, and who was so dilatory in paying up that I left him after three months and have never yet received the fourteen pounds he owed me; worked in various offices on competitions, earning overtime that enabled me to overtake my city losses—if I may so term them—for I had told my father that I could make my own way and was sensitive about asking him for money though I had to sell my good editions and some of my old furniture to tide over the many weeks when I was out of work; and then, suddenly, a balloon ascended one afternoon from the Wandsworth gas works and made a Clerk of Works of me.

The balloon drifted over Harrow and distracted the attention of a boy fielding at the nets; the boy, in consequence, was struck on the head by a cricket ball; his mother fled to his side, after cancelling by telegram my engagement to dine with her, and I went to a conversazione of the Architectural Association at the newly-built Imperial Institute, instead, where I chanced to meet Grig in charge of two little pink-and-white Grigs, one with its back hair up and the other with its back hair down.

In those days I could not be bothered with any women under thirty: young girls impressed me merely as children absurdly dressed up; they also greatly embarrassed me, but whether this was due to an uneasy perception (afterwards to be abundantly justified) that they

were not—in my father's term—safe, I do not know. I conducted these two little Grigs to the buffet—how well I remember it all!—where the one with its hair up, and who wore gloves, partook of an ice; and the one with its hair down had an ice, a ginger cake, a glass of lemonade, another lemonade and an ice; and when I led them back to discard them, I found Grig in conversation with a little man with silky auburn hair, a great pendant moustache, an angry nose, and spectacles of such enormous magnification that his eyes bulged through the lenses in startling distortion and one saw the separate prongs of his pale eyelashes as if through a reading-glass. Grig, with his usual charm, introduced me to Mr. Tallard as though I were the only pupil he had ever had. I shyly disengaged myself as soon as I could, and thought no more of the matter till three days later when I received a letter re-directed from Grig's office. It was dated from H.M. Office of Works and lies before me as I write. One corner of it is crumpled and torn where I held it while I capered round the table waving it over my head.

SIR,

There is a vacancy in this office for a Clerk of Works to take charge of the rebuilding of the Post Office at Brayness.

The salary is two pounds ten shillings a week. Travelling expenses are allowed.

Your attendance on the site would be required at 9 a.m. on next Monday week, the 22nd.

If you wish to apply for the post it is expected you will call at this office, bringing this letter with you, at 11 a.m. next Tuesday, the 19th.

Your obedient servant,
For RICHARD TALLARD,
Chief Surveyor,
T. K. S. PETERSFIELD,
Sec.

This event may seem to be a very small matter, and to open a blind alley to all opportunity; but I was fast growing sick at heart at the vicarious duties of a draughtsman, for which work I was not—as I knew—particularly well-equipped: here, at least, was a chance of testing my capacities and of release from the detestable prospect of asking my father for money. Any doubt of the wisdom of accepting was removed by Grig, who said, when I consulted him: "Certainly, go. The experience will be valuable to you on all counts," and I duly kept the appointment at Whitehall Place in the old house (soon after to be pulled down to make room for the War Office) which was the home of an Office of Works whose then personnel numbered two hundred in place of the two thousand now on its wages list.

There I was received by Mr. Tallard: that is to say, after my letter had been passed from hand to hand by several clerks, I was thrust into a large square room and the door shut behind me. In the middle of that large square room Mr. Tallard sat at a pedestal table where, fed by a clerk standing beside his chair, he was ravenously disembowelling successive files of papers and scribbling notes and directions upon them before he pushed them aside.

I had asininely expected to be greeted, as a *protégé* of Grig's, with a renewal of the social interchanges of the conversazione: but I did not then know Tallard; I did not know the Office of Works; I did not know the world; and I did not know myself. I have no doubt whatever that Tallard perfectly understood my case when he blotted out those expectations with a thoroughness that would have been brutal if it had not been so wise, so necessary and so considerate of my welfare; and that out of kindness of heart he laid it on for me extra thick. There were no favourites at the Office of Works. I had to understand that I was merely a private in the ranks.

I stood inside the door unnoticed, with my complacency trickling away out of my heels, for minutes while Tallard disposed of his immediate influx; and then I wilted as I saw the clerk hand him my crumpled and torn letter—which, as I knew, was also stained with tea—and indicate my presence by a gesture. Tallard gave me a quick flash of distorted eyeballs; read the letter as though he did not know my business and was annoyed at being interrupted; and then said, coldly:

"You wish to apply, do you?"

"Yes, sir."

He fumbled the letter; glanced through it again; grunted so that his body heaved, and then looked across the room and fixed me with his glittering lenses and his threatening nose. His mouth was hidden by his moustache and his face had no kind of expression. If he intended to frighten me he succeeded to admiration. It was as though he was in two minds whether or not to send me to prison, and it was like a sentence from the Bench when he said "A week's notice," and confirmed the conviction by scribbling on the letter and giving instructions to the clerk of which I caught only the words—"Take him . . ."

"There's a form they'll give you to sign. You'd better take the drawings with you," he then said to me; and he slapped down a pencil with a crack flat on the table as an order of dismissal. Then, astonishingly, just as I was turning to go, he said, as he reached across his table for a bundle of papers:

"The sea air will be good for you."

So the cat was out of the bag! I had been living through months of frustration in one room striving to economize, and I felt peeked and no doubt looked it.

Grig had evidently been speaking to Tallard about me, and it was a stranger's kindness of heart that gave a young man, particularly lacking in any aptitude for affairs, the chance of learning to hold his own in conflict with others and to obtain confidence in his judgments and ability to enforce his decisions—for this, more than any task of handling the technicalities of practical building, was what lay before me; and although I was quite unaware of it on that sunny Saturday morning at the end of May when I deposited my luggage in the cloak-room at Brayness station and sallied forth to explore the field of my future activities, it was not particularly with the complexities of building operations, but with the complexities of human nature I was about to grapple.

If I had thoroughly understood this I could not have taken a bigger header into the stream than I did when, after viewing the outside of the Post Office, I entered it and acquainted myself with the inside of the Postmaster. My ardour was, however, tempered by discretion, and before I went in I asked a man in the street what the Postmaster's name was. He told me it was Charles Tyler, and I thereupon went to the counter and asked for Mr. Tyler, giving my name and stating that I was Clerk of Works in charge of the forthcoming additions. The length of time I was kept waiting was no doubt the Postmaster's measure of his own importance and my insignificance, and the disparity was evidently great; but at last a flap at the end of the counter was raised and the wicket below opened to admit me to The Presence.

The Postmaster held court at a dingy, polished, yellow oak table in a bin with a dust-covered glass lid, littered over with bits of torn paper, in company with a gas-pendant of black iron tubing amazingly encrusted with dead flies. Mr. Tyler was entirely unventilated; he was inadequately lighted; and privacy was denied him by a window looking point blank into the Telegraph Office, the glass of which was neither too dirty to see through nor too thick to shut out the ceaseless chattering of the instruments. He proved to be a small, florid, square-shouldered, spectacled man with thick grey hair, heavy moustache and bushy side whiskers, who looked like the reflection of the Emperor Franz Joseph in a tablespoon. He seemed disconcerted at my appearance: whether he expected to see a workman in the gartered moleskins of those days, I do

not know. He gave me no kind of salutation but, after a glance, turned and shifted his blotting pad about uneasily and then said :

" I thought Mr. Titmus was going to look after the building work."

" No. I've been sent down by the Office of Works."

" Oh ! Well ! No one told me you were coming. Why didn't they acquaint me? "

" I've no idea."

" Well, you'd have thought they would, wouldn't you? I'm Postmaster here. You'd think they would let me know what was being done. Eh? "

" I'm afraid it's nothing to do with me."

" I didn't suppose it was. All I say is they ought to have told me. I don't know how it's all going to be managed. I saw Mr. George Bradshaw yesterday, and he didn't have much to say, but my work has got to go on. I can't have the work of the Post Office interfered with : you understand that, don't you? "

" Of course I will do the best I can, Mr. Tyler."

" But will your best be good enough? Now *here's* a thing—I told Mr. Bradshaw about it yesterday. They sent down and put a lot of poles and planks along the wall in the side passage. I told the man take them away; how are the letter-carriers to bring their barrows up the passage if it's to be blocked with builders' stuff—can you tell me that? "

" No. You see I've only just arrived."

" Well then ! That's what I say. The work of the Post Office has got to go on. If my work's going to be interfered with I shall complain to the Postmaster-General. The public has got to be considered even if I haven't. They're going to take the roof off the public office, aren't they? "

" Yes."

" Well, I said all along I didn't want that done. Why can't they build up at the back where they would not be in my way, and leave the front as it is? Eh? "

" Well, Mr. Tyler, the building would not be much to look at from the outside, would it? "

" Much to look at outside ! I have to get my work done *inside*, young man, and it's the *inside* I'm thinking about."

" Well, Mr. Tyler, I will see what can be done and arrange with you before the works are started. It is merely a question of the order in which they are put in hand."

" Yes. Well, you'd better. It's no good Bradshaw beginning to pull the place about and me having to stop him, is it ? "

On this note my first interview with Mr. Tyler ended, leaving me blissfully unaware of its utter dissonance; and I thereupon spurred off to introduce myself to the builders, Messrs. Bradshaw and Son, of Milton Crescent.

June 24. v : My First Job : The " Pipes."

LETTERS FROM READERS

Taxation of Land Values

SIR,—If one were to judge only from the reasoning and the prophecies contained in the letter of your correspondent, Professor G. M. Trevelyan, and your leading article in your issue for June 17, one would expect to find at present the houses and other buildings in our towns and villages well spread out over the land, having large gardens attached to the houses and with many open spaces and pieces of land reserved for use as recreation grounds; also that when the tax on land values comes into operation all these good things will disappear.

Quite the contrary is the case, as the advocates of the taxation of land values have been pointing out during the whole time of the agitation for this much-needed reform. Our towns are congested, there are few open spaces, gardens are small or non-existent, flats are piled over one another in tenements, and on every hand one sees similar results of the attempt to make the most of dear building land.

Around every town, large and small, there is a ring of land, priced for building purposes at many times the amount it is fetching as agricultural land, and in the towns proper are many sites either partially used, such as places for posters, etc., or not used at all, for which a high price is wanted as building sites. The existence of the system of holding up land until it ripens makes the price of every site dearer than it should be. A tax on land values will tend to bring the price of all vacant land down to its natural price by, as you say, forcing vacant land into the market. The result will be that when land is cheaper it will be easier than before to provide a large garden for each house and to provide permanent open spaces owned by the municipality or clubs and others.

In every town, without exception, there are clear examples of the value of lands being made higher by the direct action of the municipality and by the general activities of the citizens. It is right that this value should be taken in taxation to meet the expenses of the municipality and for the common good. On the other hand when a man builds a house or adds to an existing one he provides the whole value—the municipality provides none of it—and yet he is taxed in proportion as he has added value to the town. This is a deterrent to building and to improvement and it would be a much wiser policy to levy taxes on each person in proportion to the benefit each received from the local authority and central government, that is, according to the value of the land occupied by each, and correspondingly relieve from taxes the buildings and other improvements created by individuals.

The principle of the taxation of land values is a good one. There are bound to be hardships when changing over from the existing system to a new one. There will also be difficulties; and I agree heartily with Professor Trevelyan that special legislation, giving powers to local authorities to control the development of towns, should be enacted. But because this may be required is no excuse for decrying, as is so often being done today, the proposal to tax land values, which in itself is a just proposal. On the contrary, let those who desire widespread towns and a solution of our housing problem welcome this proposal and press for legislation giving such powers to local authorities as they consider are required to ensure the growth of our towns on well-ordered lines.

A. D. H.

Lowest Tenders

SIR,—I should be glad if you would kindly allow me a little space in your JOURNAL to vent a grievance which I and other builders have against the practice of accepting tenders which are not the lowest in competition.

During the past few months I have gained information that I have been the victim of decisions of this kind, and in both cases I have been keen to obtain the work, and have spent a considerable amount of time in the preparation of my price.

Whilst I have no wish to question the general fairness of architects, I feel that, despite the usual covering clause which appears in specifications, " that the lowest or any tender will not necessarily be accepted," it is their duty, if they send out invitations to several builders, to accept the lowest.

After all, architects have every opportunity to obtain information as to our qualities before inviting us to tender.

Most of the trouble appears to come

from clients who are keen on employing a particular builder, and the competition of his local rivals is only obtained as a check upon his price.

This procedure is grossly unfair, and was especially so in one case of which I heard, where the firm finally selected were fourth on the list and were given an opportunity of reducing their price to compare favourably with the lowest tender.

I feel that a client, if he accepts any tender, should be bound by law to accept the lowest price or compensate the unfortunate bidder for his loss.

An architect who is a business man as well as an artist should realize that, though it is a trivial matter for him as regards expense to send out several sets of drawings and specifications, it is a costly and aggravating matter for builders to prepare tenders with no chance of success.

SUBURBAN BUILDER

Graded Materials

SIR,—May I make one comment on your excellent plywood supplement to your issue of June 24? It is on the question of the grading of materials, a subject with which, in my view, the architect is not sufficiently familiar.

I can best explain what I mean by taking an example from the plywood industry. Other industries will have their special problems, but the principles of grading are probably present in some form or other in many other industries.

Venesta birch plywood, for instance, is all *made* the same way, but the outside veneers are sorted according to timber variations, such as the number of knots per unit area. Some boards are made, therefore, with a few knots on both sides, while others have no knots on one side and hardly any on the reverse. The former are useful where the plywood is to be painted or not seen, and the latter where the grain will be seen or where a special highly-painted finish is wanted; but both boards are equally well made.

Many architects are now wasting money because a grade suitable for staining and polishing is used for purposes where the figure will not be seen, and many other architects get disappointing results by not using a sufficiently high grade just for those parts of a job that will be seen.

To illustrate my point the following examples show how three architects have used the most suitable grade for each specific job :

1 : In our own offices (designed by Louis de Soissons and Grey Wornum) Venesta NILNOT birch was used because it was to be lightly stained and polished.

NILNOT is a grade of Venesta birch plywood free from knots on one side with a very few small knots on the other.

2 : In a staircase designed by Serge Chermayeff, Venesta SPECNOT birch was used because he wanted a high-class painted finish on a curved surface.

SPECNOT is a grade of Venesta birch plywood with a very few tiny knots on one side, the other side the same as the back of NILNOT.

3 : In the showrooms of the Cresta factory by Wells Coates, Venesta SUMNOT birch was used for partitions, cupboards, etc., that were to be painted.

SUMNOT is a grade of Venesta birch plywood with a few small knots on both sides, rather more on one side.

I am convinced from our experience in giving technical information that if more architects would use grading systems—such as the table we have ourselves prepared, and which is available to them—not only for plywood but for all materials, considerable economies would be made while at the same time getting better results.

T. CRAVEN PRITCHARD
(VENESTA, LIMITED)

Cavity Walling

SIR,—"W. A. D." tries for a debating point (JOURNAL, page 862) by decrying cubing as a method of estimating, while totally ignoring the fact that I pointed out that quantities would disclose a greater discrepancy in his own estimate. My thorough dislike of the common form of cavity walling is founded on experience of its behaviour in harbouring dirt, insects, etc., under exposed conditions, and on what I have seen in a number of instances when it has been opened up.

I regret that I cannot accept "W.A.D.'s" invitation to discuss the matter at such a length as to be likely to convince him, but I gladly offer him this alternative suggestion : Off the dampcourse build up the facing bricks in stretcher bond as though for cavity walling; when from four to six courses high all round, parge with waterproofed cement mortar and back up with common brickwork; tie with short pieces of hoop-iron embedded in waterproof mortar; repeat operations in the same order. Do not put a piano in the house until the walls have dried out, especially if it is a grand piano.

To "R. W. M." I would suggest that he consider the additional cube in his concrete lintols, and the measurement of the lead or other protection for the frames under them ; the additional finishings to reveals; the width of his thresholds; the increased perimeter of his building and the effect of this on the measurement of his brickwork, facings, eaves, soffits, fascias, guttering, roof-coverings and the like. Having done so, and valued the additional work, let him rejoice in his good fortune in finding so many small builders foolish enough to do this additional work for nothing. He will then perhaps understand why some of them are unable to pay their way.

J. R. T.

Cedar Shingles

SIR,—Our attention has been drawn to the interesting query appearing in your issue for April 29 on the above subject. Your expert's surmise as to the cause of the more rapid decay of oak shingles on the lychgate than on the church steeple is correct; there is also, no doubt, another reason which will account for this decay, and that will be the greater care with which oak shingles were selected in 1860. Only straight-grained shingles without knots will stand the weather even if the pitch be steep.

With regard to cedar shingles, the statement that they will only last for fifteen years can refer only to slash-grained shingles of inferior quality, which are sold at a very low price in Canada and in the United States.

Straight edge, or so-called edge-grain shingles, which do not show any figuring or knots, will stand, on a conservative estimate, without curling or splitting, up to sixty years. There is ample evidence for the correctness of this view, and the Agent-General for British Columbia, who is thoroughly familiar with the subject of red cedar shingles, will no doubt be glad to furnish authentic information as to the merits of edge-grain shingles. Even the best oak shingles curl and split, whereas red cedar shingles, cut on the edge-grain, lie permanently flat and suffer no distortion.

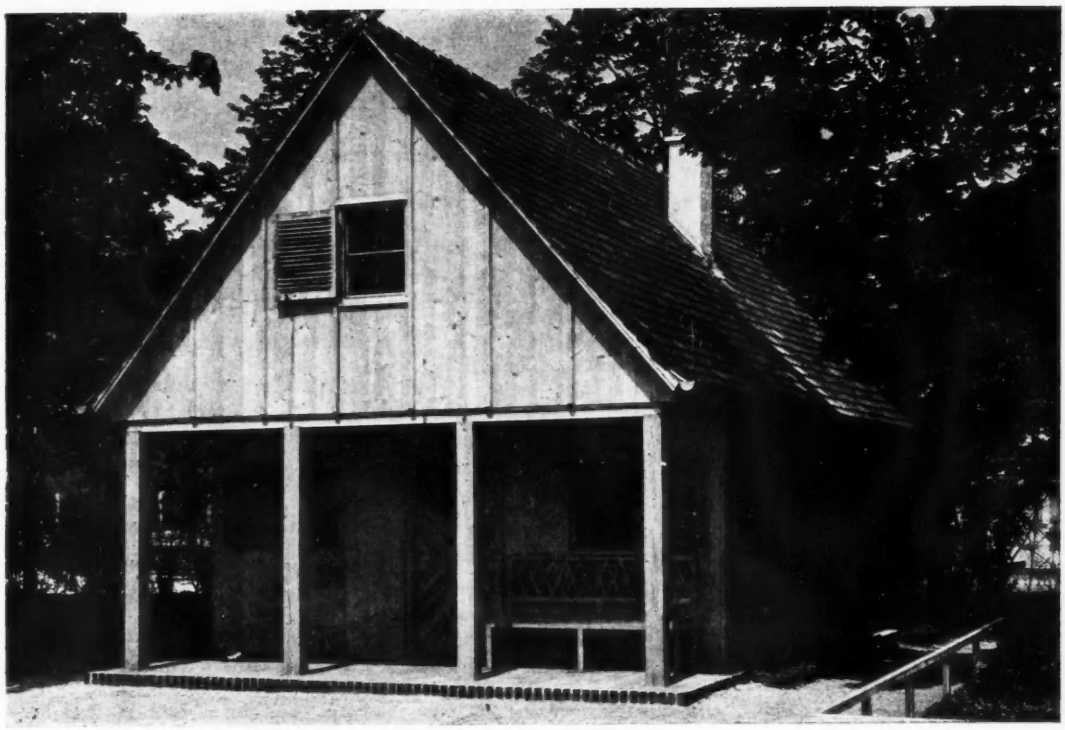
W. H. COLT, LTD.

Transport Chaos

SIR,—As one interested in the attempts which are being made to remedy the chaotic state of transport in this country, I should like to call your attention to a national conference of local authorities which has been called by the Leicester City Council to discuss canal development.

The question of road congestion and damage by heavy traffic is bound to crop up and is of vital interest to architects of houses adjacent to main roads. May I suggest, therefore, that the conference would be a fitting occasion to discuss national transport as a whole ? So far, I understand, no invitation to the conference has been issued to representatives of the three great inland carrying systems—the railways, the roads and the canals.

G. B. J. ATHOE
(SECRETARY, INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS)

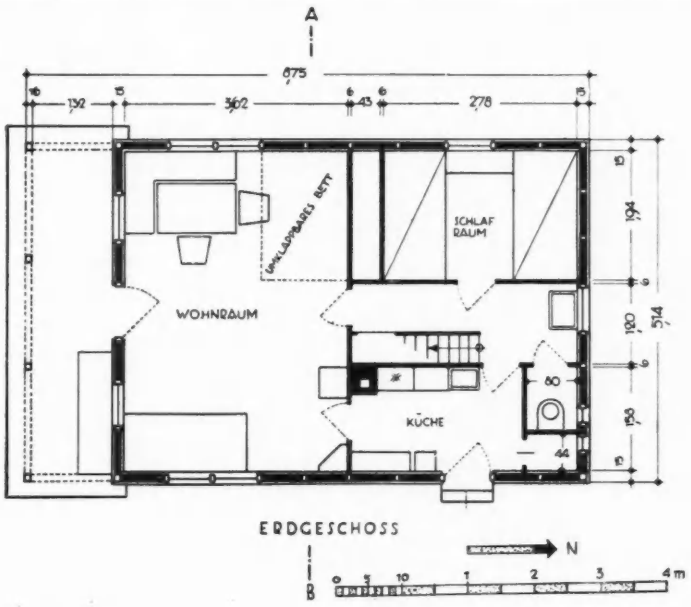


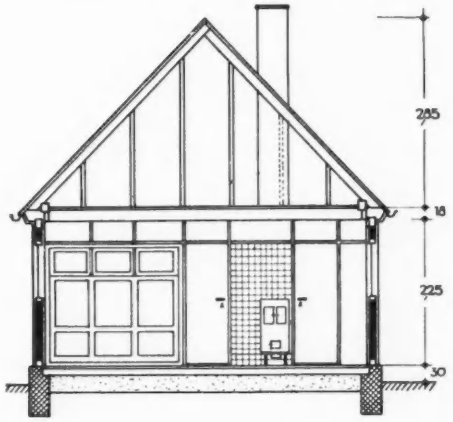
A wooden week-end house in Bavaria, designed by Jakob Kader.

LITERATURE

SMALL HOUSES FOR SMALL MEANS

MOST people imagine that Germany's admittedly immense contribution to modern housing is confined to those huge zigzags of tenement flats which have become such a conspicuous feature of the outskirts of the larger towns. This is an error. German architects are the first to admit that these represent not an ideal solution of working-class "home-hunger," but the best compromise possible in the face of economic difficulties, which have had no parallel in this country. But even as it is, quite a number of "*Reihenhäuser*," or rows of separate two- and three-storied houses, of the kind familiar in





Ground-floor plan and cross section of the wooden week-end house in Bavaria, an illustration of which is reproduced above. The accommodation shown is as follows: Wohnraum = living-room; küche = kitchen; and schlafraum = sleeping-room.

[*From* Das Kleinhaus: seine Konstruktion und Einrichtung.

our own municipal housing estates, have been built since the war to the designs of architects like Salvisberg and Tessenow.

Herr Harbers is an enthusiastic advocate of the retention of the small, where possible unattached, house within outer-city limits; and makes out an unassailable economic case for its preservation and perpetuation. He clearly prefers gabled to flat roofs. His eminently practical book offers detailed "type-plans" to both architects and their clients of a number of these (some with tiled walls and some with timber-faced gables), ranging in price from £300 to £750. Details of cost and dimensions are worked out minutely, and considered in all their bearings in the most exhaustive and methodical manner.

Commendably Herr Harbers insists on the paramount importance of proper orientation. With prevalent Central-European weather conditions the gables of houses should be made to face north and south. Commendably he deplores the "picturesque" hipped or mansard roof, which Teutonic and Latin popular taste still delights in, as both hideous and unpractical. The staircase, preferably without any turn, or intermediate landing, should be situated in the north-west corner of the cottage. The living-room should look south or west, the bedroom south or east, the kitchen—which need not exceed 6–9 square metres in area—west or north; and the bathroom always north. Furniture ought to be built in as much as possible. Free-standing tables, chairs, chests of drawers and wardrobes should be made low, and not too long or deep.

It is curious how startlingly similar in plan and appearance are the cottages of all ages and peoples, whether typical of sub-arctic, temperate, sub-tropical or tropical zones of climate. This simple fact is well brought home by the illustrations. There are pertinent examples from the Adriatic and Ægean coasts. Some inviting little houses on islands of the Greek Archipelago are shown; and a charmingly graphic sketch by a Greek architect, M. Coste-Lixouri, for a small "*mas*" designed by him "for the Mediterranean." A curious old four-square, flat-roofed "functional" house in Munich would seem to show that the type does not necessarily weather as well as has been claimed by its advocates. A wooden "week-end house" to dream of (illustrated on the previous page) designed by Jakob Kader, of Munich, costing only £224, is likely to cause a serious migration from England to Bavaria.

The fittings and furniture shown are sensible, delightful and obviously economical. The short English texts—which cover the general sub-headings, but not the explanatory details of the individual types reproduced, or the very important price and quantity schedules—are, for once, admirably translated. No English exemplars of small dwellings, ancient or modern, are illustrated. Considering (as Herr Harbers has reminded us) that England was the pioneer in the rational planning of small houses, and that we can show modern examples of this type which rank with, if they do not actually excel, the very best recent Continental designs, the omission is pretty certainly the result of what can only be called the reprehensible indifference of English architects to the architectural prestige of their own country in others.

Das Kleinhaus: seine Konstruktion und Einrichtung. By Guido Harbers. Munich: Georg D. W. Callwey Verlag.

THE ART OF THE CAMERA

THE latest issue (for 1931) of *The British Journal Photographic Almanac* is, briefly speaking, a mine of information for all camera readers.

The ordinary amateur will study with delight and some envy the many pages of reviews dealing with the latest improvements for snapshot and cine-photography. For the more experienced the book contains formulæ and methods, and illustrations of gadgets which can be made at home. Articles deal with the romance of the invention and development of photography, with modern enlarging apparatus, colour photography and the Bromoil process—a new formula for the benefit of those working this process in trying climates.

The pictures alone are an immense attraction and well display the variety and resource of those who practice photography from the artistic standpoint. The illustration of the Palais des Papes, Avignon, by E. Chambre Hardman, provides an excellent example of the fundamental importance of light and shade in the pictorial representation of buildings.

A full list of photographic societies and allied bodies in the British Isles is also incorporated in the almanac.

The British Journal Photographic Almanac, 1931. Edited by George E. Brown, F.I.C. London: Henry Greenwood & Co., Ltd. Price 2s. (paper covers) net; 3s. (cloth bound) net.

THE STORY OF ARCHITECTURE

THOSE who have read the first volume of Mr. Walter Godfrey's *Story of Architecture in England*, published some months ago, will remember that in it the author traced the history of the mistress art from Roman times to the beginning of the fifteenth century. He told us of the great period of church building, starting with the Roman basilica and rude Saxon chapel, the Norman style and the gradual evolution of Gothic through all its splendid phases till the glories of Perpendicular, which only waned with the coming of the Renaissance. Though churches naturally formed the principal theme of volume one, castles, manor houses and other domestic examples also received full attention.

In his second volume, recently

published, the author completes the cycle of the story of English architecture throughout the course of the Renaissance. The first chapter deals with the Tudor style, and others are devoted successively to Elizabethan and Jacobean, Stuart, Palladian and Georgian architecture, ending with the Classic Revival, the brothers Adam, and the neo-Greek style of the Regency. In contrast with the period of church building dealt with in the first volume, the second volume now under review is essentially one of house building, and we are afforded the opportunity of tracing the evolution of the English house, of large, "middling" or small size, from the castle and fortified manor of the Middle Ages to the country mansion and town house of the early nineteenth century.

Both volumes have obviously been planned for the lay reader as much as for the professional man; no one need fear being bewildered with technical terms or a mass of mixed details. Mr. Godfrey states in his foreword that he has "endeavoured to present a connected story, to link the character of the building craft to the life of the times, and awaken enthusiasm for an art that mirrors much of our native genius. Technicalities have been avoided as far as possible, with a view to the needs of the general public and of the schools . . . many details that are usually noticed only by architects are pointed out and their significance explained."

No matter how interesting a book on the story of architecture may be, much of its value lies in the elucidatory illustrations. Here, in the second volume alone, are provided over one hundred and fifty illustrations—drawings, photographs and plans—of churches, cathedrals and castles, manor houses, mansions, civic buildings, etc. The many drawings have been executed by well-known architects, including W. Curtis Green, A. C. Bossom, Maurice Adams, Edwin Gunn and John Begg, and all are notable for their agreeable draughtsmanship.

The Story of Architecture in England. Volume i—Renaissance. By Walter Godfrey, F.S.A., F.R.I.B.A. London: B. T. Batsford, Ltd. Price 5s. 6d. net.

[Some of the drawings published in the above book are reproduced in the Sketch Club pages overleaf.—ED. A.J.]

THE ART OF LETTERING

THIS is not so much a treatise on lettering with examples, as a very thorough examination of what exactly is meant by the term Art of Lettering, and to what extent it might be applied to the use of lettering in present-day commerce.

Lettering in stone, sign-writing, applied and engraved lettering are dealt with in separate chapters with a final chapter of general considerations.

As we know, the standard of lettering in stone has been bettered out of all recognition from the thing it was fifty years ago, with the curious exception of gravestone lettering, which has fallen into the clutches of a base form of mass production from which all taste has been excluded. The book makes a plea for better lettering—simple but better lettering—in this important branch, and suggests that a card of sample lettering, if it could be introduced into the tombstone mason's shop, would effect a change sooner than any other method. I suggest also some form of publicity on the part of English quarry-owners as a means of ousting the vile purity of Italian imported marble.

The committee who produced the book "are convinced that the continuance by artist craftsmen of experimental work is an essential condition of any lasting improvement in the standard of lettering in common use," and they are certain that the present workman does not fall short of his predecessors in times past in ability or in his pride in the quality of his work. "'To make a good job of it' is an ideal, understood by almost all workmen."

THE HOLIDAY SKETCHES COMPETITION: RULES

1. Three competitions will be held to cover the 1931 holiday season, the closing dates of each being in the middle of July, August and September respectively.

2. The competitions are open to any reader of THE ARCHITECTS' JOURNAL.

3. Two prizes, a first prize of Ten Guineas and a second prize of Five Guineas, will be awarded in each month's competition for the best and next-best sketches sent in.

4. Competitors may enter for any or all of the three months indicated, if they choose, but no competitor can win more than one prize.

5. A maximum of five drawings may be submitted by individual competitors for each month's competition. Such batches must be sent complete under the same cover.

6. The size of the drawings is not to exceed that of Royal drawing-paper, i.e. 24 inches by 19 inches.

7. All drawings should possess some definite architectural or craftsmanship interest, but they need not be exclusively concerned with buildings, and drawings of boats, vehicles, etc., will also be eligible.

8. The drawings will be judged by the Editor of THE ARCHITECTS' JOURNAL, whose decision will be final.

9. Entries for the July competition should reach the Editor of THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, Westminster, S.W.1, between the first post on June 15 and the first post on July 14. The result of the competition will be announced in THE ARCHITECTS' JOURNAL for August 12.

10. Entries for the August competition should reach these offices between the first post on July 15 and the first post on August 17. The result of the competition will be announced in THE ARCHITECTS' JOURNAL for September 9.

11. Entries for the September competition should reach these offices between the first post on August 18 and the first post on September 15. The result of this competition will be announced in THE ARCHITECTS' JOURNAL for October 7.

12. A motto of one word is to be chosen by the competitor, who will remain known by this motto until the award has been made. Only then will his identity be divulged.

13. Each entry must be accompanied by a sealed letter giving the competitor's name, address and occupation (whether principal, assistant or student). The letter should also state that the competitor will observe the rules of the competition and that the drawings submitted are his work, executed on his holiday this year. It must be enclosed in an envelope sealed with a blank seal and bearing nothing but a motto label on which is written the motto chosen by the competitor and the number of drawings entered. Copies of this label will be found in THE ARCHITECTS' JOURNAL during the period covered by the competitions. (See p. xlix of this issue.)

14. Each drawing must bear on the back a similar motto label bearing the competitor's motto and the number of drawings entered. No other means of identification must appear on the drawing. Drawings bearing a signature will be disqualified; so will drawings not bearing the printed motto label.

15. Owing to the drawings being submitted under a pseudonym no acknowledgment can be sent.

16. THE ARCHITECTS' JOURNAL will publish a selection of the drawings submitted.

17. No responsibility can be taken by the Architectural Press for loss or damage.

THE SKETCH CLUB

THIRTY-SECOND SESSION

THE brush, the pencil and the pen are the implements by the aid of which the mental impressions here recorded have been fixed. The pencil happens to figure chiefly as an instrument of precision, the brush chiefly as a wand with which to conjure atmosphere on to paper, the pen as both. But there is nothing inalienable about these functions, or indeed, those of other methods of pictorial representation, not even excepting photography. It is true that pencil and water-colour are more convenient for work "in the field," and that the impressionism of pen and ink—essentially weapons of the studio—is more deliberate. But that the effect is not necessarily less spontaneous is clear.

It is not every sketcher who has all media equally at command; hence, no doubt, the development of a partiality for a particular class of subject. There are ten thousand million potential subjects, and hundreds of sketchers among readers of THE ARCHITECTS' JOURNAL. The fruits of their holiday sketching, this summer, are certain to enliven the Sketch Club for months to come. There is still nearly a fortnight in which entries may be made in the first of the three Holiday Sketches Competitions, of which the rules are printed on the preceding page.

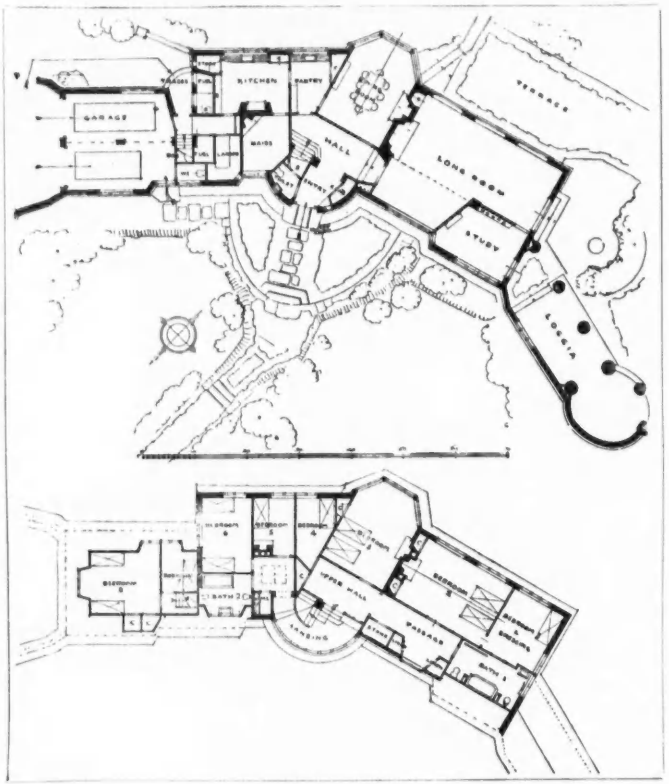
A general view of the main front from the north-west. The walls are built of whitened bricks and the weatherboarding is in elm. The roof is covered with Norfolk reed thatch.

The loggia on the garden front. The piers are of whitened concrete and the beams of oak timbering. The paving is of stone and brick. On the open rough larch timbered roof are perches for peacocks.

BOLTON MUIR, GIFFORD, SCOTLAND

DESIGNED BY P. D. HEPWORTH

ONE of the many interesting features of the July issue of *The Architectural Review* is an example of the domestic work of Mr. P. D. Hepworth — a house at Gifford, Scotland —plans and photographs of which are reproduced on this page. As will be seen, the winged plan has the garage on one side of the house proper, and a covered loggia on the other. The latter is seen in the photograph below.



Ground- and first-floor plans. The half elliptical forecourt is paved with pebbles.

The garden front from the south-west, showing the loggia on the left. The three semi-circular - headed windows light the "long" room; those in the projecting bay, the dining-room.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Rural Housing Development

BEFORE the present session closes the Government hope to receive the sanction of Parliament for their plans for rural housing development. It is expected that in the next year some 40,000 additional houses will be built in agricultural areas.

The Government's new Bill proposes to set up a central advisory body for England and Wales, and a second body for Scotland, to consider building schemes submitted by authorities in local areas. The committee will not have the powers of a central building board, but will be of an advisory nature. In all cases where the local authority considers that the existing subsidy of £11 a year for forty years is not enough to justify it putting further work in hand, the advisory committee will examine the financial position of the authority, and decide whether an increased grant shall be paid from national funds, and, if so, what the amount of the grant shall be. It is hoped to build the new houses at a cost of between £300 and £350 each and to let them at an economic rent of less than 5s. a week.

The financial resolution on which the Bill is to be founded was tabled last week in the following terms :

That it is expedient—

a : to authorize the payment, out of moneys provided by Parliament, of such special contributions, payable annually for a period of forty years, as the Minister of Health and the Department of Health for Scotland, respectively, may, on the recommendation of committees appointed by them with the approval of the Treasury and on such conditions as they may with the like approval determine, undertake to make towards the expenses to be incurred by rural district councils in England in providing houses in agricultural parishes for agricultural workers and persons of substantially the same economic position, and by county councils in Scotland in providing houses for such persons as aforesaid in rural areas;

Provided that—

i : such contributions shall be made only to councils who satisfy the said committees, acting in accordance with such general directions as may be given to them by the Minister or, as the case may be, by the Department, that their financial resources are insufficient to enable them without such assistance to make adequate provision in regard to the matters aforesaid;

ii : the rents to be charged for houses in respect of which such contributions are made shall not, notwithstanding anything in section three of the Housing (Financial Provisions) Act, 1924, exceed such sums as the Minister and the Department respectively may, in accordance with the recommendations of the said committees, determine; and

iii : the present capital values of such contributions, as calculated at the dates when the Minister and the Department respectively undertake to make them, shall not in the aggregate exceed, as respects England, eighty ninety-first parts and, as respects Scotland, eleven ninety-first parts of the sum of two million pounds;

b : to authorise the Minister and the Department respectively to assist rural district councils in England and county councils in Scotland in providing dwelling accommodation in such localities and for such persons as are mentioned in the preceding paragraph by themselves acquiring land and erecting houses, or by arranging with some other Government department to acquire land and erect houses, on behalf of and at the expense of those councils; and

c : to make provisions consequential upon, or ancillary to, certain of the matters aforesaid.

The Two Bridge Schemes

Asked, at question time, for the latest information on the Charing Cross and Waterloo Bridge schemes, Mr. Morrison, Minister of Transport, said that he understood that the London County Council had not yet come to a decision upon the report of the advisory committee appointed by them regarding Charing Cross Bridge, and that pending a decision being reached with regard to this bridge they had deferred the reconstruction of Waterloo Bridge.

Housing by Voluntary Associations

Mr. Mills asked how many housing associations to build houses to let had begun to operate under the latest Housing Act; whether any encouragement was given to those voluntary associations; and whether the Councils of Harpenden, Ware, Dorking and Erith had yet begun to take advantage of the proposals or whether they proposed to build direct or by contract under their authority.

Miss Susan Lawrence said that she was aware of two cases in which arrangements were being made between a local authority and a public utility society under section 29 of the Housing Act, 1930, but she was not aware of the making of any such arrangement by the Councils mentioned in the second part of the question. The Ware Council had, however, undertaken to grant a loan under the Housing Act, 1925, and subsidy under the Housing Act of 1924 to a public utility society proposing to erect houses for letting.

QUESTIONS THAT ARISE

Breeze Slab Partitions

E. W. writes : "*I should be glad of your expert's opinion as to the advisability of allowing breeze slab or similar partitions for bedrooms, etc., to rest on wooden floor joists.*"

Like many other modern practices in cheap building, this practice has obvious disadvantages (shrinkage of timber with consequent slight settlement, subjection to vibration, etc.), but in at least nine cases out of ten no evil appears to follow, and it would be hard to say that the practice ought to cease. It is, of course, much better to provide unyielding support. E. G.

Cracks in Plaster

F. J. C. writes : "*A large dining-room ceiling, in which cracks have appeared, was redecorated several years ago and panelled in relief, with Tynecastle enrichments, the main lines of panels being placed on wood back-plate screwed up in the hope that this would prevent further cracking, papering having previously been used without success. The construction is ordinary lime plaster and wood laths on 9 in. by 2 in. wood joists, with asphalt flat over, and the cause of cracks appears to be that the joists are not stiff enough for the span—21 ft. 6 ins.—and the whole flat moves, particularly in hot weather. Special paper with canvas back has also been tried. The plaster is not loose and is generally in fairly good condition, and cracks reappear in the same places. Can your expert suggest any treatment that would be satisfactory ?*

The only sure cure seems to be the lining of the surface with some form of wall-board stiff enough to support itself, without attachment to the plaster and free to move at its joints without opening. If a panelled treatment is permissible this can be easily arranged. Plywood would probably be the lightest and stiffest material, and each panel should be fixed along its centre through the plaster to a line of joists, and covered and supported (but not fixed) by the enriched ribs. The ceiling can be painted or distempered in the ordinary way. E. G.

Zinc Gutters

R. writes : *In course of inspection of some houses which I am having repaired, I have observed that the guttering, which is of zinc, while in a fair state of preservation, has worn thin in parts and shows a number of tiny perforations. Is there any filling or stopping which I can specify to seal off these perforations, which are really only a series of "pin holes" ?*

Bituminous paint, which has very good covering powers, thickly applied, would be a temporary measure, and unless the guttering was in very bad condition might seal off these minute holes, which sometimes appear in zinc gutters, for a period.

However, I have found that zinc guttering, when it begins to become faulty, needs so much attention that renewal in cast iron is the cheapest solution in the end. W. A. D.

LAW REPORTS

DISPUTE BETWEEN PROFESSIONAL MEN

Payne v. *Marshall. King's Bench Division. Before Mr. Justice Finlay*

THIS was an action by Mr. Edward H. Payne, an architect practising at John Street, Bedford Row, W.C., against Mr. G. E. Marshall, of Raymond's Buildings, Gray's Inn, to recover the sum of £300 as agreed fees and other sums for professional services and use of his office.

Sir R. Coventry, K.C., appeared for the plaintiff, and Mr. Trapnell, K.C., for the defendant.

The case for the plaintiff was that it was agreed between the parties in 1922 that the defendant should have the use of his office at a fixed rent. The parties collaborated in various ways, and then in 1927 the defendant, who was acting as architect for greyhound racing tracks at Brighton, Plymouth and Norwich, agreed to pay the plaintiff £100 in respect of each, but had never done so.

For the defence, it was denied that there was anything due in respect of the use of the office. The alleged agreement in regard to the racing tracks was also denied, and it was asserted that plaintiff had done nothing in connection with them.

Sir Reginald Coventry said the parties met in 1920 and came to some arrangement to assist each other. The plaintiff was a qualified architect, whilst the defendant, who had been in business in Liverpool as a builder and decorator, was anxious to start as an architect.

The plaintiff, giving evidence, said the idea was that they should work together on a fifty-fifty basis. Mr. Payne did some work in connection with the Brighton racing track, but the other schemes for Liverpool and Norwich fell through. The defendant never rendered him any assistance in his practice, as it would have been no use to him.

The defendant denied that he ever made any such agreement as to pay the plaintiff £100 for each of the racing tracks, and said it would have been mad to do such a thing, because the plaintiff could not have helped him. Plaintiff knew nothing about such work, and had never been on a track.

Cross-examined, defendant said he had been an architect for some years.

Sir Reginald: You were a builder. What right had you to call yourself an architect?

Defendant: A perfect right. I am a Fellow of the Incorporated Institute of Architects.

Sir Reginald: Is that what was called in Parliament a mushroom institution?

Defendant: You can call it what you like.

Sir Reginald: And does it not admit people without remuneration?

Defendant: It did not admit me without examination because I sent them my drawings. Defendant added that he was the official architect of the National Greyhounds Racing Club.

His lordship said this was an unfortunate sort of case, where two friends entered into all sorts of arrangements and then quarrelled. The only point which he had to decide, however, was whether there was any oral agreement by the defendant to pay the plaintiff £100 as a retaining fee in respect of each of the tracks, independently of any work done. He was of opinion that the plaintiff had failed to establish any such contract, and he could not see why the defendant should agree to pay the money for doing nothing in particular. Therefore, on that point there would be judgment for the defendant. The rest of the case would be referred to the official referee, though he hoped some arrangement could be arrived at.

His lordship added that if he could be of any assistance to the parties he would be very pleased to assist.

THE LAW AS TO UNITING FLOORS OF TWO BUILDINGS

Gill and another v. *Town Investments, Ltd. Chancery Division. Before Mr. Justice Maugham*

This action raised several interesting legal questions in regard to rights of sub-lessees, and his lordship's judgment settled important points of law.

The plaintiffs were Mr. A. B. Gill, Mr. R. A. Cousens and Major V. J. Dawson, and as mortgagees of a large block of property at 80 and 82 Regent Street, 17 Glasshouse Street, 11, 13 and 15 Air Street, and Quadrant Arcade, they sought as against Town Investments, Ltd., sub-lessees of the upper floors, an injunction restraining them from making any further openings in the main walls and from obstructing or preventing the plaintiffs from repairing and restoring the walls and blocking up the breaches already made. In the alternative the plaintiffs sought a mandatory order against the defendants, directing them to repair and restore the walls and block up the entrances.

Defendants by their defence denied that they had been guilty of any acts prejudicial to the buildings or that they had done anything to alter the identity of the buildings.

Mr. Vaisey, K.C., and Mr. L. Stone appeared for plaintiffs, and Mr. Gower, K.C., and Mr. C. V. Rawlence for defendants.

Mr. Vaisey stated that the defendants held a lease of the upper portion of the premises from the Equity Trust (Regent), Ltd., and the plaintiffs' complaint was that the defendants had cut the main walls of the second, third and fourth floors, and connected them with the floors of adjoining premises at Imperial House, Nos. 84 and 86 Regent Street, with the result that those floors were merged with Imperial House and had lost their identity. The defendants had sub-let certain portions of the buildings and had granted the tenants rights of ingress and egress from Regent Street, and to Air Street and Glasshouse Street. His contention was that the defendants had changed the identity of the premises and had, in his view, gone beyond their rights.

Sir Philip Pilditch, architect and surveyor, gave evidence for the plaintiffs, and also Mr. E. H. Lane (Messrs. Lane, Saville & Co.) and Mr. G. W. Rutter (Messrs. Hampton and Sons).

The plaintiffs also gave evidence that they never authorized or approved of what defendants did. The first they heard of the matter was when the transition had been effected.

For the defendants, Sir Edwin Savill was called, and spoke of the great convenience resulting from what defendants had done and the tendency it had to increase rental value. He could not conceive that any confusion would ensue on the point of identity, or that the head lessor had suffered by the acts done.

Further evidence was given for the defence by Mr. E. M. Leigh, Mr. C. F. Goddard and Mr. H. I. Rubens.

His lordship, after hearing legal arguments, said he came to the conclusion that he could not grant the injunction or the mandatory order asked for, and he dismissed the action with costs.

In the course of his judgment his lordship said although the matter was a complicated one, he took the view that the real issue was of a comparatively simple character. In 1925 there was an agreement between the Commissioners of Crown Lands and the Equity Trust, under which the Trust agreed to pull down the old building and erect a new one at a cost of £70,000, in consideration for which they were granted an eighty years' lease at a rent which, after the first two years, became £10,800 a year. The defendants had a lease of the upper floors for twenty-one years, with the option to renew for the full eighty years at £6,000 a year. The adjoining premises had the advantage of an excellent opening in Regent Street, whereas 80 and 82 Regent Street had only an entrance in Glasshouse and Air Streets. It was not surprising, therefore, that defendants desired to connect the upper floors of the buildings. It was apparent from the evidence

that there were great advantages to be derived from being able to describe the buildings as situated in Regent Street. The defendants obtained the consent of the Crown Commissioners and the London County Council to link up the two premises as they had done. The lease by the Crown to the Equity Trust Co. was after the floors had been opened to one another by defendants. Under these circumstances he took the view that the lease was a lease of 80 and 82 Regent Street, with the openings then existing, and there was no covenant in the lease to block up those openings. The Equity Trust Co. had charged their Crown lease to the plaintiffs. In his lordship's opinion there was no force in the contention of the plaintiffs that calling the upper part of the premises Imperial House would lose it its identity in the event of the defendants' lease coming to an end. He could see nothing in it disadvantageous to the plaintiffs. The main points in the action were: Could the plaintiffs insist on the openings being closed; and were they detrimental to the plaintiffs, if and when they desired to sell the premises included in the mortgage? In his opinion, though opinions differed, it was better to have the openings for some years than never to have had them at all, and in his view they were not detrimental to the plaintiffs.

DRAINAGE WORK

Smith v. *Lyons. King's Bench Division. Before the Lord Chief Justice and Justices Acton and Branson*

This appeal, by way of case stated, raised the point as to the liability for the repair of drainage. The magistrate at Old Street held that certain pipes carrying drainage from certain premises in Parnell Road, Poplar, were a sewer, repairable by the Poplar Borough Council, and not a drain repairable by the owner of the house, Mr. J. Lyons.

Mr. J. Hodson, for the appellant, who is the sanitary inspector of the Poplar Borough Council, said his case was that the respondent had neglected to comply with an order requiring him to do certain work to the drain of No. 138 Parnell Road, the house in question, which also took the drainage of other houses. A scheme of combined drainage was approved by the local authority in 1866, but subsequently other houses were added to the scheme. There had been proceedings in regard to the drain at No. 140, and it had been held that that was a sewer, and the Council had reconstructed it on that footing. Before the magistrate, for Mr. Lyons, it was contended that he was not liable for the work, on the ground that there had been a material alteration in his drainage scheme approved in 1866, and further, that the drain of No. 140 was indistinguishable from respondent's house. The magistrate took this view also. Counsel argued that what was done at No. 140 could not affect the position of the drain of respondent's house, and that the magistrate was wrong in dismissing the information.

The Lord Chief Justice, in giving judgment, upheld the respondent's contention in the Court below, and said if a line of pipes, which at first blush appeared to be a sewer, were to be taken out of the original category, and for the purposes of the legislation concerned regarded as a drain, it must be shown that the work had been carried out in accordance with the plan approved by the local authority. Here, what was carried out was, as a matter of fact, something quite different.

The Court dismissed the appeal with costs, without calling upon Mr. T. F. Davis for the respondent.

Justices Acton and Branson concurred.

COMPETITIONS OPEN

July 17.—Buildings for a street improvement scheme. Assessor: George Drysdale, F.R.I.B.A. Premiums: 50 guineas and 20 guineas. Conditions, etc., obtainable from the Borough Surveyor, Council House, Walsall, until July 17. (Deposit £1 1s.)

July 31.—Sending-in day. Proposed Nurses' Home at the Royal Asylum, Montrose. Limited to architects practising in the counties of Aberdeen, Angus, Fife, Kincardine and Perth. Assessor: John Watson, F.R.I.B.A. Premiums: £75, £50 and £25. Conditions, etc., obtainable from C. K. Alexander, Clerk and Treasurer, Royal Asylum, Montrose.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions: August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1 Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

THE ARCHITECTS' DIARY

WEDNESDAY, JULY 1

R.I.B.A., 9 Conduit Street, W.1. Exhibition of designs submitted in the Rome Scholarship Competition. Until July 4.

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. Fourth of five lectures on the Art of Making and Using Concrete. "The Effect of Misplacing Reinforcements." By Ewart S. Andrews, A.I.STRUCT.E. 6.30 to 9.30 p.m. Also a demonstration of the mixing, placing, and ramming of concrete will be given at the L.C.C. School of Building, Ferndale Road, Brixton, by H. A. Holt. 2.30 to 5.30 p.m. **2.30 p.m.**

THURSDAY, JULY 2

MARGATE SCHOOL OF ART. Tenth of twelve lectures on Beauty in Design. "Town Planning." By R. Goulburn Lovell, A.R.I.B.A. **5.30 p.m.**

BARTLETT SCHOOL OF ARCHITECTURE. University of London, University College, Gower Street, W.C.1. Opening of the Exhibition of Students' Work.

SATURDAY, JULY 4

Sunrise 4.47 a.m. Sunset 9.19 p.m.

R.I.B.A., 9 Conduit Street, W.1. Latest date for submission of applications for the maintenance scholarships in architecture.

LIVERPOOL SCHOOL OF ARCHITECTURE. At the Old Blue Coat Buildings, Liverpool. Annual Exhibition of Architectural Drawings to be opened by the Rt. Hon. Arthur Greenwood, P.C., M.P., at 4 p.m. Chairman: The Rt. Rev. the Lord Bishop of Liverpool. Until Saturday, July 18. 10 a.m. to 6 p.m. **4 p.m.**

ROYAL SANITARY INSTITUTE. Forty-second Congress to be held at Glasgow. Until July 11. Papers to be read will include the following: "Architecture and Engineering"; "Hospitals—Planning and Construction"; "Discharge of Sewage into Sea"; "Housing"; "Slum Clearances"; and "Single-Pipe Drainage."

NATIONAL LABOUR HOUSING ASSOCIATION. Housing and Slum Clearance Conference, to be held at the Memorial Hall, Farringdon Street, E.C.

WEDNESDAY, JULY 8

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. Last of five lectures on the Art of Making and Using Concrete: "The Mechanical Appliances for the handling of concrete on the Job." By Lt.-Colonel R. A. B. Smith, M.I STRUCT.E. **6 p.m.**

AUCTIONEERS' AND ESTATE AGENTS' INSTITUTE. Annual Provincial Meeting to be held at Great Yarmouth.

THURSDAY, JULY 9

MARGATE SCHOOL OF ART. Eleventh of twelve lectures on Beauty in Design: "Hygiene and Acoustics." By R. Goulburn Lovell, A.R.I.B.A. **5.30 p.m.**

FRIDAY, JULY 10

ARCHITECTURAL ASSOCIATION. 34 Bedford Square, W.C.1. Opening of the Exhibition of Students' Work

NATIONAL HOUSING AND TOWN PLANNING COUNCIL. Conference to be held at the County Hall, Westminster Bridge Road, S.E.1.

SATURDAY, JULY 11

Sunrise, 4.55 a.m. Sunset, 9.15 p.m.

MONDAY, JULY 13

INSTITUTION OF MECHANICAL ENGINEERS. Summer Meeting to be held at Cambridge.

THURSDAY, JULY 16

MARGATE SCHOOL OF ART. Last of twelve lectures on Beauty in Design. "Illumination and Colour." By R. Goulburn Lovell, A.R.I.B.A. **5.30 p.m.**

FRIDAY, JULY 17

DESIGN AND INDUSTRIES ASSOCIATION. Short Cruise to Norway, returning July 24.

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. Annual Exhibition to be held at Winchester.

SATURDAY, JULY 18

Sunrise, 5.2 p.m. Sunset, 9.9 a.m.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Visit to the neighbourhood of Guildford by the Brighton and Guildford Chapters.

ARCHITECTS' WILLS

Mr. George Daniel Stevenson, A.R.I.B.A., of London, left £1,366 (net personalty £412).

Mr. Edward Smith, retired architect and surveyor, of Mundesley, Norfolk, left £4,026 (net personalty £2,407).

Mr. Owen Carey Little, F.R.I.B.A., of London, left £5,034 (net personalty £4,972).

TRADE NOTES

Miss Muriel Angelus, the British film star, performed the opening ceremony, on June 17, of the new theatre constructed by Holophane, Ltd., at their premises, Elverton Street, Westminster, for the sole purpose of demonstrating their colour-lighting system.

Mr. H. Hepworth Thompson, managing director, who presided, said that the progress made in colour-lighting by the firm had made necessary the new theatre. He stressed the fact that the colour system was of British origin, and the equipment had been designed and constructed by their own engineers in their own factories: in short, it was an all-British system. He thought he was safe in stating that nowhere in the world today could they find a purer colour and a higher intensity of light at so low a first cost and current expenditure, quite apart from the fact that the system introduced a new technique into the art of stage production. That was an important point, because colour was being increasingly employed in stage and cinema productions.

Mr. R. Gillespie Williams, chief colour consultant to Holophane, Ltd., and the inventor of the system, then demonstrated the various effects. Many changes, alike in the design of curtains, scenic effects and dresses, solely by the application of colour-lighting, were shown. Other effects included a dance of coloured shadows, and the use of the cyclorama, with colour changes, for the presentation of open-air scenes. Mr. Williams also demonstrated how the colour-lighting system could be utilized in changing interior design and decoration.

Mr. Alister Macdonald, A.R.I.B.A., who was present, afterwards expressed great interest in the demonstration, which, he said, showed the enormous possibility of colour-lighting as applied to architecture. "I was amazed," he said, "at the extraordinarily good effects produced by a British firm, because one had got used to the idea that most of the best developments in the theatre came from foreign sources. The subject of colour-lighting is of growing importance, and should be studied by architects and all those interested in the stage and cinema."

The theatre was erected by Mullen and Lumsden, Ltd., and the electrical installation was carried out by the Etna Lighting and Heating Co.

It is interesting to note that Holophane, Ltd., are now equipping cinemas and theatres on the Continent and in the Empire, so that it may be said that this is a new British export trade.

*

Messrs. Croggon & Co., Ltd., of 230 Upper Thames Street, London, E.C.4, who are now engaged upon the manufacture of builders' ironwork, staircase, balustrading, balcony railing, etc., have issued a catalogue of wrought-iron fencing railings and gates. The firm manufacture and supply fencing for all purposes; wrought railings and gates can be made in their workshops exactly to architects' designs and specifications or from drawings prepared by the firm's draughtsmen to meet the requirements of clients, for building schemes, estates, public parks institutions, etc.

*

Maftex Building Board is the subject of a new leaflet just issued by Messrs. MacAndrews and Forbes, Limited, of Bush House, Aldwych, London, W.C.2. The firm remind the reader that conservation of heat in winter and exclusion of heat in summer—retarding of condensation—sound-deadening that absorbs and smothers the transmission of room-to-room noises—all are important factors in the construction of modern buildings, and state that all can be obtained by the use of Maftex—the four-in-one board that is said to combine insulation, boarding, plaster base and sound deadening—at no increase in cost over modern uninsulated construction. Maftex is claimed to be of single-ply construction, easily handled, quickly installed, and economical in cost; it is also claimed that it is moisture-proof, is not attacked by rats or vermin, and does not mould nor disintegrate. Among the more important users of Maftex are The British Broadcasting Corporation, The British International Pictures, Ltd., Elstree, Bush House, Ltd., Works Department, J. Lyons & Co., Ltd., Architect's Office, Port of Manchester Warehouses, Ltd., Universum Film Company (U.F.A.), Neu Babelsberg, near Berlin, Trafford Park Estates, Ltd., Works Department, Manchester, Halifax Building Society, Birkenhead, University of Leeds.

The new theatre of Messrs. Holophane, Ltd., designed by Robert Atkinson at their premises in Elverton Street, Westminster, S.W.1. It has been constructed for the sole purpose of demonstrating their colour-lighting system.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Extension to the Bedford College for Women (pages 7–10). General contractors, F. and H. F. Higgs, Ltd., who were also responsible for the stonework and Portland stone. Consulting engineer, Sir E. Owen Williams; heating engineers, Dobby and Williamson; electrical consulting engineers, Merz and McLellan. Sub-contractors: J. Jeffreys & Co., Ltd., heating installation; Roger Field and Bean, consulting engineers for the drains and all sanitary fittings; Drake and Gorham, Ltd., electrical work, including electric stoves; Elvin, demolition of old house on site; Dugdill & Co., electric hand lamps; Hawksley, "Everyway" electric lamps; Baird and Tatlock (London), Ltd., laboratory fittings; Henry Hope and Sons, Ltd., windows and steel casements; Eric Mundy, foundation stone and plaque; Synchronome Co., Ltd., electric clocks and bells; Hammer & Co., Ltd., chairs in hall; Bennet Furnishing Co., Ltd., blinds, lanterns, screens, etc.

Whaley Thorns School (pages 11–13). General contractors, J. Harvey. Sub-contractors: Jerram & Co., heating apparatus; Granwood Flooring Co., Ltd., floors.

Cricket Pavilion, Mill Hill School (page 14). General contractor, N. C. Wade. Sub-contractors: Dent and Hellyer, Ltd., sanitary goods; W. P. Lamb, tiles and bricks.

Old Millhillians Rugby Football Pavilion, Headstone Lane, Mill Hill (page 14). General contractors, J. and J. Dean. Sub-contractors: London Brick Co. and Forders, Ltd., and Colliers, bricks; Colliers, tiles; Stuart's Granolithic Co., Ltd., and Art Pavements and Decorations, Ltd., patent flooring; Stourbridge Glazed Brick and Fireclay Co., sanitary fittings; Thames Board Mills, Ltd., Essex wallboard.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

In connection with the proposal for the reconstruction of CHELSEA Bridge the L.C.C. Improvements Committee recommends that the new bridge shall be of the suspension type, of steel construction and with a width of ninety-eight feet.

The CROYDON Corporation is to erect four blocks at the mental hospital, at an estimated cost of £64,000.

The CROYDON Corporation recommends approval of plans prepared by Mr. Henry Berney and Mr. Macintosh for extensions at the town hall, at an estimated cost of £75,000.

Plans passed by the CROYDON Corporation: Twenty houses, Isham Road, for Messrs. Truett and Steel, Ltd.; six shops, High Street, for Messrs. North, Robin and Wilsdon; nine houses, Beckford Road, for Mr. P. Richardson; milk depot, Brighton Road, for Mr. E. Bates; alterations and additions, Bridge Hotel, West Croydon, for Messrs. Williams, Holliday and Partners; six houses, Crest Road, and forty-five garages, Croham Valley Road, for Mr. G. W. Peachey; eighteen houses, Grange Road, for Mr. P. Richardson; six shops, Mitcham Road, for Mr. H. Macintosh; eight bungalows, Meadway, for Messrs. Bethell and Swannell; additions, Children's Homes, Pawsons Road, for Messrs. H. Berney and Son; six houses, Park Road, for Mr. J. Mantell; alterations and additions, 80 High Street, for Mr. H. Williams; six houses, Davison Road, for Mr. J. Flitten; eleven houses, Beauchamp Road, for Mr. J. D. Calcott; seven shops, Grand Parade, High Street, for Messrs. Grace and Marsh, Ltd.; alterations and additions, Railway Hotel, East Croydon, for Messrs. Murray, Delves, Murray and Atkins; additions, Old Palace School, Old Palace Road, for Messrs Rees and Partners; six houses, Croham Valley Road, for Mr. G. W. Peachey.

The L.C.C. Education Committee has approved plans for remodelling and enlarging the North End Road school, FULHAM, at an estimated cost of £15,000.

Mr. A. G. Johnson has prepared plans for the reconstruction of 472A, Fulham Road, FULHAM, for Lloyds Bank, Ltd.

The L.C.C. Education Committee is to erect a new elementary school on the Mount Pleasant Lane site, HACKNEY, at a cost of £24,000.

The Marquess of Northampton is to redevelop property in Sebbon Street, ISLINGTON.

Plans passed by the LEWISHAM B.C.: Revised plans for rebuilding "Prince of Wales" public-house, Perry Rise, for Messrs. Charrington & Co., Ltd.; streets off Marvels Lane, Lee, for Mr. J. E. James; fifty-two houses, Coopers Lane and Burnt Ash Hill, for Mr. W. J. Brise; four houses, Honor Oak Road, for Messrs. William Wilmot, Ltd.; transformer station, Catford Hill, for Messrs. T. H. Sawyer and Son, Ltd.

SOUTHERN COUNTIES

The HERNE BAY U.D.C. has under consideration the layout of a new housing site in the Claremont Street district.

The Surrey C.C. has obtained sanction to borrow £49,670 for extensions at the NETHERNE mental institution.

The NORTHFLEET U.D.C. has approved the plans of the surveyor for the erection of 134 houses on the Wombwell Park estate.

The WOKING U.D.C. is to erect thirty-six houses on the Victoria Road site, Knaphill.

SOUTH-WESTERN COUNTIES

The BRISTOL Corporation is to erect 157 workmen's dwellings to accommodate persons displaced through the widening of Hotwell Road and the construction of the new road from Victoria Street to Stokes Croft.

The MARKET HARBOROUGH U.D.C. has acquired six acres of land for a housing scheme.

The OXFORD Corporation has obtained sanction to borrow £63,000 for the erection of 160 houses at Cutteslowe.

Plans passed by OXFORD Corporation: Laundry extensions, Sunnymeade, for French Laundry, Ltd.; two houses, Ferry Road, New Marston, for Mr. F. Watts; workshop, William Street, New Marston, for Mr. L. E. Papel; shop, Cinnaminto Road, for Mr. W. D. Smith; warehouse, Brewers Street, for Messrs. G. R. Cooper, Ltd.; new buildings at Lady Margaret Hall, for the trustees.

The WALSALL Corporation is to extend the isolation hospital, at a cost of £14,500.

The WALSALL Corporation is to enlarge the sanatorium at GOSCOTE, at a cost of £17,500.

The governors of the Royal Orphanage, WOLVERHAMPTON, are to erect a junior school from plans prepared by Messrs. Joseph and H. E. Lavender.

NORTHERN COUNTIES

Messrs. W. and M. W. Shennon are to erect a temporary church for the Rev. W. Hopwood in Egan Road, BIRKENHEAD.

Messrs. Woolfall and Eccles have prepared plans for the conversion of premises into a nurses' home in Park Road, BIRKENHEAD, for the Birkenhead General Hospital.

Mr. Stephen Wilkinson, the Lancashire county architect, has prepared plans for extensions at the HIGH CARLEY sanatorium, near Ulverston.

H.M. Office of Works is to erect a telephone exchange at Failsworth, MANCHESTER.

The PENRITH U.D.C. is purchasing a site at Penny Hill for a housing scheme.

The STRETFORD U.D.C. is considering a clearance scheme for the Clifford ward area.

The STRETFORD U.D.C. has obtained sanction to borrow £6,650 for the erection of wash-houses at Old Trafford.

Plans passed by STRETFORD U.D.C.: Two houses, Hillingdon Road, for Messrs. Littler and Rich; church and school, Derbyshire Lane, for the Moss Park Wesleyan trustees; public wash-house, Carriage Street, for the U.D.C.; works extensions, Ayres Road, for the National Corrugated Paper Co., Ltd.; brass-foundry extensions, Westinghouse Road, for Metro-Vickers Electrical Co., Ltd.; six houses, Seymour Grove, for Messrs. Smith and Allcock, Ltd.

Plans passed by the TYNEMOUTH Corporation: Alterations, St. Oswald's Mission, Stephenson Street, for Mr. W. Stockdale; two houses, Hawkeys Lane, for Messrs. F. R. N. Haswell and Son.

The WAKEFIELD Corporation is to erect twenty houses on the Lupset estate, by direct labour, at an estimated cost of £9,000.

The WAKEFIELD Corporation has decided to improve the baths in Almshouse Lane and erect an additional swimming bath, at a cost not exceeding £20,000.

WALES

The Swansea Education Committee has approved plans for the erection of an elementary school at COCKETT, at an estimated cost of £17,598.

The SWANSEA Corporation has decided to proceed with the erection of a branch library at Oystermouth, by direct labour.

Mr. S. Davies, builder, is to erect 140 houses on the Cockett Farm estate, SWANSEA.

The SWANSEA Corporation is to further develop the Sketty Park estate by the erection of about 200 houses.

Plans passed by the SWANSEA Corporation: Institute, Danygraig Terrace, for trustees of Mount Calvary Baptist Church; rebuilding 143 Clundy Street, for Mr. W. Williams; two houses, Lon Masarn, Tycoch, for Mr. I. J. Aubrey.

SCOTLAND

Mr. Andrew Aitkan is to erect eighteen houses in Cernworth Avenue, Newlands, GLASGOW.

Plans passed by the GLASGOW Corporation: Hall, Dalveen Street, for Mr. Alex Allan, Jr.; building, Spencer Street, Anniesland, for Messrs. Collars, Ltd.; church, Cumbernauld Road, Riddrie, for the Roman Catholic Archdiocese of Glasgow; premises, corner of Great Western Road and Fulton Street, Knightswood, for the British Linen Bank.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

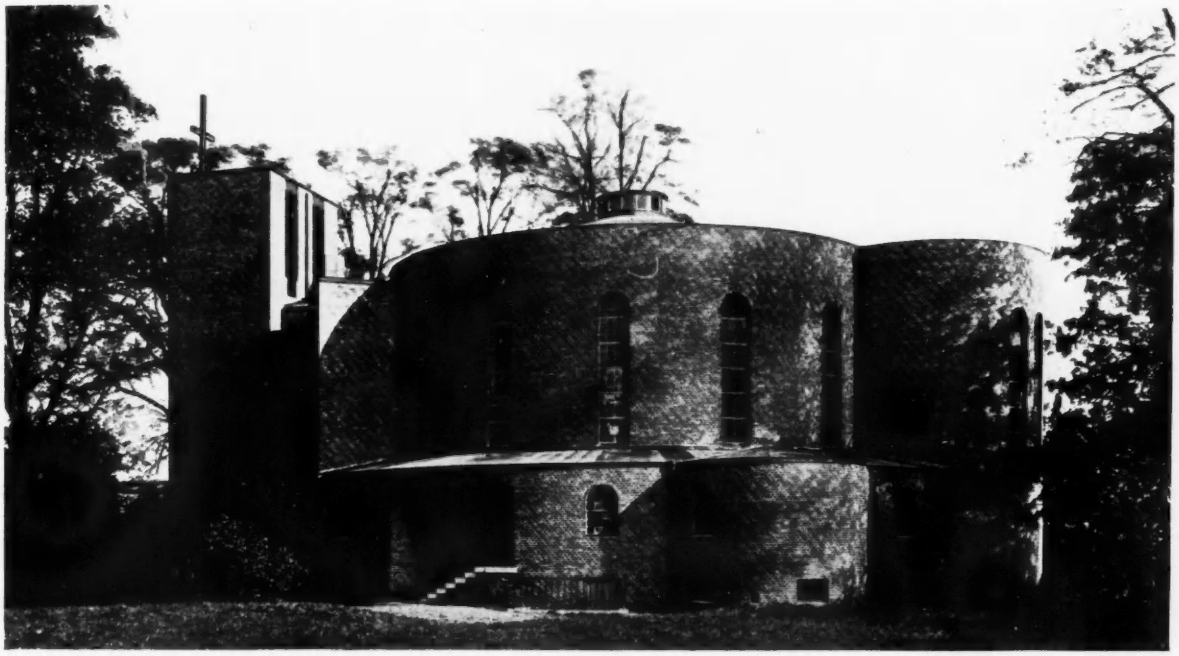
CHURCH OF CYLINDRICAL FORM

FROM ABROAD

CONCRETE LAMP-POST ON A BRIDGE



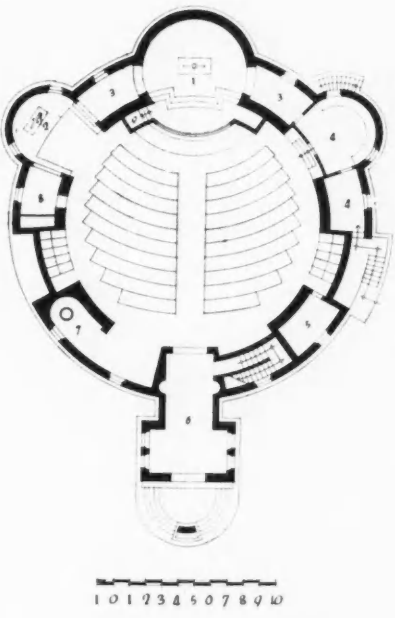
[*Professor Clemens Holzmeister, Architect.*

THE CATHOLIC CHURCH OF MARIA GRÜN AT BLANKENSEE, NEAR HAMBURG

THE church is cylindrical in form and is built of red bricks, the patterning of which is indicated in the photograph given above. It is situated in a residential quarter of the town, standing in the midst of a public park, so that it can be seen from all parts.

Below is the ground plan, in which the following are the references :

(1) High Altar.
(2) Side Altar.
(3) Oratory.
(4) Sacristy.
(5) Vestry.
(6) Vestibule.
(7) Baptistry.
(8) Confessional.
(9) Pulpit.



1 0 1 2 3 4 5 6 7 8 9 10

THE PLAN

With the exception of the pulpit, all these have their place in portioned-off niches, and all are panelled to the full extent of their height in walnut wood.

Choir and organ are reached by stairs leading from the vestibule, in part filling the interior of the tower. Inside, the church is finished in white stucco.

Drawings of the front and back elevations of the building are reproduced overleaf.

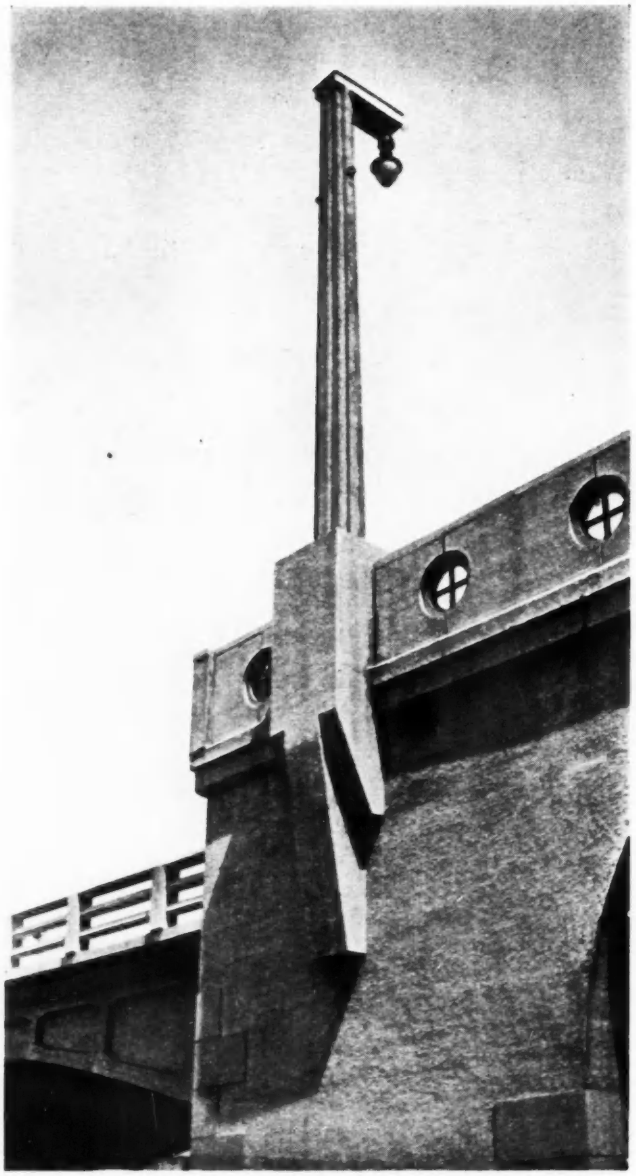
For photograph and a description see following page.



CONCRETE LAMP-POST ON A PRAGUE BRIDGE

THE bridge on which stands the lamp-post illustrated above spans the River Vltava, on the outskirts of Prague, the capital of Czechoslovakia, giving access therefrom to a modern suburb.

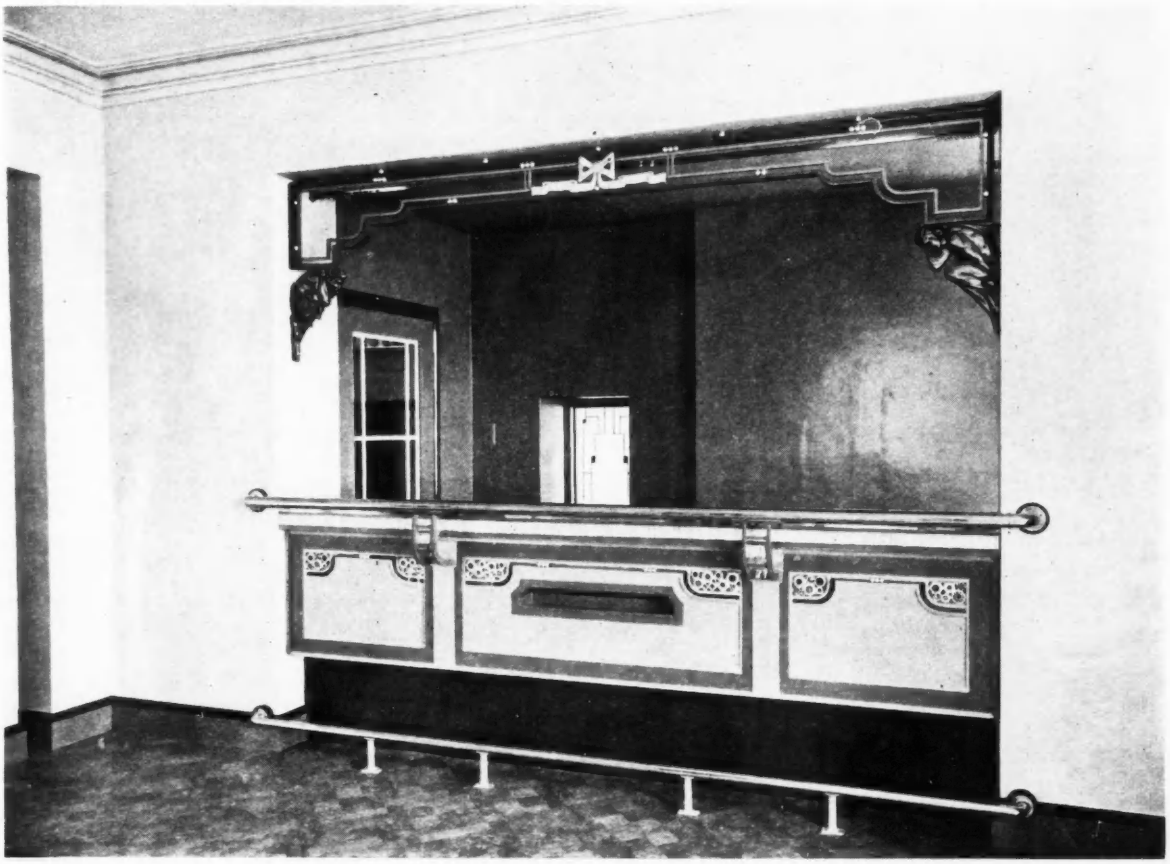
The top of the standard, which is of reinforced concrete, is 27 ft. above road level, and its form is clearly shown in the detail drawing reproduced on the preceding page. The cast-iron grilles which fill the circular apertures are painted red.

It may be interesting to note that the side-walks are paved with small flint-like stones, laid at random, with borders laid regularly in varying colours to form a pattern. The parapet, etc., is built up of precast slabs, and the surface is bush-hammered with tooled edges.

For purposes of comparison there are included in the drawing details of a cast-iron lamp-post also in Prague. It is one of several that stand in a formal garden which serves a fore-court to a block of Ministry offices. It is painted a pleasant shade of primrose yellow. In the base of the standard is a box containing winding gear for lowering the lamp for cleaning purposes.

A COCKTAIL COUNTER

IN STEEL AND GLASS, FOR A PRIVATE RESIDENCE



[*G. Alan Fortescue, Architect.*

THE COCKTAIL COUNTER FIXED IN POSITION (LEADING FROM DINING-ROOM AND FACING LOUNGE)

THE cocktail counter at Downside, Brighton, Sussex, illustrated photographically above and overleaf by scale drawings, is constructed mainly of mild steel, stainless steel and plate-glass. The acided plate-glass counter-top is bracketed from the main uprights to the counter-front, leaving sufficient space for cocktail requisites. Concealed strip lighting illuminates the counter-top and also the rosette spandrel panels, giving the latter a silhouette effect. The interior is lined in wood and fitted with two removable shelves.

There is a metal shield fitted behind the shaped opening to the centre panel, so that waste matter can be deposited on the shelf beneath and be easily removed. The narrow base resting on the floor allows ample foot room to exterior and interior. The arm and foot rests are in polished stainless steel, like the counter edge. The illuminated pelmet over is glazed with amber acided glass and supported by copper repoussé figure consoles.

The whole unit was constructed in London, delivered in one piece, and cellulose-sprayed in green and gold, with small touches of bright colours on the rosettes and hammered enrichments, after fixing.

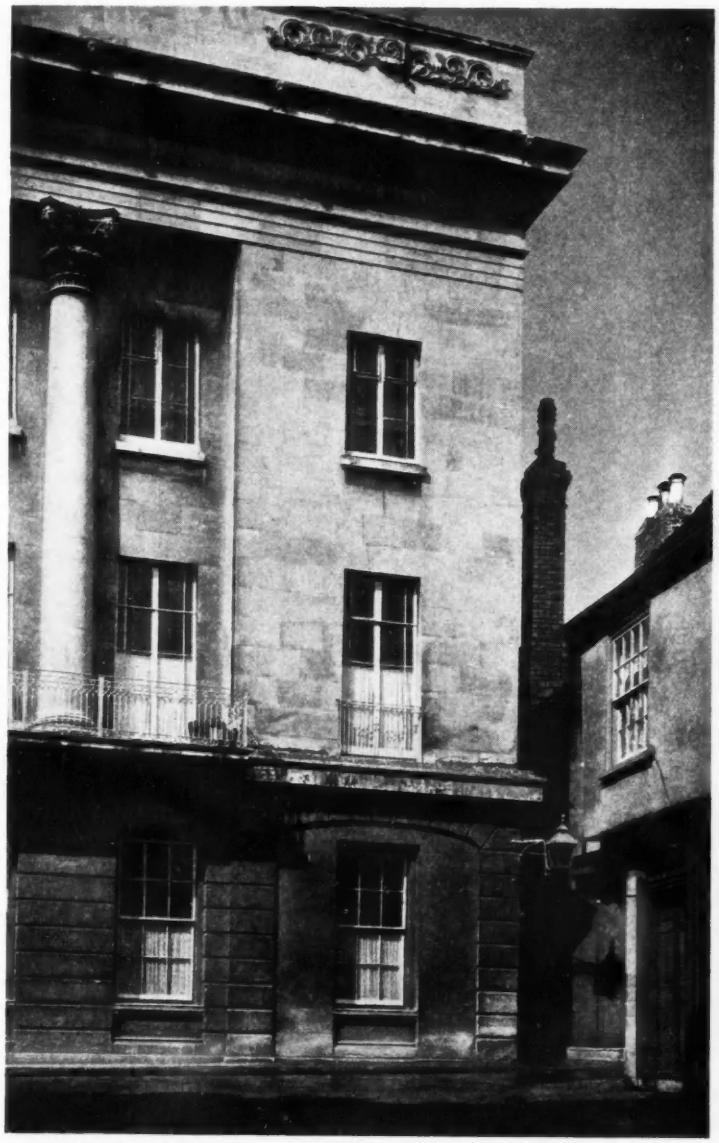
SELECTED PRECEDENTS:

THE STREETS OF STAMFORD, LINCS.: II



1. *UNNEIGHBOURLY: CLASSICAL FACADE AND RUSTIC COTTAGES*

A MINUTE'S deviation from the Great North Road brings one to the Stamford Hotel (figure 1), the classical façade of which rises cliff-like from a narrow mediæval street. The builder showed amazingly bad manners in placing this columned front alongside rustic cottages, yet, despite violation of scale, the design per se *is interesting, and the details are refined.*

Delicacy of rustication has given the ground floor an effeminate air which is cleverly corrected by the use of regular-paned sashes, contrasting with more fanciful fenestration on the upper floors. The batter of the doorway (figure 3), the subtle echo in the iron lamp bracket of the motif in the door entablature, and the unusual design of the consoles all combine to form a satisfactory composition for the entrance, while the ironwork of the veranda above, though lacking in importance as a central feature, is of good design and acts as a delicate foil to the solid rotundity of the columns.

The good condition of the entablature (figure 2) gives an instructive indication of the extent to which the local stone can be used successfully for work requiring good definition, lasting well even in an exposed position.

SEEING IT WHOLE

Cardinal Points in the Charing Cross Problem

BY the time these words are read it is likely that a decision will have been reached by the London County Council as to their future action with regard to Charing Cross Bridge. Although it is said on every hand that the public is tired of the subject, we return to it once more because we cannot think of it as a subject that architects and town-planners have a right to be tired of, even though its course has suffered by long delays and its issues are confused by politics and personal controversy.

The fact remains that the nation is shortly to be asked to invest an enormous sum in the reconditioning of a weak artery in London's circulation, and whether the reconditioning proposed is such as will effect a cure both now and in the future is ours to ask up to the very last minute of available time.

First, then, and most vitally, this is to be a scheme to cut through congestion to the relief of traffic. We must recognize that when congestion brings traffic to a standstill London will stagnate. Our very existence is bound up in perpetual motion.

Secondly, we are dealing with not merely a bridge, but London : a place of streets, buildings, activity, people. What we shall build will become part of the environment of its inhabitants and its future inhabitants.

Thirdly, we are building, in the highest sense, for England. For as Waterloo Bridge and St. Paul's Cathedral mark high levels in English cultural history; as Stockholm Town Hall proclaims the artistic sensibility of a whole nation expressed through its finest spirits; so again may Charing Cross Bridge and all that goes with it prove that we have lost nothing of the spirit for great works.

Charing Cross Bridge must be all three of these things from the very first. Useless to expect grandeur on a basis of meanness : as useless to sacrifice efficiency for grandeur.

What, therefore, we ask now, is whether the scheme that will be entered upon is to be an instrument for traffic circulation that will last long into the future ; whether the roads that it will create will be open, direct, free from obstructions; whether they will fitly provide for new buildings on such a scale as may bring relief to congestion elsewhere; whether the plan has looked forward to the inevitable changes in the mechanism of urban life ; whether it will fit itself into such a plan of London as may emerge from any scientific study and consequent re-creation that we may have to make for our own salvation in the future? Whether, finally, it is the very best, politics apart, that can be found ?

Has, in fact, the real problem been seen, and been seen *whole* ?

If, as we believe, the answer is in the negative, if very few of these questions are answered satisfactorily by the scheme put forward by Sir Leslie Scott, then we can do no other than regret its passage into action if such should take place. Meanwhile we can only hope that up to the very last minute these questions of principle will be applied to any scheme that remains to be reviewed by the London County Council.

This also we remember. It does not matter what course is ultimately followed, if it does not fulfil what we must regard as sound and wise principles, then there will be no reason why we should regard it as anything better than second best and bend all our efforts to making it better. We are, architects, engineers and town-planners, the guardians of high principle and artistic conscience. We have nothing to do with political compromise. We have nothing to do with second best.

THE ABBEY CHURCH, MALMESBURY, WILTSHIRE

The situation of Malmesbury Abbey provided natural advantages of beauty almost unsurpassed and up to a point indestructible. Much of the conventual building has long since fallen into ruin, but recent restoration, some account of which is given in a supplement to this issue, has secured a further term of lovely life for the church, and time and circumstance have left unspoiled some portions which rank among the finest examples of the work of the Norman church builders. The porch with its half-score of richly carved successive orders suggests, by the variety and intricacy of the work, the skill of the silversmith rather than the worker in baser and more utilitarian substances, and the graded scale of the enrichment when considered in relation to the mouldings reveals a triumph of rhythmical design.

NEWS & TOPICS

FUTURE OF THE REGISTRATION BILL

MANY rumours have been circulated during the past few weeks as to the future of the Architects (Registration) Bill. The position is that Mr. McShane and his friends have been very active in seeing that the Lords' amendments to the Bill have not been considered by the Commons, and it is becoming increasingly evident that the Government will have to provide the necessary time if these amendments are to come before them, and if the Bill is to become law this Session. The latest rumour is that the Government have decided to make themselves responsible for the final stage of the measure, and there is reason to believe that this is actually the case. If so, a day will be provided for the consideration of the Lords' amendments. If the Session is prorogued at the end of July or beginning of August, the necessary time will have to be provided during the present month, but if, as appears more probable, the Government simply decides to adjourn, and to continue the Session in the autumn, then it will be sufficient if the last stage is taken in October, or even November.

THE CONDITION OF WATERLOO BRIDGE

The stability of Waterloo Bridge is again in question in the Press, though the L.C.C. record little or no movement. People imagine that it may collapse at any time, though, and if one may accept the mass of supporting timber as evidence it would certainly appear so. But I have heard stories of wedges being driven in between the timber and the arch to make certain that the shrinking framework will continue to act.

*

My informant went on to tell me how the bridge, in his opinion, came to its present woeful state. According to him it was the rush of water in the now swifter river tides that loosened the mud and solid matter in which the old piles were lying, so that the bridge made its first slight movement, and that the Council, in panic, poured into the spandril tons of concrete at such high pressure that the pier was *driven* still further into the mud, and the piles pushed down on to firmer bearing. Simultaneously, the voussoirs cracked on the outer faces only while the real working arch took up a new position. I am to understand indeed that there is little likelihood of Waterloo Bridge sinking. The only difficulty is to keep the supports in position.

FITTER FITTINGS

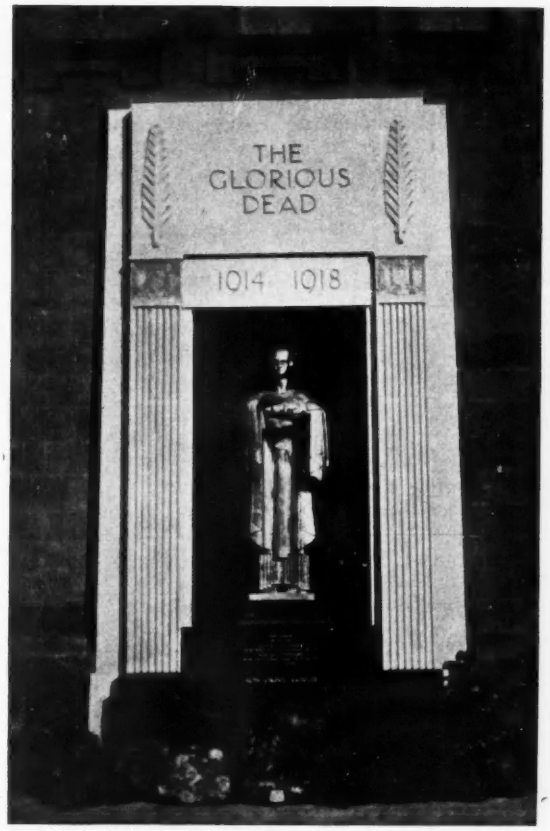
It used to be a standing worry with me to know which out of a number of execrable designs for small, and in some people's eyes unimportant, fittings I could choose as being least offensive. There were swan-neck fittings, crocus, I think they were called, lamp holders, all sorts of queer perversions of period doing service under difficulties, and precious little that could be called simple and straightforward and yet have character. Wall brackets I found the most difficult, but pendants were hard to find. Much searching brought me examples that were not aggressively fantastic and yet not dull, and now it seems that I reap the harvest of rudeness, for the travellers who call upon me have of late begun to understand—they and the firms they represent—and I can say with some measure of certainty that there are electric light fittings to be had that are cheap, varied in design, and good enough to please the reasonably fastidious.

*

Bath-room fittings are, naturally, the most completely realized in type, but enough of other kinds exists to make what used to be a torment an adventure. Don't think that public taste has entirely changed : for every one good design has twenty natural offsprings in sunset glass and maltreated metal.

STEEL HOUSING

I don't know what reason there is to expect that the Government's new housing plans will make large provision for the building of steel-frame houses, but I see that representations are being made to the Lord Privy Seal on this head, and it is by no means fantastic to assume that considerable savings could be made by adopting the methods of rapid steel-frame erection which have been extensively used in parts of Germany and America. Such houses would have no connection with the ridiculous attempts to induce people to live in tin boxes. The walls of steel-frame houses would have to be in some form of concrete—possibly light in weight and pre-cast, and standardization of possible unit forms would be a necessary concomitant. None of these things are frightening. Concrete we already have in one form or another and standardization is already apparent in the housing schemes of local engineers and surveyors and in the ghastly areas of speculative builders.



The new war memorial at Clydebank : James Millar, R.S.A., architect ; Walter Gilbert, sculptor.

Mass-production, if applied intelligently, can produce forms eminently susceptible of good arrangement. It is only a matter of intelligence. It therefore behoves us to look again into the matter of steel-frame houses, remembering what was done some years ago at Dormanstown by Professor Abercrombie.

BROADCASTS ON SCOTTISH ARCHITECTURE

The director of Scottish broadcasting in Edinburgh deserves our gratitude for having given six Scotsmen the opportunity of discussing the present architectural state of their country over the microphone. The range of subjects was wide : Lady Whitson, wife of the Lord Provost of Edinburgh, spoke on the "Changing Face of the Capital"—a fruitful talk largely concerned with town planning; Mr. Pilkington Jackson, the sculptor, elaborated this theme, and in talking of civic adornment advocated the erection of a fine modern civic hall for the capital in his discussion on "The Opportunities in Our Cities," both to give architect and craftsman an opportunity to prove their mettle, and to attract attention to Scotland as a modern country. Churches came under review next, and Mr. F. C. Mears, by visualizing a modern church built on and for Clydeside, made his listeners realize how unrepresentative of modern culture most ecclesiastical architecture is today.

*

Problems in rural building raised by the invasion of new materials enabled Mr. Gilbert Ogilvie to rub in some wholesome and constructive criticism of the cheap and nasty, particularly in municipal work; while Mr. Ian Gordon Lindsay gave an extremely interesting talk on the place of tradition in Scottish architecture. The illustrations that accompanied this talk, both in *The Radio Times* and *The Listener*, made it one of the most striking of the series, and brought out well Mr. Lindsay's contention that the modernism of Germany and Holland has affinity with the free-designing traditions of seventeenth-century Scottish architecture. This point was further elaborated in his summing up by Mr. Robert Hurd, who also drew attention to the important position of the late Charles Rennie Mackintosh as a pioneer of modern architecture more honoured on the Continent than in his native land. Mr. Hurd concluded that designing talent and good craftsmanship still exist in Scotland, but that both are stifled by lack of opportunity to develop, the bulk of modern work being done by municipalities.

MORECAMBE'S FALL FROM GRACE

The seaside town of Morecambe in Lancashire is as ambitious as most seaside towns. We remember that it has taken some share in town-planning and launched a grand programme of development. But local government in England is a curiously undisciplined and unlearned instrument, and it has not struck the councillors of Morecambe as incongruous that their town hall should have been designed as to its plan by their engineer and as to its elevations by outside architects. Did local patriotism impel them to this course or some perverse notion of economy? Either would be accepted with gravity as sufficient and proper explanation.

*

Morecambe today is not a beautiful place. I am not vindictive when I say so. It is merely that the arrangement of its streets and the buildings that line them are dull in the extreme and oft-times definitely ugly. One building alone cheered my heart during my brief sojourn there. The old L.M.S. hotel that stands by the old harbour is a building of much unpretentious charm. Long and low, with distempered walls and green shutters, it offers a pleasant and friendly invitation in a place with BOARDING HOUSE writ large across its features. This hotel, alas, as though its quietness offended, is to go, and a sumptuous palace is promised in its place. That hotel is the one note of dignity along the sea-front, and it is to be pulled down so that the place may be "laid out." It is very depressing. Not so much because an old landmark disappears as because local authorities in the main are so ill-educated and pompous that they are simply unable to command work of character, and seaside towns continue to be vulgar and dull. Complacency triumphs.

"CANT ABOUT RURAL ENGLAND"

Sir Peter Chalmers Mitchell is in a position to speak with unique authority on a particular aspect of housing—that of our four-footed fellow-animals (rather unjustly dubbed "dumb"). And now I find him vocal on behalf of the all-too-inarticulate biped. Many will endorse his commonsense. "I should like," he said, in opening Oxford's new Zoo last week, "to say a word against the wanton nonsense talked about those beautiful rose-covered hovels in the country—so pretty to look at, but with no light, no ventilation, and no sanitation, and in which birth and sickness have to take place in rooms in which children can hardly stand upright. . . . At the present time there is a great deal of pestilent nonsense talked by people who call themselves friends of rural England concerning the development of the countryside. I have no doubt that when the Romans drove their magnificent roads across the country some aged Druids complained of their oak trees being cut down. You cannot build a great road without sometimes interfering with the parish pump." But I am not altogether surprised that Sir Michael Sadler should have confessed that he had listened very nervously to Sir Peter's speech. He and I and you, reader, may know what he means; but are there not many who will be only too ready to twist his meaning?

AS TO THE MARBLE ARCH

Every now and again the ridiculousness of some particular aspect of London strikes some particular Londoner. This time it is "A.A.B.," that denunciatory voice from *The Evening Standard*, who is offended that Marble Arch should stand isolated in a sea of traffic, its mighty gates shut to no effect. He says: move it to make a monumental entrance to Downing Street. I think his suggestion is hardly practicable because in the first place I think he would find the arch bigger than he expected when set beside the buildings that flank Downing Street. Secondly, it was designed to form an axial monument to Nash's Buckingham Palace, where it would have stood clear. Professor Adshead once suggested in a charming drawing that it might be set again in the line of the Park railings so that it should be used as it should be. The whole point is that a monument of such suggestive form suffers by neglect and gains enormously, functionally and æsthetically, when an instrument, not a luxury.

ASTRAGAL

PARK LANE HOTEL

Piccadilly Extension

DESIGNED BY MESSRS. HENRY TANNER

AN extension to an existing building has an interest peculiar to itself in that it offers opportunities for somewhat distinctive treatment on its own account, yet it must needs subdue its own character in some degree to that of the original building, which is usually of larger dimensions and of greater importance than the added portion. Such elements of interest are not absent from the recent extension to the Park Lane Hotel carried out under the direction of Messrs. Henry Tanner.

Even a very cursory glance at the exterior facing Piccadilly conveys the impression that the new portion is in some degree subsidiary to the rest of the building, while at the same time it forms a complete architectural whole which can be judged upon its own merits, as distinct from, though connected with, the main block. As to material, it resembles the older part, even in the fact that adjacent to the entrance there is provision for business premises apart from the hotel. But the two shops which flank this new ballroom entrance are on a small scale. The entrance itself is a trifle lighter, perhaps more frivolous in treatment, than the main entrance, the façade shows less emphasis on window openings and cornices, and the whole is more simply designed, in a manner suitably indicating to the eye that the newer, narrower part of the whole group is in fact an extension.

Within, the same evidence of independent completeness, yet of subservience to a larger whole, is perceptible. The great ballroom occupies the principal part of the basement floor, and alongside it is a spacious ante-room. The independence of the new block is displayed, moreover, in the several upper floors, each providing self-contained suites overlooking the Green Park, and a number of bedrooms at the back. But these floors are connected with the older part of the hotel by means of new corridors, and access is also provided to the ballroom and its accessory rooms and stairways from the main building, as well as by way of the new entrance.

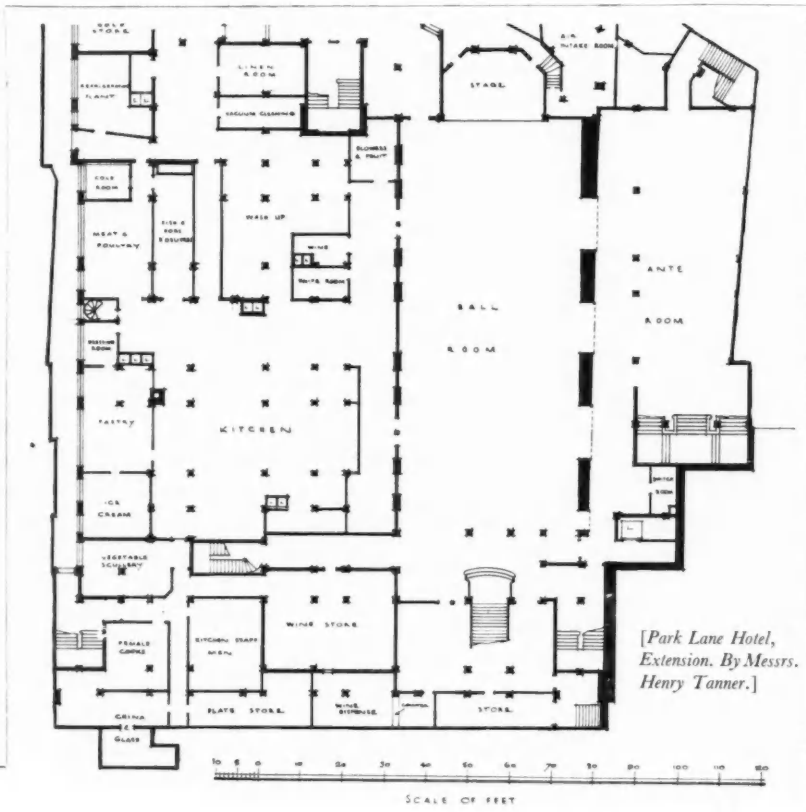
The new entrance to the ballroom. The marquise is of gold and green; the inner doors have a silver-bronze trellis. Black granite forms the base of the façade, in which two small shops are set beside the doorway.

The staircase to ballroom balcony, showing dwarf wall of Swedish green marble, with balustrade of silver-bronze. Clusters of lights in various pyramidal and tiered groupings combine with mirrors to provide brilliant illumination.

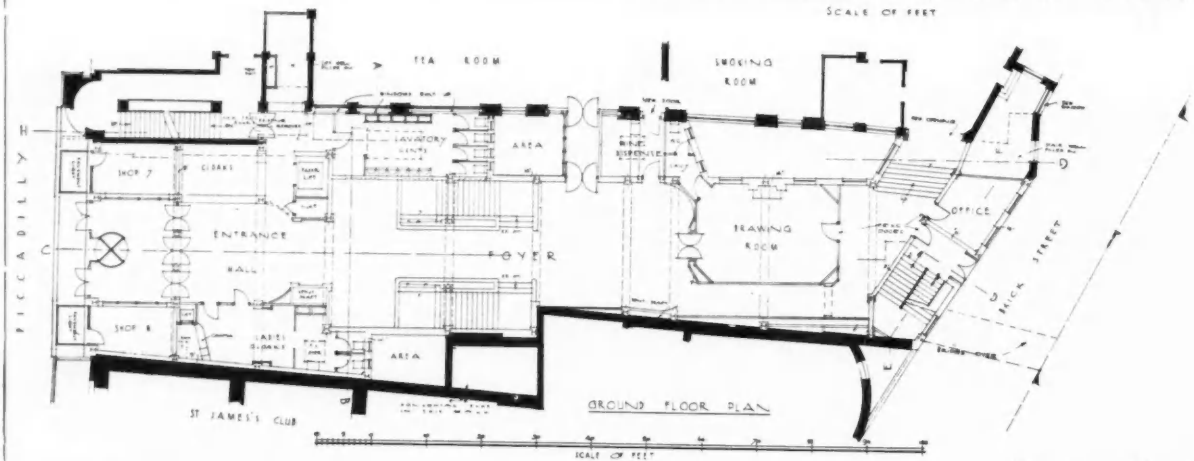
C

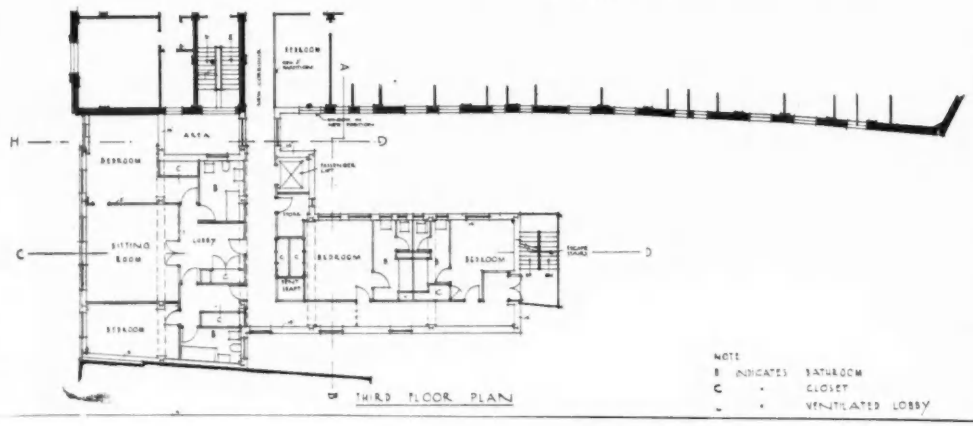
The subdued colour scheme, and the wall surface of gold-lacquered silver-leaf on the ground floor and the staircase to the ballroom, are especially intended to supply an unobtrusive but effective setting for the colourful frocks of women guests. A note of green and silver, introduced outside by the marquise sheltering the entrance, is touched with varying emphasis within, particularly by means of green Swedish marble and green-stained veneered sycamore in conjunction with silver mouldings and silver bronze balustrading. Decorative wall panels, carried out in transparent colour, and modernistic-oriental in character, supply the requisite touch of sophisticated gaiety at the sides of the staircase. An amber-tinted wall surface below the ground-floor level takes the place of the silver toned walls elsewhere, and is likewise foreshadowed in the light gilded decoration at the entrance.

Mirrors, appearing in many subsidiary and decorative positions in the scheme, are also employed to form the ballroom side of the sliding wall, capable of screening completely the ballroom from the ante-room. A mezzanine floor provides a promenade gallery with a view into the ballroom on two sides. V. M. C.



[Park Lane Hotel, Extension. By Messrs. Henry Tanner.]





Basement (showing whole of building), ground- and first-floor plans. The ground floor shows, in its axial planning, from the entrance right through to the drawing-room, the independent unity of the new building, while a new opening behind the drawing-room, and other new doors on the same floor, as well as a new corridor on the third floor, provide inter-communication.

Park Lane Hotel Extension.]

Almost cubist severity combines with the freedom of rococo curves in the attainment of novel effects at the ground-floor level. Here first impressions prepare the guests for subsequent variations on a similar theme.

[*By Messrs. Henry Tanner.*

The spacious entrance hall leads to the foyer and the staircase descending to the ballroom. Triple inverted cones surmounting the large stanchions with their modernistic capitals, provide the principal means of lighting.

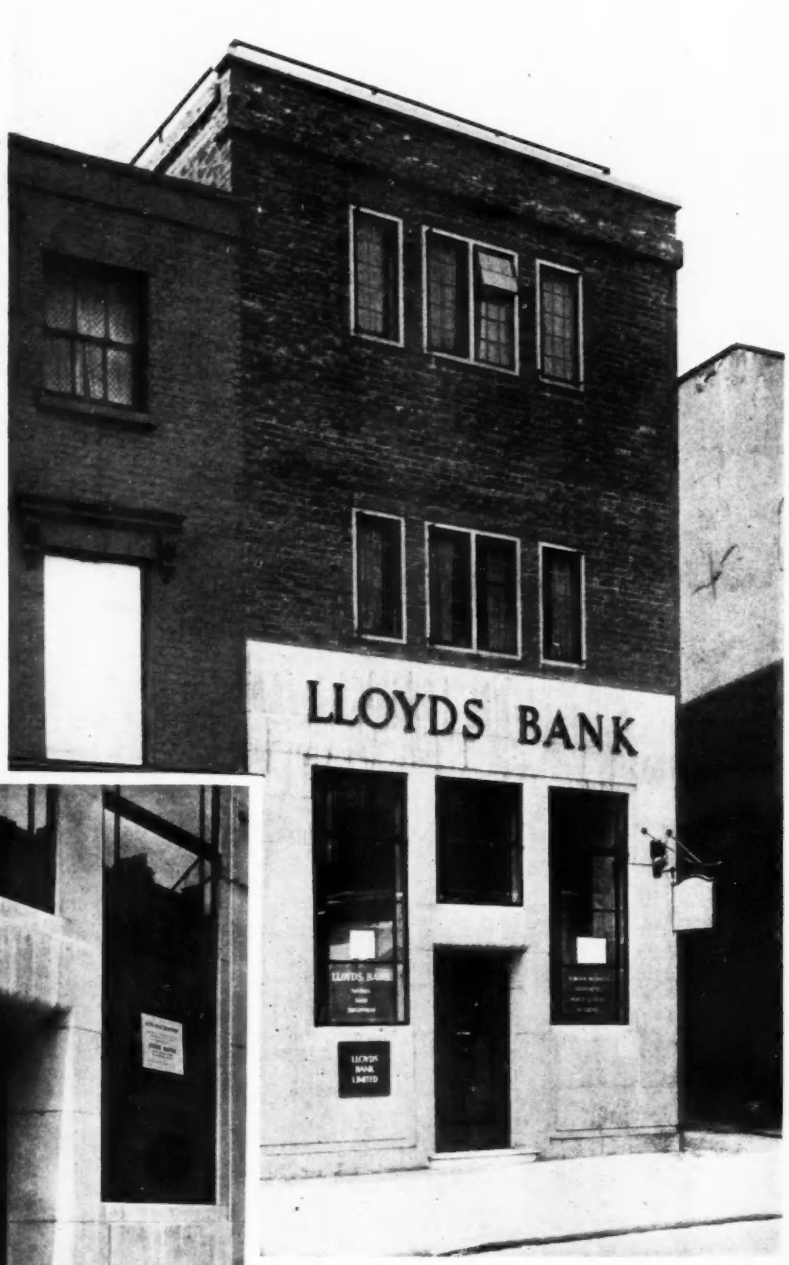
LLOYDS BANK,
Kentish Town Road, N.W.

DESIGNED BY
G. ALAN FORTESCUE

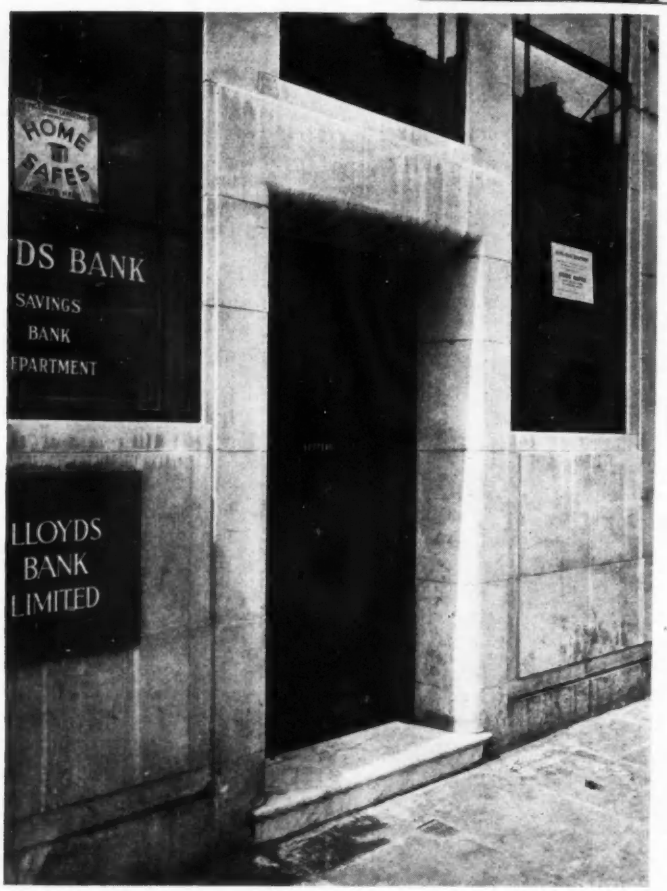
THE front of the typical small branch bank here illustrated is faced in artificial stone, the remainder of the walling being built with Horley facing bricks, finished with a flush joint.

The ground floor provides a banking hall, measuring 28 ft. by 16 ft., and accommodating three cashiers and four ledger clerks; and a manager's office, 10 ft. square. There is a heating chamber in the basement. The first and second floors are designed as a flat for separate occupation, with an entrance on the ground floor from a right-of-way running at the side of the bank premises. The first floor affords a sitting-room, a kitchen and a lavatory; the second, a bedroom, a bathroom and a linen room.

All the floors throughout the building are constructed of patent flooring. Some of the working spaces, such as the staff side of the counter and the manager's office, etc., are laid with wood-block flooring; the public space however, is floored with marble.



A general view of the front to Kentish Town Road.



A detail view of the street entrance and door. The front of the bank is faced with artificial stone; generally, the walls are of Horley facing bricks.

For the vacant office of City of London Surveyor (in succession to Mr. Sydney Perks), the Officers and Clerks Committee have selected three candidates. They are Mr. A. F. Bourdas, Valuer to the Westminster City Council; Mr. Albert Endicott, Superintending Estate Surveyor, H.M. Office of Works; and Mr. F. C. Read, Principal Clerk to the City Architect and Surveyor, who has been in the department since 1889.

Bernard Whistlow, F.R.I.B.A. : An Autobiography : vii

BRADSHAW & SON: BUILDERS

BY KARSHISH

(H. B. CRESWELL)

THE brand-new Clerk of Works appointed by H.M. Office of Works to see the roof taken off the Brayness Post Office and two stories built on top, with extensive rebuildings and additions in the rear, after, on his first arrival, instantly interviewing the postmaster, at once hurried off, as in duty bound, to ginger up the Contractor.

Messrs. Bradshaw and Son had their offices in a detached Victorian villa, and their yard and shops in what had formerly been the garden behind it. The blighted aspect of the front in-and-out drive—where the one skeleton limb of a last-surviving laurel held aloft two dusty, fainting leaves to the witness of heaven from under a heap of empty cement barrels; and where ironmongers' and painters' stores could be seen through the bay windows of the half basement on each side of the front steps—was out of mind inside the door. Here neat efficiency reigned. The woodwork was freshly grained and varnished; a counter with a hatch filled an opening between the entrance-hall and the former dining-room; and the treads of the stairs were covered with lead, copper-nailed and finished with brass nosing-strips, highly polished.

On asking at this hatch for Mr. Bradshaw I was shown into the room behind it by a fresh-faced boy clerk, with his hair brushed into a quiff and his coat tightly buttoned, and given a chair from which I heard word passed through a door at the back for "Father." After a minute or two a tall, sickly-looking man of thirty, with an untidy brown mane and beard—as though his small head had been dipped in hair which had partly stuck haphazard to it—came in and told me simply, as though I were one of the family, that "Father" was out and about, but would be in shortly. This was Mr. George Bradshaw Junior. I mentioned I had visited the Post Office and, being under the impression that the chief duty, and pride of calling, of a Clerk of Works was to raise objections, at once got to business and objected to planks being deposited in the side passage.

"Oh, well, we've got to get the work started *somehow*," said Mr. George.

"But the work has *not* been started," I told him. "That's another point. The contract date for commencing is the 12th. More than a week has gone by and nothing has been done."

"Well, we must have a chance to get the men together, and order the bricks; and there's special scaffolding wanted. It will be an awkward job to tackle, anyhow—and then the tarpaulins, too! We can't get the extra size, and, as far as we can gather, it's not to be had. We shall have to put on a sailmaker to join what we've got. Lucky there's a plenty in the town can do the job."

"But the point is that the letter ordering you to commence is dated the 12th and——"

"Oh, well, there's time enough. We can't start before we're ready. Richards is just about clearing up at Deal. He will be free the end of next week. We can't do any good till Richards comes back."

"But you are under a penalty of fifteen pounds a week for each week or part of a week during which the works may be in arrears after the expiration of nine months from the contract date for commencing; and, from what you say, the best part of three weeks will have gone by before you've even made a start," I said. I had, it will be observed, sweated up in Conditions of Contract to some purpose.

"Well, we can't start before we've got the men and the stuff—that's flat," said Mr. George.

At this point the senior member of the firm came in. "Father" was a tall, burly, grey-haired man of sixty, with a beard trimmed navy fashion, a flushed face and small, hot-looking pale-grey eyes, with the pupils contracted to such mere pin-points that there appeared to be none. His manner was impetuous and flurried.

"Oh! I see! Well, we didn't expect to see *you*," he said, when his son had told him who I was. "We understood Mr. Titmus was going to look after the job."

"Who is Mr. Titmus?"

"Titmus? Oh, he's our chief architect here, Titmus is. Everyone knows Mr. Titmus."

"Why did you think *he* was appointed?"

"Oh well, that's what's said in the town. He didn't exactly tell us so himself in so many words. So you'll likely be staying on here, I suppose."

"Certainly. Till the job's finished."

"Oh! Well! Yes! I see! All right! We shall be making a start now just as soon as ever Richards gets back."

"I was just saying that you'll be nearly three weeks behind time."

"Eh? Behind time! How's that? We haven't begun yet!"

"Exactly. You're late!"

"Late! What does he mean?" He looked at his son.

"He says we ought to have started when we got the order," said Mr. George.

"Well, so we are starting, aren't we?"

"But you haven't," I said. "I've been down to the Post Office to see, and absolutely nothing has been done."

"I've been telling him we need a week or two to get ready in," said Mr. George.

"Well, but you ought to have been prepared beforehand. You contracted to begin when you got the order, which was given on the 12th, and . . ."

"Well now, that beats anything I ever heard tell of," Father burst out, flinging his hat down on the table. "Start a job the day you get the order without a brick or a barrow or a man to start it with! Do you suppose we keep men on our pay sheet waiting in case we get an order, and foremen kicking their heels about the yard, and stacks of bricks and all sorts in stock? Why there's goods specified we never heard tell of before. We shall want the iron drain pipes first go off; and some of those glazed angles from Burmantofts, which has got to be built in soon as ever we start, will have to be special made. Richards can't leave the Deal job till fag end of next week—and lucky he can then; and if he came sooner he'd be standing idle till the trucks can be cleared, for a mort of the plant has got to come from Deal, and you know what the railway is when you're in a hurry. Start on the 12th! My word! We can get started as soon as anyone—yes, and get finished, too; and what we can't do nobody can do—and so I tell you. Not getting started! Here, Jack, fetch the order book. Not started yet! and scarcely a week since we signed! A nice thing, I will say! Here you are, you can see for yourself. Milsons—never used their ground lime before. Burmantofts, special. Macfarlanes—that's the Angus pipes. Bricks, urgent. Dorman Long, stanchions—they've got to be special made. What more do you expect? Here is near a dozen acceptances of the quotations we got—that's the order number for the Post Office, D. 107; count them and see for yourself. Not started, you say! Well, if *that* isn't making a start, I'd like you to tell me how you'd have us go to do it. My word! Not started yet!" and poor Father subsided, flushed, breathing deeply, and much agitated. His vehemence, which made his whole body shudder, would have overborne my inexperience even if his arguments had not.

" I didn't know what was being done," I said, weakly. " I've only the contract to go by, and I've got to see it carried out."

" Oh well, we shall keep to our contract. You may rely on that. You will see for yourself, soon as ever Richards comes back, whether we are getting started or not."

The Clerk of Works, however, was not at the end of his resources.

" There's another thing," I said; " the work of the *Post Office* must not be interfered with."

" Oh, well, we shall see to that, of course; but I've got to carry out my contract. Mr. Taylor spoke to my son last week——"

" Mr. Taylor ? "

" The Postmaster."

" But his name's *Tyler*."

" Oh, well——" Father began in a judicial tone.

" How do you spell it ? "

" Why, T A Y L O R—don't he ? " He turned to his son, who nodded.

" But I was told ' Tyler,' and I called him Tyler and he didn't correct me."

" No? Well, there's a lot that call him that way—but, as I was saying, he stopped my son in the street and said how he wanted this, and didn't want that; and how one thing had ought to be this way and the other different; but if Mr. Taylor thinks he's going to order me about as if I was one of his new young Post Office ladies that cries to him when he talks at her, he'll find he's mistaken. I've been in this town two-score years and more longer than Mr. Taylor has; and wearing a top-hat on Sunday and sending his boy to Mr. Stowler's school is not going to make all the difference as *that* comes to," and Father laughed shortly and not very pleasantly.

" The various works are to be carried out in such a manner and in such sequence as the architect shall approve," I said glibly.

" Yes. That goes without saying, of course. We understand, and will give the architect satisfaction, you may rely on that."

" Will you send for the drawings and specification, and let me know what you propose ? "

" Well, it's just on dinner now; and we close down Saturday afternoons," said Father. " But next week, soon as ever Richards comes back——"

Just then a whistle sounded shrilly in the distance, and there was immediately a sound of brisk movement in the adjoining room and on the floor above.

" Are you putting up anywhere ? " Father asked.

" I'm going to look for rooms this afternoon. I came straight from the station."

He spoke aside to his son and then said to me in a simple, frank way :

" I can't ask you in myself because my wife is laid up with a nabcess, and they're not expecting anyone at home; but my son will be glad to give you a bit of dinner, if you're not particular. He lives quite handy here."

The hearty good nature which prompted this offer of hospitality to a stranger was spontaneous; and the recollection of my manner of declining the invitation has ever since made me want to sink through the floor. No doubt I was wise to excuse myself, for Tallard would certainly have had misgivings if he had come to hear that his Clerk of Works had got his legs under the contractor's table within an hour of first meeting him. Wisdom, however, bore no part in my refusal for, although I perhaps had an instinctive sense that intimacy of this kind was inappropriate, I was unaware of any sinister implications. The proposal was, however, entirely unexpected and took me by surprise; my natural shyness reduced me to embarrassment; and my attempts to extricate myself led me to insincere halting excuses which I recognized as having so much the complexion of social snobbery that I set the gilded horror on my confusion by colouring up and thereby confirmed the impression I specially dreaded to give—namely, that Father had presumed on the condescension of a superior. The figure I cut was so disconcerting that Mr. George, with innate good taste, turned to look at a photograph of a brand-new butcher's shop with a brand-new butcher standing at the door, which was framed on the wall: and Father gazed steadfastly at the floor.

" Oh, well ! All right ! Very good ! " he said. " Then we shall look to see you again some time next week "; and on that we shook hands and I left them.

I wanted to kick myself as I walked away, and had an impulse to turn back and accept the invitation: and the memory of that moment still remains a painful one, for I have long come to know that men of the rank in life of the Bradshaws are of the salt of this earth. Theirs is the state where the realities of life are frankly and simply acknowledged as ever-present facts; and where pretences, make-believes, opportunism, posturings, affectations, solemn hocus-pocus, cat-like sycophancy and insincere conventions are furthest to seek : and if I were given the choice of two impossibilities, I would rather hold the esteem and share the freemasonry of such men than have the patronage of princes and be the cynosure of salons.

" Father " was so called by all his men owing, probably, to Mr. George's habit of continually going about asking, in a chirpy manner, " Seen Father anywhere? " " Father been this way?" but, needless to say, I never so spoke of him. Poor Father, as I soon was to gather, had a few years before been confined for months in a lunatic asylum; and his often confused and always vehement manner, the air of watchful strain of his son, and the circumspect attitude towards him of the men, supported the testimony of his unearthly eyes that all was not well with him. Sometimes he was jovial and expansive, and on one such occasion he gave me an account of his lapse from sanity with the simple, cheerful frankness with which a man might tell of any other unpleasant experience.

" It took five of 'em and a policeman to hold me down," he said with modest pride; and when I left the asylum, Mr. Geoghan, the chief attendant, said to me, ' We've had a many strong 'uns here in my time,' he said, ' but you beat the lot,' he said."

Mr. George was quiet, subservient and wary, and seemed to act on an instinctive understanding of the wishes of his senior, whose mind sometimes became so much entangled, when his decision was waited for, that the point in debate had to be, for the time, dropped.

It was at Brayness that I first began to be aware that " the pecking order," which exists among all creatures living in community, is paramount among human beings; and that for an architect to be well born, or at least to be classified as a Public School man and used to good society, gives him the great advantage of a good position in that order. The pecking order is so called because it is best observed in the fowl run, where each bird pecks or is pecked by the others in a fixed unvarying rule of precedence; so that one bird, at the top, pecks all the others and is pecked by none, and that at the bottom pecks none and is pecked by all. Among fowls the right to peck is found not to depend upon any physical or (perceptible) mental advantages; and of human beings the same is true, for the power to peck—which is the ability to wound feelings—depends mainly upon accident of birth and upbringing. Thus king pecks duke; duke, squire; and squire, tradesman, through all stages and gradation down to the wholesaler who pecks the retailer, and the daughter of the engine-driver who pecks the daughter of the donkeyman. Personal force and intellectual attainments have little or no part in establishing the pecking order. Amazing as it may seem, a certain Colonel Lockwood, now gone to oblivion, was able to peck even Mr. Bernard Shaw—as anyone who cares to read the preface to *Blanco Posnet* may observe. The pecking power of aristocracy entirely subsists in its

invincible ability to hurt the feelings of commoners, as I later had occasion to learn; and at Brayness the circumstances of my birth and upbringing—relatively obscure though they were—gave me pecking power over everyone I had to do with.

I am reminded of this by the circumstances of my not being corrected by the postmaster when I mis-called him Tyler. I was horrified when I knew what I had done; but my horror was entirely due to the idea that Mr. Taylor, by identifying me with the sort of person who pronounces "a" "aye," would assume pecking rights over me, as, in fact, he had begun to do. In those pre-typewriter days I wrote an execrable scrawl, was bad at spelling, knew little of geography, used arithmetic like a schoolboy, had no experience of life, and was unexercised in authority and ignorant of affairs, so that, on all counts, Mr. Taylor was a weightier man than I was, besides being an older; but I knew instinctively that he was far below me in the pecking order, just as I knew that the Bradshaws, for all their mastery of technicalities in which I was little more than an intelligent inquirer, also were. I at least could not merely smile at Mr. Taylor's vaunted Sunday hat, but could feel ashamed at the thought of joining him in one; and when, in the week following our introduction, Father and Mr. George definitely conceded right of peck to me by addressing me as Sir, I regarded their action as perfectly fit and natural, without reflecting that a Clerk of Works is not usually so addressed by the builder.

It will have become clear before this that the unlucky Bradshaws had caught a tartar. I was, in fact, a very devil of a Clerk of Works, and must have been a severe tax on the builders' patience and, I am afraid, to a certain extent, on their pocket as well; for I had far too much the idea that my duties were akin to those of a policeman. I had no experience to inform discretion, and I enforced my authority without sympathy for their interests or understanding of their difficulties; and I must have wearied them by my ceaseless questioning of their methods and by my rigid interpretations of the letter of the specification. In this, if I did not enhance the prestige of the Office of Works, I no doubt served Tallard's purposes excellently; and it was not the building, but the builder and the Postmaster and, I may add, myself who suffered from my too stiff and conscientious methods; for the difficulties I encountered were for the most part those I made for myself, and, if they were not serious, they made up for that alleviation by their frequency. It was the saving grace of the ready humour, unfailing tact, wisdom and unquenchable high spirits of the foreman, Joe Richards, that kept things going without positive mutiny or deadlock; and, after a time, under his skilful guidance and, probably, no less skilful manipulation, I obtained a better idea of how to fit myself into my shoes. It was not, however, the pressure against which I daily battled that prompted me to readjust myself, but the heavy touch of an anonymous joker.

Some weeks after the work started, I had annexed, as my office, a highly convenient room; and to advertise my dignity, as well as my whereabouts, I pinned up outside the door a bit of paper bearing the words, "Clerk of Works." It was with a shock which discomforted me like a blow in the wind, that I found a few days later that someone had added to the inscription with a blunt lead pencil, so that it read: MR. CLERK OF THE WORKS SQ UIRE, F.R.I.B.A.

NEXT WEEK: VIII—"JOE RICHARDS, FOREMAN"

The previous instalments appeared as follows:

May 27. i: I am Articled.
June 3. ii: Episodes of Pupilage.
June 10. iii: Episodes of Growth.
June 17. iv: My First Job: The Sewer.
June 24. v: My First Job: The "Pipes."
July 1. vi: I Turn Clerk of Works.

LETTERS FROM READERS

A Neighbour of the Bank

SIR,—As the person guilty of omitting to draw attention to the charming good manners of the Lothbury bank, I stand chastened by Mr. Nathaniel Lloyd.

But may I have your permission to put an idle question to him? Suppose the Bank of England, in contemplating rebuilding, had decided to remove their venue nearer their chief debtor, and suppose they had chosen that site in Bridge Street, Westminster, which faces the Houses of Parliament, and which abuts on to Norman Shaw's Scotland Yard building on the Embankment, that site which is now occupied by a heterogeneous mass of Victorian respectability. Suppose, as a further idle thought, the architect entrusted with the new building had been suitably impressed with the ennobling inspiration of good architectural behaviour, would he have designed his Embankment elevation in the Norman-Shaw-Queen-Anne manner as a neighbourly gesture to Scotland Yard, and his Bridge Street front in a style to preserve a civil face to that paragon of English national architecture, the Houses of Parliament?

J. R. LEATHART

Lowest Tenders

SIR,—I quite agree with "Suburban Builder," and have always made a practice of informing my clients that if I invite tenders I expect the lowest tender to be accepted, unless it is out of proportion to the rest of the tenders, in which case I point out that it is an unpractical tender and the work could not possibly be done for the money. I consider it very unfair, when a contractor has been "invited" to tender, if his price is lowest, not to accept it. Why put him, at special request, to the expense of pricing if he is not to have the job?

If a client insists on the covering clause being on the invitation, the architect must follow his client's instructions. In the case of advertising or public notice, anyone may tender as long as they pay the deposit for quantities, and it is then absolutely necessary to protect the client's interests by inserting the covering clause.

C. F. BURTON

SIR,—If a selected number of builders are asked to tender for a job, the lowest tender should be accepted, provided that it is not too much below the next one above. The clause, "the lowest or any tender will not necessarily be accepted," is used as a safeguard in case the lowest man complains—in spite of the suspicious lowness of his tender—and also in case the client alters his mind and decides not to build at all, or even to invite another bunch of builders—which he has a perfect right to do. "Suburban Builder" must be living in a locality where right principles are not thought much of, although, of course, there are good and bad in all walks of life. I may say, however, that from thirty-six years' experience as an architect I have found that it is not customary for the great majority of clients and their architects to treat builders in the way of which he complained.

I think it would be well if "Suburban Builder" considered the motto, "Once bitten, twice shy," and refrained from tendering in future for the people he has mentioned.

ALLEN T. HUSSELL

SIR,—I think "Suburban Builder" has a real grievance. When inviting builders to tender, I have always informed my client that, although he is not legally bound (and I should object to such a condition), he is morally bound to accept the lowest tender.

When inviting builders in a limited competition, only those in whom the architect has confidence are asked; therefore, it appears to be nothing short of an injustice not to accept the lowest

tender, provided that the estimate is a fair one, and not unreasonably low or obviously a mistake, in which case it would be a greater injustice to bind a man to an impossible figure. I quite agree that where a client is keen on employing a particular builder, and invites competition for the purpose of checking his price, such a practice is to be deprecated. Moreover, it shows a lack of confidence in the very man to whom the client is desirous of entrusting his work. I know that the business man has little room for sentiment, but to me an ounce of sentiment is worth a pound of law

C. F. W. DENING

SIR,—With reference to the letter from a "Suburban Builder," in the case where a number of builders are definitely invited to tender, the assumption is that they would not be invited unless considered capable of doing the work; therefore in my own practice I always advise that there is a moral obligation to take the lowest tender, provided that this tender is not due to a sudden disproportionate drop in reference to the others, and, as a rule, this practice is accepted by my clients. There have, however, though not often, been cases where a client, having a preference for another name on the list, offers the work to this man, provided he will reduce his tender to the amount of the lowest, and I have never known a builder refuse to do so.

In the case of an open invitation for tender by advertisement, the same moral claim cannot exist, as people may tender who are totally unfit for the class of work under consideration.

There is one paragraph in your correspondent's letter to which I take exception. He states that it is "a trivial matter for an architect as regards expense, to send out several sets of drawings and specifications," and I would like him to understand that it is just as "costly and aggravating" as for builders to prepare a tender with no chance of success.

If your correspondent thinks he is not getting a fair deal, he should refuse to tender.

T. W. T. RICHARDSON

The I.A.A.S.

SIR,—During the hearing of Payne *v.* Marshall in the King's Bench Division, a report of which appears in THE ARCHITECTS' JOURNAL of July 1, the following dialogue occurred :

Defendant : I am a Fellow of the Incorporated Association of Architects and Surveyors.

Sir Reginald Coventry, K.C. : Is that what was called in Parliament a mushroom institution ?

The question, which I myself, of course, had no opportunity of answering, and the innuendo, which I had no opportunity of controverting, merely represent a repetition of a derogatory and unjustifiable statement made in the House of Commons by a member of Parliament. The day after it was made, I invited the member in question to call here and either to substantiate or withdraw his remark. He never came. I have extended to Sir Reginald Coventry the same invitation which I extended to the member of Parliament whose fallacious observations the former saw fit to quote.

G. B. J. ATHOE
(SECRETARY, THE INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS)

External Cement Rendering on Brickwork

SIR,—There has been a good deal of information lately on the subject of cement stucco; the comparative advantages of this and cavity walls have been discussed with amazing differences of opinion. A particular case which came to my notice may be of interest.

I had to examine a house which was built some four years ago. It was built of 13½-in. brickwork, rendered externally with Portland cement, finished in white cement (3 and 1). There was some crazing to this stucco on the house, mostly slight, but with one or two bad cracks. There were, however, some courtyard walls rendered in the same way both sides, and it was noticeable that in each case these had crazed and cracked to a very much greater extent. I decided to hack the rendering off one of these walls so that we could examine the actual condition, and this is what I found :

1 : The crazing appeared to be in nearly all cases in the white stucco only.

2 : That in some few places the salts from the brickwork had prevented the cement from adhering, but that

3 : Generally the rendering was very hard and adhered very firmly to the bricks, so much so that, in hacking it off, the face of the bricks sometimes came off with the rendering.

4 : That the whole wall was saturated despite a damp course and a coping, the driest part being under the coping.

It seems evident therefore that at any rate in exposed positions rain will get through an ordinary good cement stucco, and that, brickwork being more absorbent, the water is drawn inwards. When the wall is rendered on one side only, the damp presumably evaporates on the other side, but when as in this case the wall happens to be rendered on both sides, there is no outlet, for, though the natural forces may drive the water through the rendering, the drying elements are not strong enough to pull it out again.

It would appear, therefore, that a semi-impervious external coating is worse than no coating at all, and that if a stucco is wanted it should be either entirely impervious (such as a painted stucco) or more porous, such as of lime plaster, which will allow moisture to dry outwards in spells of dry weather.

H. D.

Standardize Empire Timber!

SIR,—The notes of the Science Standing Committee on European Oak in the *R.I.B.A. Journal* raise the whole question of timber specification. How is the architect to be certain that he will get what he wants, or that a clearly-written description will not convey to the builder or timber merchant some totally different impression? If "English oak" does not mean English, what does it mean ? asks the architect, only to receive from the timber merchant the reply that it indicates a species of wood, common throughout Northern Europe, known botanically as *quercus robur pedunculata.* If the bewildered architect, greatly daring, protests that he also specifies "Austrian oak," he will be yet further abashed by the answer that Austrian is in reality a Hungarian timber and is indistinguishable from oak exported from many parts of Russia.

It is high time that something was done about it. *The Empire Forestry Association Handbook, 1930,* gave the most serious attempt yet made at commercial standardization. The U.S.A. have gone farther and refuse the title walnut to any but wood of the genus *juglans,* thus excluding from this class the African and Queensland woods commonly known as walnut; and since 1926 only trees of the family *meliaceae* may be called mahogany. Professor Chalk of the Imperial Forestry Institute, Oxford, has pointed out that the pendulum may swing too far, and that it is no harm to include under a general name timbers possessing similar physical and mechanical properties. At the present time much of the timber from Africa is marketed under names which do not in the least indicate the qualities of the woods and are at times quite misleading. Fancy names are useful for selling purposes but tend to confusion, a good example being white chuglam, which is the sap wood of *terminalia bialata,* the same tree as silver greywood.

The more Empire timbers are imported the greater will become the confusion unless some conference can agree and publish a standard nomenclature, familiar to all who have to deal in timber. LL. E. WILLIAMS

SOUTHWARK CATHOLIC RESCUE OFFICES

DESIGNED BY HUGHES AND STOTT

A general view of the offices, from Westminster Bridge Road, showing the bas-relief panel over the corner entry.

THE point where St. George's Road runs out of Westminster Bridge Road is the beginning of the Pilgrims Way to Canterbury. Hereabouts there stands the Cathedral House of St. George's R.C. Cathedral. The whole of this triangular site is now the property of the diocese; and the first sign of the changes that are contemplated can be seen in the erection of the new offices for the Southwark Catholic Rescue Society at the corner of Barbel Street.

The architects planned a three-story building, erecting just sufficient to meet the needs of the Society at present, and allowing for future extension; a link being also provided at the Barbel Street end for future development when the existing houses are demolished.

In view of the irregular shape of the site, the main entrance was placed directly on the corner, with the offices facing Barbel Street, having the board room directly over. The secretary's room was placed on the corner on the first floor with the view to Westminster Bridge Road, and the interview and reception rooms were arranged at that end, the hall and staircase being planned to take up the irregularities still remaining. In this way the largest number of regular rooms was obtained, at the same time masking the irregularity of the area.

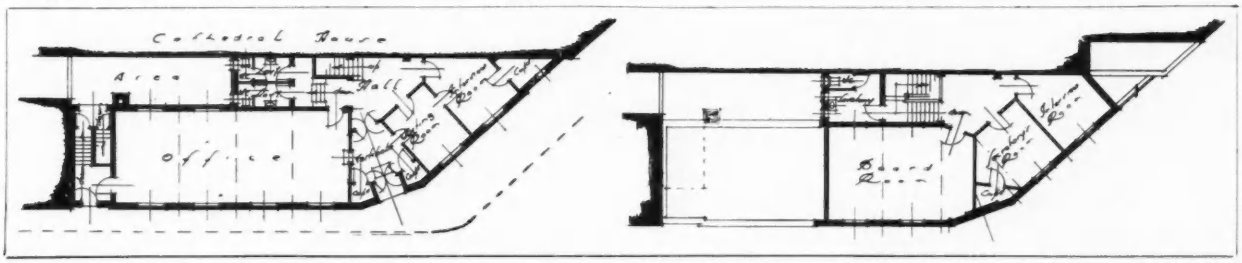
It was necessary to respect certain important lights in Cathedral House at the rear; and the area provided allows for this, as well as affording light and cross-ventilation to the new building.

The building was erected as a steel-framed structure, encased in brickwork. Prudent economy was the prime consideration; the second was a building which, while providing for a secular purpose, would take its place comfortably beside its taller and more austere grandmother; the third was to clothe the ground floor facing the street with a material that could not be easily disfigured by the scribblings of children. Thin glazed grey-mottled terra-cotta slabs were therefore chosen, the walls over being in ordinary London stock facings in keeping with the surrounding work.

The religious association of the building is expressed in the fine bas-relief panel of "The Mother and Child," executed in Portland stone, over the corner entry, by Mr. P. Lindsey Clark, A.R.B.S. A decorative relief is formed in the string course in rosary beads, divided in regular decades of beads between the openings, the principal beads being picked out in red roses. To complete the motif, the wrought-iron grille is fashioned on simple lines radiating from a central heart.

The windows are built up of standard steel domestic casements in stout wood frames, the circular heads to windows alone being purpose-made. The key-stones in Portland stone and copings in artificial stone provide a further relief in texture to the street front.

The ground-floor vestibule and the lavatories are laid in terrazzo to floors and dados. The ground-floor rooms are covered in plain lino. The first-floor rooms are finished in oak wood blocks, the hall and staircase being covered in rubber.



Sketch plans of the ground and first floors. The secretary's and board rooms are on the first floor, over the working office accommodation. The building has been planned with future extensions in view.

TO THE YOUNG ARCHITECT IN AMERICA

BY FRANK LLOYD WRIGHT

TODAY the young man I have in mind hears much, too much, about new and old. Sporadic critics of the "new" take their little camera-minds about—(snapshot emulation by the half-baked architect)—and wail, or hail the dawn. If by chance the novice builds a building the cackling, if not the crowing, outdoes the egg. Propagandists, pro and con, classify old as new and new as old. Historians tabulate their own oblique inferences as fact. The "ites" of transient "ists" and "isms" proclaim the modern as new. And yet architecture was never old and will ever be new.

From architecture, the main current, little streams detach themselves, run a muddy course to be re-gathered and clarified by the great waters as though the little rills and rivulets had never been. All art in our time is like that, and we witness only the prodigal waste Nature sponsors when she flings away a million seeds to get a single plant—seeming in the meantime to enjoy her extravagance.

Nature's real issue, no doubt, in the life of the mind is no less wasteful, and she may enjoy her extravagance in the million fancies for one idea: millions of cerebrations for one thought: a million buildings for even one small piece of genuine architecture. Yes, she gives gladly a million for one now, because the species has declined five hundred years to the level of a commercially expedient appliance. The species itself, you see, is in danger. So be glad to see as evidence of life the babel of personal books, the dereliction of æsthetic movements—especially be glad to see the half-baked buildings by the novitiate.

But confusion of ideas is unnatural waste of purpose. Such confusion as we see means a scattering of aim Nature herself would never tolerate. The confusion arises because there is doubt in some minds and fear in some minds and hope in other minds that architecture is shifting its circumference. As the hod of mortar and some bricks give way to sheet-metal, the lockseam, and the breaker,—as the workman gives way to the automatic machine,—so the architect seems to be giving way either to the engineer, the salesman or the propagandist.

I want to assure you that the circumference of architecture *is* changing with astonishing rapidity, but that its *centre* remains unchanged. Or am I only to reassure you that architecture eternally returns upon itself to produce new forms that it may live on for ever?

AMERICAN WORK THE WORLD ADMIRES

Except in a few instances the only buildings we have today approaching architecture are the industrial buildings built upon the basis of common sense: buildings built for the manufacturer who possessed common sense or buildings for residence built to meet the actual needs without abject reference to the "higher-ups"—nor with foolish, feathered hat in hand to "Culture." These sensible works we possess and the world admires, envies and emulates. This American of common sense, is today the only "way out" for America. He is still the only architectural asset America ever had or has. Give him what he needs when he needs it.

To find out what he needs go whenever and wherever you can to the factories to study the processes in relation to the product and go to the markets to study the reactions. Study the machines that make the product what it is. To acquire technique, study the materials of which the product is made, study the purpose for which it is produced, study the manhood *in* it, the manhood *of* it. Keep all this present in your mind in all you do, because ideas with bad technique are abortions.

In connection with this matter of "technique" you may be interested to know that the *beaux-arts* that made most of your American progenitors is itself confused, now likely to reinterpret its precepts, disown its previous progeny and disinherit its favourite sons or be itself dethroned, since posterity is already declining the sons as inheritance: the sons who enabled the plan-factory to thrive, the "attitude" to survive in a sentimental attempt to revive the dead. Yes, it is becoming day by day more evident to the mind that is a mind how shamefully the product of this culture betrayed America. It is beginning to show and it shames America.

At our architecture as "Culture" quite good-naturedly the Old World laughs. Coming here expecting to see our ideals becomingly attired, they see us fashionably and officially ridiculous, by way of assumption of customs and manners belonging by force of nature and circumstances to something entirely different. They see us betraying not only ourselves but our country itself. But now by grace of freedom we have a little otherwise to show to command dawning respect.

No, young man, I do not refer to the skyscraper in the rank and file as that something nor does the world refer to it, except as a stupendous adventure in the business of space-making for rent—a monstrosity. I again refer you to those simple, sincere attempts to be ourselves and make the most of our own opportunities which are tucked away in out-of-the-way places or found in industrial life as homes or workshops. Our rich people do not own them. Great business on a large scale does not invest in them unless as straightforward business buildings where "Culture" is no consideration and columns can give no credit.

American great-wealth has yet given nothing to the future worth having as architecture or that the future will accept as such unless as an apology. In building for such uses as she had, America has made shift with frightful waste.

WHERE THE FUTURE LIES

Though half the cost of her buildings was devoted to making them beautiful as architecture, not one thought-buils structure synthetic in design hat American great-wealth, and even less American factotumized "learning," yet succeeded in giving to the modern world. American wealth has been "sold" as it has, itself, bought and sold, and been delivered over by professions, or the Scribes, to the Pharisees. So, young man, expect nothing from the man of great wealth in the United States for another decade. Expect nothing from your government for another quarter of a century!

Our government, too (helpless instrument of a majority hapless in art), has been delivered over to architecture as the sterile hang-over of feudal thought, or the thought that served the sophist with the slave. That is why the future of architecture in America really lies with the well-to-do man of business,—the man of independent judgment and character of his own, unspoiled by great financial success—that is to say, the man not persuaded, by winning his own game, that he knows all about everything else.

Opportunity to develop an architecture today lies with those sincere and direct people, who, loving America for its own sake, live their own lives quietly in touch with its manifold beauties—*blessed by comprehension of the ideal of freedom that founded this country*. In our great United States, notwithstanding alleged "rulers" or any "benign" imported cultural influences, these spontaneous sons and daughters are the soul of our country; they are fresh, unspoiled life, and therefore they are your opportunity in art, just as you, the artist, are their opportunity. You will be their means to emerge from the conglomerate "in between."

THE APPLIANCE AND LIFE

Architecture expresses human life, machines do not, nor does any appliance whatsoever. Appliances only serve life.

Lack of appreciation of the difference between the appliance and life is to blame for the choicest pseudo-classic horrors in America. And yet our more successful " modern " architects are still busy applying brick or stone envelopes to steel frames in the great American cities. Instead of fundamentally correcting this error, shall any superficial æsthetic, disguised as new, enable this same lack of appreciation of the principles of architecture to punish us again this time with a machinery abstract, which will be used as an appliance of the appliance of another cycle of thirty years? If so, as between architecture as sentimental appliance and architecture as mechanical appliance, or even the æsthetic abstract itself as an architectural appliance, it would be better for America were you to choose architecture as the mechanical appliance.

But, then, organic architecture would have to keep on in a little world of its own. In this world of its own the hard line and the bare upright plane in unimaginative contours of the box both have a place—just as the carpet has a place on the floor, but the creed of the naked stilt—as a stilt—has no place. The horizontal plane gripping all to earth comes into organic architecture to complete the sense of forms that do not " box up " contents but imaginatively express space. This is modern.

In organic architecture the hard straight line breaks to the dotted line where stark necessity ends and thus allows the appropriate rhythm to enter in order to leave suggestion its proper values. This is modern.

In organic architecture, any conception of any building as a building begins at the beginning and goes forward to incidental expression as a picture and does not begin with some incidental expression as a picture and go groping backward. This is modern.

Eye-weary of reiterated bald commonplaces wherein light is rejected from blank surfaces or fallen dismally into holes cut in them, organic architecture brings the man once more face to face with Nature's play of shade and depth of shadow, seeing fresh vistas of native creative human thought and native feeling presented to his imagination for consideration. This is modern.

The sense of interior space as reality in organic architecture co-ordinates with the enlarged means of modern materials. The building is now found in this sense of interior space; the enclosure is no longer found in terms of mere roof or walls but as " screened " —space. This reality is modern.

In true modern architecture, therefore, the sense of surface and mass disappear in light, or fabrications that combine it with strength. And this fabrication is no less the expression of principle as power - directed - toward - purpose than may be seen in any modern appliance or utensil machine. But modern architecture affirms the higher human sensibility of the sun-lit space. Organic buildings are the strength and lightness of the spider's spinning, buildings qualified by light, bred by native character to environment—married to the ground. That is modern !

CONCERNING WAYS AND MEANS

Meanwhile, by way of parting moment with the young man in architecture, this he should keep concerning ways and means :

1 : Forget the architectures of the world except as something good in their way and in their time.

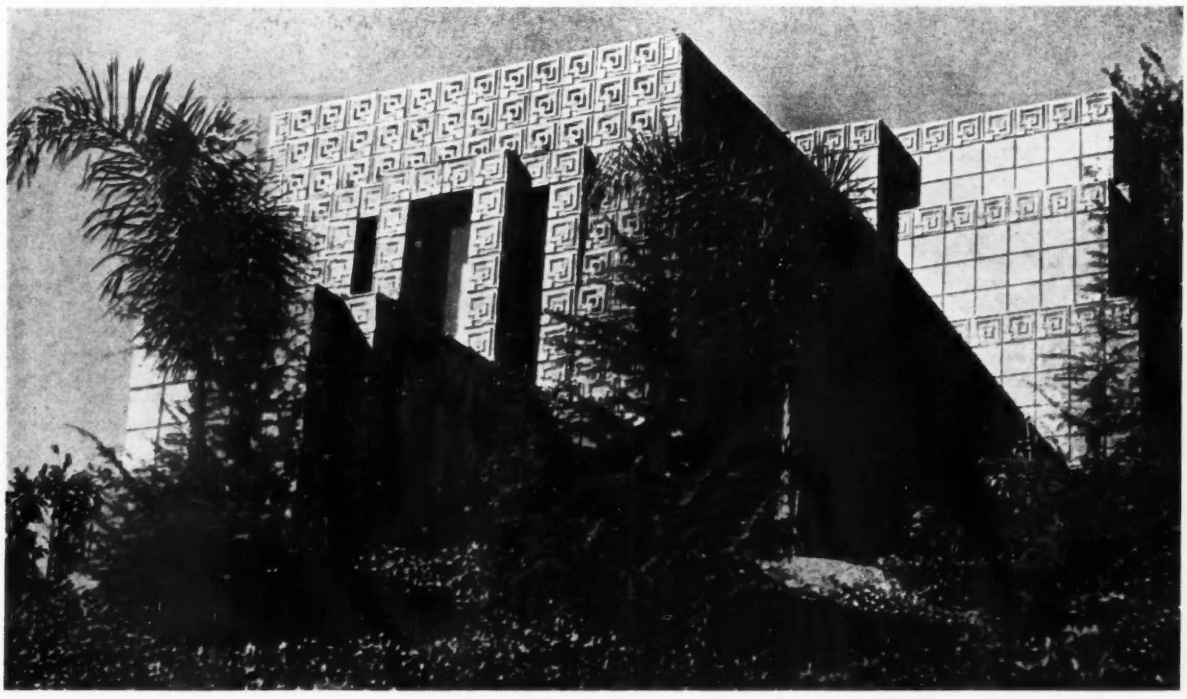
2 : Do none of you go into architecture to get a living unless you love architecture as a principle at work, for its own sake—prepared to be as true to it as to your mother, your comrade, or yourself.

3 : Beware of the architectural school except as the exponent of engineering.

4 : Go into the field where you can see the machines and methods at work that make the modern buildings, or stay in construction direct and simple until you can work naturally into building-design from the nature of construction.

5 : Immediately begin to form the habit of thinking " why " concerning any effects that please or displease you.

6 : Take nothing for granted as



Residence in California constructed with a double wall of concrete blocks with insulating air space.

beautiful or ugly, but take every building to pieces, and challenge every feature. Learn to distinguish the curious from the beautiful.

7: Get the habit of analysis; analysis will in time enable synthesis to become your habit of mind.

8: "Think in simples," as my old master used to say—meaning to reduce the whole to its parts in simplest terms, getting back to first principles. Do this in order to proceed from generals to particulars and never confuse or confound them, or yourself be confounded by them.

9: Abandon as poison the American idea of the "quick turnover." To get into practice "half-baked" is to sell out your birthright as an architect for a mess of pottage, or to die pretending to be an architect.

10: Take time to prepare. Ten years' preparation for preliminaries to architectural practice is little enough for any architect who would rise "above the belt" in true architectural appreciation or practice.

11: Then go as far away as possible from home to build your first buildings. The physician can bury his mistakes, but the architect can only advise his client to plant vines.

12: Regard it as just as desirable to build a chicken-house as to build a cathedral. The size of the project means little in art, beyond the money-matter. It is the quality of character that really counts. Character may be large in the little or little in the large.

13: Enter no architectural competition under any circumstances except as a novice. No competition ever gave to the world anything worth having in architecture. The jury itself is a picked average. The first thing done by the jury is to go through all the designs and throw out the best and the worst ones so that, as an average, it can average upon an average. The net result of any competition is an average by the average of averages.

14: Beware of the shopper for plans. The man who will not grubstake you in prospecting for ideas in his behalf will prove a faithless client.

It is undesirable to commercialize everything in life just because your lot happens to be cast in the machine-age. For instance, architecture is walking the streets today a prostitute because "to get the job" has become the first principle of architecture. In architecture the job should find the man and not the man the job. In art the job and the man are mates; neither can be bought or sold to the other. Meantime, since all we have been talking about is a higher and finer kind of integrity, keep your own ideal of honesty so high that your dearest ambition in life will be to call yourself an honest man, and look yourself square in the face. Keep your ideal of honesty so high that you will never be quite able to reach it.

Respect the masterpiece; it is true reverence to man. There is no quality so great, none so much needed now.

[The foregoing extracts are from "To the Young Man in Architecture," one of *Two Lectures on Architecture* by Frank Lloyd Wright, published by The Art Institute of Chicago, price 75 cents, post free. "In the Realm of Ideas" is the title of the other lecture in the booklet.]

QUESTIONS THAT ARISE

Finishing to Cement Dado

R. D. writes: "*I am troubled by the method used by some plasterers in forming a cement dado. This was specified as to be in cement and sand, ¾ in. thick (1 and 3) finished smooth from the trowel for future painting. The walling was rendered, scored over for a finishing coat, and the latter applied almost neat from the trowel to a thickness of less than ⅛ in. Whilst in this manner a smooth surface is easily obtainable, is there a possibility of this fining coat cracking?*"

To obtain a smooth face with cement and sand, composed 1 and 3, a considerable amount of energy is necessary on the part of the plasterers. With this object in view, nine out of ten plasterers prefer to apply a finer coat as a finishing. Neat cement, of course, should not be used, nor any mixture not containing a proper proportion of sand.

There is no objection to finishing this type of work in the manner as executed for "rendering," but the composition of the final coat should be 1 part of cement and 2 parts of well-washed sand.

It is also of importance that the first coat should be well wetted before application of finishing coat. W. A. D.

Clerk of Works' Office

H. T. writes: "*Has any reader experienced trouble with a builder regarding the description in the specification of a clerk of works' hut? I specified that the builder was to provide a suitable office with necessary heating, lighting and a bench with three drawers. The trouble, however, is with the size. The builder has informed my clerk of works that an office 8 ft. by 8 ft. would be of sufficient area to meet all requirements, but the clerk of works suggests that 100 sq. ft. of floor space is necessary. Does the wording 'a suitable office' cover this?*"

It is very strange to hear of any difficulty being experienced in connection with the erection of a clerk of works' office, for the builder is usually only too glad to fall in with the wishes of the clerk of works, especially at this early stage.

Probably in this case the builder has a portable hut among his plant which he has used for another job, and is therefore keen to save labour and materials by erecting this.

If your correspondent had added that the office was to be to the satisfaction of the architect, he would have been sufficiently covered, but I consider that it is fairer all round if the area required is given in the specification.

On a job lasting for twelve months 12 ft. by 8 ft. would be a very convenient size. It allows a bench for the whole length of one side, and gives plenty of room, when, say, four people are discussing a detail opened out on the bench. C. OF W.

Stained Woodwork

J. R. writes: "*All the interior woodwork of a private residence I have in hand is of Austrian oak. My client wishes it slightly stained and afterwards wax-polished. I shall be much obliged if you would recommend a suitable type of stain and a mixture for the wax-polish.*"

I advise your correspondent to try out test pieces in the two following ways:

1: Apply a weak solution of caustic potash; the solution might be made of more than one strength by adding different amounts of water to the original solution; the weaker it is, the less the staining of the wood. When dry, sponge over with a weak vinegar solution; again, when dry, rub down with fine glass paper if the grain has been raised, and then wax polish. This waxing may be done *a*: by using a lump of hard white wax on which a stiffish brush (of boot-polishing type) is rubbed to take up the wax and then in turn rubbed on the oak. *b*: Make up a paste of beeswax dissolved in No. 1 petrol, rub on with a rag and then polish off with a cloth and soft brush.

It should be noted that if this method of staining be adopted, it must be remembered that its success depends on the oak being all of the same kind and preferably from the same batch of boards. The use of English, Japanese, or other kind mixed in with the Austrian would be apparent, as caustic soda acts differently upon each type of oak.

2: Use a light grey-brown tone of stain. This should be laid on with a soft painter's brush and contains its own wax polish, so that when dry it will polish up under a cloth or soft brush without the addition of further wax; although after a month or so a light application of small quantities of wax-polish will enhance the shine if considered advisable. Usually, however, it is left alone and only rubbed over occasionally with a dry cloth. J. C. R.

THE SPECIFICATION WRITER

Rural Cottage Specifications: Type vii. West Country

BY PERCY F. WARREN

THE West Country is exceedingly rich in buildings of architectural merit, built almost exclusively of stone, and roofed with either thatch or stone tiles; and the Tudor influence is very strongly marked. The following outline specification describes a pair of cottages recently built on the borders of Somerset and Dorset to house servants employed at an old Tudor country house, recently altered and added to.

SPECIFICATION

WALLS

The external walls are to be 18 ins. in thickness for the full height, upon a cement concrete foundation, 2 ft. 6 ins. wide by 9 ins. in thickness, built in roughly-squared random-coursed Ham Hill stone, bedded and set in mortar composed of one part ground lime to two parts of Morton sand, so that a cream-coloured mortar is obtained.

The stones are to be roughly squared on bed and perpends and roughly hammered on face. The stones are to be walled in the mortar and the joints are to be compressed, raked out with a stick and brushed with a stiff brush when the mortar has partly set. All mortar is to be removed from the surfaces and edges of the stones and the mortar joints must be kept back.

Main angles and jambs to windows and doorways to be hammer-dressed.

The party wall is to be built in brickwork in lime mortar, and the 4½-in. internal walls in cement mortar.

LINTOLS

The lintols over the doors and window openings in the external walls are to be in English oak with sawn face, 6 ins. deep and 5 ins. on soffit and, behind these, reinforced concrete lintols 13 ins. on soffit by 12 ins. deep.

THATCHING

The whole of the roofs are to be thatched with unthrashed wheat straw. The thatch is to be 15 ins. thick and laid to the pitch shown on the drawings in short bundles, the straw ends only showing, and thatching carefully formed round the hips, ridges, valleys and chimney-stack, and sewn on with tarred line to 1¼-in. by 1-in. sawn red fir horizontal laths, 8 ins. apart, securely spiked to the counterlaths under.

The eaves and gable ends are to be neatly clipped off and dressed up and wired with ½-in. G.I. netting, pegged with hazelwood pegs.

Provide and fix two lines of "runners" along the eaves and verges, formed by splitting hazel rods from end to end, the rods being about 6 ft. long by ¾ in. diameter, fixed flat on the surface of the thatch with pegs made in a similar manner, twisted and bent in the middle to the shape of a hairpin, pushed into the thatch astride the runners at intervals of 12 ins. and secured firmly to laths. Put two similar lines of runners to ridges.

The bottom row of thatch at the eaves and also along the verges to be laid with a double thickness of straw.

WINDOWS

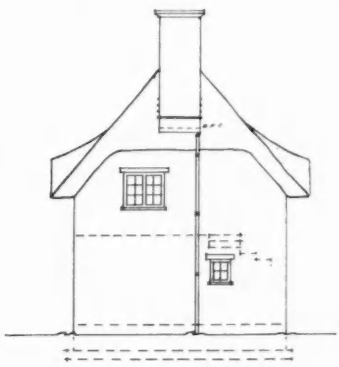
The West Country is subject to very severe driving rains, and extra precautions must be taken to exclude the weather. The windows are to be casements having 4-in. by 3-in. wrought, rebated and water-grooved deal frames and mullions, and 7-in. by 5-in. twice-sunk weathered and throated English oak sills. The casements are to be 1¾ ins. thick, rebated for glazing and water-grooved on all edges, divided into panes with 1¼-in. twice-rebated glazing bars.

FITTINGS

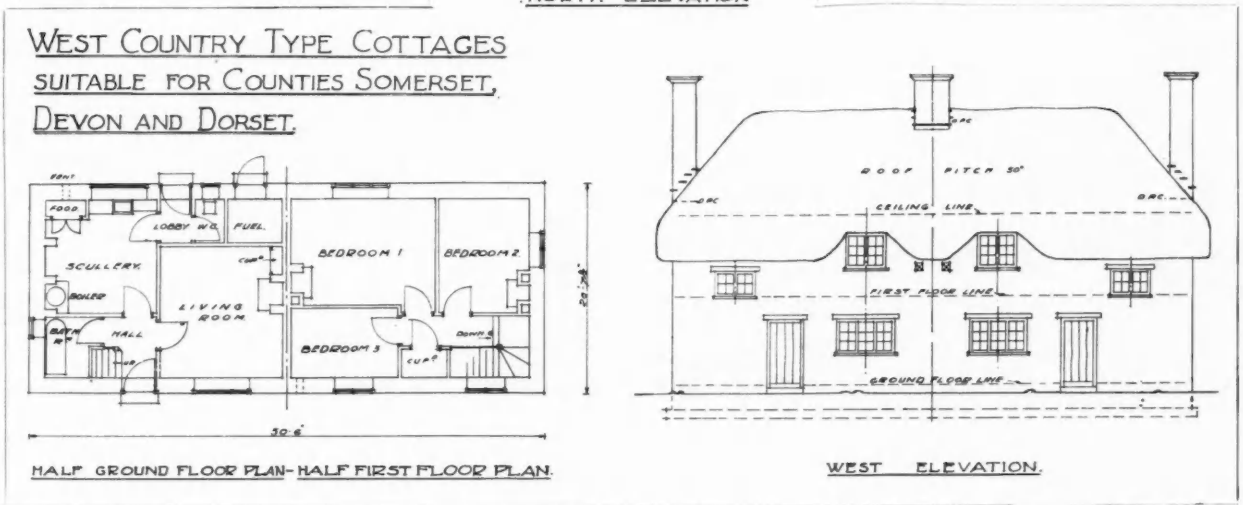
A modern type of combination cooking grate should be provided and fixed in the living-room, and a small portable cooking range in the scullery.

The washing boiler should be fixed upon a concrete platform in the scullery, so that the complete contents thereof can gravitate to the bath in the bathroom adjoining by means of a pipe connected from the boiler to the hot-water tap on the bath.

NO one who has supervised cavity-wall construction, using the ordinary twisted fish-tail metal ties, can be unaware of the perfunctory clearing of the ties from mortar droppings which usually occurs. Since without such clearing the whole purpose of hollow-wall construction is liable to be defeated, and it is probably only by sheer luck that a large proportion of such work appears to fulfil its purpose, any improve-



NORTH ELEVATION



Drawing to illustrate the accompanying specification, prepared by Percy F. Warren.

ment which is likely to reduce risk of "bridging" will be welcome. Such claims are made for a new knife-edged tie. It appears likely that improvement would be secured by its use, though a practical test is the only means of proving it. The slightly bevelled corners on the underside may, however, prove insufficient to prevent water travelling across from one wall to the other as claimed, as a very slight extension of the mortar joint would close the gap. A better form for the bottom of the vertical centre part would be an angular one, having a central apex below to encourage dripping, and this would, moreover, accentuate the difference between top and bottom of the ties and make it less difficult for careless workmen to reverse them in use. EDWIN GUNN

Light-weight Bricks and Blocks

THE demand for bricks and blocks of much less than the normal weight has greatly increased during the past few years. This is due to the extended employment of panelling materials, which do not have to carry the superincumbent structure but are only required to fill the spaces between the structural members. When light panels can be used, the supporting members can be slighter and a considerable saving in the cost of materials and erection is thereby effected.

Another very important use of light-weight bricks and blocks is for insulation against heat, cold, or even sound. They are invaluable for retaining the heat in furnaces instead of allowing it to radiate into the atmosphere and be lost. Equally valuable are they in refrigerators, where they serve the opposite purpose and prevent external heat from gaining access to the cool chamber. Light-weight bricks and blocks are also used to prevent sounds being heard outside the room in which they are produced. For this purpose they are largely used for partitions and in the construction of audition chambers, telephone boxes, hotels, and private houses. In fact, they are now used for so many purposes that an extensive industry is occupied in their rapidly-increasing production. Some of these articles, whilst of first-class quality and serving certain purposes admirably, are useless for others. Blocks of one type would be needlessly expensive for some purposes, but are highly resistant to weather, and so are invaluable for exposed positions.

Many thousands of light-weight blocks are now used for building partition walls in existing buildings—particularly in the conversion of large houses into flats. Such blocks are used under almost ideal conditions, and so can be made of materials having a maximum lightness and sound-proofness, whereas blocks and bricks used for exterior work must necessarily be of greater relative weight in order that they may withstand exposure. It is, therefore, of great importance to select bricks or blocks made of suitable materials, and not to place too much emphasis on mere "lightness" when the goods have to withstand exposure to the weather. It may appear needless to mention what seems so obvious a matter, but the fact that complaints have been made because blocks intended for interiors have been used for external work shows that caution is needed.

CLASSIFICATION

Light-weight bricks and blocks may be arranged in three groups or classes :

a : Those containing a large proportion of clay and resembling ordinary building bricks in most respects except weight.

b : Those made of some light-weight material, the particles of which are united by a mineral cement, such as Portland cement or sorel (magnesium oxychloride) cement, or, in some cases, by clay, in which case the articles must be heated in a kiln. This is not necessary when Portland or sorel cement is used.

c : Those made of plaster and fibre, or of wood or other material which cannot withstand a high temperature or prolonged exposure to the weather.

The first group includes all the materials which are practically fireproof and capable of resisting the weather for many years. The articles in the second group are not really fireproof, though they possess some power of resistance to fire and to the weather. They are only suitable for interior work except in sheltered places or very mild climates. The materials in the third group are extremely light, but they are inflammable and not resistant to weather. They can, therefore, only be used for interior work.

CLAY PRODUCTS

The materials in the first group are much more varied than those in the other groups. They owe their lightness to ingenious methods of introducing air into the texture of a porous material, such as a brick, so as to retain all the important properties of the material and yet reduce its weight (figure one). To be able to do this successfully is much more remarkable than is generally realized, and it is not accomplished without considerable skill. Failure to recognize the technical difficulties involved has led to severe losses by some manufacturers and to many disappointed users.

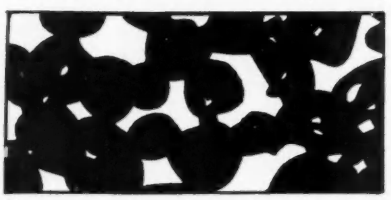


Figure one : Magnified section of porous brick.

The simplest means of making light-weight bricks, using clay as the principal material, is to mix as much sawdust as possible with the clay of which ordinary bricks are made, and then to proceed with the manufacture of the bricks in the ordinary way. During the heating of the bricks in the kiln, the sawdust will burn out, leaving a "pore" in place of each particle of sawdust. If, for instance, a volume of sawdust particles equal to 30 per cent. of the volume of the brick can be introduced, the porosity of the brick would be increased by 30 per cent. (by volume). Instead of sawdust, other materials such as flour, ground meal of various kinds, coke, "waste" chemicals, such as naphthalene, and, in short, any powder which will burn away completely in the brick kiln without damaging the bricks, may be used. Very coarse particles, such as some kinds of seeds, are not desirable, as small pores are preferable to large ones, and small pores require the use of small particles of added matter. Softwood sawdust is largely used, but its particles are usually much larger than those of hardwood sawdust, so that the latter would be preferable. Unfortunately hardwood does not burn as readily as softwood, and its use introduces various complications. It is unfortunate that the addition of pore-forming substances is greatly restricted by the plasticity or binding power of the clay. For this reason, only a relatively small increase in porosity can be secured by this means.

PERFORATED BRICKS

Another means of increasing the proportion of air space to solid matter in bricks is to make them with a large number of very small perforations (figure two). These are not made by drilling holes into the finished brick, but are produced automatically when the bricks are being shaped. English brick manufacturers have not developed this type of brick very fully, and have been content to make bricks with not more than about twenty $\frac{1}{2}$-in. holes. On the Continent, bricks with 200 perforations are made; indeed, so numerous are the perforations that it is surprising that the bricks retain their strength !

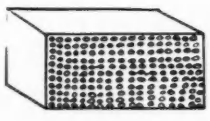

Figure two : Perforated brick. The spaces are automatically formed in the process of shaping the clay.

HOLLOW BLOCKS

Another method consists in making one or more large passages longitudinally through the bricks or blocks, thereby producing "hollow blocks" (figure three) or "hourdis." Such

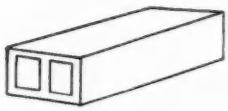

Figure three: A typical hollow block, which may have "walls" five-eighths of an inch in thickness.

blocks may conveniently be made as large as four or even eight ordinary bricks, but with only one quarter of the relative weight. If the blocks are well designed, they can have "walls" and a centre partition, $\frac{5}{8}$ in. thick, and hollow spaces each $1\frac{5}{16}$ ins. wide, thereby producing the equivalent of a $4\frac{1}{2}$-in. wall with only $1\frac{7}{8}$-in. solid matter—a reduction of nearly 50 per cent. of the weight of blocks, 12 ins. square and $4\frac{1}{2}$ ins. thick.

Hollow blocks are quite safe for ordinary building purposes, as solid bricks are ten times stronger than the crushing strength of walls built of them, the mortar being the weak part in a wall. There is no ground for the fear, sometimes expressed, that a hollow wall cannot withstand the pressure of the blocks above it.

Hollow blocks are made of many different patterns and sizes so as to suit various requirements. Some users prefer the hollow portions to be vertical, and suggest that horizontal flues form runways for mice and other vermin which would be stopped by vertical flues. Ingenious devices are used to keep the blocks in position, the commonest being to form grooves on the tops and bottoms of the blocks, so that these grooves engage with those on other blocks and produce "tongue-and-groove" joints. In some blocks, the mortar placed in grooves forms a seal and bond.

The great problem with many hollow blocks is the production of end-blocks and closers. The simplest procedure is to use end-blocks of special shapes, designed so as not to show the hollow portion when they are in position in the wall.

An alternative method is to turn the end block vertically and cut it to the required height. Closer blocks must usually be made specially, as without them the other blocks will not "break joint" satisfactorily. These problems are for the manufacturer rather than the user, but the latter must not overlook them or he may find himself in a difficulty.

CAVITY BRICKS

Recently, a well-known firm of brick manufacturers have supplied what they term "cavity bricks," which may be regarded as ordinary bricks with a large cavity scooped out of them, or, alternatively, as bricks with an abnormally large "frog." These bricks weigh only about $5\frac{1}{2}$ lbs., and are therefore advantageous for use in panel work. They are sometimes regarded as being handier than hollow blocks, though that is, necessarily, a matter of opinion.

DIATOMITE BLOCKS

Bricks and blocks of very low weight may also be made by means of *hollow particles* united by a cement or by clay. The most popular material of this kind is known by various names, such as Kieselguhr, diatomite, moler, and diatomaceous earth (figure four). The

Figure four: Representative shapes of diatom skeletons, as revealed by the microscope.

differences between these substances are not important for most purposes, but are serious in a few cases. The particles are the skeletal remains of diatoms and similar creatures, and consist of hollow particles of many sizes and shapes, the "walls" of each particle being so thin as to require a powerful microscope to enable them to be seen. Bricks and blocks made of Kieselguhr or similar material are exceedingly light in weight, have great sound- and heat-insulating powers, and if bonded with suitable clay they have a high fire-resisting power. Such articles may be made in the form of either solid or "hollow" blocks; the latter are preferable where conditions permit, as their insulating powers are increased by the large hollow portions in association with the high porosity.

PUMICE BLOCKS

Pumice—one of the constituents of volcanic lava—and tuff, which is of similar origin, are highly porous materials. If they are not ground too finely (which would destroy their porous structure), they are very suitable for the production of light-weight blocks.

It is difficult to use clay as a bond for pumice, as the mixture is very easily distorted when in the kiln, but Portland cement or sorel (magnesium oxychloride) cement can be used with satisfactory results. Pumice blocks sawn from the natural material are occasionally used. Most pumice and tuffaceous blocks are less porous than those of diatomite, but more so than those made of clay and sawdust. They are chiefly used for interior work, where they have no serious weight to support.

PLASTER BLOCKS

When lightness and cheapness are by far the predominant factors, blocks made of fibre and plaster are often used, and for interior work they meet a great need. Such blocks are neither so strong nor so hard as others, but in many buildings hard walls are not necessary. The purpose of the fibre is partly to enclose air, and so reduce the ultimate weight, and partly to act as reinforcement to the plaster.

SELECTING BRICKS AND BLOCKS

When selecting light-weight bricks and blocks for any purpose, great care should be taken to ensure that all the desired properties are possessed in sufficient measure by the article selected.

It is useless to employ a plaster-fibre block for permanent use out of doors, though for temporary structures, such as exhibition buildings, it may be useful and satisfactory. On the other hand, it may be a needless expense to use Kieselguhr-clay blocks for a partition wall in the interior of a well-built structure where there is no likelihood of exposure to severe conditions.

For the conservation of heat in furnaces, Kieselguhr-clay blocks and bricks are unquestionably the best, but they must be protected on one side from excessive heat and on the other side from the weather.

For buildings with a steel skeleton and brick panels between the steel members, highly-porous blocks, cavity bricks, or hollow blocks are usually best, as they are exposed to the weather.

Interior partitions may usually be made of any kind of highly-porous material, but in some industrial buildings the effect of vibration or chemical vapours somewhat restricts the choice.

Hollow blocks made of clay are not so sound-proof as highly-porous ones, but are sufficiently good for many factory buildings where high sound-proofness is not required.

For some purposes there is no need to use porous blocks so long as the blocks employed are light in weight. In such cases a mixture of magnesium chloride, magnesia and sawdust may be satisfactory, or a partition of light wood, wallboard or lath and plaster may be used.

From the foregoing it will be realized that the right selection of suitable blocks for some purposes requires a detailed knowledge of the factors involved, as well as of the properties of the available blocks. Such blocks should not be chosen haphazard, but with care and skill.

When it becomes necessary, the requisite information can usually be obtained from the manufacturers of the blocks, though few firms will recommend a rival product when it is more suitable for a particular purpose than what they produce. For important work on a very large scale, independent advice should always be sought.

A. B. SEARLE

MODERN COTTAGES AND COUNTRY HOUSES

BY E. MAXWELL FRY

From Germany: Villa at Altona-Othmarschen. Karl Schneider, architect.

PROFESSOR J. G. WATTJES has looked over the country houses of Europe and America. His book is one of those international surveys that appear from time to time. It was his intention to make a record of the best achievement in country-house design in all parts of the world where the country-house idea is fairly understood. That best achievement he had hoped to represent as a unified twentieth-century style of building, but, as he says in his introduction, "neither the architecture of the country house nor modern architecture in general has brought that oneness in conception which had been hoped for and which was believed—and is still, by many—to be an essentiality."

This being true, we must accept the widely varying national and individual styles as representing the state of country-house architecture in Europe and America today. And we need not regret the variety which national needs and preferences bring to this collection of all talents. Architecture is an art, and requires that its practitioners shall be moved—and moved greatly—to create. National preferences and traditions being no mean, but rather grand, things may be therefore expected to provide some substantial part of the emotion of architecture, as we know them to have done with us in England. And national needs, the stress of natural conditions and weathers, are severe external moulders of architecture, producing the mighty eaves of Switzerland just as they have formed the gentle slopes of stone-slated Derbyshire roofs.

These things, tradition and natural circumstances, so long as they have meaning and bearing, will continue to affect design wherever they are properly understood and keenly felt; and architecture will not suffer. Where they are used as picturesque stock-in-trade, it

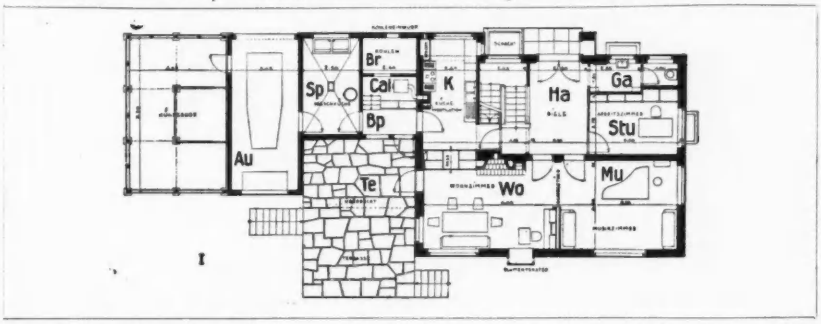
is time for the work of le Corbusier. Turning to the matter of the book itself, it is, of course, very exhilarating to look through such a collation of styles. Not only exhilarating, but definitely instructive.

After a time one begins to make some rough classification into houses that are built in a national tradition, houses that are definitely modern, and houses that are either freakishly national or very badly modern.

What strikes one particularly is the comparative simplicity of, say, the farm-country-house at Zürich, André Lurçat's house at Parc Montsouris, and Karl Schneider's house at Hamburg. The first is simply national, vigorously traditional, and good right through. The last two, as simple and straightforward, are created by emotions that cannot be said to owe very much to national-local conditions, and none to anything but the widest cultural traditions. The three are linked by the purity and vigour of their creation.

This book shows examples in nearly all European countries, architecture that has become as nearly international as bad Renaissance classic used to be, but how refreshingly clean and healthy beside it!

I find much of this architecture of the *avant-garde* too much a statement of new discovery and too little humanized; as though it were unable, under the



Ground-floor plan of the Swiss house. In addition to the references quoted on the preceding page, Wo = living-room; Ga = dressing-room; Br = fuel; Bp = store; Au = garage.

stress of abstract thought, to allow admittance to the occasional, the kindly human touch. Perhaps this will come naturally as discovery gives place to more confident handling.

It must be obvious from these remarks that this book is interesting in an unusual degree. The photographs are excellent and are accompanied by small plans, not very readable. The text is printed in Dutch, French, German, and English. E. M. F.

Modern Cottages and Country Houses in Europe and America. By Professor J. G. Wattjes. Amsterdam: Kosmos.

LITERATURE

THE NATIONAL PHYSICAL LABORATORY'S REPORT

IF the annual report of the National Physical Laboratory serves no other purpose, it is a wholesome reminder of the important part which scientific research is playing today in industrial development.

As in previous years, the Report for the Year 1930 is not a detailed record of work and results, but a general statement of the work undertaken and in progress. Even in the 295 pages it occupies it would be impossible to do more than indicate the character and general application of the various researches and tests undertaken, including as they do heat and general physics, radiology, electrical standards and measurements, electrotechnics, wireless, photometry, metrology, engineering, aerodynamics and metallurgy. Scarcely an industry or profession but receives some assistance, either directly or indirectly. Often it takes the form of co-operation with some such institutions as the Building Research Board, the Roads Department of the Ministry of Transport or the British Engineering Standards Association.

It may be noted that, in order to simplify procedure and the correlation of test results, the testing and experimental work of the acoustic laboratories at the Building Research Station at Garston, near Watford, has been taken over by the Laboratory. A scheme has been agreed upon with the object of securing close liaison with the Building Research Station, particularly on questions of the structure of buildings or special architectural features.

In the matter of sound transmission, the range of test frequencies has been extended, and preliminary experiments are under way on the transmission of mechanical blows by partitioning. Various other researches in sound which have been undertaken have considerable practical interest. Other work of architectural interest includes researches on illumination, and we note that the construction of an experimental instrument for determining the glare effect in any actual lighting system has been completed. Street lighting experiments were conducted at Leicester in September last with eight different lighting systems, and the analysis and correlation of the results is expected to yield results of value.

Reference is made in the report of the Engineering Department to investigations upon wind pressures on structures and bridges, also upon concrete for road making. The actual results of many of the investigations mentioned have been, or will, in due course, be published in various special reports and papers. The present Report does little more than indicate the nature of the work. A. H. H.

The National Physical Laboratory Report for the Year 1930. London: H.M. Stationery Office. (For the Department of Scientific and Industrial Research). Price 12s. 6d. net.

THE SLUM: ITS STORY AND SOLUTION

"IN 1931 there is to be a new offensive against the slum. This book is for those who take part in it." Such is the opening of Major Barnes's latest contribution to the literature of the great cause of the abolition of the slum, in which he is himself a leader with notable qualifications—an architect and a housing expert, with inside experience of legislation both on the L.C.C. and in Parliament. He goes on to say: "In continuing the fight, nothing can be more heartening than to know there is an objective, that it is attainable, and that past struggle has brought it within reach. . . . Nothing more and nothing less than a separate dwelling for each family, with adequate accommodation, set in surroundings clean and comely."

The book falls into two parts: first, the history of the slum problem, and the efforts already made—and a knowledge of both is essential; and, secondly, the solution. The history falls into defined stages, marked by some great figure such as Chadwick, Shaftesbury or Octavia Hill.

The Royal Commissions and their evidence and results in legislation are specially dealt with. The earlier Acts refer to public health, and only later is the importance of housing realized, and that in its turn is related to Town Planning. The culminating Act of 1930 has put plenary powers into our hands, but the work is still full of delays and difficulties, and overcrowding continues to a scandalous degree. The root difficulty is poverty: though the problem of the uneconomic rent is partly solved by public expenditure. There still remain the cost of transport in time and money, the landlord and the vested interests, and the enormous practical difficulty of "decanting" or providing intermediate houses for the people while slum areas are being cleared and rebuilt. Some factories may take their workers into satellite towns, but there will always be certain classes who must live near their work in central positions, and these are often the poorest who need proper accommodation most.

The author advocates another Royal Commission and a detailed survey of the whole position in its various bearings, with a view to speeding up the application of powers which are only waiting to be enforced. E. K. D. H.

The Slum: Its Story and Solution. By Major Harry Barnes, F.R.I.B.A., F.S.I. London: P. S. King and Son, Ltd. Price 18s. net.

SOCIETIES AND INSTITUTIONS

R.I.B.A. COUNCIL MEETING

THE following are some notes from minutes of a recent meeting of the Council of the R.I.B.A. :

The President. The Hon. Secretary spoke of the great services which Sir Banister Fletcher had rendered to the Institute and to the profession during his tenure of the office of President, from which he was shortly to retire, and on the Hon. Secretary's proposition a very hearty vote of thanks was passed in favour of the President. The President, in thanking the Council for their kind resolution, briefly referred to the work of the session and expressed his gratitude to the members of the Council and to the secretary and staff for their loyal support.

Retiring Members of Council. On the proposition of the President a cordial vote of thanks was passed in favour of the retiring members of Council.

The Annual Dinner. A cordial vote of thanks was passed in favour of the Benchers of Lincoln's Inn for their kindness in lending the Hall of Lincoln's Inn for the annual dinner.

South Wales Architecture Medal. The award of the R.I.B.A. South Wales Architecture Medal, 1930, for the new building for Messrs. James Howells & Co., St. Mary Street, Cardiff, designed by Mr. Percy Thomas, F.R.I.B.A., of Messrs. Ivor Jones and Percy Thomas, was formally approved by the Council.

Joint Committee of Architects and Quantity Surveyors. On the recommendation of the Practice Standing Committee the following members were appointed to represent the R.I.B.A. on a Joint committee of architects and quantity surveyors which has been set up to consider and report on questions of mutual interest to the two professions : Messrs. J. Alan Slater, L. Sylvester Sullivan, Sydney Tatchell, and Charles Woodward.

The International Congress for Art Education, Vienna, 1932. On the recommendation of the Board of Architectural Education, Mr. A. H. Moberly, F.R.I.B.A., was appointed to serve as the R.I.B.A. representative on the Organizing Committee of the above Congress, and a donation of £5 5s. was made towards the funds of the Organizing Committee.

The Advisory Council of the Building Industry. Mr. Sydney Tatchell, F.R.I.B.A., and Mr. Louis Blanc, L.R.I.B.A., were appointed to represent the R.I.B.A. on the Advisory Council of the Building Industry and Mr. Louis Blanc on the Executive Committee of the Advisory Council. A contribution of £25 was made to the funds of the Advisory Council for the year 1931.

Grant to the Wren Society. It was agreed to make a grant of £100 to the Wren Society towards the cost of publishing the drawings of Sir Christopher Wren.

The Architectural Association. It was agreed to renew the grant of £100 to the Architectural Association for the year 1931.

The Association for the Preservation of Rural Scotland. It was agreed to make a grant of £10 to the Association for the Preservation of Rural Scotland for the year 1931.

The Court of Governors of the University College of the South-West of England. Mr. John Bennett, F.R.I.B.A., President of the Devon and Cornwall Architectural Society, was appointed to represent the R.I.B.A. on the Court of Governors of the University College of the South-West of England.

The Empire Forestry Association. Mr. H. D. Searles-Wood, F.R.I.B.A., was renominated as the R.I.B.A. representative on the Governing Council of the Empire Forestry Association.

British Standard Specification for Constructional and Electric Signs. Mr. P. J. Waldram, L.R.I.B.A., was appointed to represent the R.I.B.A. on a technical committee which has been set up by the B.E.S.A. to prepare standard specifications for constructional and electric signs.

The Ulster Society of Architects. The revised bylaws of the Ulster Society of Architects were formally approved by the Council.

The Control of Advertisements under Town and Country Planning Schemes. The President reported that on the recommendation of the Art Standing Committee he had signed, on behalf of the R.I.B.A., a memorandum on the control of advertisements under Town and Country Planning Schemes drawn up by the Scapa Society for submission to the Standing Committee of the House of Commons which is at present considering the Town and Country Planning Bill. The action of the President was approved.

Christmas Holiday Lectures for Boys and Girls. The Art Standing Committee reported that Mr. E. R. Jarrett, A.R.I.B.A., had accepted their invitation to give the next series of Christmas holiday lectures to boys and girls.

Suggested standard form of Agreement between architect and client. A draft standard form of agreement for use between architect and client drawn up by Mr. W. E. Watson, F.R.I.B.A., at the request of the Practice Standing Committee, was approved for publication.

Membership. The following members were elected : As Hon. Corresponding Members, 2; as Fellows, 16; as Associates, 11; as Licentiates, 22.

Election, July 6, 1931. Applications for Membership were approved as follows : As Hon. Associate, 1 application; as Fellows, 18 applications; as Associates, 5 applications; as Licentiates, 45 applications.

Reinstatement. The following ex-member was reinstated : As Associate : Bruce Johnston.

Application for Election as Licentiate under Section III (f) of the Supplemental Charter of 1925. One application was approved.

Applications for Transfer to the Retired Members Class under Bylaw 15. The following members were transferred to the Retired Members Class : As Retired Associates : Lt.-Col. Frank Earle (A. 1893); James Paxton (A. 1892); Bertram Norman Southall (A. 1889).

Election of Students. The following probationers were elected as Students of the R.I.B.A. :

Andrews, Edwin Douglas (Intermediate Examination); Bell, James (Glasgow School of Architecture); Bickerton, Beryl Wainwright (Architectural Association); Booth, Leonard Noel (McGill University, Montreal); D'Alwis, Hylton Theodore Shirley (Liverpool School of Architecture); Darch, John Thomas (Welsh School of Architecture); Davies, William John (Welsh School of Architecture); Garnett, Kathleen Erica (Intermediate Examination); Halstead, Haydn Albert Edward (Robert Gordon's Colleges, Aberdeen); Harvey, David (Edinburgh College of Art); Holder, Frederick William (London University); Jones, Albert Edward (Northern Polytechnic); Jadhar, Marooti Krishnaji (Bombay School of Art); Lazarus, Jacob (Liverpool School of Architecture); Livingstone, Duncan (Edinburgh College of Art); Locke, Bertrand (Special Exemption); Meiring, Adriaan Louw (Liverpool School of Architecture); Middlemiss, Clyde Oliver (Southend School of Arts and Crafts); Pratley, Gilbert John (Northern Polytechnic); Roe, Mervyn Frederick Hurford (Birmingham School of Architecture); Ross, Henry Sheldon (McGill University, Montreal); Savill, Alexander Gordon (Architectural Association); Scott, Robert Alexander (Edinburgh College of Art); Sjostrom, Cyril Leonard (Northern Polytechnic); Smith, Richard Vernon (Liverpool School of Architecture); Valentine, Hugh Allen Inglis (McGill University, Montreal).

ARCHITECTURAL SOCIETIES VISIT SUSSEX

Members of the South-Eastern Society of Architects joined with members of the Hampshire and Isle of Wight Society of Architects in a visit to Chichester and neighbourhood on June 27. Among the party, which numbered about 150, were Messrs. Arthur A. G. Fenning, F.R.I.B.A., president of the South-Eastern Society; John L. Denman, F.R.I.B.A. (one of the vice-presidents); Richard Goulburn Lovell, A.R.I.B.A., of Eastbourne (hon general secretary); and J. Arthur Smith, F.R.I.B.A. (president of the Hampshire and Isle of Wight Society).

The party first visited the Cathedral, where they were conducted round by the Dean (the Very Rev. A. S. Duncan-Jones) and Mr. Macdonald Gill,

architect, the Dean explaining the restoration work now in progress. The party afterwards visited the Old Kitchen and the chapel at the Bishop's Palace, the Guildhall in Priory Park, and St. Mary's Hospital, returning to the Dolphin Hotel for lunch.

After lunch the party went in motor coaches and private cars to Boxgrove Priory, over which they were conducted by the Vicar, the Rev. E. A. Popham; then to Goodwood racecourse, Trundle Hill and the prehistoric camp, where an interesting talk was given by Mr. Lovell. From Goodwood the party proceeded to Midhurst, where a visit was paid to the Cowdray ruins, and then back to Chichester in time for tea, which was served at the Dolphin Hotel.

LAW REPORTS

BUILDERS' SALE WITHOUT CONSENT

Cressall v. *Houghton and others. Chancery Division. Before Lord Justice Lawrence*

THIS was an interesting action, and raised a point as to whether a purchaser could enforce specific performance for a sale of land from a vendor who held under lease from a freeholder, to whom he was under covenant not to assign or part with without approval, when such approval had not been given before the contract for sale.

The action was by Mr. Alfred E. Cressall, of Julian Road, Folkestone, against Messrs. C. H. Houghton, P. Denne and R. J. Chidwick, builders trading in partnership at Cheriton Road, Folkestone, for the specific performance of an agreement of September, 1930, for the sale by the defendants of their leasehold interest in a plot of land at Cheriton Road, Folkestone.

Mr. Ramsbotham appeared for the plaintiff, and Mr. A. Clark for the defendants.

Mr. Ramsbotham said the defendants held the land under lease from Lord Radnor, who was the freeholder, and the lease contained a covenant that the defendants would not assign or part with any part of the land without Lord Radnor's consent.

What happened here was this. The plaintiff desired to acquire the plot in question in September last, and he employed Mr. V. Shone, an architect and surveyor of Folkestone, to negotiate for it. Mr. Shone was successful in his task and purchased the defendants' interest for £75. An agreement was signed which stated that defendants sold, subject to the approval of Lord Radnor, their interest in the land, for £75 paid as compensation for loss of building profit and subject to defendants tendering for the erection of any preferred house, prior to tenders being invited. The plaintiff paid a deposit of £5. Later the defendants asked for the payment of a sum of £65 odd for plaintiffs' share of the fencing of the land, party wall and sewers. The plaintiff declined to pay these additional charges, and defendants then said unless plaintiff paid that sum he could not have the land.

Under these circumstances the action was brought.

His lordship pointed out that, in his opinion, the parties had entirely mistaken their rights. He would have thought that it was quite plain that plaintiff could not enforce an agreement which had never been approved by the third party, Lord Radnor. The agreement was quite contrary to the covenant in the defendants' lease, which said that they should not assign or part with the land until they had the approval of Lord Radnor. The action was entirely misconceived. The Court did not decree specific performance where the consent of a third party had to be obtained, and it had not been done. He dismissed the action with the costs. The counter-claim, which had not been opened, he dismissed without costs.

ALLEGED ENCROACHMENT

Barr v. *Hearsey. Chancery Division. Before Mr. Justice Farwell*

In this action the plaintiff was Mrs. Ethel Gertrude Barr, of Laleham-on-Thames, the wife of Mr. V. S. Barr, an architect, against the defendant, Mr. Walter R. Hearsey, garage proprietor, of Laleham-on-Thames, for an injunction restraining him from erecting any building or other structure on land adjoining plaintiff's land in such a manner as to encroach upon or overhang her property.

Plaintiff's case was that the defendant had erected a garage adjoining her garden and had placed a gutter upon the wall 8 ft. from the ground and extending 61 ft. in length, which projected from 2½ to 1½ inches beyond the wall so as to become an alleged nuisance.

Defendant set up a counter-claim against the plaintiff for an alleged trespass by the plaintiff, saying that the plaintiff had erected an aviary and trellis work on his wall.

With regard to the plaintiff's claim, defendant replied that he had erected his wall on old footings, the base of which abutted some inches beyond the present wall and that his gutter did not extend beyond those foundations.

Expert evidence was given by Mr. W. R. Lowe, architect, and Mr. W. Woodbridge Biggs, F.S.I.

His lordship, in giving judgment, said the whole thing seemed to him to be a storm in a tea-cup, and he was not inclined to help either party. The counter-claim obviously failed. After considering all the facts he granted plaintiff 40s. nominal damages and there would be no costs to either side, each party paying their own.

LIGHT AND AIR DISPUTE

News of the World, Ltd. v. *Allen Fairhead and Sons, Ltd. Chancery Division. Before Mr. Justice Farwell*

This was an action by the proprietors of the *News of the World* against Messrs. Allen Fairhead and Sons, Ltd., contractors, of Enfield, for an injunction to restrain the defendants rebuilding 65 Fleet Street and 41 Whitefriars Street to such a height as to be a nuisance by obstructing the ancient light of plaintiffs' premises on the opposite corner, viz., 67 Fleet Street and Nos. 2 and 3 Whitefriars Street.

Mr. Swords, K.C., for the plaintiffs, said that the plaintiffs' premises were rebuilt in 1927 at the corner of Fleet Street and extended down Whitefriars Street. The defendants' premises were immediately opposite. Whitefriars Street was roughly about 23 ft. wide. The defendants' old building was 43 ft. high at the Fleet Street end and slightly lower in Whitefriars Street. But the new building they proposed to erect was 69 ft. 6 ins. throughout. Mr. Scott, the plaintiffs' architect, protested that this would seriously interfere with the plaintiffs' ancient lights, and after an interview and some correspondence the defendants modified the height by about 2 ft. This being unsatisfactory to the plaintiffs, the writ in the action was issued.

One of the defences raised was that by reason of the demolition of the plaintiffs' old building they had lost or abandoned any easement of light over their property.

The plaintiffs, counsel said, would call evidence to show that there had been no alteration in the position of the windows in the old building and the new building.

The expert witnesses called on behalf of the plaintiffs were Mr. Augustus Alban Hamilton Scott, architect, Old Square, Mr. Edgar Bunce, A.R.I.B.A., and Mr. John Swarbrick, F.R.I.B.A.

Sir Herbert Cunliffe, K.C., for the defendants, submitted that the plaintiffs had wholly failed to establish the identity of the old lights and therefore it could not be said that the defendants had created a nuisance.

Mr. Percy S. Waldram, consulting engineer and surveyor and daylight illumination expert, gave evidence for the defendants.

His lordship dismissed the action with costs. He said he was not satisfied that there had been any abandonment of rights which plaintiffs enjoyed before the old building was pulled down. But in order to succeed plaintiffs must prove the exact position of the windows and apertures which previously existed. This they had not done. In his opinion the defendants' building was not a nuisance. Plaintiffs had not established any rights to lights at all beyond the ground floor. Although they had some rights with regard to these they had failed to satisfy the court that the defendants' building was a nuisance and therefore the action would be dismissed with costs.

TRADE NOTES

For accurate colour matching by artificial light, it is necessary to instal a unit which will give complete correction, allowing no direct rays whatever to reach the work. For this purpose the Sheringham Daylight Unit has been specially devised. Its principle is simple. Under the electric lamp is a cup-shaped specular reflector which screens the filament in all downward or horizontal directions, and throws back these components on to the main pigment-treated reflector. As with the Sheringham corrective reflector, these pigments are arranged and proportioned in accordance with a mathematical formula, and the resultant light is claimed to be so corrected as to give a spectroscopic analysis identical with that obtained from true north daylight. It will, of course, be appreciated that the light of day is not constant in its composition, and therefore the Sheringham unit is designed to give true average daylight. The accuracy with which colours can be matched by Sheringham Daylight is shown by a plate published in colour in a booklet by the Sheringham Daylight Company (1930), Ltd. This shows a delicately-shaded Japanese vase photographed in the four qualities of light indicated. The ordinary daylight photograph was taken at 3 p.m. in February in fine sunny conditions, using a north-aspect light. In the three electric light views great care was taken to render the results strictly comparable. These views repay close study and comparison, as they indicate more graphically than would be possible by reference to spectroscopic analyses or formulæ the divergencies or similarities between the various qualities of light.

*

From now onwards it will be possible for the community as a whole to enjoy the benefits of domestic refrigeration, for Electrolux, Ltd., have brought out a small refrigerator which will be sold at a price which almost everyone can afford. This new refrigerator will be delivered and installed in any home in Great Britain for the sum of 23s. down. It will be known as the " Freezolux " gas-operated refrigerator. It is different from all other refrigerators in that it has no mechanism whatsoever, depending for its operation upon a small gas flame. It is an extremely simple piece of equipment and any woman can understand it, for it is quite automatic and absolutely reliable. Although of small size, it is sufficient for the needs of the average household, and, last but not least, it is of British manufacture throughout, for it is made in the Electrolux works at Luton, Beds.

The cooling unit is designed to operate on gas. the consumption being 2½ cubic ft. per hour, thermostatically controlled. A supply of cooling water amounting to three gallons per hour will also be necessary. The cooling water will be controlled simultaneously with the supply of gas, resulting in average consumptions over 24 hours of approximately 35 to 40 cubic ft. of gas and 40 to 45 gallons of cooling water per day of 24 hours under average conditions of use throughout the year.

The time cannot be far distant when domestic refrigerators will be as widely used as gas-cookers, for everyone who uses gas is now able to obtain a " Freezolux " on terms they can well afford. The advantages of a domestic refrigerator are fairly well known. In addition to the preservation of foods of every kind—particularly meat, fish and milk—a refrigerator prevents a good deal of waste; particularly during hot weather when food goes off quickly and has to be thrown away.

*

In a leaflet issued by Messrs. Henry C. Stevens, Ltd., attention is drawn to the firm's stains for woods. These are supplied in nine different kinds, namely, mahogany, walnut, oak (two shades), rosewood, wainscoat, cedar and ebony. They consist, it is claimed, of durable colour matters so combined as to produce a close and extremely natural resemblance to the colours (with their soft rich undertones) of the best descriptions of the real woods. They can be used for floorings, staircases and halls, and as a border decoration round Turkey carpets; or for churches, chapels, public halls, railway-stations, warehouses, factories, etc., shop fittings, etc. The method of using the stains consists of three distinct operations: First, staining; secondly, sizing; lastly, varnishing, beeswaxing or French polishing. The wood, it is stated, should be very evenly planed, and knots and nail holes covered by mixing into paste a little of the stain with plaster of Paris, and sappy portions of the wood damped with water or sized. Stain may then be laid on plentifully with a brush, along the grain of the wood. When the wood is thoroughly dry, it must be twice sized (using each time a strong solution of size), and subsequently varnished. If an interval of twenty-four hours, or longer, be left after staining before sizing, the colour is softer and richer. As the beauty of the result depends mainly on the grain of the wood, well-seasoned wood of beautiful figure and variety in the grain should be selected for choice work. Work intended for French polishing should be sized once before applying the polish. Gas black should not be used in finishing off the ebony stain; this stain should be sized as soon as the stain is dry. Exterior work should be sized once and varnished twice, and for rough work boiled oil may be used instead of varnish. The different stains can be mixed together to obtain a modification of their respective colours, and they may be diluted with water for light shades, or applied twice for a deeper shade. The stains are obtainable from Messrs. Henry C. Stevens, Ltd., 57 Aldersgate Street, E.C.1.

*

The business carried on by Stein Bros., Ltd., at Ocean House, 24–25 Great Tower Street, London, E.C.3, has been merged into that of Honeywill Bros., Ltd., of 79 Mark Lane, E.C.3. The combined companies will be carried on under the name of Honeywill and Stein, Ltd., at London House, 3 New London Street, London, E.C.3. Telephone Nos.: Royal 3040–1–2 and Royal 8724–5. Mr. R. H. Stein has been appointed managing director.

ANNOUNCEMENTS

ARCHITECTS' CONFERENCE, DUBLIN, 1931

GOLD CUFF LINKS were found in the Italian Garden, Garnish Island, during the week-end tour to the South of Ireland.

A GOLD SIGNET RING was found in the director's office after the visit to Messrs. Guinness's Brewery on Saturday, June 20.

Mr. Harry Allberry will be pleased to arrange for the return of these articles on inquiries being addressed to him at 8 Merrion Square North, Dublin.

The Automobile Association has issued a special map of Oxford Street, which clearly indicates the restrictions and prohibitions which obtain within the scheduled area of control. All essential information regarding prohibited turnings to the right, one-way streets and speed restrictions are clearly shown, in addition to a summary of the regulations, and motorists who have studied the map will have no difficulty in understanding and complying with the various control systems. The map may be obtained gratis on application to the Secretary, the Automobile Association, Fanum House, New Coventry Street, W.1, or to any A.A. branch office.

Messrs. Burnett and Sons, chartered architects and surveyors, have removed their offices from 2 High Street, Southampton (necessitated by the Bargate improvement scheme), to 20 Portland Terrace, Southampton. Telephone No.: Southampton 3087.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Park Lane Hotel Extension, No. 107 Piccadilly, W.1 (pages 39–41). General contractors, Higgs and Hill, Ltd. Sub-contractors : Aston Construction Co., Ltd., steelwork; Dent and Hellyer, Ltd., drainage and internal plumbing; Fenning & Co., Ltd., black Belgian granite; Kleine Co., Ltd., fireproof flooring; C. A. Rigby, waterproofing work; J. Whitehead and Sons, Ltd., marble work to staircase; Middleton Fireclay Co., Ltd., faience work; Richard Crittall & Co., Ltd., heating, hot and cold water services, and ventilation; Crittall Manufacturing Co., Ltd., steel windows; Tredegars, Ltd., electric lighting; R. W. Brooke & Co., Ltd., maple floor to ballroom; Express Lift Co., Ltd., passenger lift; George Johnson, Ltd., hand lift; Ames and Finnis, roof tiling; Emerson and Norris, cast stone dressings; Chas. Smith & Co., Ltd., locks and furniture; Eric Munday, shop and entrance fronts, canopy, etc.; Kenan, Ltd., decorations on the ground floor and basement; F. Tibbenham, Ltd., decorations to the residential suites on upper floors facing Piccadilly; Dent and Hellyer, Ltd., and Shanks & Co., Ltd., sanitary fittings; Carter & Co., Ltd., tiling; Art Pavements and Decorations, Ltd., precast staircase; D. Sebel & Co., Ltd., iron staircase; W. Hitchins & Co., Ltd., laminated doors.

Lloyds Bank, Ltd., 275 Kentish Town Road, London (page 42). General contractors, Lole & Co., Ltd. Sub-contractors : Horley Facings, bricks; Caxton Floors, Ltd., fireproof flooring; Engert and Rolfe, Ltd., asphalt to flat roof; Zeta Woodblock Flooring Co. (1910), Ltd., woodblock flooring in banking hall (staff side); Art Pavements and Decorations, Ltd., patent flooring in banking hall; H. and C. Davis & Co., Ltd., central heating; Watson, Marsh & Co. (Brondesbury), Ltd., electric wiring; L. G. Hawkins & Co., Ltd., electric light fixtures; Holborn Sanitary Co., Ltd., sanitary fittings; W. and R. Leggott, Ltd., door furniture; Brunswick Engineering Co., metal casements; Hobbs, Hart & Co., Ltd., strongroom door; H. B. Sale, Ltd., metal counter grilles; W. T. Nicholls, Ltd., counter fittings, etc.; G. Johnson, Ltd., book lift.

New Offices for Southwark Catholic Rescue Society, Westminster Bridge Road and Barbel Street, S.E. (page 47). General contractor, Albert Monk. Sub-contractors : Ragusa Asphalte Paving Co., asphalt; Shaw's Glazed Brick Co., terra-cotta; A. D. Dawnay and Sons, Ltd., structural steel; Kleine Co., Ltd., fireproof flooring; Hollis Bros., Ltd., wood-block flooring; Mosaic and Terrazzo Co., terrazzo; Holden & Co., linoleum; Leyland and Birmingham Rubber Co., Ltd., rubber flooring and stairtreads; Air-Vent Heater Co., Ltd., central heating and boilers; Gas Light and Coke Co., Ltd., gas fixtures and fitting; A. J. Dean & Co., Ltd., electric wiring, fixtures and heating; Holborn Sanitary Co., Ltd., sanitary fittings; The Jones Lock Co., door furniture; Crittall Manufacturing Co., Ltd., casements; Gladwell and Kell, Ltd., metalwork and folding gates.

There are still six days left for intending competitors to submit sketches for the July Holiday Sketches Competition. Full particulars of this competition, together with the necessary motto labels, appeared in last week's (July 1) issue of THE ARCHITECTS' JOURNAL.—ED., A.J.

COMPETITIONS OPEN

July 17.—Buildings for a street improvement scheme. Assessor : George Drysdale, F.R.I.B.A. Premiums : 50 guineas and 20 guineas. Conditions, etc., obtainable from the Borough Surveyor, Council House, Walsall, until July 17. (Deposit £1 1s.)

July 31.—Sending-in day. Proposed Nurses' Home at the Royal Asylum, Montrose. Limited to architects practising in the counties of Aberdeen, Angus, Fife, Kincardine and Perth. Assessor : John Watson, F.R.I.B.A. Premiums : £75, £50 and £25. Conditions, etc., obtainable from C. K. Alexander, Clerk and Treasurer, Royal Asylum, Montrose.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor : Percy Thomas, O.B.E., F.R.I.B.A. Premiums : £500, £400, £300 and £200. Conditions from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor : Andrew N. Prentice, F.R.I.B.A. Premiums : £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor : Francis Jones, F.R.I.B.A. Premiums : £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions : August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1 Assessors : Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium : £500; also a further amount of £750 will be awarded to other designs according to merit.

THE ARCHITECTS' DIARY

THURSDAY, JULY 9

MARGATE SCHOOL OF ART. Eleventh of twelve lectures on Beauty in Design : "Hygiene and Acoustics." By R. Goulburn Lovell, A.R.I.B.A. **5.30 p.m.**

BRITISH MUSEUM, Bloomsbury, W.C.1. Lecture on "Origins of Architecture. 1. Greek." By Cecil Hallett, B.A., F.S.A. **12 noon.**

SCIENCE MUSEUM, Exhibition Road, S.W.7. Lantern-Lecture on "Electricity." By S. H. Groom. **3 p.m.**

FRIDAY, JULY 10

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Opening of the Exhibition of Students' Work.

NATIONAL HOUSING AND TOWN PLANNING COUNCIL. Conference to be held at the County Hall, Westminster Bridge Road, S.E.1.

ROYAL SANITARY INSTITUTE. 1931 Congress at Glasgow. Lecture on "A Continuous Health Policy." By Major Walter Elliott, M.P., LL.D., D.SC., M.B. In the Royal Technical College, Glasgow. **8 p.m.**

SATURDAY, JULY 11

Sunrise, 4.55 a.m. Sunset. 9.15 p.m.

MONDAY, JULY 13

INSTITUTION OF MECHANICAL ENGINEERS. Summer Meeting to be held at Cambridge.

TUESDAY, JULY 14

SCIENCE MUSEUM, Exhibition Road, S.W.7. Lecture on "Light and Colour." By S. H. Groom, **12 noon.**

VICTORIA AND ALBERT MUSEUM, S.W.7 : Lecture on "Architecture" (No. 1). **12 noon.** Lecture on "Architecture" (No. 2). **3 p.m.**

ARCHITECTS' JOURNAL HOLIDAY SKETCHES COMPETITION. Closing date. Entries for July Competition to reach the Editor at 9 Queen Anne's Gate, S.W.1, by first post.

THURSDAY, JULY 16

MARGATE SCHOOL OF ART. Last of twelve lectures on Beauty in Design : "Illumination and Colour." By R. Goulburn Lovell, A.R.I.B.A. **5.30 p.m.**

SCIENCE MUSEUM, Exhibition Road, S.W.7. Lecture on "Lighting and Illumination." By G. Tilghman Richards. **12 noon.**

INSTITUTE OF FUEL, 53 Victoria Street, S.W.1. Meeting in the Marylebone Room, Great Central Hotel, London. **10.30 a.m.**

NATIONAL SMOKE ABATEMENT SOCIETY, 71 Eccleston Square, S.W.1. Council Meeting followed by Open Meeting. Address : "Smoke Abatement from the Manufacturers' Point of View." By W. Prescott, Federation of British Industries. **3.15 p.m.**

FRIDAY, JULY 17

DESIGN AND INDUSTRIES ASSOCIATION. Short Cruise to Norway, returning July 24.

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. Annual Exhibition to be held at Winchester.

SATURDAY, JULY 18

Sunrise, 5.2 a.m. Sunset, 9.9 p.m.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Visit to the neighbourhood of Guildford by the Brighton and Guildford Chapters.

MONDAY, JULY 20

VICTORIA AND ALBERT MUSEUM, Cromwell Road, S.W.7. Lecture on "Ironwork." **12 noon.**

WEDNESDAY, JULY 22

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to St. Mary-le-Bow, Cheapside, E.C.2. Tickets obtainable from the Secretary. **3 p.m.**

THURSDAY, JULY 23

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to new Offices of *Punch*, Bouverie Street, E.C.4. Tickets obtainable from the Secretary. **3 p.m.**

BRITISH MUSEUM, Bloomsbury, W.C.1. Lecture on "Origins of Architecture."—II. (Roman, etc.) **12 noon.**

SATURDAY, JULY 25

Sunrise, 5.11 a.m. Sunset, 9.0 p.m.

TUESDAY, JULY 28

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to Welwyn Garden City. Tickets obtainable from the Secretary. **3 p.m.**

THURSDAY, JULY 30

NATIONAL PORTRAIT GALLERY, St. Martin's Place, W.C.2. Lecture on "Inigo Jones." By John Steegmann, M.A. **3 p.m.**

SATURDAY, AUGUST 1

Sunrise, 5.22 a.m. Sunset, 8.50 p.m.

VICTORIA AND ALBERT MUSEUM, Cromwell Road, S.W.7. Lecture on "Ecclesiastical Metalwork." **12 noon.**

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Having inspected houses at Cheshunt, the BARKING U.D.C. has revised its scheme for the erection of 152 houses on the Upney Farm estate, the cost now being estimated at £52,266.

Plans passed by the BARKING U.D.C. : Nineteen houses on the Becontree estate for the L.C.C.; petrol depot, West Bank, for Trinidad Leaseholds, Ltd.; houses, Ripple Road, for Messrs. Lord and Mellodew, Ltd.

The BARKING U.D.C. is to deal with various clearances, and has instructed the architect to prepare plans for the erection of three- and four-story tenements on the cleared sites.

The BARNES U.D.C. has acquired a site of five acres at Mortlake for a housing scheme.

The BRENTFORD Education Committee has approved revised plans for erection of a school centre in Boston Road at a cost of £4,000.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

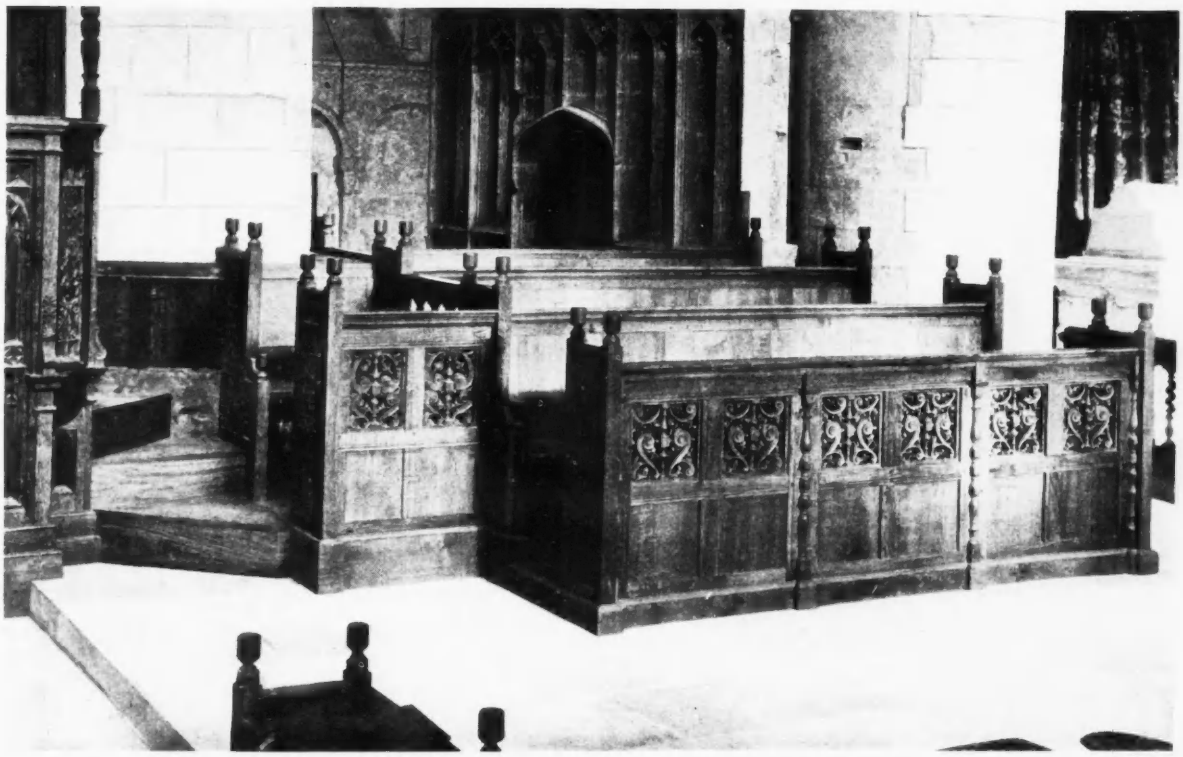
MALMESBURY ABBEY RESTORATIONS

SIR HAROLD BRAKSPEAR'S DRAWINGS OF THE PULPIT, CLERGY SEATS, SEDILIA, ETC.



THE CLERGY SEATS, WITH PART OF THE PULPIT, ON THE NORTH SIDE OF THE CHOIR

THE pulpit and clergy stalls, of which photographs are given above and on the last page, while the architect's drawings of these and some other details are reproduced overleaf, show new work undertaken in the course of the restoration of Malmesbury Abbey.

This generation is perhaps more cautious of unqualified applause of antiquity than its predecessors, yet it is more careful than they to preserve the distinctive qualities of ancient work, rather than resorting to imitation. This modern care of antique relics is seen throughout the renovations recently completed under the direction of Sir Harold Brakspear.

The great west window, blocked by a nineteenth-century choir gallery, was opened up. Appropriate silk hangings on the sanctuary walls replaced an indifferent painting. To the great Norman piers was restored a larger measure of their ancient dignity, by the lowering of the floor to the extent of over a foot, so that their height is no longer severely curtailed, and their proportions are more satisfactorily revealed.

In common with so many of its contemporaries, the roof was suffering from the activities of the beetle. Not only has this condition of the woodwork in inconspicuous structural positions been remedied, but the new pulpit, with its richly carved panels, balusters and canopy, the clergy seats, the sedilia, all in keeping, that have been added to the refurnished east end, demonstrate that the present age can contribute beauty of craftsmanship and enhance the grandeur of the monuments of past piety.

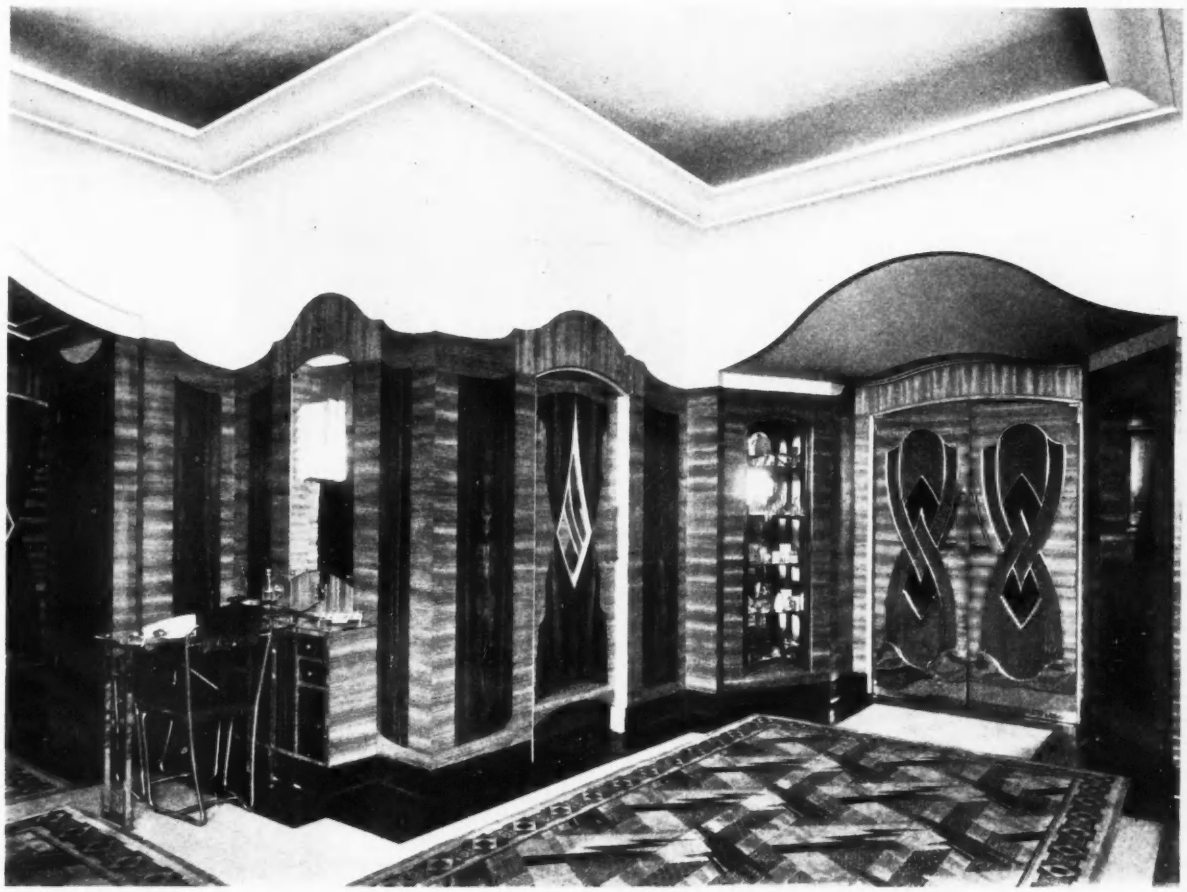
LADIES' HAIRDRESSING & MANICURE SALON

AT THE STRAND PALACE HOTEL, LONDON — DESIGNED BY OLIVER P. BERNARD



THE MAIN ENTRANCE DOORS AND A MANICURE TABLE

THE walls of the ladies' hairdressing salon, waiting room and manicure salon, of which the photograph reproduced above gives a general impression, and the drawing overleaf some details drawn to scale, are faced with woodwork, wainscot-high, panelled and veneered with African Zebra and Zebrano of exceptionally fine figure. The door frames are of fine-quality solid sycamore, and both sides are faced with the veneers already mentioned, with a centre opening glazed with obscured glass panels. The mirrors introduced in the wall panelling are of polished peach plate-glass, frameless, but studded into position by decorative stainless steel rosettes. The skirting is of black Biancola, polished and coved at its junction with the floor ; this has a similar tile surround with Sienna Biancola centre panelling. The colouring of the floor is thus complementary to the wall treatment, while the ceiling and upper part of the walls are finished in smooth plaster with ivory egg-shell glaze.

The clock face is of ivory herolith, with stainless steel chapters and polished aluminium hands. Herolith has, in fact, here been widely used for the first time in architectural decoration, the wash-basin tops and surrounds, cupboards, showcases and all fitments being finished in this material.

Stainless steel is extensively employed : for example, for the manicure tables, which have engraved plate-glass tops, half-an-inch thick, for the manicure basins and for the electric-light fittings by which the tables are illuminated. The chairs, the first tubular stainless steel furniture made in this country, are upholstered in green leather.

OLIVER P. BERNARD FRIBA.
-ARCHITECT-

SELECTED PRECEDENTS:

THE STREETS OF STAMFORD, LINCS.: III

1. LIVELY ASYMMETRY OF THE SEVENTEENTH CENTURY

FOREIGNERS used to orderly Continental towns at first find the beauty inherent in the variety of our streets difficult to appreciate, and as Stamford is typically English it is full of buildings that fit into no formal scheme but stand isolated, sometimes hidden, taking the traveller by surprise.

Concealed in a quiet square stands a remarkable late-seventeenth-century house (figure 1) containing features worthy of notice. The linking of the window jambs to the stringcourse is unusual, though here satisfactory, and the inconsequent asymmetry of the ground-floor windows, centred on the front door but not in relation to the house-front, gives life to an otherwise formal façade. The rich textured roof is deep for a house of this size, but scale is preserved by the diminution of the top row of dormers. The elaboration of the chimney-stacks carries uniformity over the whole building by echoing the quoin motif that marks the house wall.

To start life as a covered fishmarket and later become a public library (figure 2) surely constitutes an unprecedented rise from the ranks. The architect responsible for this development has exercised considerable tact and discrimination in the design of his windows, in his glazing and in the choice of lettering, and the finished building is curiously reminiscent of St. Paul's Church, Covent Garden, London.

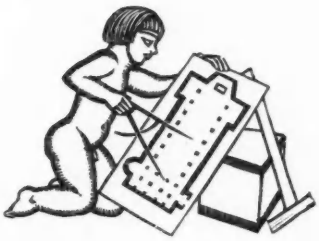
THE ARCHITECTS' JOURNAL



WEDNESDAY, JULY 15, 1931

BEATING THE SLUMP

THE speech of the King last Friday on the occasion of his opening a new dock at Glasgow is one we must all take to heart. His Majesty commended those responsible for the vast undertaking because they had shown faith in the future of the nation, and had carried through the scheme in the teeth of the trade slump. They had prepared for the long-awaited revival with sagacious foresight. " The future lies in the hands of the men with brains, energy and determination."

To members of the architectural profession it is becoming clearer each week that the revival in trade is already operative. Six months or a year ago they were preparing few plans—some public-house reconstructions, perhaps, for these are the clubs of the unemployed working men, where they meet to hear of jobs, if possible, and where the keener-witted will gather in groups and compare results for newspaper competitions, before sending-in days; and a few housing schemes and alterations to shops.

But during the last two months business has been warmer. Even South Wales and " the Frozen North " show signs of a thaw. Odd places are humming, like Kidderminster with carpet works, or like Sevenoaks with middle-class villas. There is no doubt that the revival is already operative. Just as pessimism reappeared, when Germany's precarious financial state became known, President Hoover announced his good news, and the revival was emphasized. For we are all glad that America, whose achievements in city planning and building are so worthy of respect, is prepared to help Europe to solve the post-war problem, the problem of bridging the gulf between those who demand and those who supply. There has been no more tantalizing spectacle, for instance, than that of architects, builders and workmen, ready to supply houses, on one side of the chasm, and house-hungry people on the other side of the chasm. For in spite of the void being bridged, as it were, by public authorities, in many instances the picture is still true of vast numbers of people.

We have always dimly suspected that the Reparations business had a good deal to do with this gap between supply and demand. If the Debt settlement continues to have an accelerating effect on the revival we shall consider the case is proved.

" Industrials are steady," we read in the evening paper. The Standard Statistics Company of America, a cautious and conservative agency, began advising the purchase of common stocks as long ago as mid-June. The British prophet of finance calling himself " Toreador " quotes the American super-prophet, Babson, to the effect that " this country will again enter a period of marked prosperity," and " Toreador " caps the remark with " the spirit of constructiveness is abroad." Now that is exactly what architects are finding, " the spirit of constructiveness *is* abroad " amongst leaders of industry.

For the best of the latter have used the period of the slump to think hard. They are now realizing that the architect is the best man to assist them in replanning their factories or in choosing sites for their new works. For the architect has also used the time of the slump as an opportunity for study—the methods of mass production and the use of new materials have been reviewed, office organization has been overhauled, standard specifications and drawings have been brought up to date, and a new integer of the relations between function and design has been adopted.

For Britain, the difficulty will be to avoid the destruction of amenities, in the large amount of building necessitated by the revival. Regional Planning has yet to be understood and appreciated by the multitude, and even the enlightened are apt to vote for prosperity at any price.

Architects have a duty to the nation at large as well as to their clients, and the true economy in segregating factories, in leaving roadways wide enough for future transport, and in preserving streams, and skies too, free from contamination, must be patiently and clearly explained.

The spirit of constructiveness must not construct the means of paying higher dividends and wages only, but the means of increasing beauty and dignity.

In economics *laissez-faire* is dead; in æsthetics let it be damned.

AT PORTMEIRION, MERIONETHSHIRE

The Citadel, the dominant feature of Mr. Clough Williams-Ellis's Welsh essay in owner-development at Portmeirion, is here seen with the Venus steps in the foreground. Behind the campanile is the Prior's Lodging; to its right, Government House. The buildings are colour-washed buff, pink and apricot.

[*From* Portmeirion Explained. *See the book review on page 90 of this issue.*

NEWS & TOPICS

CHARING CROSS BRIDGE

THE Charing Cross Bridge proceedings took a most surprising turn last week. Just when it was expected that the L.C.C. would resolve to go forward with their second attempt to get past Parliament, the resolution was deferred and the Advisory Committee reconstituted in order to re-examine scheme No. 4, which its authors had claimed to have been wrongly adjudged in the chairman's report, not only in certain technical details but in the matter of cost. With surprising ignorance of the true status of the several architects, engineers and town planners who together constituted the group of men responsible for scheme No. 4, they were referred to by Sir William Roy as "a firm of engineers." The outcome of the Advisory Committee's second examination is not known as I write at this moment. If the technical matters are settled satisfactorily, then cost is the main issue, and cost boils itself down to a matter of professional opinion upon the chances of recoupment of the official scheme No. 6 against those of No. 4.

*

I should have thought myself that there could be no doubting the superior chances of development possessed by the open and unobstructed roads of No. 4 against the tunnels and noisome underspaces of No. 6, and remember how little disposed was the Parliamentary Committee of last year to accept the L.C.C. valuer's opinion upon this very important matter. But perhaps the L.C.C. will be taking the precaution of obtaining independent opinion before they make up their minds.

*

Be that as it may, I note with satisfaction the growing element of doubt both in and out of the L.C.C. as to the likelihood of scheme No. 6 ever passing Parliament; and if the authors of scheme No. 4, in refusing to pass over what they considered to be the genuine misunderstandings as to the nature of their plan for assuring the future of the south bank of the Thames, have in any way checked the headlong rush of the L.C.C., then I think we have good reason to be grateful to their fighting spirit, and to Sir Leslie Scott's sense of justice and devotion to public interest in re-examining their proposals.

MR. GREENWOOD AND WILMSLOW

Mr. Greenwood, the Minister of Health, in opening the annual exhibition of drawings by students of the Liverpool School of Architecture, made an excellent and sensible speech in which he traced the rise and fall of architectural taste from mid-Victorian days until the present, contrasting with the ostentation and pomposity of other days the dignity and simplicity of the best work of this age. He lived, he said, near St. James's Park Station, and had learned to admire the qualities of simplicity and nobility with which that building is invested. He could not understand Epstein, but he did realize that his sculpture was part of the unity of the structure.

*

Now Mr. Greenwood, instead of using generalized statements about bad architecture, took a specific example. When he went, he said, to where the well-to-do people lived outside Manchester, he saw some of the worst buildings that ever disgraced God's earth. And that, in my opinion, is a much more useful thing to have said than the usual platitude that goes down for good sense. Observe what happens at Wilmslow, the suburb indicted:

"They weren't built to provide scenery to frame Mr. Greenwood's entry into Manchester" (inferior complex and pique).

"Wilmslow is no worse than any other place" (dawn of realization).

Wilmslow Urban Council have decided to send a letter of protest to Mr. Greenwood (being certain, in their own complacent minds, that nothing is wrong with Wilmslow, they conclude that they must have made a mistake in voting for Mr. Greenwood, who so daringly violates the law of averages). Mr. H. Price (the chairman of the Council), to a voice of doubt among his councillors: "But you don't agree that the houses in Wilmslow are the worst which ever disgraced God's earth?"

Very guarded reply from councillor.

PRESERVING BOSTON STUMP

The tower of St. Botolph's, Boston, better known as the "Boston stump," is to be repaired through money collected in Boston, U.S.A., mainly from descendants of Pilgrim Fathers. This is a very real way of welding the friendship of two countries, so often strained by the passage of much money in the opposite direction. Over £11,000 was handed over by Mr. Walter B. Whiting, one of whose ancestors was assistant rector at St. Botolph's, and the work of restoration will one day have been completed by the joint efforts of little Boston, Lincs.—old-world, and big Boston, Mass.—new-world.

Some time ago Astragal recorded the use of ropes and spars suspended from a captive balloon to indicate the outline of a proposed building. At the Hotel Cecil site this framework bearing a section of coping recently served a similar purpose.

"WET TIME" IN THE BUILDING INDUSTRY

The Conference of the Amalgamated Union of Building Trade Workers laid a good deal of stress upon the need for a satisfactory settlement of the "wet time" question. Wet time is time lost to both employer and employed, but for the workman the loss is total, for the employer not quite so, for much of his work is not subject to the risks of bad weather and can more easily be covered. A recent strike in Scotland established a rate of ½d. per hour compensation pay for wet time, but it is obvious that a more reasonable method of spreading the risks for the workmen must be devised by employers and the Unions. Really efficient employers should be able to afford to pay something to make up the absolute loss.

THE SQUARE OF FASHION

The devolution of London Squares is one of the most significant signs of the changing aspect of the metropolis; but it is only what has been happening for generations. In the days of the Merry Monarch, Soho and Golden Squares were almost as fashionable as St. James's; but as their illustrious residents departed to the Elysian Fields (as one hopes), or to a newer West End (as one knows), first an artistic, then a purely business, character became imparted to these quadrates. So, too, in Early Victorian days, Hanover Square and Cavendish Square divided favour with the newly-formed squares of Belgravia, but in course of time shared the fate that was, later, to overtake such centres in Bloomsbury. Two squares, however, withstood, until more recent days, this tendency of Fashion: Berkeley Square and St. James's Square for long bore charmed lives. At one time the latter was a byword for wealth and fashion. Dr. Johnson somewhere visualizes the highest attainment of a lady's fortunes as the possession of a house here; indeed, the records of its residents, since it was created in Charles II's day, read like pages from Debrett.

★

When Robert Adam contrived the famous house for Sir Watkin Williams Wynn on the west side, could he have supposed it would become the office of a great firm of land agents? When Lord Falmouth's cannon were placed in front of his one-time residence, did those mute reminders of a day that had been so noisily eloquent imagine that they would come to guard the premises of a great bank? And did Brettingham's noble pile, which screens the old house in which George III first saw the light, suppose that it would see the day when it would be offered for rent or sale to the highest bidder? Such structures as have already passed away here, Ormond House and Cleveland House, for instance, may be said happily to have escaped such a fate.

★

It is just upon two hundred and seventy years since Mr. Pepys recorded the formation of the square; and for the best part of that period it was, to use the phrase of the old topographers, "well inhabited." But it is just upon a century since clubs began to invade its privacy, to be followed by the London Library and a branch of the War Office; and Banks and Insurance Offices have long been busy on spots where the *fine fleur* of two earlier centuries had lived and disported themselves.

BUILDERS' PRICES 200 YEARS AGO

In 1734 William Salmon published a book entitled *Palladio Londinensis or the London Art of Building*. It was the seventh year of the reign of George II; Walpole was Prime Minister; and the façade of the Treasury Buildings overlooking the Horse Guards Parade had just been completed. It is interesting to compare the prices of materials and labour nearly two hundred years ago with those current today, bearing in mind that the purchasing power of money was five times greater then than now. Part I. of *Palladio Londinensis* contains specification notes, with prices of all trades, together with "A Table showing briefly the Prices of the Most Common Materials used in Building."

★

Bricks per thousand cost 16s.; tiles, £1 5s. The price of a load of sand was 3s.; and of 25 bushels of lime, 12s. 6d. Gravel was 2s. 4d. a load, while 9-in. square paving tiles cost 10s. 6d. per 100, and hair, for plastering, 1s. a bushel. Oak was 2s. 2d.; fir, 2s. a foot cube; rough deal boarding, £1 5s. per square, or, workmanship only, 3s. per square; straight-jointed boards, £1 8s., or 5s.; deal dowelled floors, £4 10s., or 18s.; feather-edge boarding, 1s. 6d. per yard super; oak fencing posts, 6 ins. square with rails 5 ins. and pales 3 ins. by ¼ in., 4s. per foot, but fir fencing was only 1s. cheaper. Deal bolection panelling was 4s. per yard super, and all deal mouldings worked by hand with a plane from 1s. to 1s. 6d. per foot run.

★

A bricklayer was expected to lay 1,000 a day, and the cost of a rod of brickwork was £5 10s. Flanders brick paving was 3s. 6d. per yard super, and the laying was only 5d., while the bricks themselves cost £1 per 1,000. A square of tiling (the workman to find all materials) was £1 12s. Portland stone was 2s. 3d. per foot cube, and sheet lead, cast or milled, £1 per cwt. Internal plastering with lime and hair was 4d. per ft. super, and external stucco in imitation of stonework, 1s. 6d. to 2s. per yard. The paragraph on plate-glass notes that if the squares are between 1 and 2 ft. in size, the cost is 5s. per foot, and it rises to the largest size squares (4 ft. by 3 ft.), which cost 6s.

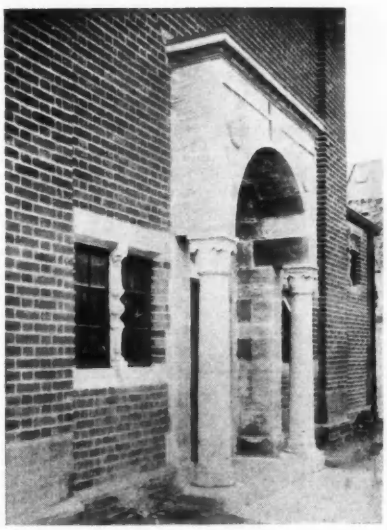
★

An advertisement in *The London Evening Post* of June 27, 1732, is quoted: "Thomas Lovett Glasier of the Green Lamp in Red Lion Street sells the best Crown Glass for 40s. the half case or at 7d. per foot." The same merchant also sold the "Famous Chymical Putty so much approved and used at Gentlemen's Country Houses." But the advertiser ends on a warning note: "N.B. He deals only for ready Money."

★

Painting was apparently a respectable hobby in 1732, for Salmon remarks "that several Noblemen and Gentlemen have by themselves and Servants painted whole Houses without the Assistance or Direction of a Painter which when examined by the best Judges could not be distinguished from the work of a professed Painter." And the house decorator was a greedy fellow, for the amateurs found, when all was done and the mess cleared up, that it had cost them a sum "which at the utmost doth not amount to one fourth part of the Painters price." From between the lines of Salmon's book, one obtains many vivid glimpses of the ups and downs of architectural practice in the spacious days of Archer, James, Campbell, Gibbs and Kent.

ASTRAGAL



BAPTIST CHURCH AT LEEDS

DESIGNED
BY
HERBERT J. MANCHIP

A side-view of the main porch, which is carried out in Ancaster stone. The foundation stone is built in at the foot of the brick wall, and is seen in the left corner.

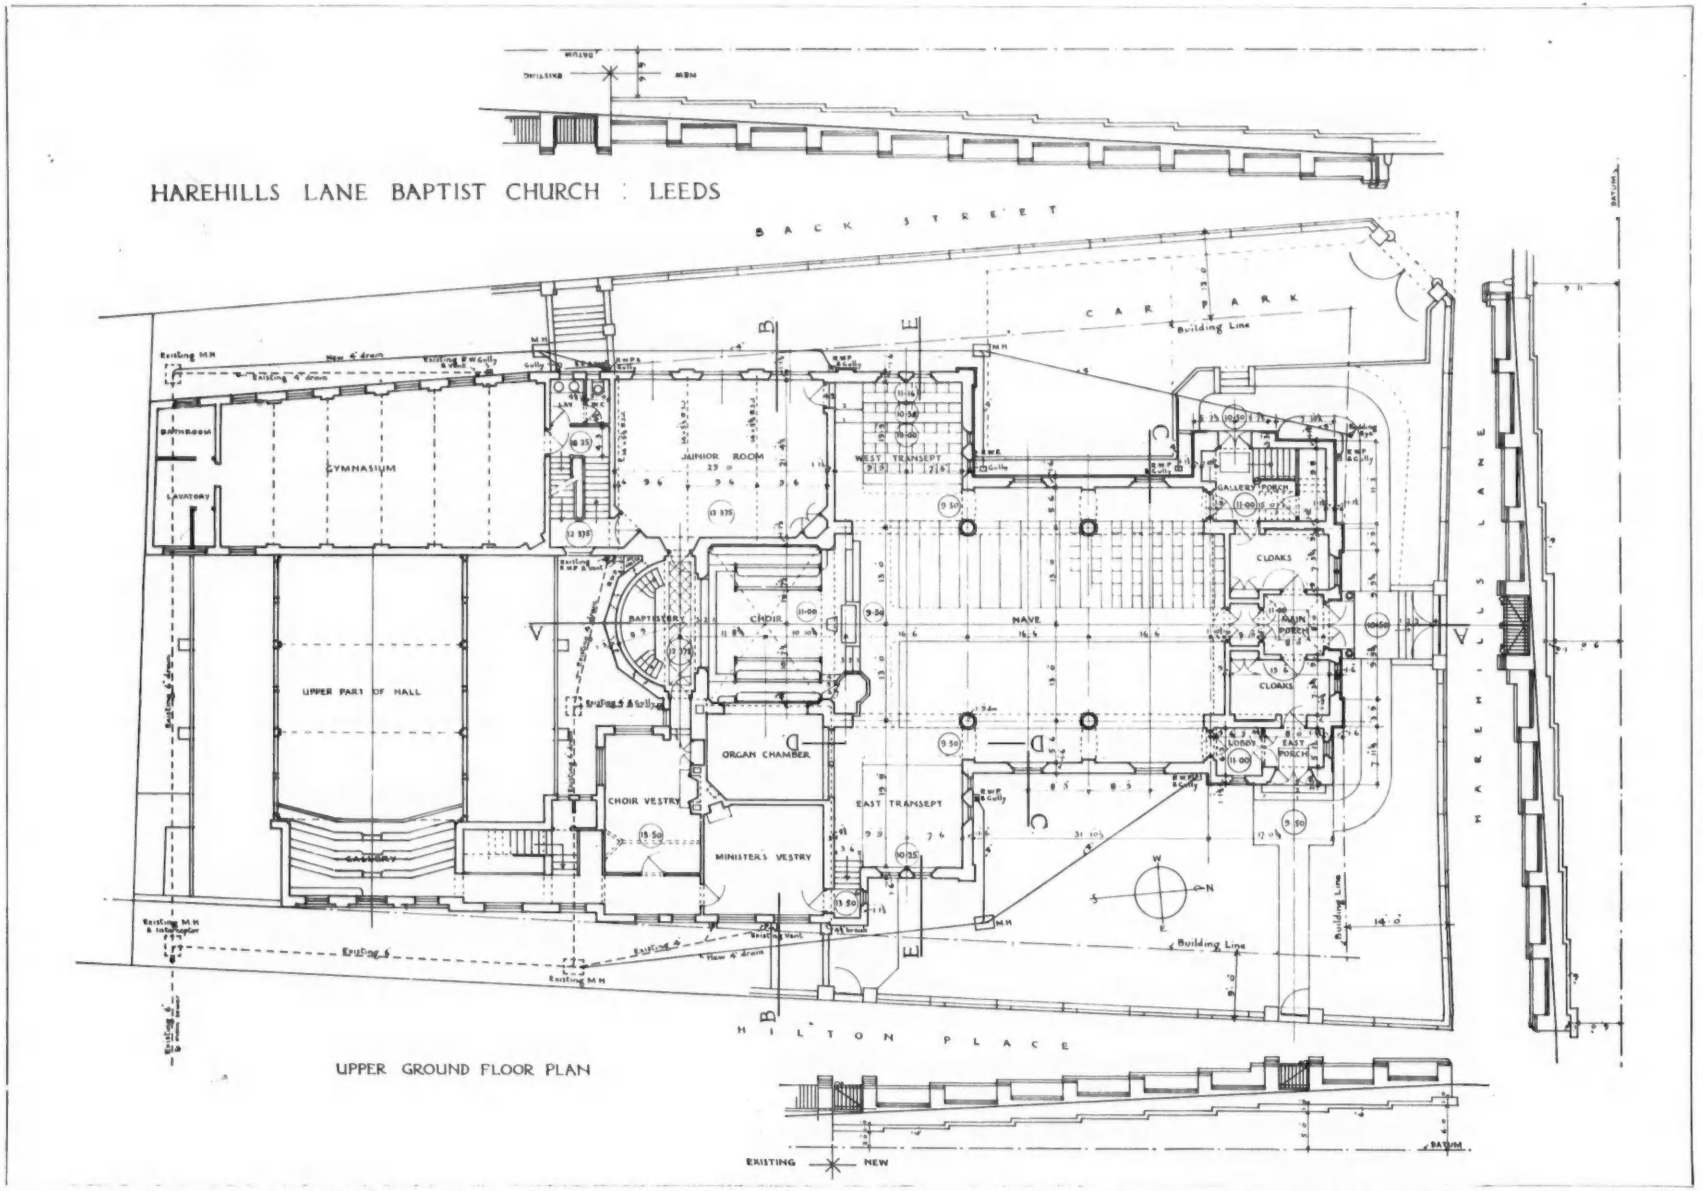
Doorway of the porch illustrated in the view opposite. It is constructed of oak, and is furnished and embellished with wrought iron hinges and studs. Above are tracery lights.

HAREHILLS Lane Baptist Church, Leeds, has been erected on the highest portion of a site sloping away in two directions, the lower parts of which were already occupied by a hall and gymnasium, etc. As will be clear from the plan and sections reproduced on the two following pages, the new portion has been dovetailed into the old with an ingenuity further exhibited in supplying a variety of accommodations ancillary to the church proper. Seating accommodation is provided for about 450 persons, including a small gallery over the main entrance. The need for a staircase leading up to this has led to a slight but almost unnoticeable departure from mathematical balance as regards the north or entrance end. The space for public worship is, however, perfectly symmetrical, and the disposition of the baptistry, behind the communion table and choir, is effective in promoting devotional sensibility.

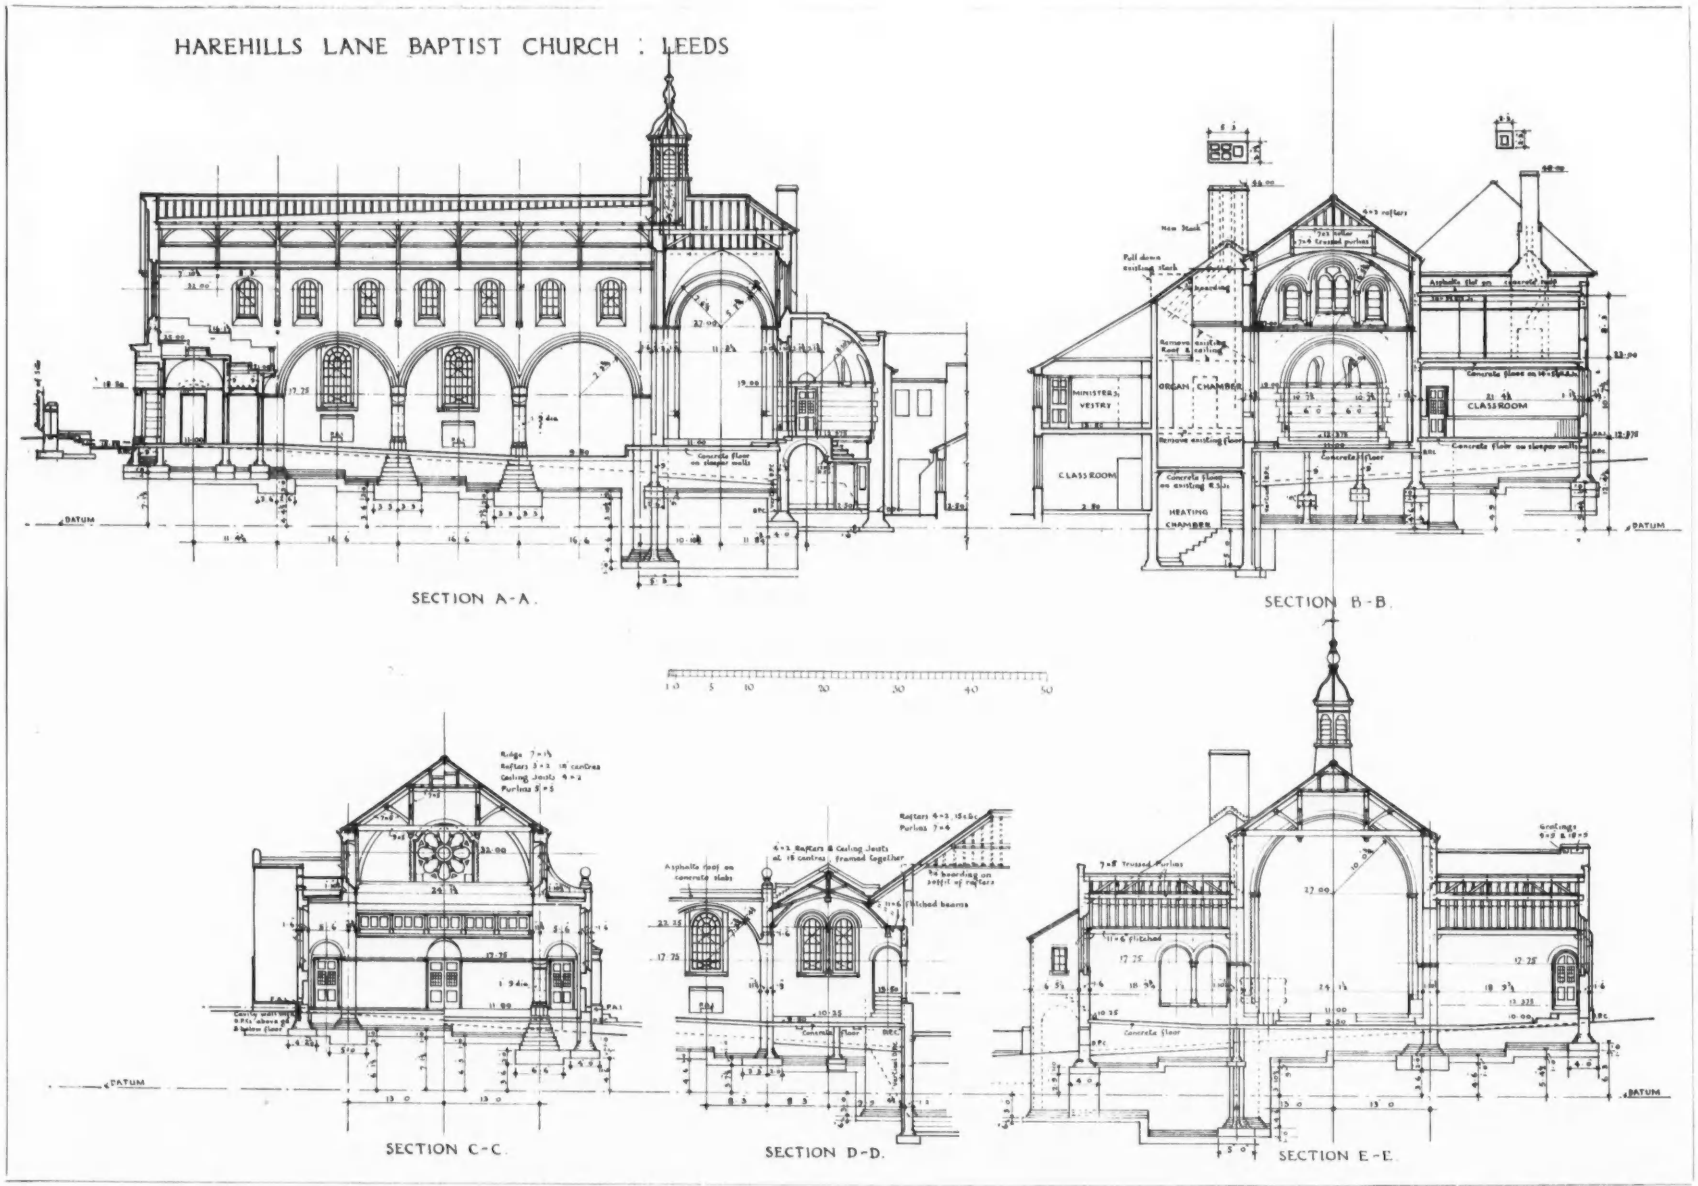
The walls are built of Yorkshire hand-made bricks, with which the Ancaster stone sparingly employed makes a successful blend. The principal roofing material is Cornish slate. Metal casements are employed throughout, and many of the windows are glazed with leaded lights in tracery. All the principal joinery is in oak.

Within, the design derives a quiet dignity from the reliance placed on simple semicircular arches in brick. The outline is carried out in the windows and in the pair of openings forming a screen between organ chamber and east transept, which are filled by wrought metal screens bearing the names of some ten illustrious musicians running down the ages. The oak pulpit, choir stalls and communion table were made by the general building contractors.

A general view of the church from the north-east corner. The materials are brick, stone and slate, and metal casement windows are employed. The main porch, of which details are shown above, is in the centre of the north end, and is seen on the right.

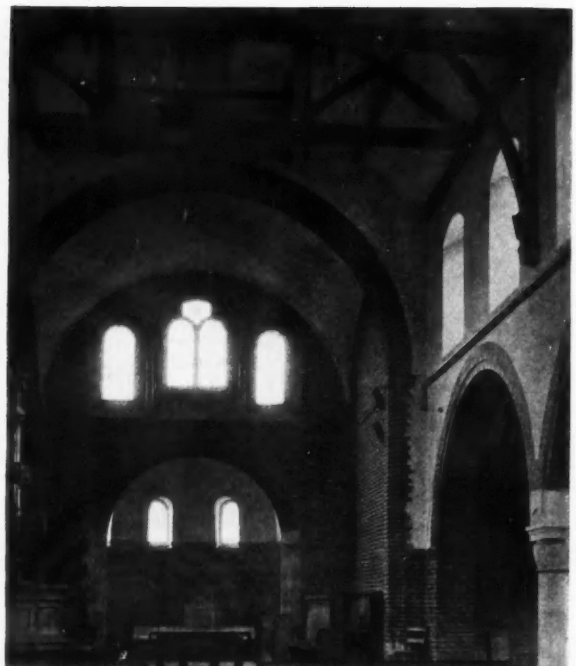


The main floor plan. As will be clear from the general view on the preceding page, the site slopes fairly steeply, and the church proper occupies its highest point. The body of the church is symmetrical about the centre-line of choir and nave, though the remainder is not, owing to the need for a gallery stair at one end and ancillary rooms at the other.

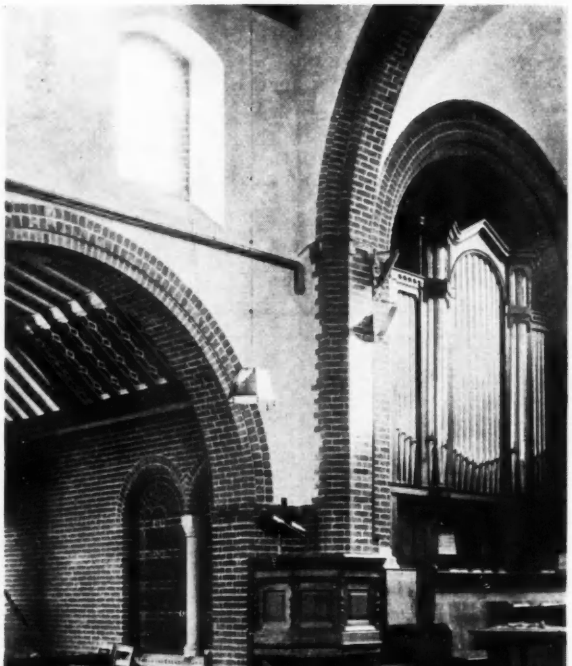


[*By Herbert J. Manchip.*

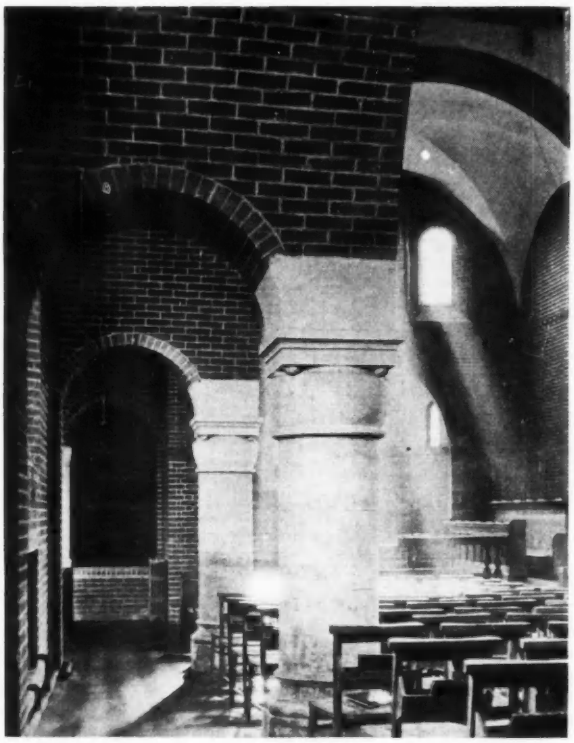
Five sections, taken on the lines indicated on the plan reproduced on the facing page, and reduced in the same proportion. Features are the fairly steep rake of the floor towards the choir—the transepts are also slightly cross-raked—and the domed baptistry. The church provides some 450 seats, including the small gallery.



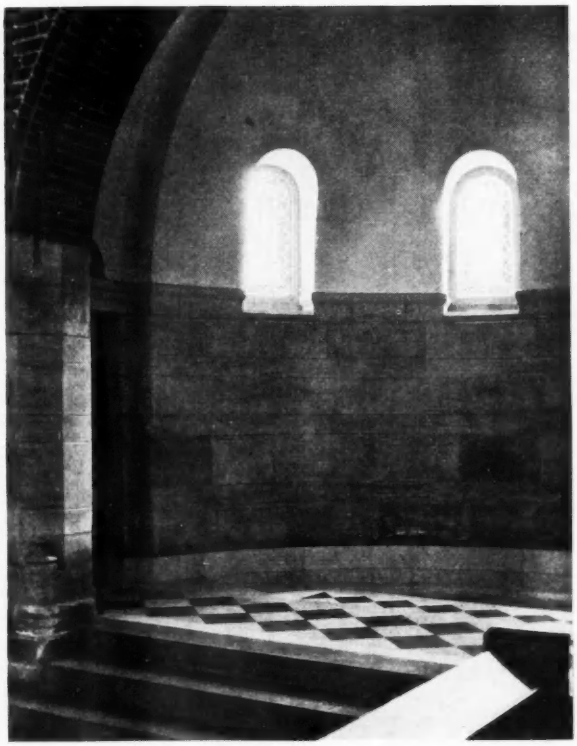
The nave and choir, looking southwards through the arch to the baptistry (illustrated below).



The pulpit and organ, the positions of which are seen in the adjacent view on the left.



The east aisle, the vista of which is closed by one of two organ screens, bearing musicians' names.



A cross view into the domed baptistry from the western choir stalls : it is segmental on plan.

Bernard Whistlow, F.R.I.B.A. : An Autobiography : viii

JOE RICHARDS: FOREMAN

BY KARSHISH

(H. B. CRESWELL)

MY wish to be candid may have led me to disparage myself unfairly. I was not inept : my shortcomings lay, not in the things I did, but in my manner of doing them. I was right in refusing the builder's hospitality; and I was right in calling for an early start, in requiring consideration for the postal work and in pressing for a well-considered scheme of operations; and although I taxed the patience of Father and Mr. George by my hesitation in believing that the result of doing things their way was the same as doing them mine, I was, nevertheless, always ready to refer any points in dispute to Tallard. However, after my first references had been returned to me curtly minuted "Yes. See Specification. R.T."; or "Certainly. Question need not have been asked. R.T.", I was so powerfully armed that I had merely to mention Tallard's name for Father to wince and make a discomforted withdrawal, as though he had been a dog threatened with a stone.

Poor Father ! With the best intentions I made things difficult for him, whereas, had I been better informed, I might, with no remission of conscientiousness, have lightened his task. Tallard, of course, was not going to knock holes in his compact, watertight specification to suit the convenience of the builder; and he would have required good reason indeed for not upholding the decisions of his clerk of works. Good reason would, however, have been far to seek on one particular occasion when Father refused point-blank to do what I told him, and when the need for Tallard to come down and arbitrate was only prevented by the resource of Joe Richards, the foreman—as will appear.

At my first interview with the builders it became clear that they depended on Joe Richards, for they met my every demand with the promise of due attention "just as soon as ever Richards comes back"; and I do not think they could have taken the roof from over the head of the irascible and inflated postmaster, and got the work carried through at all, without him. Richards did not show up in the following week as had been promised me; nor were there any signs of him in the beginning of the next, so that the chaunt, "just as soon as ever," etc., on the lips of Father, of Mr. George and of even a clerk in the office, which at every turn opposed my urgency, became positively loathsome to the ear. However, on the second Wednesday after my arrival I observed scaffold poles being planted in barrels of sand along the footway in front of the building. Richards had come back !

I do not think that men of the stamp of Joe Richards are bred anywhere but in England, or found outside the building trade. I got to know him as intimately as he would permit; but time has given me a better understanding of him, and he has grown in memory since those far-off days, so that I now recall him with an esteem which touches on affection. My recollections of him are so vivid and so voluminous that I scarcely know where to touch on them.

Joe Richards was a short, broad-shouldered, wiry, muscular man, with a bright, limpid, blue eye like a child's, and a bushy, light-brown beard, which usually carried a crumb or two of plaster, a shaving or a half-burnt match. He was short in body, with long, sinewy, bandy legs; and the power, wise caution and cheerful endurance those legs expressed as they bore him in smooth, effortless strides along planks and up ladders, were eloquent of his personality. He seemed to be about forty, but his eldest son was thirty-one, he told me, and his nine children all out in the world except one daughter, who had met with an assidence and got her leg put all crooked like, and who kept house for him; and it was characteristic of his marvellous vitality that he never slept more than four hours. He told me of the crippled daughter in the cheerful, high-pitched, singing voice, with a note of astonishment in it, which he always used, and which gave such force to his whimsicalities.

The death of his wife had evidently been a great blow to him, for the calendar of his life dated from that event. "Just four years 'afore my wife died"; "Just about the time my wife first took ill"; "My wife hadn't been dead mor'n three years"—such was his common way of fixing the dates of the inexhaustible experiences which I egged him on to relate; and I much question whether any woman had a finer memorial than this daily tribute on the lips of her husband and father of her children. Her Joe, however, did not particularly keep her memory green in other ways—or at least he took some trouble to let me suppose he did not, for his fun was always just over the horizon.

He was one of the old order of foremen that is fast passing out of knowledge, and owed his position not to any literary acquirements, but to his capacity, his mastery of building practice, and to his ability to take responsibility and to organize. He never made a note, but kept dimensions and everything else in his head; and he wrote, and even read, with difficulty, owing partly, I believe, to his spectacles, which were horn-rimmed, and had, he told me, belonged to his father; and "my son," he said, "can have 'em arter I've done with 'em, for they're good old specs, they are."

Once, at a time when the postmaster was, with good reason, on his hind legs frantically pawing the air, I came to the building and found two labourers hard at work screening the accumulations of broken plaster which loaded the space where the floor had been. I went to Richards, in some annoyance, for an explanation.

"They're a-looking for my spectacles, sir."

"Looking for your spectacles ! What do you mean ?"

"Why, I dropped my old specs somewheres about last night in the dark, and they're bound to find 'em, sir, if they screen out the rubbish."

Richards was first and foremost a craftsman, with all the craftsman's pride in himself and in a good job. He was no looker-on and director of others, but identified himself with the building as the leader of the men and a sharer in their work. If Joe was not in his shirt-sleeves it was a sign of bad weather indeed. He was a bricklayer by trade, and took a delight in turning to and doing any awkward or particular bit of work with his own hands. "That's mine," he would say. "That's waiting for me, that is—soon as I can find a chance to tackle it." He was completely ambidexter and would change about freely from right to left to rest himself or as suited his purpose, and I have seen him lying on his back in a trench for the better part of a day cutting away under an old wall in preparation for underpinning—a job that could only be got at left-handed. He had the affection for his tools which belongs to the craftsman in all callings, and which is so delightfully presented by George Bourne's record of a Surrey labourer in *The Bettesworth Book* ; and he had a doting admiration for materials, which included bricks and sand, and even extended to individual planks and scaffold poles.

"Here; let that be ! Bring that there back," he suddenly broke off in his high singing voice, to a labourer who was carrying off a short length of battered old scaffold pole. "Go on;

put that down where you found it."

"You never know what them foreign chaps will be up to," he said to me. He called all of his men "foreigners" who did not belong to "Brayness and neighbourhood," as the local paper termed it.

"Why, what's the matter ?"

"That's my old gantry, that is. Had 'un since before my wife died. I've slung seventeen hundredweight with that there before now. There's not a knot or a flaw in 'un."

This was all fair and square. It was also all fair and square when he said one day, pointing to a dirty old bit of wood—as I esteemed it :

"See that slat, sir ?"

"What about it ?"

"Well, you won't see another like that 'un. That's mine, that is. That's a bit o' real red pine, out of Canada."

"Oh ! Is it ?"

"Yes, sir. It's my straight-edge, when I wants a good 'un. You can take and throw that in the sea, and put in the sun, and that won't move. I got that at a sale of old stuff where Father asked me to try and pick up some shuttering I was short on. It were just arter my wife took and died, and I've had that ever since. You won't scarcely ever see another like that, sir."

Much of Richards's talk was, however, coloured by a whimsical humour which was so subtle that to this day I do not know how far he was quizzing me and how far he was serious.

One day, for instance, he suddenly stood while we were walking together.

"This here old board I'm standing on, sir," he said, his face, with its clear, inscrutable eyes turned up to me; "that's mine, that is. That took and saved my life once, that old board done, and Father give it to me. That go about wherever I go, sir, and I allus has it for my gangway so it won't come to no harm."

Richards's eye was always so bright that there was never room in it for any augmented glint of joy, and the rest of his countenance was so involved with his beard that other expressive features were veiled. I never in all those months knew him once to laugh, and none could tell whether he smiled; yet in his mind, I fancy, he was always laughing, for his utterances were tinged with a mischievous waggishness which led him even to make ironical fun of his own seriousness as well as of mine, so that I was slow to recognize it although I was aware of unexpected draughts which threatened to un-hat me—so to speak—and leave me exposed. It was the quiet, observant demeanour of some of the older hands when Joe was launched upon reminiscence that first made me suspect he was keeping all the fun to himself by playing up to my perplexity at his apparent simplicity of mind. It is clear to me, now, that though he might be attached to the old plank that had took and saved his life, he was chiefly engaged by the absurdity of his sentimental regard for a wretched old scaffold board which he daily trod under foot, and was amusing himself at the expense of my credulity. In spite of his quizzing of me—for there is no doubt he freely indulged himself in that wickedness—he was never by word or sign disrespectful; and I never had a blunt word from him, much less a surly one, although, God knows, I often gave him cause enough for remission of his enduring cheerfulness.

He was an extraordinary man. His childish frankness of manner hid a reserve so deep that one never knew what he really thought or felt; and his resources of humour and quiet tact frequently saved difficult situations. It was, however, as a reservoir of information that I chiefly remember him. He was no theorist, but favoured the empirical method of acquiring knowledge, which he imparted always by anecdote spiced with whimsicality—but how far consciously spiced I cannot determine. Perhaps others may see more deeply into this delightful man's nature than I can. There are a score of different fields in which I could display him, but I will take that of mortar, for I early became lost in perplexity at the way lime and cement ignored most of the rules laid down for them in the books I had brought with me—which books were my sole source of knowledge. If they failed me, I was lost; and I turned to Richards in the hope that he would re-establish my confidence in them. His singing, high-pitched voice, with its rising note of astonishment, must be imagined.

"Some limes is fast, sir, and some is slow," he told me; "and the slow sets the harder in the long run, I reckon; but the weather has a lot to do with 'un, and so's the sand. Now, that there sand we used at Bigtons—the Dower House, they call it—two years back ! It were sharp and nothing to complain about, but that there took and turned, sir !"

"Turned ?"

"Yes, sir. Took and turned sour."

"Turned sour ! What do you mean ?"

"Well, I reckon it done, sir ! Held off. Go sulky like. Wouldn't make no start. I washed some on it, but *that* didn't please 'un, so I had to wait. Father got in a state when the architect complained, and told me to gauge 'un with a bit o' cement; but that there wasn't satisfied even then, sir ! Nothing I could take and do wouldn't please 'un. I reckon lime wasn't good enough for that; that wouldn't take up with nothing but cement to my way o' thinking. That kep' me waiting a rare time, that did."

"What were you waiting for ?"

"Waiting for the mortar to set ! You can't go on ahead o' the mortar, sir. That's what happened along o' the Fire Station look-out tower by Polders market-place four year after my wife died. 'Get on ! Get on !' says the architect. Well, I told 'un how it were with the mortar that slow and the joints half-inch and an eighth, but he didn't take no heed and I had to get on to satisfy; so I *get* on. Well, we go right up fur as a bit of corbelling there were under the coping and then, sure enough, that old tower took and shut up."

"Shut up !"

"Yes, sir, that shut right up, that done."

"But I don't understand."

"Why, shut right up, sir, like one of these 'ere concertinas ! The mortar couldn't stand up to the weight on top of 'un, and that stood out all over better part of an inch in places; and that spilled along the ground nigh a foot high all round, that done, before it got finished, sir. First I knew was the men coming down overhand. I shouted, 'Who blow the whistle ?' but they'd felt her move, and down they come."

"How did you put things right ?"

"Pull right down and build up again, sir."

"Good gracious ! What did the architect do ?"

"Go off the pier, sir."

"*What !*"

"Go off the pier — jump in the sea, sir ! Don't say nothing to Father about Polders Fire Station, sir. It's that what drove him off his head. There was going to be a law action or summat, but that came to nowt after Mr. Grainger went. We got paid for all in the end. It weren't no fault of mine, I reckon."

"I suppose the architect ought to have specified cement mortar," I said.

"Well, that carry on too, sir ! There's times when you don't know what that'll be at. It go rancid like, I reckon—turn rotten, same as fresh water will take and do, and come all right arter. There was them anchor beds for the pumps down at the new sewage works, seven by four by five feet deep they was, solid; two of broken flint, one sand, one cement : two on 'em was all right and t'other was all wrong ! How do you account for that, sir ?"

"How do you mean—all right and all wrong ?"

"Well, two of 'em you could search with a twelve-pound sledge and they rung same as they'd been blocks o' granite; but the third, arter three weeks, was that green we took and

broke 'un up with picks. That hadn't set at all hardly, for all it was mixed in the same mill with the same water and the rest as t'other lots. I reckon the cement had took and gone mouldy.

"How could it do that?"

"Well, Father dunno, and he knows a lot; and the municipal engineer, he dunno neither. The only thing I can make on't is an unhealthy foreign chap I took on—a labourer he was, and I put him to spading into the mill. Well, sir, I reckon he got spitting into the pan, and that's what turned *that*. He had to go to hospital soon arter and died there all eat up—a rum go, wasn't it, sir?"

"I don't understand it."

"No, sir, and there's plenty others what don't, neither; but this here Portland cement is fancy goods what'll always hit back at you when you don't expect. When we were digging the butts up on Radder Down about the time my wife took ill Father told me to make a safe lock-up for the barrers and picks, so I built 'un in nine inch with a lot of throw-outs I had, and put an eight-inch slab of seven-and-one broken chalk and sand concrete, over, to roof 'un. That wouldn't be more nor twelve foot square inside, and after ten days, when I took the centring down, that was as hard so you'd think nothing could bust her; but what do you think that go and do very next day, sir?"

"What?"

"Why, that old slab took and sot down!"

"Sat down!"

"Yes, sir. Sot right down, that done, and broke the barrers and spilled the walls over, and I reckon it was all along o' being thirsty. I had a tarpaulin over, but what with the sun and the rare lot o' wind there was, I reckon that got thirsty and that turned her. You wouldn't hardly credit the deal o' water a bit of concrete will ask for, sir. That'll lie under a week, and scarce drink all that want then. Lime don't ask for none scarcely—fat lime, anyways. I've seen that washed right out of walls in a thunderstorm and run down like so much milk, sir!"

"What's fat lime?"

"Why, hot lime—Dorking lime—chalky lime, that come all greasy-like in the banker arter you slake it: same as what the plasterers beat up for putty. Then there's stone lime, sir, and *that* come over queer, too, sometimes when you don't reckon! When we built that shop for Mr. Flick, the butcher, down middle of Beach Street under Mr. Titmus, I was short of cement just afore we finish running the length o' cornice there is along the top there. Father come along and says, 'Make do with a bit o' lime and get done with; no call to send up to yard for that lot,' he says. There warn't more than two or three feet to the return end where the Bank began, and I run it with some Abernethy grey stone lime I had there, made up strong, two-and-one, to finish and make a job. Well, sir, I didn't take any particular notice till two or three days arter, when Mr. Titmus came to me in a rare stew because Mr. Ferringer, the bank manager, had writ him a letter complaining as what we was encroaching on 'un; and, would you credit it, sir? That had took and grow a matter of near three inches! That there cornice *grow*, sir! It grow!"

NEXT WEEK—IX: TRIALS OF A CLERK OF WORKS

The previous instalments appeared as follows:

May 27. i: I am Articled.
June 3. ii: Episodes of Pupilage.
June 10. iii: Episodes of Growth.
June 17. iv: My First Job: The Sewer.
June 24. v: My First Job: The "Pipes."
July 1. vi: I Turn Clerk of Works.
July 8. vii: Bradshaw & Son: Builders.

LETTERS FROM READERS

Cant About Rural England

SIR,—Sir Peter Chalmers Mitchell has done work in the zoological field for which he deserves our gratitude, but we who are concerned for the face of England can scarcely applaud his recent utterances on rural amenities.

Surely he knows that "pestilential nonsense" is talked about every mortal subject ever discussed by man, and it is neither scientific nor illuminating to quote the minority views of sentimental numskulls and then perform the easy task of proving them foolish.

I haven't a doubt that Sir Peter is not so Philistine as the reports of his Oxford address would make him appear even to those who know (or can guess) what he really meant to say.

To the beauty smashers generally, however (who are ever on the look-out for support), his attack on the picturesque is likely to be read with satisfaction as a chit for just that brutal dunce-building (whether of houses or of roads) that is so needlessly rubbing the bloom off England.

No decent person who has a little imagination could do other than deplore the existence of "rose-clad hovels," but if he is moved publicly to announce his views, his imagination should also make him realize the need for making it quite clear that it was the hovels that he objected to, and not the roses.

There were plenty of "practical" people with compassionate hearts in the Victorian era who yet had no eyes, and who would have cheered Sir Peter's speech (as reported) to the echo.

The rose question (which I take to stand for amenities generally) would have troubled them not at all, whence the Peabody Buildings, West Kensington and Crewe.

CLOUGH WILLIAMS-ELLIS

SIR,—Without knowing the context of the words you quote from Sir Peter Chalmers Mitchell in the paragraph "Cant about Rural England" on page 38 of your issue of July 8, it is impossible to judge of them fairly. In extravagant language, such as is used by some public speakers, he indicates a truth. People who are not thoughtful, whether they are on the outskirts of the "Preserve Rural England Group," or among the number of those who will commit any barbarity so long as they are told it is in the interests of "modern progress," are liable to do humanity much harm.

Those who work sanely for the good of humanity balance as well as they can what is to be gained or lost by changes, and they are not mesmerized into placing a false value on beauty or age, nor are they fearful to deny *that* "*modern progress*" which follows in the train of those who make changes with stupid delight at the utterance of these two words.

Change is inevitable in the world. It is of its very nature; and beauty is desirable, whether newly created or growing old. These qualities of life are in man's control, and those who devote their lives to the study of either are serving the people; they are better honoured together, jointly.

While it is good to be aware of existing beauty and seek to avoid its destruction, the goodness that strives to obtain beauty in changes is, perhaps, more useful to mankind, for without such care the future will have little to enjoy.

The man who succeeds in assembling modern cheap materials in a roadside house, so that it offends none and pleases some, deserves our thanks more than he who builds new buildings in an old-world manner; for the latter builds for the richer few, and builds in a manner that lacks the merit of common-sense economy, and in one that is very easy, for examples are plentiful.

A. R. POWYS
(SECRETARY, THE SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS)

A Neighbour of the Bank

SIR,—I might give a parliamentary answer to Mr. Leathart by replying, "That is a hypothetical question," but I resist the temptation, for I have no wish to score off him or anyone else.

It seems to me that the exercise of

architectural courtesy must vary with circumstances. It is conceivable that existing buildings may be of a temporary character, or may be unworthy of consideration, as in America, where a Greek temple, a Swiss chalet, a schloss, a mediæval castle and a bungalow are found in close proximity. Or it may be that arguments for and against an innovation are fairly equally balanced, as shown in recent correspondence in *The Times* respecting the rebuilding of the east side of Trafalgar Square. Each problem must be settled on its merits and having regard to the purpose of the new building. Nevertheless, we are familiar with the type of new building which rises, big and blatant, like a parvenu amongst decayed gentlefolk, and offends the eye because its designer did not take thought for the surroundings amongst which it was to stand.

The Bank of England covers an area of four acres: it may be expected to remain, as now altered, for the next 100 years, and I venture to think cannot properly be ignored by architects of neighbouring buildings without offending our sense of good taste.

NATHANIEL LLOYD

Lowest Tenders

SIR,—Every right-thinking architect will agree with "Suburban Builder's" general contention, which I understand to be that, when the competing contractors are selected firms of good standing, the lowest tender should automatically be accepted, and I believe that in the great majority of cases this is what actually happens. Unfortunately, there have been cases where the invitation to builders to tender has merely been camouflage to cover the acceptance of one particular firm's estimate. In such cases the reasons are sufficiently obvious. This does not invalidate the principle stated above, but only goes to show that some of those connected with the building trades, as in all other departments of human activity, are weaker vessels, subject to a falling away from grace.

There are, however, other aspects of this question which are not dealt with in your correspondent's letter. To give an example: A short time ago I invited tenders from several firms, all of good standing, and the prices submitted, with one exception, were within narrow limits of each other and agreed with my own estimate of the value of the work. But one contractor gave a tender some hundreds of pounds below the others, a price for which it would have been impossible for him to carry out the job without heavy loss. On investigation, it was found that his estimating clerk, having been hurried in getting out his figures, had omitted to include several large items.

On page xlvi *of this issue is printed a first set of motto labels for the Second—July—Holiday Sketches Competition. The rules were printed in full in* THE ARCHITECTS' JOURNAL *for July 1.*

What, then, was to be done? Acceptance of the lowest tender would have involved the builder in serious trouble, which would inevitably act to the detriment of the client, while refusal to accept deprived the client of an unexpected but, nevertheless welcome, pecuniary advantage. In effect, this particular problem was tackled to the satisfaction of all concerned, but it would be of interest to know what your architect readers would have done in such a contingency.

Considering the enormous volume of building work which is tendered for in this country, I venture to suggest that builders very rarely have cause to complain of any departure from impartiality and fair dealing on the part of the architect.

REGINALD A. RIX

SIR,—I cannot believe that the practice of obtaining "Check Tenders" is as common as "Suburban Builder" would lead us to think, but as he has ventilated his grievance an observation or two on the subject may not be amiss.

In the first place, it must be agreed that the procedure is, as your correspondent says, grossly unfair and, in my opinion, renders the architect liable to an action at law, for where tenders are invited for the performance of work the person inviting the tender would, it would seem, be liable to pay the tenderer a proper remuneration for his services if the information so obtained be made use of otherwise than in a legitimate manner. The beginning of the trouble is the selection of the list of builders to be invited to tender. If this selection is made with care, then there should be no reason for accepting any tender but the lowest, provided, of course, that the tender has been properly prepared and is for a sum at which, in the architect's opinion, the work can be properly carried out. An invitation to tender implies faith in the integrity and ability of the builder to perform the work; and if that faith is wanting, then that builder ought not to be involved in quite unnecessary trouble and expense. The custom for the lowest tender to be accepted has, I believe, been recognized by the courts as a reasonable custom.

F.R.I.B.A.

LAST D.I.A. LUNCH DISCUSSION

The Decoration of Ships

THE Design and Industries Association held their sixth and final luncheon at Gatti's last Thursday, when Sir Alfred Booth presided over a discussion on the interior decoration of British passenger ships.

Up to the time that Germany, France and Sweden designed ship interiors upon which really original and creative thought had been expended, British shipowners and designers were secure in the thought that no one could better them at their job of reproduction. That they have been shaken in their complacency is shown by their almost frantic efforts to achieve "*art*" in the *Empress of Britain*. They went the wrong way about it, of course, and the interiors by academicians and artists of infant drollery remain what one would expect them to be. One cannot compare them with the responsible and really distinguished work aboard the *Kungsholm* or the *Bremen*. Much as one would like to compare them one cannot. They are dissimilar things.

Everyone speaking at the meeting must have had these examples in mind, though Sir Charles Allom and Mr. Ashby Tabb, who represent the good old days and reproductions of the good old days, could not allow that there was lasting excellence in the new work, which, indeed, they confess to not being able to understand. If I heard them aright, I understood them to be a little in doubt as to period work (for which I am glad) but still determined to give the public what it wants—vain phrase! —and to make it bright and light, whatever that may mean.

The feeling these experts gave me was that though they might be eminent in their sphere of commercialized decoration they were really devoid of philosophic basis and could never hope to produce original work.

Mr. Clough Williams-Ellis sowed the right seeds of doubt when he showed how well the *Bremen* and *Europa* were weathering the storms of transatlantic competition, as much through their decoration as anything else.

I don't know what Mr. Howard Robertson means by "a certain museum feeling" in ship decoration, nor how such feeling can possibly go with the modern spirit. I personally dislike any "museum feeling" in a ship, and agree with Mr. Williams-Ellis that if we are in doubt as to what the public wants, then we might design simply, economically and without over-elaboration. That would be a change that might be welcomed with surprising fervour.

LUXURY FLATS,

Hampstead Heath, N.W.

DESIGNED BY
YATES, COOK AND DARBYSHIRE

ON the summit of Hampstead Heath, "Bellmoor," a large block of modern flats, has been erected. The architects, in planning and detailing, have endeavoured to produce a comprehensive scheme, embodying all the latest developments in luxury-flat construction.

The building comprises eighteen flats, a lock-up store on the lower ground floor to each flat and a large garage under the forecourt, independently approached by a slope from a private road.

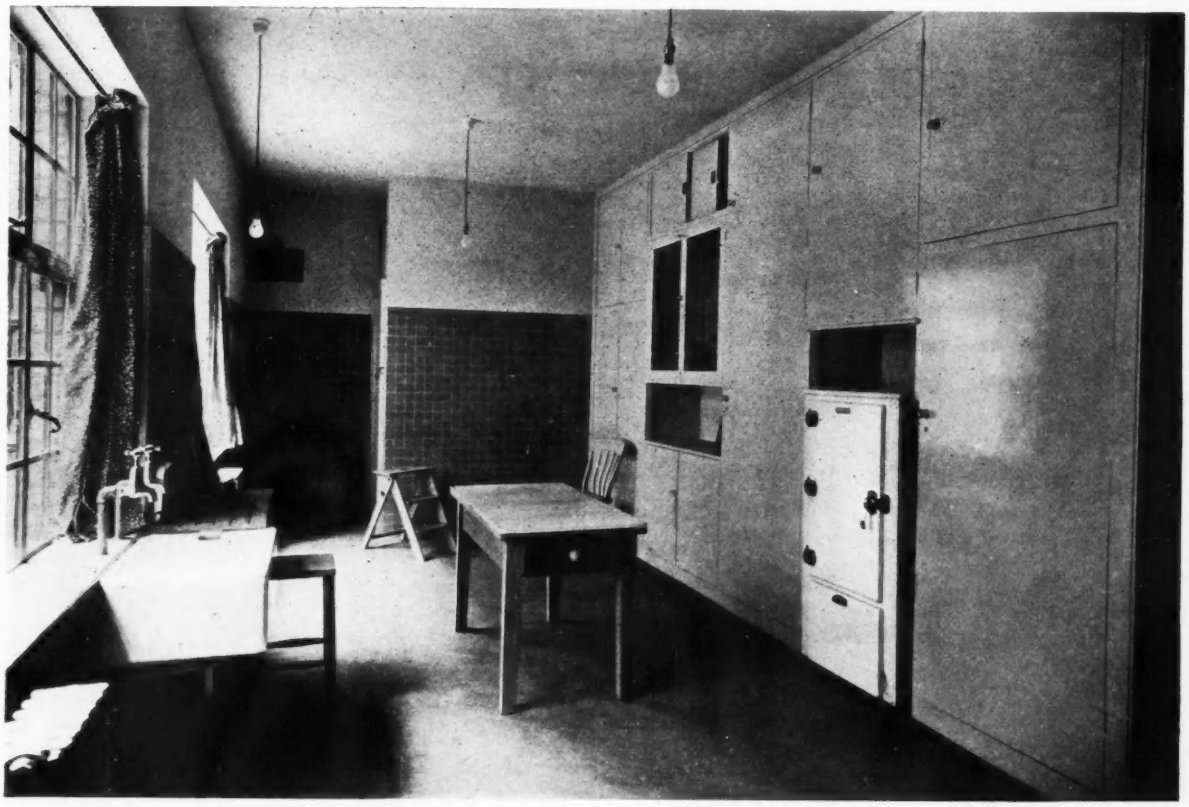
It should be noted that advantage has been taken of the slope in East Heath Road to incorporate two flats at a lower level, the remaining four floors having four flats per floor. A small caretaker's flat is also provided at the low level. A feature of the planning is the arrangement of all scullery doors around one central service staircase.

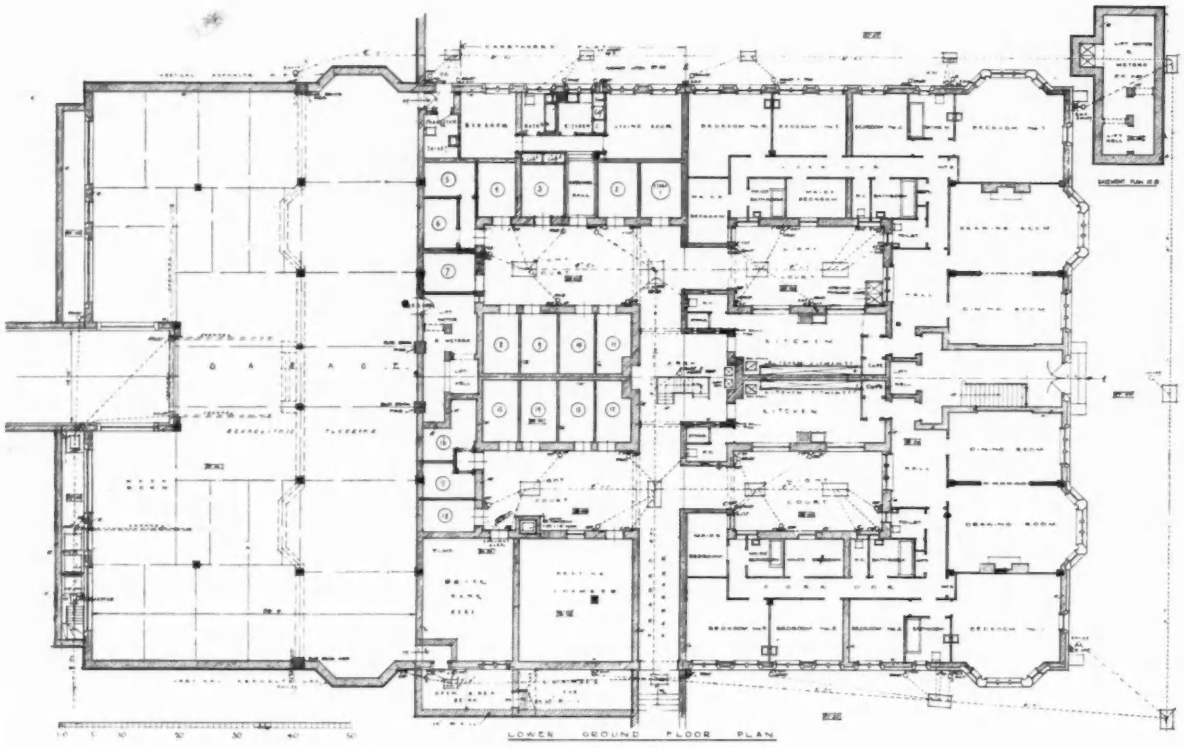
The accommodation of each of the twelve principal flats is as follows :

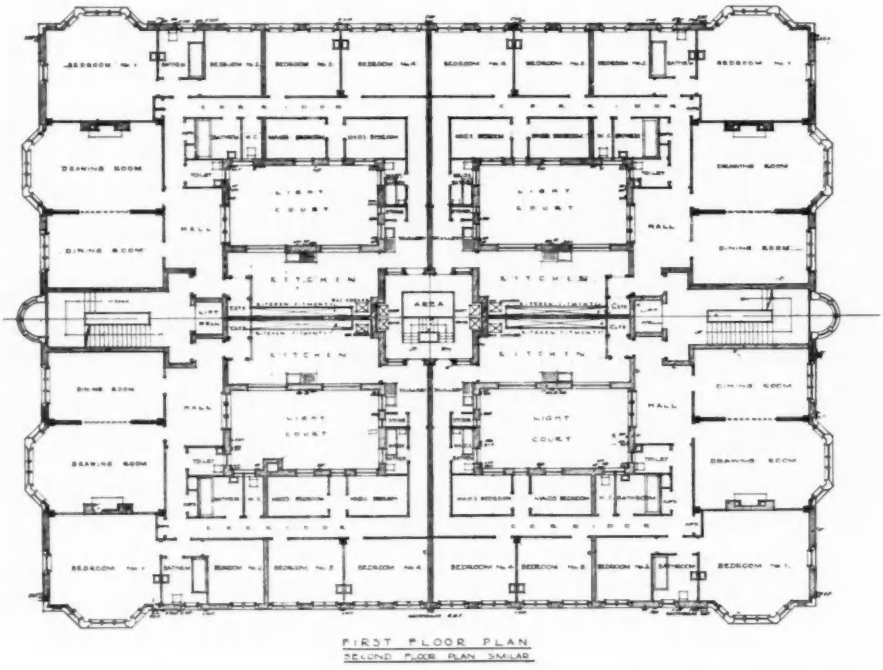
Vestibule, hall, drawing-room, dining-room, four bedrooms, two bathrooms, two w.c.s, two maids' bedrooms, maids' bathroom, maids' w.c., kitchen with refrigerator, scullery, store, larder.

One of the staircases, showing, in the centre of the landing, the lift doors, on either side of which is an entrance to a flat. All the staircases possess good natural lighting.

The kitchens are installed with the most modern fitments, including refrigerators. One end of each kitchen is connected through a lobby with the hall, the other with the scullery and servants' quarters.

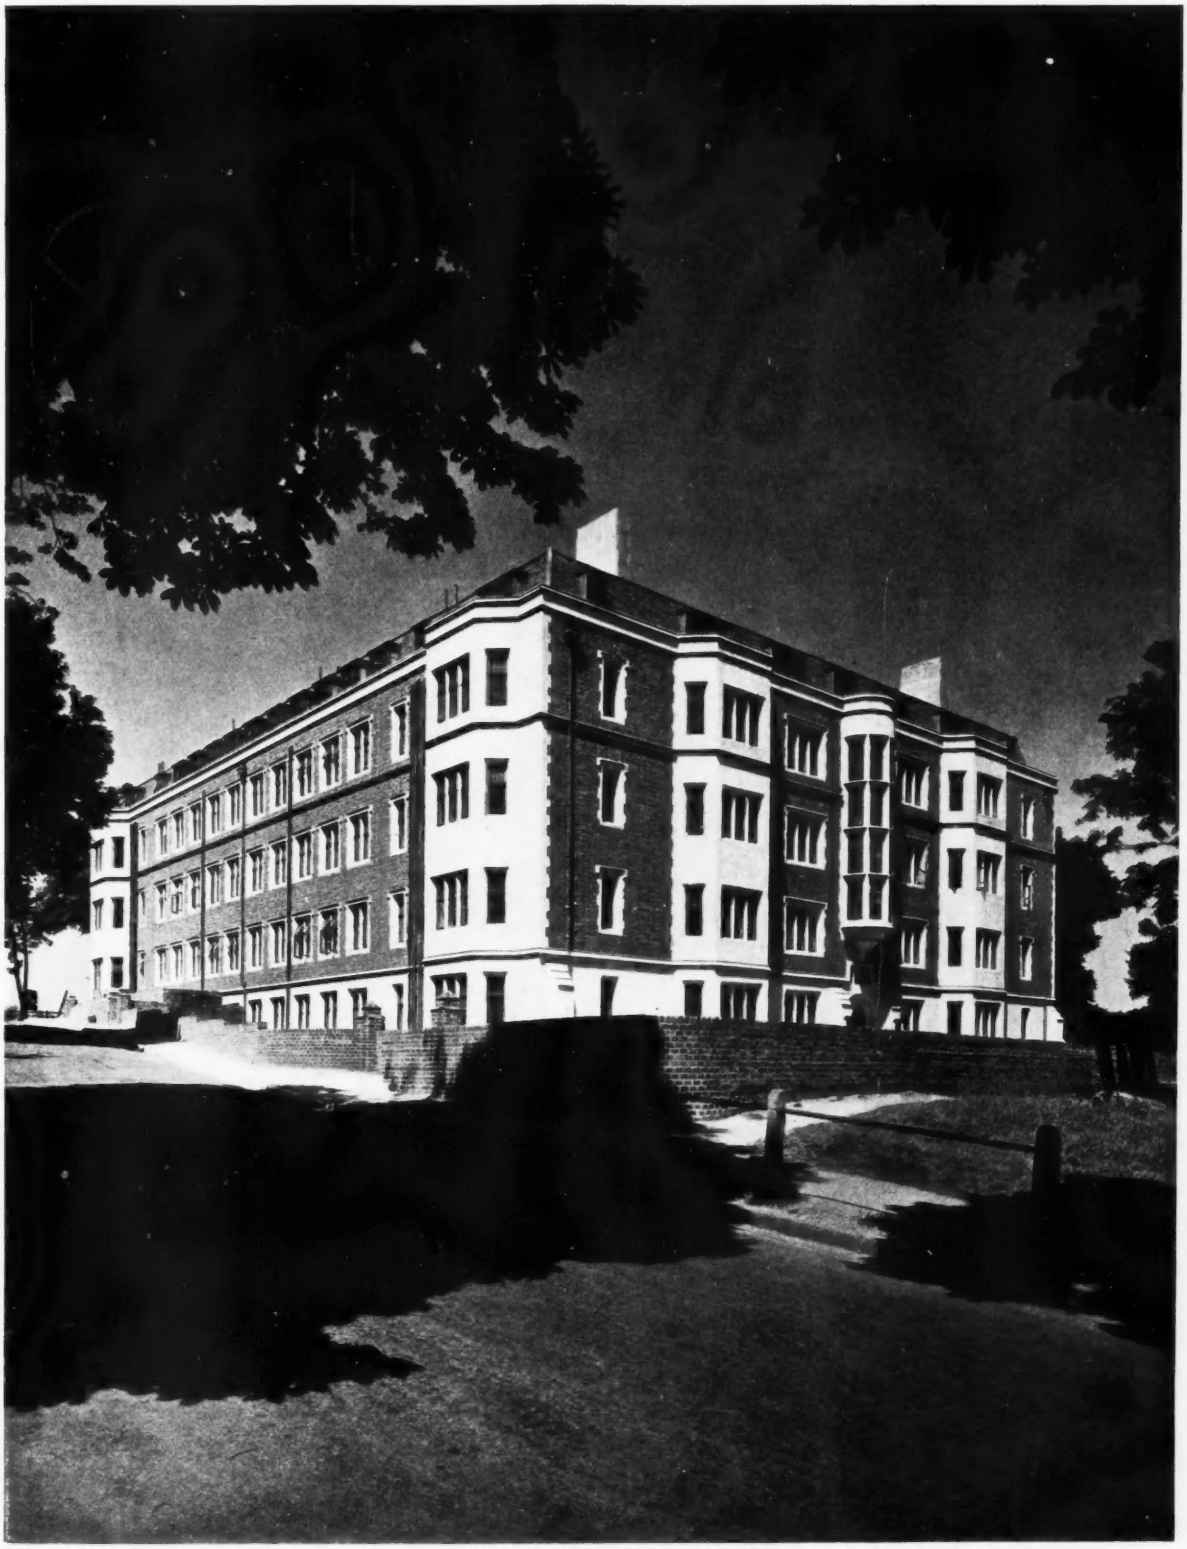






Plans of the lower ground, first and second floors. Among the important features of the lower ground floor is an open garage, about 100 ft. long by 60 ft. wide, for the accommodation of tenants' cars. This is provided with a wash-down and is approached by a sloping roadway in front of the forecourt to the main façade.

"Bellmoor," Hampstead Heath, N.W.] [*By Yates, Cook and Darbyshire*



"Bellmoor," Hampstead Heath, N.W.] [*By Yates, Cook and Darbyshire.*

A view taken from East Heath Road. On the other entrance front—which is of similar design—is the drive down to the garage.

THE SKETCH CLUB

THIRTY-THIRD SESSION

By Percy J. Westwood. (Soft Ground Etching : 5″ × 10½″)

No. 51 : Calle Della Madonna, Venice.

By Ruth Cobb. (Pencil : 9″ × 12″)

No. 192 : The Bridge, Aurey.

THIS session of the Sketch Club is devoted to reproductions of some of the architectural subjects at the eleventh exhibition of the Society of Graphic Art which opened on Wednesday last, July 8, at the Royal Institute Galleries, Piccadilly, W., under the presidency of Mr. Frank Brangwyn, R.A., R.E. The exhibits number 352, and include drawings in pencil, pencil and chalk, pen and ink, pen and wash, chalk and charcoal, colour prints, etchings, wood-engravings and aquatints. Mr. Percy J. Westwood shows six subjects, two of which are reproduced on this page, and has the honour of being the only architect represented at the exhibition. The collection will remain on view to the public until July 30.

By Percy J. Westwood. (Soft Ground Etching : 5″ × 10½″)

No. 30 : At Avignon.

By Herbert G. Hampton. (Pen and Wash : 11¼″ × 9½″)

No. 329 : York.

By W. Aloysius Johnson. (Pencil : 14″ × 9½″)

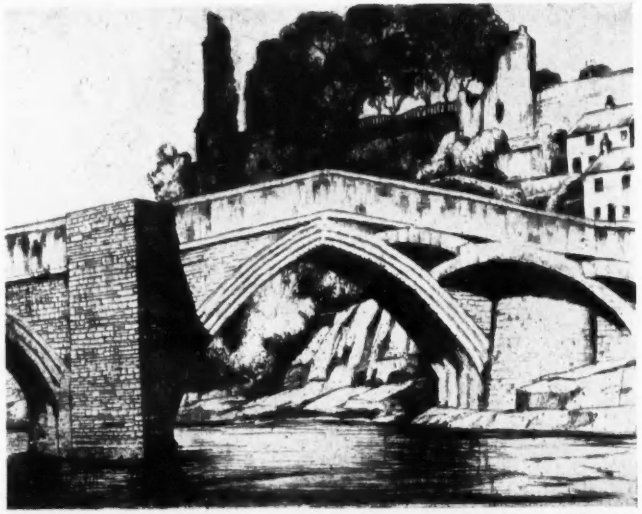
No. 199 : Low Tide at Boston.

By W. Aloysius Johnson. (Pencil : 11″ × 9″)

No. 6 : The Heart of Manchester.

By Hilda Cowham.
(Pencil : 6¾″ × 8½″)

No. 4 : Sospel, Alpes Maritimes.



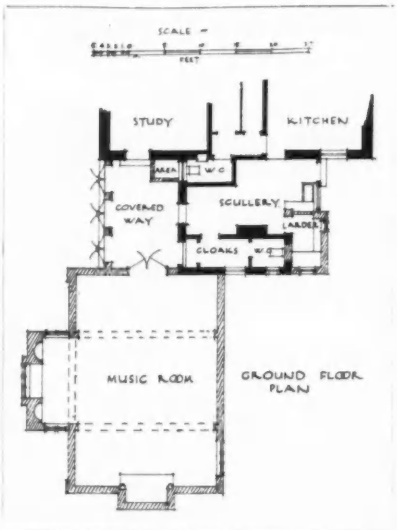
By Stanley Peck. (Etching : 8¾″ × 7″)

No. 138 : The Old Bridge, Barnard Castle.

MUSIC ROOM FOR A VICTORIAN HOUSE

DESIGNED BY JOHN D. CLARKE (JOHN D. CLARKE AND WORSFIELD)

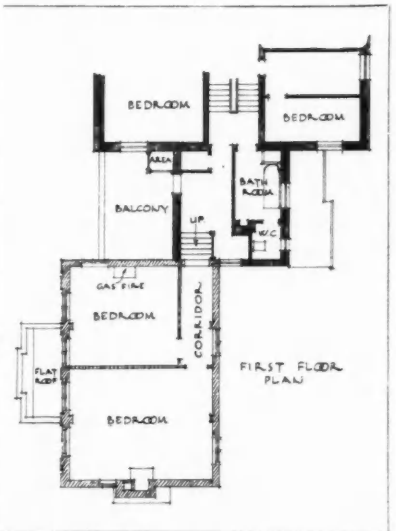
The addition, of brick and slate, showing the loggia, with glazed steel doors, connecting on the left with the existing Victorian house. This was a conspicuous specimen of the worst period of Victorian architecture—1860; speculative builder; domestic Gothic—complete with anæmic yellow brick and "Early English" stone dressings.



The music room is entered from the loggia by a pair of glazed doors, and contains a performers' niche.

THE owner of "Beckford," East Grinstead, Sussex, a great musician, required an addition consisting of a music room, with two bedrooms over, and the difficulty was to provide a room that would serve as a suitable environment and yet at the same time would not externally accentuate the existing poor design. An addition was built of 2-in. stock bricks, roofed with slate. This was connected to the house by a loggia, in which are three pairs of glazed steel doors, made to be lifted off their hinges and stored away in summer.

Good acoustics were essential, and were ensured by using on the walls and ceiling an ordinary lime plaster, finished with a wood float; the surface of the walls was broken by wood fluted pilasters; also there was a fairly large cove at the junction of walls and ceiling. A big square bay window, framed by pilasters and having two niches, forms a background for two or three musicians, after the nature of a small stage.



Above are planned two bedrooms and a short corridor connecting with the bedroom landing in the existing house.

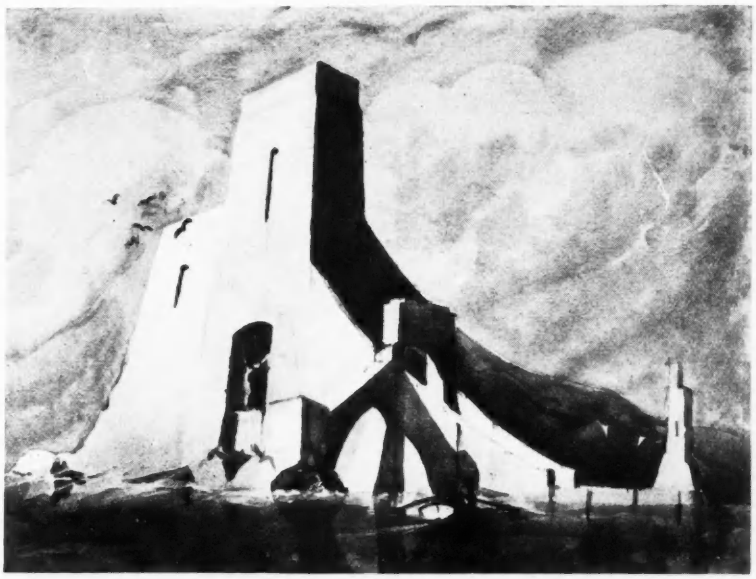
The music room, looking towards the fire-place; and the performers' niche. The walls, ceiling and woodwork are throughout of an indefinite warm brown-grey tint, save for a single note of vivid colour in the glazed entrance doors (not here shown; see plan), which are lacquered Chinese red.

SCHOOL WORK: LIVERPOOL

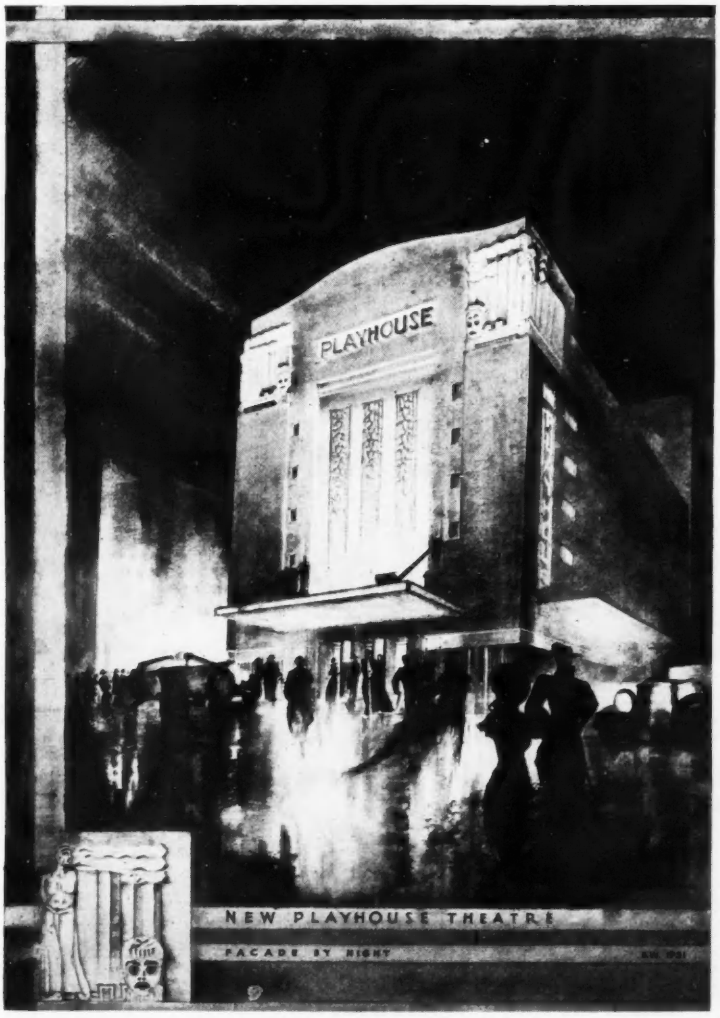
BY W. DOUGILL

THIS year the annual exhibition of drawings of the Liverpool School is housed in Bluecoat Chambers, one of the few remaining architectural gems of the district, and one is thus able to contemplate the effusions of youth in an atmosphere of sedate and artistic charm.

It might be of interest, first of all, to make a few generalizations. Throughout the year, the established policy of the School, evolved over a long term of years, has, in the main, been adhered to. One notices, however, evidence of minor innovations which only go to prove the dynamic character of the curriculum and show that the School is alive to new modes and new conditions as they arise.



A monument to sailors on the Brittany coast. Six-hours' sketch design by B. Allsopp.



A repertory theatre for Liverpool. Fifth-year thesis design by D. Winston: perspective view (for plan and section see following page).

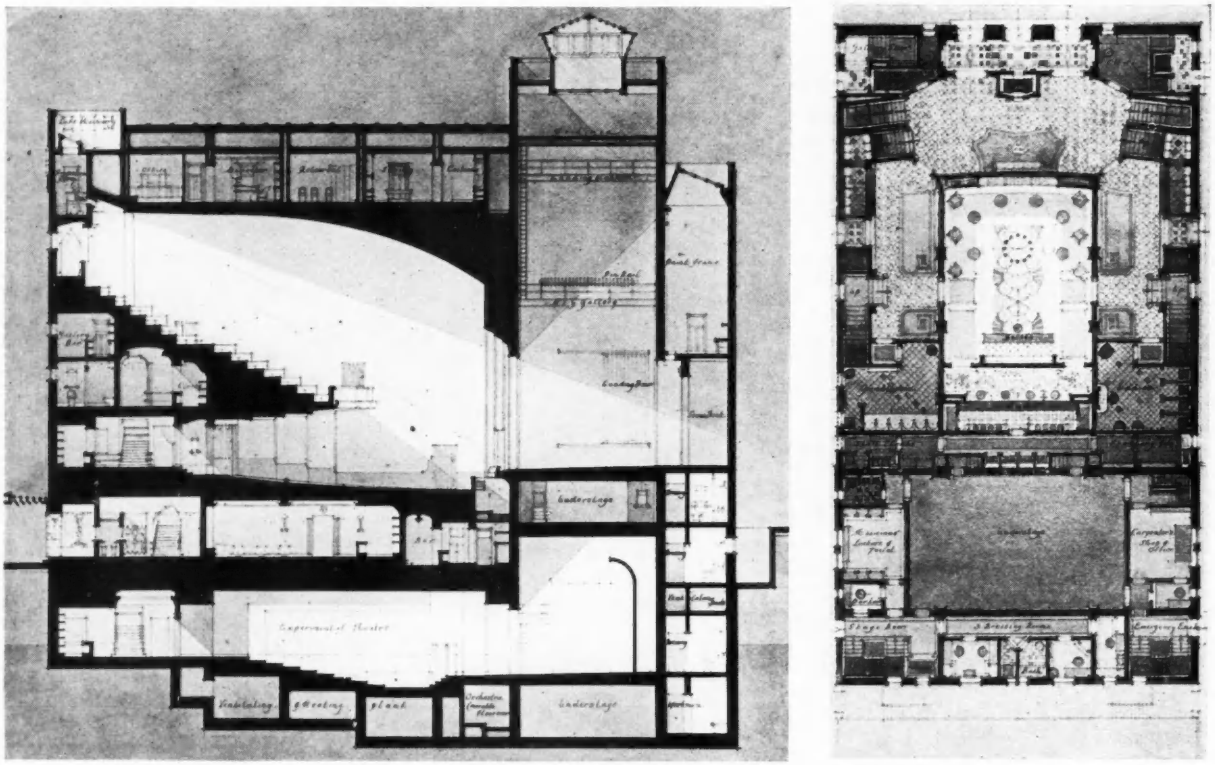
There is an abundance of evidence that so-called modernistic design is in the ascendant. This, as one feels it should be, is most conspicuous in the fourth- and fifth-year designs, which have been evolved after the students have received an adequate grounding in classical and traditional work.

Colour, as a definite branch of architecture, has received greater emphasis than in the past, and the effects of this are easily discernible in the work of all years.

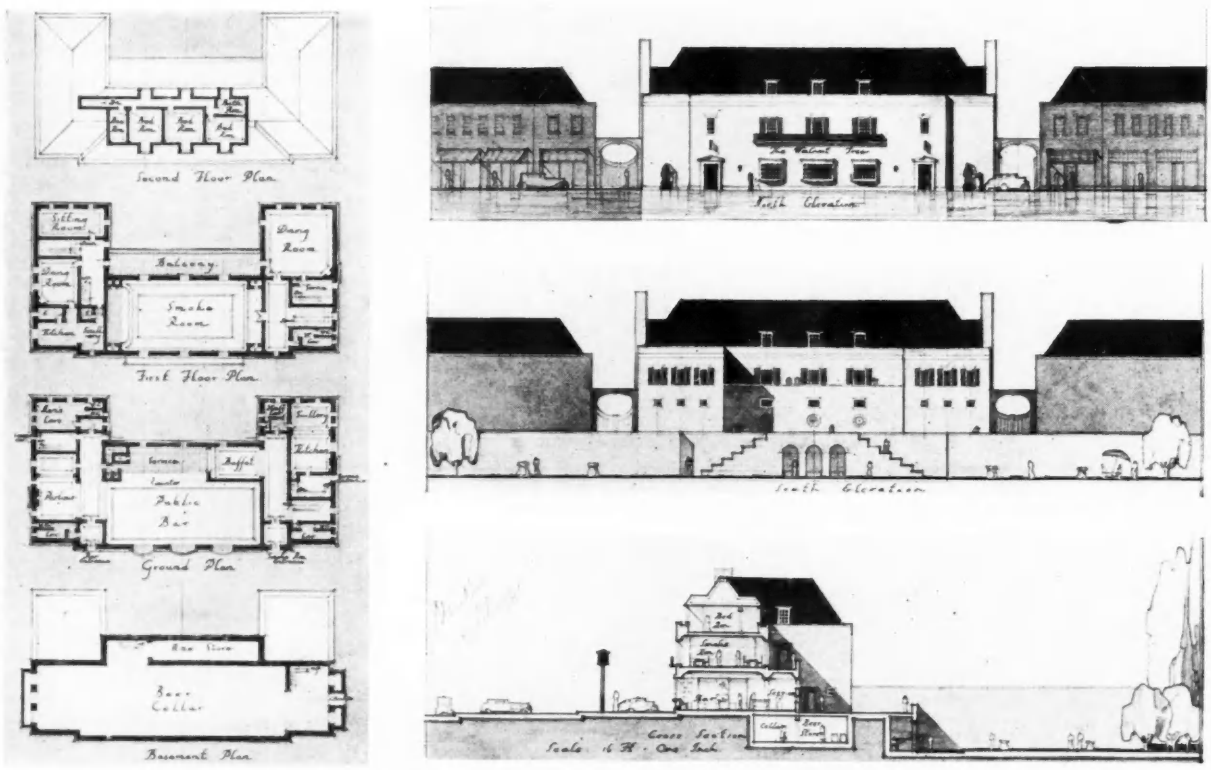
Finally, one notices a greater restraint in the rendering of finished projects, for which Indian ink holds a virtual monopoly. As a contrast to this, the more ephemeral designs are shown in a rich variety of presentation, with charcoal and colour predominating, according to the subject.

Though pride of place in the exhibition naturally falls to the fifth-year work, it will make this notice more comprehensible if we examine the work of the various years in order of seniority. It is only in this way that one can visualize the gradual crescendo of interest from the regularized work of the first year to the culminating work of the fifth.

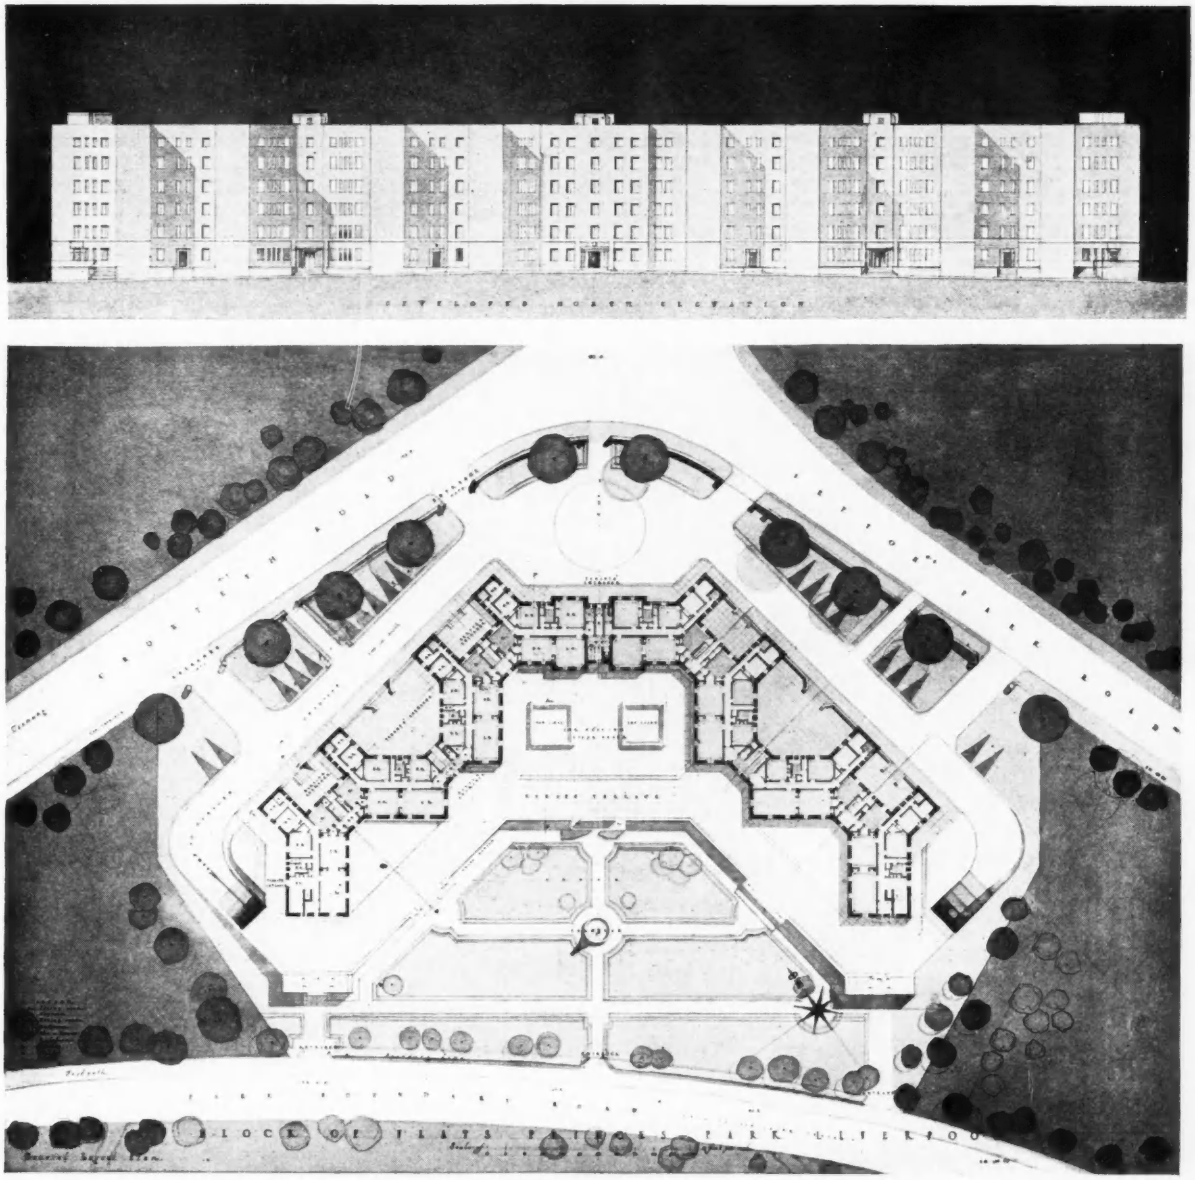
In the first year's work one notices diagrams dealing with the Elements of Form; large measured drawings of St. George's Hall, by which the students make acquaintance with the T and set squares, and receive a foretaste of the big schemes expected of them in the later years of the course; colour diagrams; construction sheets; and a series of small designs.



A repertory theatre for Liverpool. Fifth-year thesis design by D. Winston: longitudinal section; and entrance-floor plan (for perspective see preceding page).



A suburban inn. Third-year design by Glynn Roberts: plans; and north and south elevations, with cross section.



A block of flats facing Prince's Park, Liverpool. Fifth-year thesis design by E. J. Harrison: developed north elevation; and general layout plan.

Perhaps the most important scheme in the second year, shown by a number of delightful drawings, is a research subject in the form of an Italian Renaissance museum, in which the students had to apply motifs derived from buildings of the period. One believes that these drawings, and the research which is embodied in them, will have a healthy stabilizing influence on the later work of the students. The other designs include a market hall, and a small house, part of which is developed as working drawings.

In the third year, design predominates. Worthy of mention are a seaside café and bandstand, by E. Farrar; a sailors' church and institute, by B. Allsopp, a delightful effort at picturesque composition, the rendering of which gained for the author the Minoprio Prize for the best-rendered drawing of the third year; a suburban inn, by W. V. Reakes; and a design for the same building, by Glynn Roberts, shown by three drawings dramatically rendered in charcoal.

The work of the fourth year consists almost solely of designs of an ambitious character, each carried out in a relatively short time, and set with the object of testing the students' powers of imagination and facility of expression. One particularly notices R. S. P. Hubbard's layout for an electrical exhibition; a school of music, by A. Fidler; the layout of a pleasure island, by L. Berger; and a scheme for the layout of a headland, by G. P. Bell. An interesting model accompanies the latter design

It is from the productions of the fifth year that one obtains abundant evidence that the system of the School is more than justifying itself. Particularly is this so in the case of the final theses. Unlike the "commercial" programmes of the preceding years, the subjects for the theses are chosen by the individual students, who also select their own sites. The thesis is inevitably the supreme test, and gives a clear indication of the author's imagination and capabilities in design in all its aspects.

Exigencies of space will not allow o1 comments on each thesis, and therefore a few only are selected more or less at random.

E. A. Ferriby shows an exhibition building for Liverpool. The main building consists of a large hall and ancillary accommodation for major and minor exhibitions, together with two auditoria. The whole scheme shows competent handling of modern forms to suit a modern programme.

N. S. Lunn's scheme is a municipal office building over the new Mersey Tunnel entrance. Considerable ingenuity is displayed in the planning of this complex structure, in which the author has conceived the idea of lofty twin towers to give punctuation and emphasis to what will eventually be a focal point in the city.

R. J. Gardner Medwin submits a design for a planetarium and observatory. The drawings, which are beautifully rendered, are indicative of considerable research into the scientific aspects of the subject.

E. J. Harrison shows a block of flats for Liverpool. The plans are novel in form, and the whole conception is clean in development. An outstanding feature is the basement garage, made possible and practicable through the slope of the site.

D. Winston is represented by a design for a new playhouse at Liverpool. On a restricted site the author has provided all the accommodation necessary for a theatre of this type, including an experimental theatre at lower ground-floor level. The interior is treated in a quiet, attractive and appropriately intimate manner.

A. M. Best shows an ambitious scheme for a basilica at Lourdes; R. G. Parker, a crematorium; and O. Weerasinghe a university for Ceylon.

In addition to the foregoing design theses, mention is due of the colour thesis of J. Sheridan, and the construction theses, including that by M. Riad—a railway and bus station for Cairo; and F. J. M. Ormrod's covered tennis court, in which the author has exploited the use of "Lamella" construction for the pseudo dome over the court.

Interspersed among all the above-mentioned drawings, and also monopolizing the entrance hall, are the numerous six-hour sketch-designs executed by students in all years. These cover a wide range of subjects, and many of them show a remarkable facility for quick conception and appropriate—often dramatic—presentation.

Holiday sketches, models, a series of fifth-year designs other than theses, measured drawings, and a set of working drawings by each of the five years, complete the list of exhibits.

QUESTIONS THAT ARISE

Cubic Capacity of Public Institution

P. H. T. writes: "*Can you inform me as to the present cost per cubic foot of a fairly large workhouse or public institution? The scheme I have in mind would comprise a building for the inmates, an administrative block and boiler rooms, etc. I think it might be possible, however, to put an average value per cubic foot for the whole, including drains, paths, drives, boundary walls, etc.*"

Without further detailed information than that given it would be impossible to give an inclusive price per foot cube to cover the different types of buildings included in an institution of this sort, and without knowledge of the site it is also impossible to include for boundary walls and paths.

The administrative block would cost more than the pavilions or dormitories, while if these blocks were connected by corridors or covered ways, which were included in the calculation of the total cubic contents, this would affect the estimated price.

A rough indication of what these buildings would cost would be:

	Per foot cube
Administrative block....	2/0–2/6
Inmates' pavilions.....	1/9–2/0

An alternative method of arriving at the approximate cost of these buildings is according to the number of patients or inmates.

A guide as to the present-day prices, according to this method, would be about £700–£800 per inmate.

In each case these prices are exclusive of land and furnishings. J. W.

Plaster for Walls

A. B. writes: "*What plaster does your expert recommend where it is necessary to paint or distemper the walls immediately a building is completed? The contemplated building is a factory, and the inconvenience of carrying out internal decorations when once the machinery is installed will be readily understood. In some of the recent London stores I have noticed that there are no signs of the wall plaster being damp, and the colours are fast.*"

It is reasonably safe to do as your correspondent suggests upon plastering finished in Keene's cement on a Portland backing, provided that the brickwork beneath has been given an opportunity of drying out.

This might, however, prove an expensive finish for a factory, and a preferable alternative would be a reliable hydrated lime plaster, painted with an undercoat of one of the special paints having a tung-oil-resin basis, with any desired finish, or distempered in waterbound distemper using an earthy pigment not likely to discolour.

A further alternative even lower in cost and quite suitable for factory work would be to face internally in sand-lime bricks (unplastered) with flat struck joints distempered. The usual cause of blotchy paint and distempering on new work is saponification of the paint by the action of free lime from cement or plaster, liberated during hydration and setting. E. G.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Rural Housing

THE Government proposals in regard to rural housing were outlined by the Minister of Health, on the money resolution authorizing payments for the provision of houses for agricultural workers and others.

Mr. Greenwood said that in the rural district council areas since the war over 41,000 houses had been built. On the whole, it looked as if that was a good figure, but when one considered the number of houses which had been made available for rural workers it was clear that this figure did not carry them very far. A large number of houses in rural district council areas had been provided for the industrial population.

The pressure from the towns on the countryside had restricted the accommodation for the agricultural worker. Behind that there had been the difficulty of the customary wage of the agricultural worker, and the customary rent he had paid in the past. Of the 41,000 houses provided by rural district councils, only 15,000 had been built in purely agricultural parishes, and only a third of these were let to people in agricultural employment. Owing to their reduced resources, the rural district councils would be able to do very little more in housing unless they were given financial assistance.

The financial proposal was to provide £2,000,000 for the purpose. The money was to be allotted on the recommendations of an Advisory Committee, to be appointed by the Minister with the approval of the Treasury, which would consider applications from rural district councils. The houses were to be confined to agricultural parishes. The maximum cost of building a house was to be £350; and it was estimated that it could be let at a rent of 3s. a week, about half of which was to be set aside for the payment of capital charges and repairs. It was difficult to say how many houses would be provided under the scheme, but he thought the number would be about 40,000. The Committee would consider the poverty of the area and they would get away from the flat rate of grant. If the

local authority were able to make part of the contribution that it should make under the Act of 1924, and that was reasonable, it would be asked to make it. The more that could be done, the farther the capital sum involved would go.

In some cases where through sheer poverty the rate contribution was impossible, the whole of it would have to be met, and would be met. The local authority would go before the Committee with their schemes and proposals and the explanation of their poverty, and the Committee would make their recommendations on specific points, the number and type of houses in respect of which special assistance should be given, the date by which the houses were to be completed, the rent at which the houses were to be let, and the amount of the special grant which was to be given. If the estimated product of a penny rate for the present financial year did not exceed 5d. a head of the population and the poundage of the general rates levied for the year 1930 exceeded 10s., they seemed to have reasonable conditions establishing a level of real property. So far as he could tell, out of about 650 rural district council areas in England and Wales the test would include between 300 and 400. It would include all the truly agricultural areas of the country which could be described as really poor. Many authorities had built next to no houses, and some in Scotland had not built any. Where local authorities could not build houses, and where the country would not, there should be, in reserve, the power of the State to step in and make arrangements for the building of the houses. After debate, the resolution was agreed to.

Architects (Registration) Bill

Late on the evening of Thursday, July 9, the House of Commons considered and agreed to the Lords' amendments to the Architects (Registration) Bill.

Housing by Direct Labour

Mr. Day asked the Minister of Health whether he could state the number of local authorities in England and Wales who were at present erecting houses by direct labour; and the number of houses which had been altogether erected by direct labour during the twelve months ended to the last convenient date.

Mr. Greenwood said that, at the latest available date, 118 local authorities were erecting houses by direct labour, and during the twelve months ended March 31 last 5,248 houses were erected by this means.

Timber and Joinery

Commander Bellairs asked the Minister of Health whether he was satisfied that local authorities were acting in conformity with Circular No. 569 of March 24, 1925, which recommended that when there was no alternative to purchasing material from abroad the local authorities should keep in mind preference for goods and materials of Imperial origin; and whether this had been or was being done in connection with timber and joinery used in housing schemes.

Mr. Greenwood said he had no reason to believe that local authorities generally were not acting in conformity with the advice which had been given to them on this subject.

LITERATURE

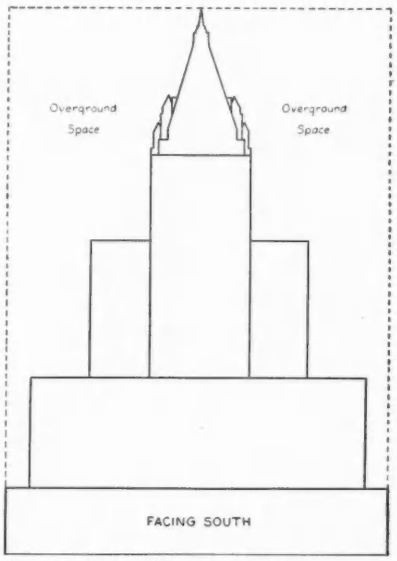
THE NEW YORK REGIONAL SURVEY

THE sixth volume of the New York Regional Survey contains a mass of information of the very first importance to all those concerned with town planning. It is impossible to deal with more than a few of its salient features, but some of these have such a direct relationship to the proposals for the revision of London's building regulations, now under consideration by the L.C.C., that it is absolutely necessary to deal with them to the exclusion of many other features in the book of which the purport bears less immediately on our own problems.

The main factor affecting the future of London is the relationship between possible building masses and the traffic facilities available. In New York, this problem has reached a more advanced stage, with the result that the conclusions that have been reached there are of the greatest value to us. It is, perhaps, not sufficiently recognized that, as regards area, New York is less intensively built up than the central area of London. At the southern end of Manhattan less than half the area is occupied by buildings, and in the central part only about 60 per cent., while the skyscrapers which loom so large in the public mind are less in bulk than would be a single story added to all the buildings in New York.

The regular street plan of New York renders traffic organization easier there, and yet in some districts the congestion is acute. Numberless proposals for duplicating and triplicating traffic routes have been made, but this investigation shows that these are relatively uneconomic, compared with the alternative of regulating building masses, and making better provision for lateral expansion. The position is forcibly put in a quotation from Albert E. Siebert: "At present we are not making progress, but are sliding backward. Every fifty-story building erected means so many more persons on our overcrowded sidewalks and crosswalks, and so many more vehicles on our nearly impassable streets, and also means a definite increase in the intolerable congestion of our subways. It is not possible to build subways fast enough to keep pace with such insane building."

A recent study of land and building costs and revenue affirmed that in a central site in New York the economic height was sixty-three stories, but the land value taken was a very high one, to some extent dictated by the fact that a number of properties must be acquired to provide an area suitable for the design of a high building, in accordance with the zoning regulations. In Chicago, a city more comparable topographically with London, a similar study resulted in a decision in favour of fifteen stories. After a review of such studies the conclusion is reached that the limitation of bulk is of greater importance than the limitation of height in itself. It is thought that it is probably impossible for any large city to control building bulk and uses to an extent that will obviate all congestion during the peak traffic periods, but they become excessive if the peak periods are unduly lengthened owing to delay. Mr. F. K. Stevens is quoted as saying: "I think there is a danger that if the developers continue they will kill the goose that lays the golden egg. In other words, we will crowd so many people into a district that the section will not be able properly to conduct its business."



[*From* Buildings: Their Uses and Spaces about Them.]

Section of the New York Life Insurance Building, illustrating "overground" space.

[*From* Buildings: Their Uses and Spaces About Them. *By courtesy of the* Architectural Record.
Block after block closely built over with four- and five-story tenements in New York. The lofty new apartment districts can be seen in the vicinity of Central Park.

The solution is considered to be that regulations should not prohibit height, but should insist that height shall be related to space on the ground. Proportion and scale between vertical and horizontal dimensions would then be preserved, not merely for the eye, but also to ensure health, safety, economy, and comfortable circulation. Thus, zoning should do much more than regulate distribution of bulks and spaces on lots, blocks and small districts. It should determine the location and proper degree of spaciousness, as well as the reasonable concentration of working and living districts over large areas. It should be an essential part also of any method of dealing with transport improvements.

Another point mentioned in the comparison of London with New York is that the altitude of the sun shows a difference of nearly 11° in favour of the latter city. It is not practicable to review the variations in practice thereby demanded, nor to touch on the extended studies of housing conditions and the review of zoning procedure included in the latter part of this work; it must suffice to add that it would well deserve summarizing as a handbook for those interested in the future of our great cities. H. V. LANCHESTER

Buildings: Their Uses and Spaces About Them. By Thomas Adams, Wayne D. Heydecker and Edward M. Bassett; 1931. Committee on Regional Plan of New York. Price $3.

AN ARCHITECTURAL ESCAPADE

WHAT fun it all is, this three-dimensional scene-painting of Mr. Clough Williams-Ellis's on his Welsh peninsula! What a sedately gay, friendly fantastic comedy one is invited to look upon by means of the one shilling entrance ticket, if one may so describe the little green brochure *Portmeirion Explained. Essays by Several Hands*, edited by Mr. Noel Carrington. Better still, no doubt, to be an actor on that stage, even though "an Authority," in the essay on "Bald Facts," hints at such occasional adversities as "rain for twenty-four hours at a stretch."

This little green book is a delight, with the illustrations from *Country Life* photographs setting lovely scenes for any amount of imagined pretty comedies or romantic drama. Mr. Williams-Ellis, the actor-manager, or "owner-developer," sets forth the story of his enterprise in half a dozen pages, while Mr. A. C. Limber describes "What to do and What to See," when the "very distinct tendency to do nothing whatsoever," which the atmosphere of this materialized dream-place induces, has been sufficiently indulged.

The cue to outside critics and other supers in the comedy is given by Mr. Christopher Hussey in a note reprinted from *Country Life*: "Portmeirion might easily have been an architectural horror. . . . Actually . . . with all its . . . joyous freakishness, Portmeirion is essentially of the soil, and every part bears the authentic touch of the artist." He pleads for something of the same happy touch in some of our larger watering-places.

SOCIETIES AND INSTITUTIONS

CONFERENCE AT THE R.I.B.A.

ON Saturday, June 27, the Board of Architectural Education held a conference with representatives of all the schools of art and technical colleges throughout the country which offer facilities for the instruction of intending architects. Mr. Thomas E. Scott, F.R.I.B.A., headmaster of the Department of Architecture, Building and Surveying, of the Northern Polytechnic, London, read a paper on "Some Problems connected with the training of Architectural Students in Schools of Art and Technical Colleges." A discussion followed on the subject of the paper and on points of general interest. The chair was taken by Mr. L. Sylvester Sullivan, then chairman of the Board of Architectural Education. At the conclusion of the meeting the members of the conference inspected the exhibition of drawings submitted in the final competition for the Rome Scholarship in Architecture, 1931, and a special exhibition of drawings executed by evening school students.

R.I.B.A. EXAMINATIONS

The R.I.B.A. Statutory Examination for the office of District Surveyor under the London Building Acts, and the Examination for the office of Building Surveyor under Local Authorities, will be held at the R.I.B.A., London, on October 14, 15 and 16, 1931. The closing date for receiving applications for admission to the examinations, accompanied by the fee of £3 3s., is September 23. Full particulars of the examinations and applications forms can be obtained from the Secretary, R.I.B.A.

STUDENTS' EVENING AT THE R.I.B.A.

On Tuesday, June 23, a students' evening was held in connection with the R.I.B.A. Exhibition of Architects' Working Drawings. There was a good attendance of students, and they spent a considerable time inspecting the exhibition, which included drawings lent by Messrs. C. Cowles-Voysey, F.R.I.B.A. (Corporation of Hastings, offices at the White Rock Approach; Kingsley Hall, Bow); W. Curtis Green, A.R.A., F.R.I.B.A. (Stockgrove Park); L. Sylvester Sullivan, F.R.I.B.A. (office building at 37–39 Lime Street, London); and Maurice E. Webb, D.S.O., M.C., F.R.I.B.A. (Commercial Union new head office, Cornhill; Sebright's Endowed School, Worcestershire). Messrs. L. Sylvester Sullivan, H. A. Dawson (representing Mr. Maurice E. Webb), John Dower (representing Mr. C. Cowles-Voysey) and Christopher Green (representing Mr. W. Curtis Green) explained to the students the special points of interest in their respective drawings.

THE OWEN JONES STUDENTSHIP

The last day for the receipt of applications for admission to the competition for the Owen Jones Studentship has been extended from July 1 to August 31, 1931.

SMALL HOUSE COMPETITION

The President of the Royal Institute of British Architects has nominated Mr. John Watson, A.R.S.A., F.R.I.B.A., President of the Royal Incorporation of Architects in Scotland, as assessor in the competition for a design for a small house promoted by Associated Newspapers, Ltd., in connection with the "Scottish Ideal Home Exhibition."

CROYDON ARCHITECTS

Coun. Major F. W. Rees and Mr. A. H. Barnes have been elected members of the Science Standing Committee of the R.I.B.A.

Mr. W. H. Ansell has been elected chairman of the Board of Architectural Education.

ARCHITECTS' SKETCHING TOUR

The members of the Essex, Cambs. and Herts. Society of Architects have just returned from a sketching tour in the district of Bruges, which has been most successfully carried through under the leadership of the chairman of the West Essex Chapter, Mr. T. H. B. Scott, F.R.I.B.A. The party visited several places of interest, including the housing scheme at Le Zout, Ghent, Antwerp and Brussels.

LIVERPOOL SCHOOL OF ARCHITECTURE

Prizes and Scholarships—Session 1930–31

Open Scholarships

R.I.B.A. Victory Scholarship: B. B. Lewis.

R.I.B.A. Victory Scholarship, honorary mention: Miss Hilary Archer.

Archibald Dawnay R.I.B.A. Scholarship in Construction, third year: A. Roberts.

Archibald Dawnay R.I.B.A. Scholarship in Construction, fourth year: F. J. M. Ormrod.

Honan Travelling Scholarship of the L.A.S.: L. Berger.

School Scholarships

Lord Waring Travelling Scholarship in Decoration (all years): J. G. R. Sheridan.

Holt Travelling Scholarship, third year: G. Roberts.

Ravenhead Travelling Scholarship, second year: L. H. Burnett.

Holland, Hannen and Cubitt's Prizes for Working Drawings, fourth year: A. G. S. Fidler.

Holland, Hannen and Cubitt's Prizes for Working Drawings, third year: A. E. Rice.

Holland, Hannen and Cubitt's Prizes for Working Drawings, second year: G. C. Timmis.

John Rankin Prize for Sketch Designs, fourth year: A. P. S. Hubbard.

John Rankin Prize for Sketch Designs, third year: J. B. Alcock, H. B. Allsopp.

Gordon Selfridge Prize for Design, second year: M. G. Gilling.

John Lewis Prize for Furniture Design, fourth year: A. G. S. Fidler, A. P. S. Hubbard.

Anthony Minoprio Prize for Rendering: H. B. Allsopp.

Berry Webber Prize, first year: B. T. Howells.

Examination Lists—Session 1930–31

Faculty of Arts: Diploma in Architecture

FIFTH EXAMINATION

(*Exemption from Final Examination for A.R.I.B.A.*)

Distinction in Architectural Design

Banister, H. — Parker, R. G.

Distinction in Architectural Construction

Ormrod, F. J. M.

Ordinary Diploma

Fairhurst, R. F. — Richardson, Rachel J.
Furbur, E. R. — Sheridan, J. G. R.
Hewitson, T. T. — Stirrup, G.
Kelly, R. H. — Weerasinghe, O.

FOURTH EXAMINATION

Distinction in Design

Beckett, S. H. — Parkinson, J. L.
Bennett, A. C. — Peace, F. N.
Berger, L. — Plews, C. E.
Crighton, A. — Rennie, H. G.

ROYAL BRITISH SCULPTORS

The Royal Society of British Sculptors have awarded their silver medal "for the best work of the year by a British Sculptor in any way exhibited to the Public in London" to Mr. Gilbert Bayes, V-P.R.B.S., for his frieze "Drama through the Ages," on the Saville Theatre, Shaftesbury Avenue, W.C.

THE INSTITUTE OF LANDSCAPE ARCHITECTS

Mr. Edward White has been elected the new President of the Institute of Landscape Architects.

INSTITUTION OF SANITARY ENGINEERS

The summer meeting of the Institution of Sanitary Engineers was held on Thursday and Friday, June 25 and 26. An inspection of the Ford Motor Company's works at Dagenham was made on Thursday and the general meeting was held at the Holborn Restaurant on Friday evening, followed by dinner and a dance. Members of the Institution of Municipal and County Engineers (Eastern District) and the Chartered Surveyors' Institution (Essex Branch) also attended the visit to Dagenham.

HIGHER BUILDING EDUCATION

The announcement which appears on an advertisement page in this issue concerning the establishment of a degree course in building in the University of Manchester is of importance. It is interesting to observe the extent to which the educational facilities for building students have developed during recent years. The original system has been almost entirely replaced by the arrangement of (a) general courses, which provide for those requiring instruction in the work of the industry as a whole; and (b) trade courses, suitable for apprentices requiring technical training in their own particular craft. A further stage in the development was reached last year when there was introduced the scheme of National certificates and diplomas in building, instituted by the Institute of Builders in conjunction with the Board of Education.

The degree course in building technology in the Manchester University will cover a period of three years, and will lead to the degree of Bachelor of Technical Science. It will provide a comprehensive training in building science and construction, and, in addition to fundamental subjects such as mathematics, mechanics, chemistry and physics, it includes building construction, builders' quantities, structural and reinforced concrete design, surveying and levelling, builders' estimates, accountancy and costing.

LAW REPORT

ALLEGED PARTNERSHIP WITH LANDOWNER : BUILDER'S ACTION

Cooper v. *Pilkington. Chancery Division. Before Lord Justice Romer*

THIS was an action by Mr. John Cooper, a master builder, of Quarry Wood, East Grinstead, against Mr. John Pilkington and Mr. H. E. Pilkington, trading as farmers, of Owletts Farm, Ashurst Wood, East Grinstead, seeking to establish a partnership between plaintiff and defendants in certain building operations.

The defendants denied that any partnership existed, as alleged.

Mr. E. G. Palmer appeared for the plaintiff and Mr. Robert Fortune for the defendants.

His lordship, after hearing the evidence, gave judgment. He said in this case plaintiff was seeking to establish between himself and the defendant firm a partnership in connection with the building of certain bungalows that took place in 1927 and 1928 on land the property of the defendants. This was unfortunate litigation because his lordship could not help thinking that the whole matter was due to a misapprehension in the mind of the plaintiff and his wife as to the effect of what was said at a certain interview that took place between plaintiff and Mr. Henry Pilkington, at which Mrs. Cooper said she was present, but at which interview, according to Mr. Pilkington, she was not present. His lordship thought that it was more probable that she was present at the interview, having regard to the version she had given in the witness box. He should therefore assume that she was present.

It appeared that in 1927 Mr. Cooper was a master builder, and he had done a certain amount of work for the defendant firm in connection with their farm. Then the plaintiff mentioned to Mr. Henry Pilkington that he would like to build a house for himself upon a portion of Owletts Farm. They went down to Quarry Wood and to a certain spot where there was a convenient frontage to the high road, and it was common ground that on that occasion the plot of land in the north-east corner was selected.

He accepted the evidence of Mr. Pilkington that at that time the plot of land was not staked out, but was definitely agreed upon between him and the plaintiff. It had a depth of 200 ft. Mr. Pilkington wanted £50 for it. Plaintiff was not willing to give more than £25, and ultimately £25 was agreed upon as the price.

Thereupon Mr. Cooper began to build his bungalow on the plot and he cleared enough space on the plot obviously with the intention of building a second bungalow there. Mr. Pilkington was not willing that two bungalows should be built on it. According to Mr. Pilkington, thereupon it was agreed that another bungalow should be built on some adjoining land.

It was in connection with the second bungalow that the dispute between the parties had arisen. It was agreed that the actual building of the bungalow should be entrusted to the plaintiff. It was to be built partly from material obtained from some old cottages. Plaintiff's case was that the bungalow should be built by him in partnership with the defendant firm. This the defendants denied. Before referring to the evidence his lordship wished to say that in order to establish a partnership, the terms of the partnership must be definitely proved. Further, that the defendant was to share profits was

prima facie evidence of a partnership, but was by no means conclusive. According to the plaintiff he was to have £3 10s. a week and a share of the profits, and in this he was corroborated by his wife. It was said by Mr. Henry Pilkington that what was settled was this: that plaintiff should build the bungalow and that when it was sold he was to get not only £3 10s. a week but a share in the profits. The two accounts agreed exactly, except that according to Mr. H. Pilkington the profit to be divided was to be contingent on the house being sold. The court had to look at what took place afterwards, to see whether the parties treated themselves as partners. Here Mrs. Cooper got out figures as to the bungalow and showed that a balance was due to the plaintiff. If there had been a partnership it was inconceivable to his lordship's mind that the parties should have settled the small balance like that instead of waiting to see what the profit would be, if and when ascertained. To settle the balance as was done was more consistent with the employment of a contractor. So far as it was on the plaintiff to discharge the onus that was upon him of proving a partnership in the building of the bungalow, he had failed to do so. There was no single document in existence which even suggested it. Defendants denied that plaintiff was ever a partner, and he came to the conclusion that the plaintiff had failed in establishing a partnership.

Plaintiff also alleged that there was a partnership in relation to other bungalows on land of the defendants'. But there was no suggestion that there was a contract for a partnership entered into between them, except in relation to the second bungalow. His lordship unhesitatingly came to the conclusion that the plaintiff had failed to establish the onus laid upon him. The action must be dismissed, and defendants must pay the costs of the action and counterclaim.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Harehills Lane Baptist Church, Leeds (pages 71–74). General contractors, Armitage and Hodgson, Ltd. Sub-contractors : Edgar Fitton & Co., heating; Woodhead Partners, electric lighting; Hollis Bros. & Co., Ltd., wood-block flooring; J. and H. Patteson, Ltd., marble and mosaic work; The Kingsmill Metal Co., wrought ironwork and bronze memorial panels; C. E. Welstead, Ltd., metal windows; Chas. E. Steel, lead glazing; Wood, Wordsworth & Co., organ; G. H. and S. Keen, carved oak communion chair; Geo. M. Hammer & Co., Ltd., oak chairs.

"Bell Moor," The Heath, Hampstead (pages 79–81). General contractors, F. G. Minter, Ltd., who were also responsible for the joinery. Sub-contractors : Ragusa Asphalte Paving Co., Ltd., asphalt; Bath and Portland Stone Firms, stone; Smith, Walker, Ltd., structural steel; "Vita" Glass Marketing Board, glass; Cashmore Art Workers, ornamental lamps; H. and A. Booth, Ltd., central heating; Berkeley Electrical Engineering Co., Ltd., electrical installation; Woodfyt Sales, Ltd., electric light fixtures on main staircases; Matthew Hall & Co., Ltd., plumbing; Shanks, Ltd., sanitary fittings; Nettlefold and Sons, Ltd., door furniture; Williams and Williams, Ltd., casements; S. W. Farmer and Son, Ltd., iron staircases; Carter & Co., Ltd., tiling and patent flooring; Hammond Bros. and Champness, Ltd., lifts ; Kelvinator, Ltd., refrigerators ; G. F. Sharp, craftex decorations.

Beckford, East Grinstead, additions (page 84). General contractors, A. W. King and Sons. Sub-contractors : Wood, Russell & Co., Ltd., Sentry boilers.

ANNOUNCEMENTS

Messrs. Wigglesworth and Marshall-Mackenzie, FF.R.I.B.A., have removed their office to 52 Seymour Street, Portman Square, London, W.1. Telephone No. : Ambassador 1157.

Sir Edwin L. Lutyens, K.C.I.E., R.A., has removed his office to 5 Eaton Gate, London, S.W.1. Telephone No. : Sloane 9008. Telegrams : "Aedificavi Sloane, London."

COMPETITIONS OPEN

July 17.—Buildings for a street improvement scheme. Assessor : George Drysdale, F.R.I.B.A. Premiums : 50 guineas and 20 guineas. Conditions, etc., obtainable from the Borough Surveyor, Council House, Walsall, until July 17. (Deposit £1 1s.)

July 31.—Sending-in day. Proposed Nurses' Home at the Royal Asylum, Montrose. Limited to architects practising in the counties of Aberdeen, Angus, Fife, Kincardine and Perth. Assessor : John Watson, F.R.I.B.A. Premiums : £75, £50 and £25. Conditions, etc., obtainable from C. K. Alexander, Clerk and Treasurer, Royal Asylum, Montrose.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor : Percy Thomas, O.B.E., F.R.I.B.A. Premiums : £500, £400, £300 and £200. Conditions from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor : Andrew N. Prentice, F.R.I.B.A. Premiums : £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

THE ARCHITECTS' DIARY

WEDNESDAY, JULY 15

BEAUX ARTS GALLERY, Bruton Street, W. "The Art of Yesterday," an exhibition of Paintings, Drawings and Sculpture by leading artists. Closing date, August 14.

THURSDAY, JULY 16

MARGATE SCHOOL OF ART. Last of twelve lectures on Beauty in Design : "Illumination and Colour." By R. Goulburn Lovell, A.R.I.B.A. **5.30 p.m.**

SCIENCE MUSEUM, Exhibition Road, S.W.7. Lecture on "Lighting and Illumination." By G. Tilghman Richards. **12 noon.**

INSTITUTE OF FUEL, 53 Victoria Street, S.W.1: Meeting in the Marylebone Room, Great Central Hotel, London. **10.30 a.m.**

NATIONAL SMOKE ABATEMENT SOCIETY, 71 Eccleston Square, S.W.1. Council Meeting followed by Open Meeting. Address : "Smoke Abatement from the Manufacturers' Point of View." By W. Prescott, Federation of British Industries. **3.15 p.m.**

FRIDAY, JULY 17

DESIGN AND INDUSTRIES ASSOCIATION. Short Cruise to Norway, returning July 24.

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. Annual Exhibition to be held at Winchester. Until July 21.

MUNICIPAL AND COUNTY ENGINEERS. Annual General Meeting and Conference. Birmingham. Until July 20.

SATURDAY, JULY 18

Sunrise, 5.2 a.m. Sunset, 9.9 p.m.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Visit to the neighbourhood of Guildford by the Brighton and Guildford Chapters.

NEW ESTATES COMMUNITY COMMITTEE, 26 Bedford Square, W.C.1. Meeting. **12 noon.**

NEW ESTATES CONSULTATIVE COUNCIL, 26 Bedford Square, W.C.1. Meeting. **2 p.m.**

MONDAY, JULY 20

VICTORIA AND ALBERT MUSEUM, Cromwell Road, S.W.7. Lecture on "Ironwork." **12 noon.**

THE COUNCIL FOR THE PRESERVATION OF RURAL ENGLAND. Public Meeting at Shire Hall, Hereford. **2.45 p.m.**

TUESDAY, JULY 21

THE LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. Visit to the new abattoir, Prescot Road. **5 p.m.**

WEDNESDAY, JULY 22

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to St. Mary-le-Bow, Cheapside, E.C.2. Tickets obtainable from the Secretary. **3 p.m.**

THURSDAY, JULY 23

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to new Offices of *Punch*, Bouverie Street, E.C.4. Tickets obtainable from the Secretary. **3 p.m.**

BRITISH MUSEUM, Bloomsbury, W.C.1. Lecture on "Origins of Architecture."—II. (Roman, etc.) **12 noon.**

SATURDAY, JULY 25

Sunrise, 5.11 a.m. Sunset, 9.0 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Tour to Luxembourg, visiting Dinant, Lesse Valley, Ardennes Forest and Treves. Return August 4. Full particulars may be obtained from the Secretary.

MONDAY, JULY 27

INSTITUTE OF PUBLIC CLEANSING. International Conference, Guildhall, London. Until July 31.

TUESDAY, JULY 28

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to Welwyn Garden City. Tickets obtainable from the Secretary. **3 p.m.**

THURSDAY, JULY 30

NATIONAL PORTRAIT GALLERY, St. Martin's Place, W.C.2. Lecture on "Inigo Jones." By John Steegmann, M.A. **3 p.m.**

SATURDAY, AUGUST 1

Sunrise, 5.22 a.m. Sunset, 8.50 p.m.

VICTORIA AND ALBERT MUSEUM, Cromwell Road, S.W.7. Lecture on "Ecclesiastical Metalwork." **12 noon.**

MONDAY, AUGUST 3

Bank Holiday.

SATURDAY, AUGUST 8

Sunrise, 5.33 a.m. Sunset, 8.38 p.m.

SATURDAY, AUGUST 15

Sunrise, 5.44 a.m. Sunset, 8.24 p.m.

MONDAY, AUGUST 17

Closing date of THE ARCHITECTS' JOURNAL July Holiday Sketches Competition.

SATURDAY, AUGUST 22

Sunrise, 5.54 a.m. Sunset, 8.11 p.m.

TRADE NOTES

An important announcement has just been made in connection with the electrical heating of buildings. It is that Messrs. Barker, Young & Co. will in future be solely responsible for the marketing in Great Britain and the Irish Free State of the Unity tubular heater, the Morganite system of radiant heating and the Electrorad system.

The Unity tubular heater, which enjoys a wide popularity, is manufactured by Messrs. Young, Osmond and Young, Ltd., and has hitherto been marketed by them. The Morganite system of radiant heating, which has recently become prominent in connection with the heating of schools, is manufactured by the Morgan Crucible Co., who have been responsible for the compilation of much data on that form of heating. The Electrorad system is manufactured by the National Radiator Company and has hitherto been marketed by the Electro-Gas Development Co., Ltd., who have effected a large number of installations on this system.

These three systems have, in the past, been commercially competitive, but they are, it is understood, in reality technically complementary. Thus it was thought that the greatest service could be rendered to the profession, etc., by the formation of a centralized organization dealing exclusively with the electrical heating of buildings and possessing the sum total of experience and manufacturing resources. The firm of Messrs. Barker, Young & Co., therefore, has been specially formed to fill this need. It is claimed to comprise a technical staff of wide experience both in heating and electrical technology, who will be able to give reliable and unprejudiced advice on all electrical heating problems.

The three systems which have hitherto been in competition have one essential point in common: namely, that they depend not upon thermal storage but upon the instantaneous conversion of electrical energy into heat, and the difference between them lies purely in the matter of dissipating this heat into the room. The systems differ widely in so far as the radiators are dissimilar in construction, appearance, weight and surface loadings. Also, the method of fixing and the positions in which the radiators are placed are unique to each system.

The Unity tubular system depends for its operation upon a mixture of low-temperature radiation and convection. The Morganite radiator system depends upon low-temperature radiation of relatively high intensity delivered from a small service. The Electrorad low-temperature panel system emits a high proportion of radiation over a wide surface at a low surface temperature.

The Morganite system, therefore, is most suitable for buildings where the degree of ventilating is excessive and where it is necessary to minimize convection as far as possible and to provide for a distribution of radiation strictly in accordance with the relative heat losses of the room through the walls, ceiling or floor. The Unity tubular system is, of course, well known as one of the simplest methods of space warming by electricity that has yet been devised, as may be testified by the fact that over 2,000 installations are now in operation. The Electrorad low-temperature panel system consists of an extensive metallic plate which is warmed over its surface by means of removable elements located in coils on the rear face of the plate. When fitted to a

Mr. E. Mac Young
(of Young, Osmond and Young, Ltd.)

wall or ceiling it projects 1¼ ins. as a maximum and presents the appearance of a moulded architectural panel. It may also be recessed in the plaster or concrete. The application of this system has hitherto been confined to schools, private houses and first-class office buildings.

*

Messrs. Concrete, Ltd., of Leeds and London, have issued a new catalogue describing and illustrating their Bison precast and tile floors and roofs. There is no difference in the strength obtained from the two floors, but the observations in the catalogue, some of which are as follows, will be found helpful to architects in arriving at a decision as to which class of floor is more suitable for any particular purpose.

Owing to the fact that Bison precast units are grouted and not laid in one operation, they do not "ring" to the extent that a tile floor does. The makers, therefore, would recommend a precast floor as being more soundproof than a tile floor. Bison precast flooring, since it requires no timber shuttering, is speedy in erection, and the fact that it is precast allows of it being walked on by other trades immediately it is in place. There is also no wet concrete to contend with other than that used for grouting up. As regards adaptability, a tile floor has the advantage over a precast floor, and should be used wherever there is any question as to spans and possible bearings, since a precast floor relies upon accurate dimensions and is often at fault where these have to be changed as the contract proceeds. If plaster is required on the under surface a tile or precast floor will take this equally well. Where plaster is not to be used, a tile floor is unsightly, and a precast floor with pointed joints has a much better appearance. These, the firm state, cover some of the outstanding questions which are raised in considering a floor. While each type of floor has certain advantages over the other, there is little to choose between them. The precast floors have a big advantage in speed in erection at the site and the hollow tile floors have the advantage for big spans and in buildings on an awkward site. In the catalogue is printed an imposing list of London and provincial buildings in which the firm's precast or tile floors have been used.

*

The use of bricks made from white burning clay for light reflection is becoming increasingly common, particularly in big blocks of flats and office buildings in the West End. The chief reasons for this are the mellow appearance avoiding all glare, the very low cost and the high structural strength and weathering qualities of the "Phorpres" quality. An entire works of London Brick Company and Forders, Ltd., is now concentrated upon the production of these bricks, and this simplification has reduced production costs considerably.

The Directors of Westminster Bank Limited have declared an interim dividend of 9 per cent. for the half-year ended June 30 on the £4 shares, and the maximum dividend of 6¼ per cent. on the £1 shares for the same period. The dividends (less income tax) will be payable on August 1.

Morganite radiation thermostat desk type.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The Surrey Education Committee has approved plans for erection of a secondary school for boys at BEDDINGTON at a cost of £43,200.

The Surrey Education Committee has decided to proceed with the provision of two mixed central schools, each for 360 children, in the BEDDINGTON and WALLINGTON area.

The BERMONDSEY B.C. has approved plans for the erection of fifty flats in Pages Walk and twenty-four flats in Elgar Street.

The BERMONDSEY B.C. is to prepare three clearance schemes for the Elgar Street, Charlotte Place, and Bryants Alley areas.

Plans passed by BERMONDSEY Corporation: Alterations, St. Helena Tavern, St. Helena Road, for Messrs. Hoare & Co., Ltd.; eight tenements, Paradise Street, for Messrs. Geo. Parker and Sons, Ltd.

The Surrey Education Committee has submitted to the Board of Education plans for the erection of a secondary school at COULSDON, at a cost of £47,000.

Plans passed by the DARTFORD U.D.C.: Extensions, Prince of Orange public-house, Heath Street, for Messrs. C. N. Kidd and Son, Ltd.; offices, off Hythe Street, for Messrs. Daren, Ltd.; club premises, Spital Street, for the Dartford Conservative Club, Ltd.; seven bungalows, Windsor Drive, for Mr. G. H. Giles; seven bungalows, Tile Kiln Lane, for Mr. C. A. Taylor.

The HACKNEY B.C. has scheduled several areas, involving some 200 houses, for clearance schemes.

Plans passed by the ILFORD Corporation: Eight shops and houses, Eastern Avenue, for Mr. L. W. Robinson; thirty-two houses, Park View Gardens, for Mr. J. Aldridge; three shops and houses, Loxford Parade, eight houses, Vaughan Gardens, for Mr. T. Anders; two houses, Park Road, for Mr. E. Meredith; two houses, Roy Gardens, eight houses, Falmouth Gardens, eight houses, Moss Terrace, workshop, Green Lane, and twenty-six houses, Kelsie Gardens, for Mr. G. F. Siegerts; thirty-nine houses, Cedar Park Gardens, for Mr. F. Smith; eighteen houses, Vista Drive, for Mr. P. G. Ashton; four houses, Glendale Avenue, for Mr. W. Crampin; eight houses, Tomswood Hill, for Messrs. Haines and Warwick, Ltd.; two houses, The Drive, for Mr. A. P. Griggs; twenty-six houses, Glenwood Gardens, for Mr. A. Smith; thirteen houses, Henley Road, for Messrs. E. Glenny and Son; eighteen houses, Campbell Avenue, for Mr. W. Wakeling; two houses, Redbridge Lane, for Mr. W. M. Edwards; five houses, Redbridge Lane, for Messrs. Baskett and Brown; six houses, Thornton Road, for Mr. W. L. Thompson; alterations, 245 High Road, for Messrs. Cuthbert Lake and Sutton; alterations, 282 Henley Road, for Messrs. Storrar and Hunt; additions, United Methodist schools, Eastern Avenue, for Messrs. G. Baines and Son.

The Surrey Education Committee has approved plans for the new Tiffin County School for Girls at KINGSTON, the cost being estimated at £45,000.

The Surrey Education Committee is preparing detailed plans for extensions at the KINGSTON Technical Institute.

The Surrey C.C. has appointed Messrs. Douglas Matthews, Son and Ridley as architects to prepare plans for extensions at the RICHMOND hospital.

The trustees of Percy Hall, Abbey Street, and Jamaica Road, ROTHERHITHE, are to rebuild the premises.

The governors of the WIMBLEDON School for Girls have decided to erect a gymnasium at a cost of £2,930.

SOUTHERN COUNTIES

Plans passed at BRIGHTON: Two houses, Graham Avenue, for Mr. E. H. Rowe; two bungalows, Reservoir Road, for Miss L. Anson; seven houses, King Charles Avenue, Woodingdean, for Mr. W. H. Clark; recreation room, Whitehawk Road, for St. Mark's Parochial Church Council; alterations, 1 Belvedere Terrace, for Palmeira Avenue Mansions Estate Co.; additions, Convent of Our Lady of Lourdes, London Road, Withdean, for the Rev. Mother Superior; two houses, Vernon Avenue, Woodingdean, for Mr. H. King-Jones; extension of warehouse, 28A Sillwood Street, for Mr. S. A. Feldwicke; new classrooms, St. Mary Magdalen's Schools, Upper North Street, for the managers.

The Hampshire Education Committee is to enlarge the CHILWORTH school at a cost of £7,000.

The Hampshire Education Committee is to erect a junior school at WOOTTON MILTON, at a cost of £3,840.

SOUTH-WESTERN COUNTIES

The CHELTENHAM Corporation has asked the Borough Engineer to report as to the desirability of revising the building bylaws in connection with representations by the Naunton Estates, Ltd., for the use of hollow blocks in lieu of bricks.

Plans passed by the CHELTENHAM Corporation: Cinema, Winchcomb Street, for Albany Ward Theatres, Ltd.; four houses, Naunton Lane, for Naunton Estates, Ltd.; house, Charlton Lane, for Mr. G. E. Wild; cloak-rooms, etc., St. Paul's Practising School, St. Paul's Road, for the College Committee; extensions, Savoy Hotel, Bayshill Road, for Mr. F. Gregg.

MIDLAND COUNTIES

The BIRMINGHAM Corporation is to obtain tenders for leasing the island site in High Street for development.

The BIRMINGHAM Corporation is to erect twelve houses for the police on the Weoley Castle estate and the Daisy Farm estate at a cost of £5,200.

The BIRMINGHAM Corporation is to reconstruct and enlarge the Holyhead police station at a cost of £6,500.

The DUDLEY Education Committee is obtaining tenders for the erection of a senior school, Brewery Fields, to the plans of Messrs. Crouch, Butler and Savage.

The NEWARK R.D.C. is to erect twenty houses in the parish of Balderton.

NORTHERN COUNTIES

The HULL Corporation is now to obtain tenders for the construction of baths in Albert Avenue.

The HULL Corporation has approved the layout, prepared by the city architect, for the erection of houses in Barnsley Street.

The HULL Corporation is to obtain tenders for the erection of a further 600 houses on the Endyke estate.

The LANCASTER Corporation has adopted a scheme, prepared by the borough engineer, for the development of the Ryelands estate, provision being made for bowling greens, putting greens, playground shelters, etc., at a cost of £8,000.

The MANCHESTER Education Committee is now obtaining tenders for the erection of a senior school at Withington.

The MANCHESTER Education Committee has accepted the tender of Messrs. Ogden Bros., Ltd., Oldham, for extensions at New Moston Council school.

The MANCHESTER Corporation has had plans prepared for the erection of residential flats at Fog Lane, Didsbury, and asked the sub-committee to report on the general question of the erection of residential buildings or flats.

The MANCHESTER Corporation is seeking grants for schemes for the erection of wash-houses at Collyhurst and Abbey Hey.

The MANCHESTER Corporation is to erect two blocks of shops at Moor End, Northenden.

The MANCHESTER Education Committee has accepted the tender of Messrs. Ogden Bros. Ltd., Oldham, for the erection of a nursery school and domestic block at Palmerston Street school.

The MANCHESTER Education Committee has accepted the tender of Messrs. Tinker & Young, Ltd., for the erection of new buildings for the Collyhurst council school.

The Lancashire Education Committee is to erect a branch county library at PRESTWICH.

The ROCHDALE Corporation is to erect a new fire-station and thirty-two dwellings for the accommodation of the firemen.

The SALFORD Corporation is to erect 138 flats at Wheaters Field, Broughton, at a cost of £75,750.

The SALFORD Corporation is to erect conveniences in Seedley Park, at a cost of £1,200.

Plans passed by the SHEFFIELD Corporation: Two houses, Richmond Road, for Mr. V. L. Ward; three houses, Kennedy Road, for Messrs. J. Marsh and Son; four houses, Whirlow Grove, for Mr. W. Darwent; three houses, Bobcroft Grove, for Mr. W. Croft; two houses, Harley Road, for Mr W. Green; fourteen houses, Chesterfield Road, for Mr. J. H. Dyson; two houses, Harley Road, for Mr. W. E. Mottram; two houses, Struan Road, for Mr. D. Richervy; two houses, Haugh Lane, for Mr. G. M. Taylor; four houses, Norton Lees Crescent, for Messrs. Bonser Bros.; two houses, Redmires Lane, for Mr. S. Peat; two houses, Barnsley Road, for Messrs. Oxspring Bros.; twelve houses, Hall Road, for Messrs. W. and E. Sadler, Ltd.; six houses, Parkhear Road, for Mr. A. Ramsay; bank, Ecclesall Road, for Sheffield Savings Bank; four houses, Dalmore Road, for Messrs. Plant Bros.; four houses, Richmond Road, for Mr. F. Talbot; four houses, Retford Road, for Mr. J. E. Payling.

The STOCKPORT Corporation is to erect 558 houses on the Garners Lane estate.

The Durham County Public Assistance Committee is to erect relief offices at TANFIELD, at a cost of £1,600.

In connection with the Seacombe Ferry improvement scheme, the WALLASEY Corporation is to erect a new booking hall and clock tower.

The WARRINGTON Corporation has decided to provide 119 houses for persons to be displaced through the James Street clearance scheme.

Plans passed by WARRINGTON Corporation: Extensions to bakery, Goulden Street, for Messrs. Bennetts; three houses, Manchester Road, for Mr. R. Smith; assembly hall, Westy Lane, for Rev. J. L. Cullen; building, Priestley Street, for Whitecross Co., Ltd.; bridge over road, Rose and Crown Street, for Messrs. Thomas Whittle and Sons, Ltd.; alterations, works, Academy Street, for Messrs. Rylands Bros., Ltd.

SCOTLAND

The GLASGOW Education Committee has approved a site at Carnwadric for the erection of an elementary school, and, in the meantime, is to erect a temporary school with ten classrooms.

The GLASGOW Education Committee has acquired land for the extension of St. Columba's Roman Catholic school at Grovepark Street.

The GLASGOW Corporation has asked the medical officer of health to report on the advisability of establishing a hospital for nervous diseases.

Plans passed by the GLASGOW Corporation: Temporary building, Hillview Street, Shettleston, for the Apostolic Church; temporary hall, Paisley Road, Cardonald, for the Cardonald Unionist Association.

The GLASGOW Education Committee has obtained sanction to borrow £6,000 for the erection of a temporary school at King's Park.

The GLASGOW Education Committee is to undertake alterations and repairs at various schools, at a cost of £28,000.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

STAIRCASE IN A STUTTGART STORE

HOUSED IN A SEMICIRCULAR WINDOW BAY FEATURE, CONSTRUCTED OF STEEL AND GLASS

[*Eisenlohr and Pfennig, Architects*

THE FEATURE AS PRESENTED TO THE CAMERA'S EYE

THE subject chosen for illustration above, and by way of a detail drawing overleaf, is one of the two principal staircases in the new building of the Breuninger Store, Stuttgart. The actual stairs are within the building, but the half-landings project into a semicircular bay, which is glazed through its entire height, and are cantilevered from beams which form part of the general steel frame.

The window is constructed from steel channels, running vertically where the windows meet the two walls, and horizontally at 3 ft. 3½ in. centres. Every fourth horizontal member is level with a landing, to which it is held by three steel brackets spanning the 12 ins. or so of space between the edge of the landing and the window.

The joinery generally is of Jarrah, stained to a deeper tone of its natural colour, and polished. The treads are 12½ ins. and the risers 6½ ins., resulting in very easy going, which could not have been obtained had the landings been contained within the building.

The ironwork of the balustrades is painted blue, and the circular handrail is of brass; all wall surfaces are painted bright green, with a fine stippled finish. The building generally is faced with slabs of travertine, 3 ft. 3½ ins. by 1 ft. 9¾ ins. by 2 ins. thick, which line through with the horizontal bars of the window.

IN BECHSTEIN HALL, W.

WALL TREATMENT IN FABRIC, WOOD AND GLASS

[*Sir John Burnet & Partners, Architects.*

LOOKING ACROSS THE LOBBY FROM FRONT TO BACK SHOWROOMS

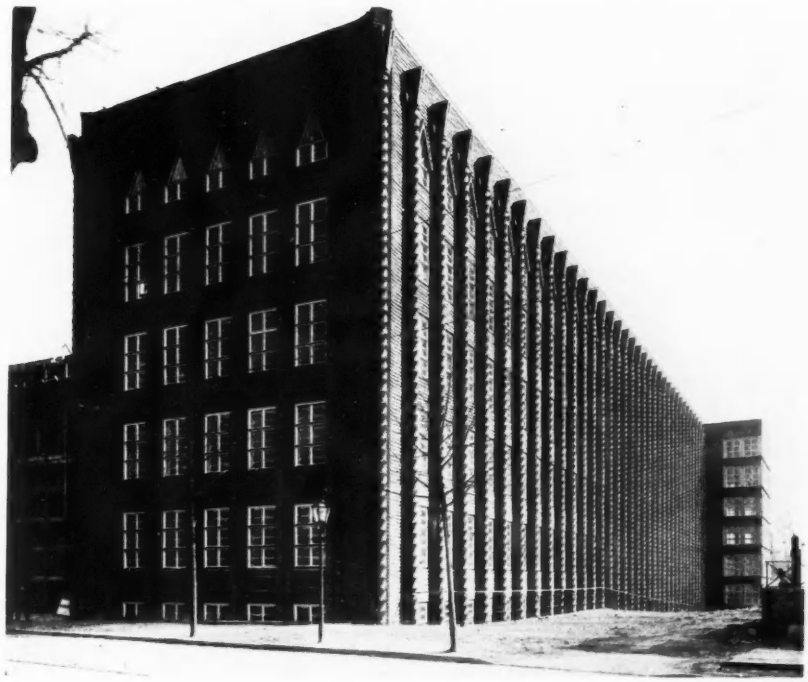
ABOVE is a photograph and overleaf are details, drawn to scales of half full-size and ¼-in. to one foot, of one of the walls of the staircase hall or lobby, which is situated between the front and back showrooms of Bechstein Hall, Brook Street, W.

The doors on the left lead to the staircase; the others to the back showroom. The former are of walnut and are fitted with fire-resisting panels of clear glass, relieved with bands of acid-treated glass. The leaves have antique bronze grip-and-push handles. On the surrounding wall is a woven fabric, specially designed with musical instruments as motifs. The floor is in oak blocks laid to pattern, the moulded skirting and base are of black wood, and the ceiling and frieze are of plaster, painted pale cream.

This detail is supplementary to that taken from the same building which was the subject of a photograph and drawings in the issue for June 24 last.

SELECTED PRECEDENTS:

FACTORY FASHIONS FROM ABROAD



1. THE HAUS NEUERBERG CIGARETTE FACTORY, HAMBURG

[Fritz Höger, Architect.

THE factory is far less stereotyped in its external character than is popularly imagined. Roughly speaking, there are two ways in which it can be designed: it can either be considered as a purely engineering job, careless of niceties of appearance; or it can be planned so as to make the best of what is generally by no means necessarily unpromising raw material. In the latter class (with which we are alone concerned here), two schools of design exist. One seeks to ennoble the factory with intimate graces borrowed from the idiom of public or domestic architecture; the other frankly accepts it as such, but strives by good grouping and proportion, with a minimum of adventitious detail, to make it express a certain massive industrial dignity.

Figures 1 and 2, the work of a past master of intricate brickwork, are examples of somewhat self-consciously "civic" embellishment. The pleasantly fantastic pattern of the window surrounds in figure 2 certainly redeems the building from the grim, box-like monotony that characterizes so many uniformly-fenestrated factories. In figure 1—where the traditional skill of Hamburg bricklayers was available and has been exploited to the full—the same kind of decoration, in no way germane to the nature of a factory, reappears in a rather exaggerated degree. This building might be mistaken for an important block of offices, such as Herr Höger's "Sprinkenhof" or "Chilehaus" in the same city.

[Fritz Höger, Architect.

2. THE SCHERK PERFUME FACTORY, SÜDENDE, BERLIN

Figure 3, which wears a very English, Neo-Georgian air, is a not unsuccessful attempt to impart something of classic calm to a modern brewery. There are few breweries in beer-drinking (and -exporting) Denmark, but in a small country such as there are, being of considerable magnitude, naturally assume the character of national monuments.

Figures 4 and 6 are compositions in which the central features are towers serving the prosaic function of water cisterns. The latter, erected during the war, is the work of the first architect to make architectural history with a factory building—the famous Turbine-Shop at the A.E.G. Works in Berlin, which dates from 1909. The former, less skilfully handled, evinces good disposition of mass; while the slightly over-architecturalized tower fits well enough into an industrial valley landscape of tall chimneys.

Figure 5 is an example of the simplest possible kind, being a perfectly square, perfectly plain, box-like structure. Yet, though it relies for effect on nothing more than the accentuation of its floor-levels by alternate bands of red-brick and white cement-stuccoed wallage, its unsophisticated appearance is pleasing. THE ARCHITECTS' JOURNAL

WEDNESDAY, JULY 22, 1931

OFFICIAL PATRONAGE FOR INDUSTRIAL DESIGN

SO it has come at last ! Design, the poor relation of Industry, has been officially patted on the head and provided with a heartening array of deputy aunts and uncles to watch its welfare.

The Board of Trade has appointed a committee, under the chairmanship of Lord Gorell, to consider the desirability of forming in London a standing exhibition of articles of everyday use and good design, and the desirability of travelling exhibitions of the same kind, both at home and abroad, and (most difficult of all to consider) the constitution of the central body which should be charged with the work of co-ordinating these activities; and, finally, finance.

Whether this committee owes its existence to an official desire to do something or other to stifle the growing volume of criticism concerning our national ineptitude in design, or whether it is the preliminary manifestation of some constructive planning by the Board of Trade to bring design into effective relation with industrial production, the composition of the committee will prevent it from becoming one of those bodies which are determined never to offend permanent officials or powerful politicians and which, with an air of tremendous purpose, achieve exactly nothing.

None of the persons on it is temperamentally disposed to let sleeping boards lie, and we are hopeful of some practical outcome of its work when we see among its members such names as Howard Robertson, Clough Williams-Ellis, Roger Fry, C. A. Richter, Professor E. W. Tristram and Harry Trethowan.

More than one organization that is interested in the design of industrial products is (*ex officio* presumably) represented : the President of the Design and Industries Association, for example. It will probably occur to the committee, in considering their problem of organization, that there are societies in existence whose activities might usefully be co-ordinated for the service of these exhibitions-to-be.

A few months ago it was suggested, quite unofficially, in an article in *The Architectural Review*, that a sort of Islamic marriage of convenience might well be arranged between the Royal Society of Arts, the Design and Industries Association, and the Society of Industrial Artists, so that industrial design might be improved by the pooling of their functions. Those three societies (and particularly the first two) have accumulated much useful experience in the heart-breaking task of acting as liaison between design and industry; and if the new-born committee could make use of that experience, and ultimately bring about a close and amicable partnership between all the organizations that, according to their lights, are tinkering with the problem of betterment in design, it could save itself a lot of costly and discouraging experimental work, and enlist and perhaps direct an abundance of expert help.

But the chief difficulty that confronts the committee is not organization nor even finance; it is the supply of articles of good design, fit to be exhibited. Anyone who inspects in detail the weary miles of muck that line the aisles of the British Industries Fair every year; who examines the fancy goods deparments of retail establishments, large and small; who mourns the snail's progress of modern ideas of design in the trades that are responsible for making the Englishman's home what it usually is—any such conscientious observer is overpowered with depression. It is to be alleviated only by the hope that some day someone or some body of people will cry, with voices influential enough to penetrate to the cobwebbed recesses of counting houses all over England : *THERE IS MONEY IN GOOD DESIGN.*

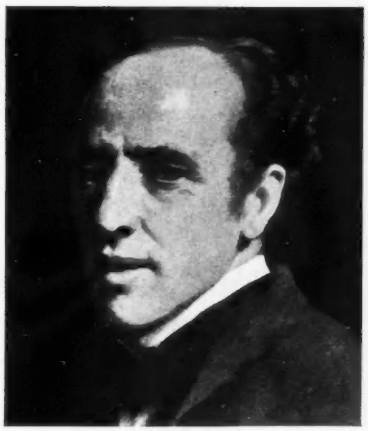
Unless the cash value of good design is made very clear, this Board of Trade committee will find that its standing exhibitions will only demonstrate the fact that British industry is standing still. Only money moves mountains today, and there is a mountain of incompetence to be shifted before we can again hold our own with the nations of Europe in design.

IN CONCRETE, STEEL AND GLASS

The "Volkandinj" Co-operative Society's building at The Hague, by Jan. W. E. Buijs. With the aid of concrete, steel and glass, Dutch architects have been able to produce buildings of a type unknown before this age. Although to an extent they bear an international likeness, there is a subtle difference from those of other countries.

[*From* Modern Dutch Buildings. *See the book review on page 121 of this issue.*

NEWS & TOPICS



Clough Williams-Ellis, F.R.I.B.A.

Howard Robertson, F.R.I.B.A.

As announced in the leading article on page 101, Messrs. Clough Williams-Ellis and Howard Robertson have been appointed members of the committee formed by the Board of Trade to consider the desirability of arranging exhibitions at home and abroad of articles of everyday use and good design.

THE REGISTRATION BILL

As briefly mentioned in the last issue of THE ARCHITECTS' JOURNAL, the Lords' amendments to the Architects (Registration) Bill were considered and agreed to by the House of Commons on Friday, July 10. There was, however, some opposition, chiefly of an obstructive character, by Mr. MacShane and Mr. Ernest Winterton, the two Labour members who so strenuously fought the measure in Committee. Their arguments did not affect the views of the majority of the House, however, and no difficulty was experienced by Lt.-Col. Moore in inducing members to agree with the Lords' amendments. The Bill is now in its final form, and, at the time of writing, is merely waiting for the Royal Assent.

PANELS ON A STATUTORY FOOTING ?

An amendment to the Town and Country Planning Bill has been tabled by Mr. Isaac Foot, Miss Eleanor Rathbone and others, that may make that important measure really useful, and be of enormous help to architects. The amendment seeks to establish the Advisory Committees or panels on a proper and statutory footing. The reasoning is simple, of course. If you give control to local authorities, which is to say, to their engineers or surveyors, what sort of control do you expect to get ? The only possible way to make such control effective is to direct the untrained official with competent advice. Even so, I am not very sure that good work will result. Education alone will be finally effective.

THE ROYAL ACADEMY MEMORIAL

The Royal Academy's memorial to the Prime Minister makes proposals very similar to Miss Rathbone's amendment, and serves to prove how widespread is the desire for planning the resources of the countryside so as to eliminate the waste which spoliation in all its forms does, in fact, represent. Unfortunately for us all, the Town and Country Planning Bill, though looked upon by all parties as a desirable measure, has not made sufficient progress to justify its supporters in thinking that it will become law this session. I am told that such is the case. If true, it may mean very considerable delay, which this country cannot at this moment afford.

BEER GARDENS

Mr. Lansbury, whom Francis Birrell recently described as the only British Minister since Sir Robert Walpole to have a reasonable sense of values, should be supported in his efforts to build " beer gardens " in public parks. By architects, at least, he should be supported. For architects are an understanding race of men, downtrodden, and many are fond of beer in moderation.

A CLOISTRAL SPACE AT THE CENOTAPH

But I set out to discuss Mr. Lansbury's plans for government buildings in Whitehall, where, for the moment, he has been stalemated by the opposition to his suggested building line on the Embankment. It will be remembered that Mr. Lansbury's attention was rather focussed on Whitehall, where he hoped to be able to create a quiet and cloistral space opposite the Cenotaph, and will be now unable to do so without considerable difficulty. As he says, he may have to pull down Richmond Terrace.

*

I like Richmond Terrace for itself, but I don't think I should mind it being pulled down, so long as the Office of Works don't design the building that replaces it. If the Embankment Gardens can be kept (without railings, please) and the cloistral space opposite the Cenotaph allowed for, then Richmond Terrace may be sacrificed, and you will be provided with a very good programme upon which to design the new building.

COMPETITION REGULATIONS REVISED

Revised regulations for the conduct of Architectural Competitions are published in the current number of the *R.I.B.A. Journal*. The revisions, with one exception, seek to avoid unfairness and partiality. The regular staff and present students of a school of architecture providing a sole assessor from its staff are forbidden to take part in that competition. If the assessor is one of three, the ban is lifted. The important new clause makes it quite clear that an assessor may not act as consulting architect unless he has been so appointed before the inception of the competition and the fact is made known to competitors. He may, however, act as arbitrator in any dispute between promotors and architect. Under a new clause these regulations are subject to a waiver by the council or president acting in the interests of the profession or the client. The new clause further defining the position of an assessor will be welcomed because, while it fortifies his judicial position, it gives greater freedom to the individual competitors, who may now know that their individual expression will not be subject to interference or limitation beyond the assessor's report. A man who can win an open

competition should be capable of working out his own salvation afterwards, and it cannot be said that the practice of allowing the assessor to assume paternal control over a young man's work has ever been attended with beneficial results.

POLYGONAL GASHOLDERS

I count the waterless gasholder among the blessings of this new age. To think that those foul red cylinders, rising and falling within their evil-smelling nests of rusting iron, will be replaced by upstanding polygonal towers of fixed dimensions is a fine thought, for these new holders are nobly proportioned, and catch the light in an inspiring way. It is significant that the attempt of an architect to add a dome to a waterless gas holder was everywhere looked upon with amused contempt as an uncalled for gilding of the lily. There is no ornamenting these things; they are sufficient in their own proportions.

PENNY-WISE HASTINGS

Hastings provides me with yet another example of the blithe way in which the annually elected governors of English towns rush, with little or no consideration of the consequences, into expenditure on matters that can only be decided by trained professional men. Hastings held a competition some time ago for a pavilion to hold 2,000 people, which Mr. Vincent Harris won with a "well thought out and straightforward design." The town council, thinking they knew better, turned the design down, and built quite an expensive sort of shelter and bandstand themselves. Now they find that they were penny-wise pound-foolish, and wish they had listened to good advice when it was given them. They have consequently wasted town money which they were elected to spend wisely and with good taste. *Verb. sap.*

HARASSED HOLBORN DWELLERS

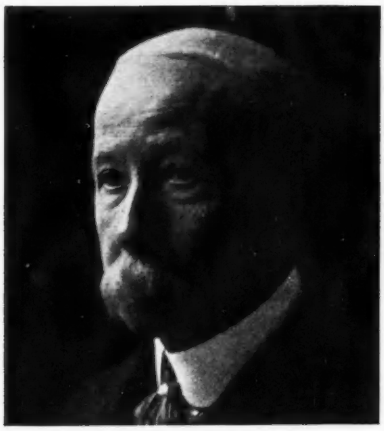
Holborn's new one-way traffic scheme has raised a good many protests from hapless wayfarers asking nothing better than to be allowed to proceed along it or its tributaries with reasonable expedition, upon their lawful occasions. Nor has it left untouched those who have the occupancy of offices on the single routes. A member of the Holborn Borough Council, pointing out that Southampton Street was now unapproachable, except from one direction, added that it was largely used by solicitors or architects, whose clients found it very difficult to call upon them. And they could not use the telephone on account of traffic noises. If the plan were really being proved to operate for the greatest good of the greatest number, there would be some reason for an appeal to the public spirit of the minority; but is it? ASTRAGAL

THE LATE W. R. LETHABY

An Appreciation

BY JOHN GLOAG

WILLIAM RICHARD LETHABY died on Friday at his London home, at the age of seventy-four. Architect, critic and author, he had for many years inspired a school of architectural thought, and with quiet consistency had amplified and applied the teachings of William Morris, cooling their emotionalism to practical temperatures, and reproducing in his teaching and his books something of the mediæval creative spirit. He was President of the Arts and Crafts Exhibition Society, a Vice-President and one of the founders of the Design and Industries Association, and had held the appointment of Principal of the Central School of Arts and Crafts, later being appointed Professor of Design at the Royal College of Art. His special interests and abilities rendered his appointment in 1906 as Surveyor of the Fabric to Westminster Abbey peculiarly happy. He did much valuable work in restoration and preservation, and it was only his age that impelled him to resign, in 1928, his active association with a building he deeply loved.



W. R. Lethaby, F.S.A., F.R.I.B.A., who died in London on Friday at the age of 74, was architect to the Dean and Chapter of Westminster Abbey for over twenty-one years, and a most valuable contributor to architectural literature. A Soane medallist in 1879 and a Pugin student in 1881, he was one of the Founders of the D.I.A.

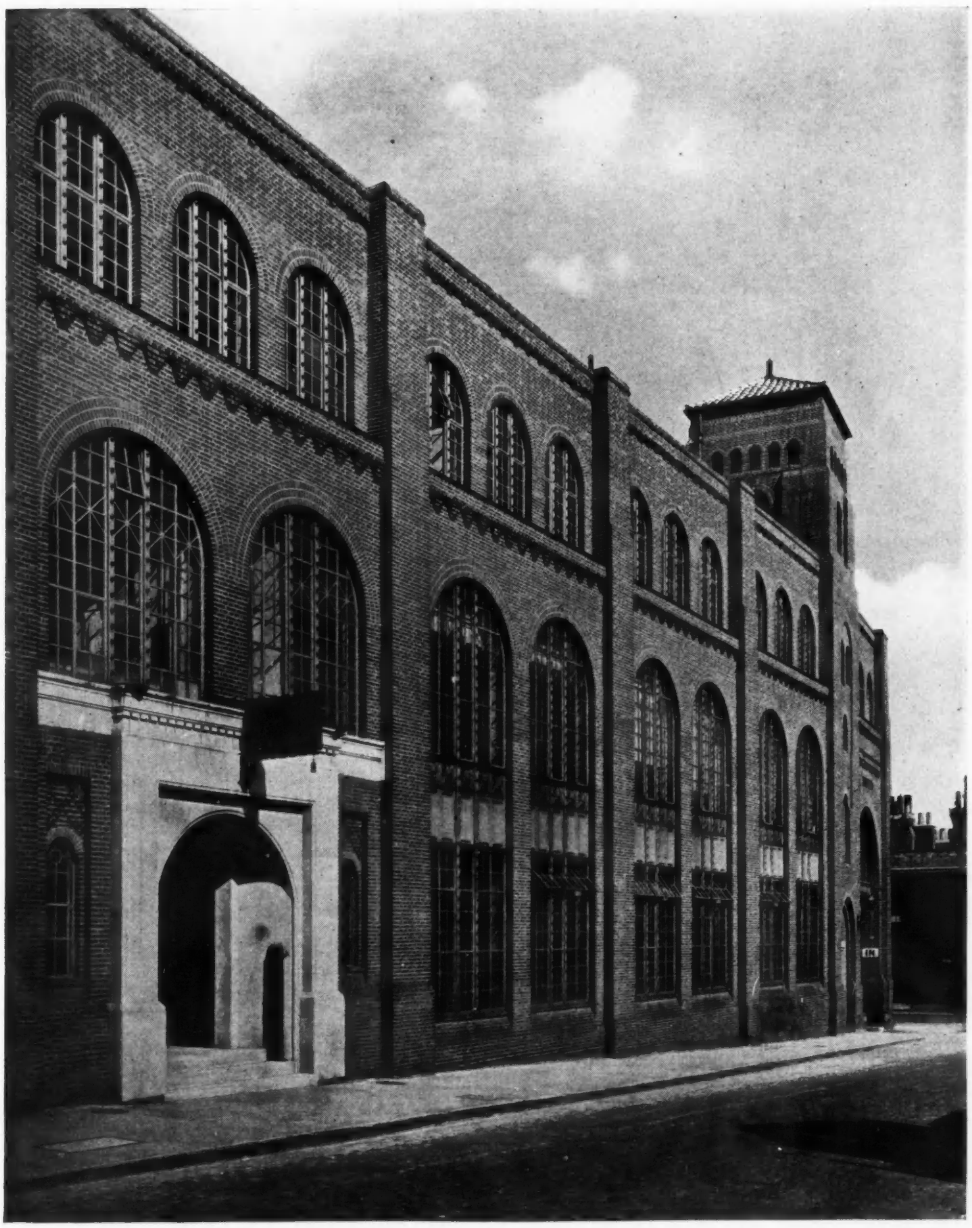
He was a pupil and assistant of Norman Shaw, but it was not as a practising architect that he exerted his influence upon his contemporaries and upon each new generation of architects. Intensely interested in building materials and methods, he became a chronicler of craftsmanship, an archæologist of distinction, and a writer on architecture who always thought in terms of human work, and who held art to be necessity ennobled. "Nothing great or true in building seems to have been invented in the sense of wilfully designed," he once wrote. His suspicion of the Renaissance, when "what we called by the mysterious long word 'architecture' became a question of taste in shapes," is indicated in that most lucid book, *Architecture: An Introduction to the History and Theory of the Art of Building*. But although he had marked preferences in the work of the past, he never rejected his own time, or attempted to resurrect any style. He wished to revive our failing sense of civic order, and to preserve as far as possible the liberties of craftsmen as individual workers, and his vigorously constructive thoughts on these matters are set down in *Form in Civilization*.

Most of his other books are historical or archæological studies, and among them are: *Westminster Abbey and the King's Craftsmen; Greek Buildings Represented by Fragments in the British Museum; St. Sophia* (in collaboration with H. Swainson); *London Before the Conquest;* and *Londinium, Architecture and the Crafts*, an invaluable record of the architectural character of Roman London. But of all his books, *Mediæval Art* is perhaps the greatest, its writing being illumined by his own spiritual and artistic affinities.

Some day it may be possible for a publisher to issue a collected edition of his works, which will enable a future generation to appreciate all that was best in the critical thought of the arts and crafts movement with which he was so sympathetically associated. For years his charm as a writer, and his urgent sense of the importance of æsthetic environment, have rendered a great service to architecture by enlarging public interest in everything concerned with building both in the country and the town.

A LONDON GLASS WAREHOUSE

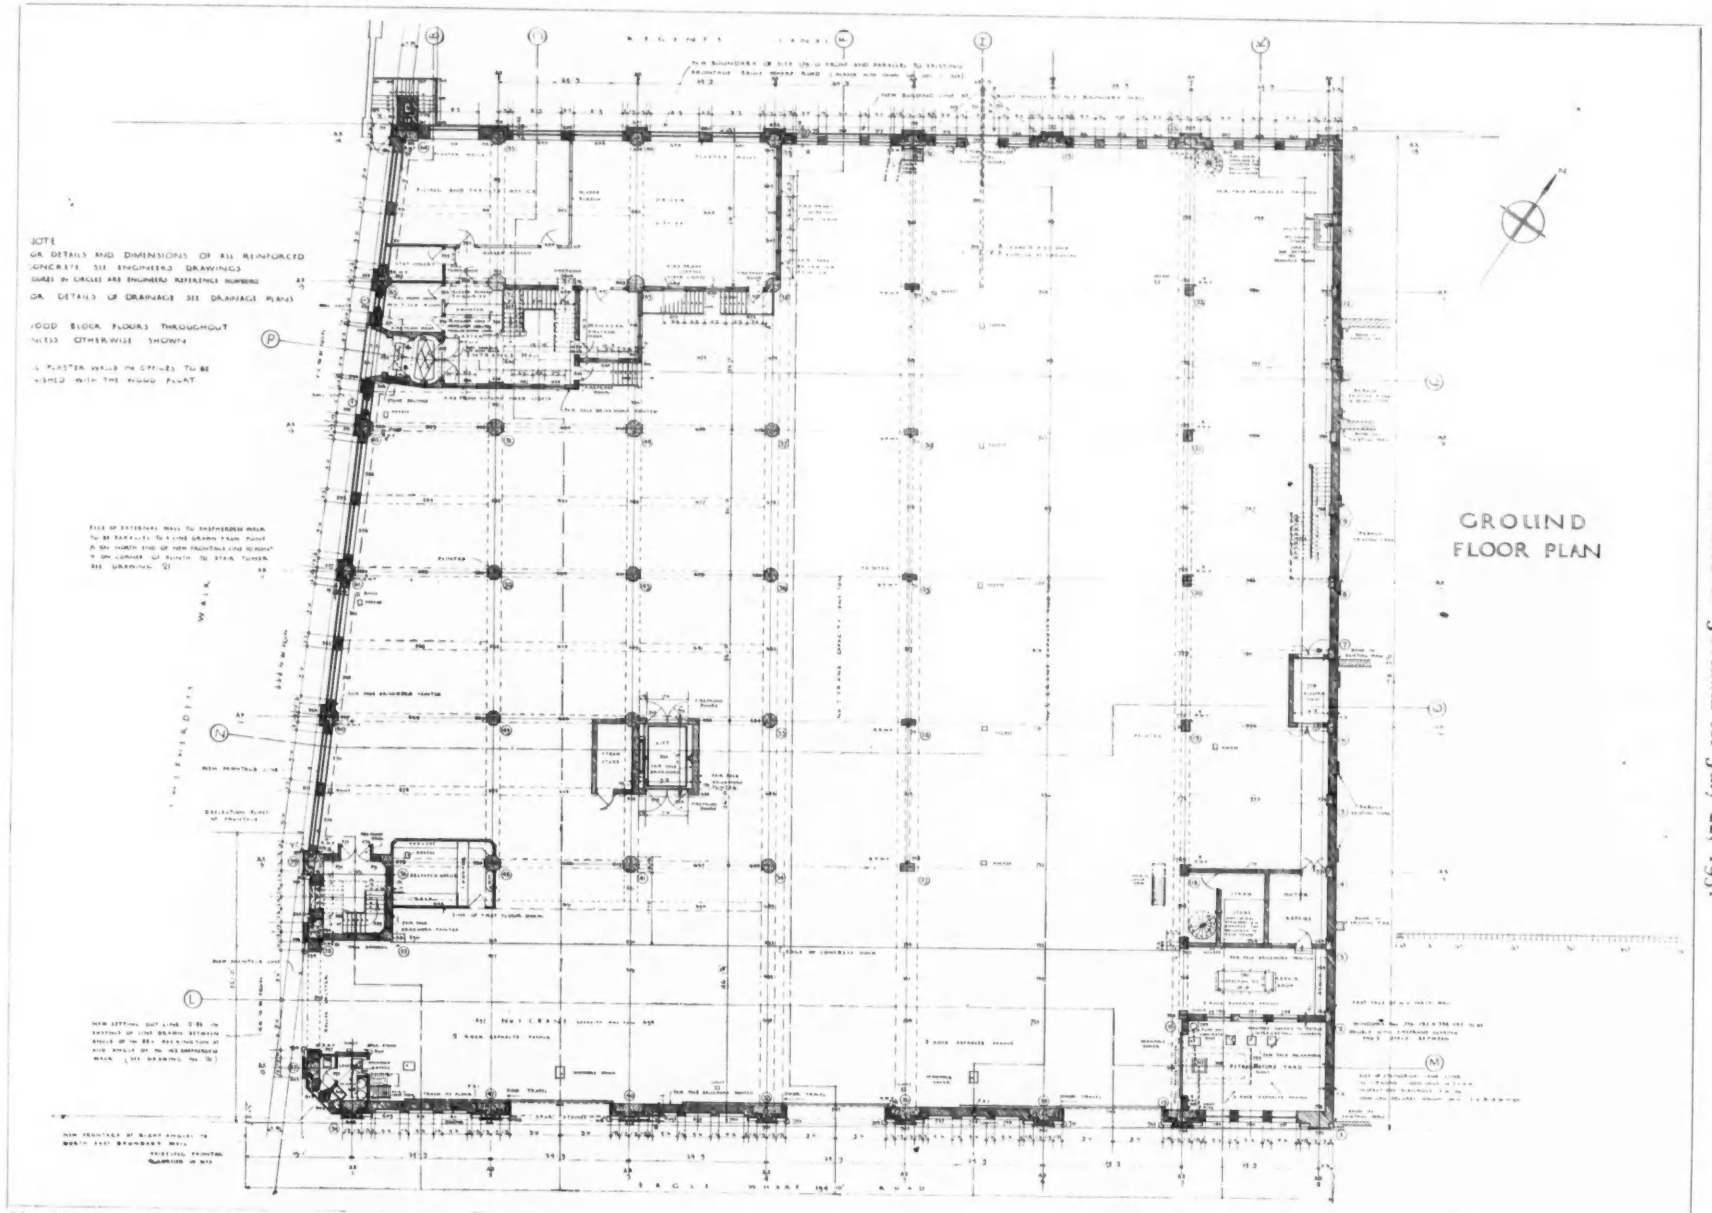
DESIGNED BY SIR JOHN W. SIMPSON, K.B.E.



The main, western front to Shepherdess Walk, N., showing in the foreground the entrance to the offices and, beyond, the entrances to the tower and lorry yard, the architect's working drawings of which are reproduced as one of the supplements in this issue.

IT might seem remarkable at first blush that civilization as we know it today would have been impossible but for the discovery of glass-making. Yet glass was one of the most extraordinary achievements of human genius and was the very foundation upon which modern science—both housing and technical—has been built. It was in 1826 that the name of Pilkington came to be associated with the industry. Thus for more than a hundred years the history of the glass-making branch of the family has been closely interwoven with that of St. Helens. Today the firm owns three large glassworks in that town, in addition to collieries and a brickworks, works at Doncaster and Maubeuge, Belgium, and depots and maintains representatives in many parts of the world.

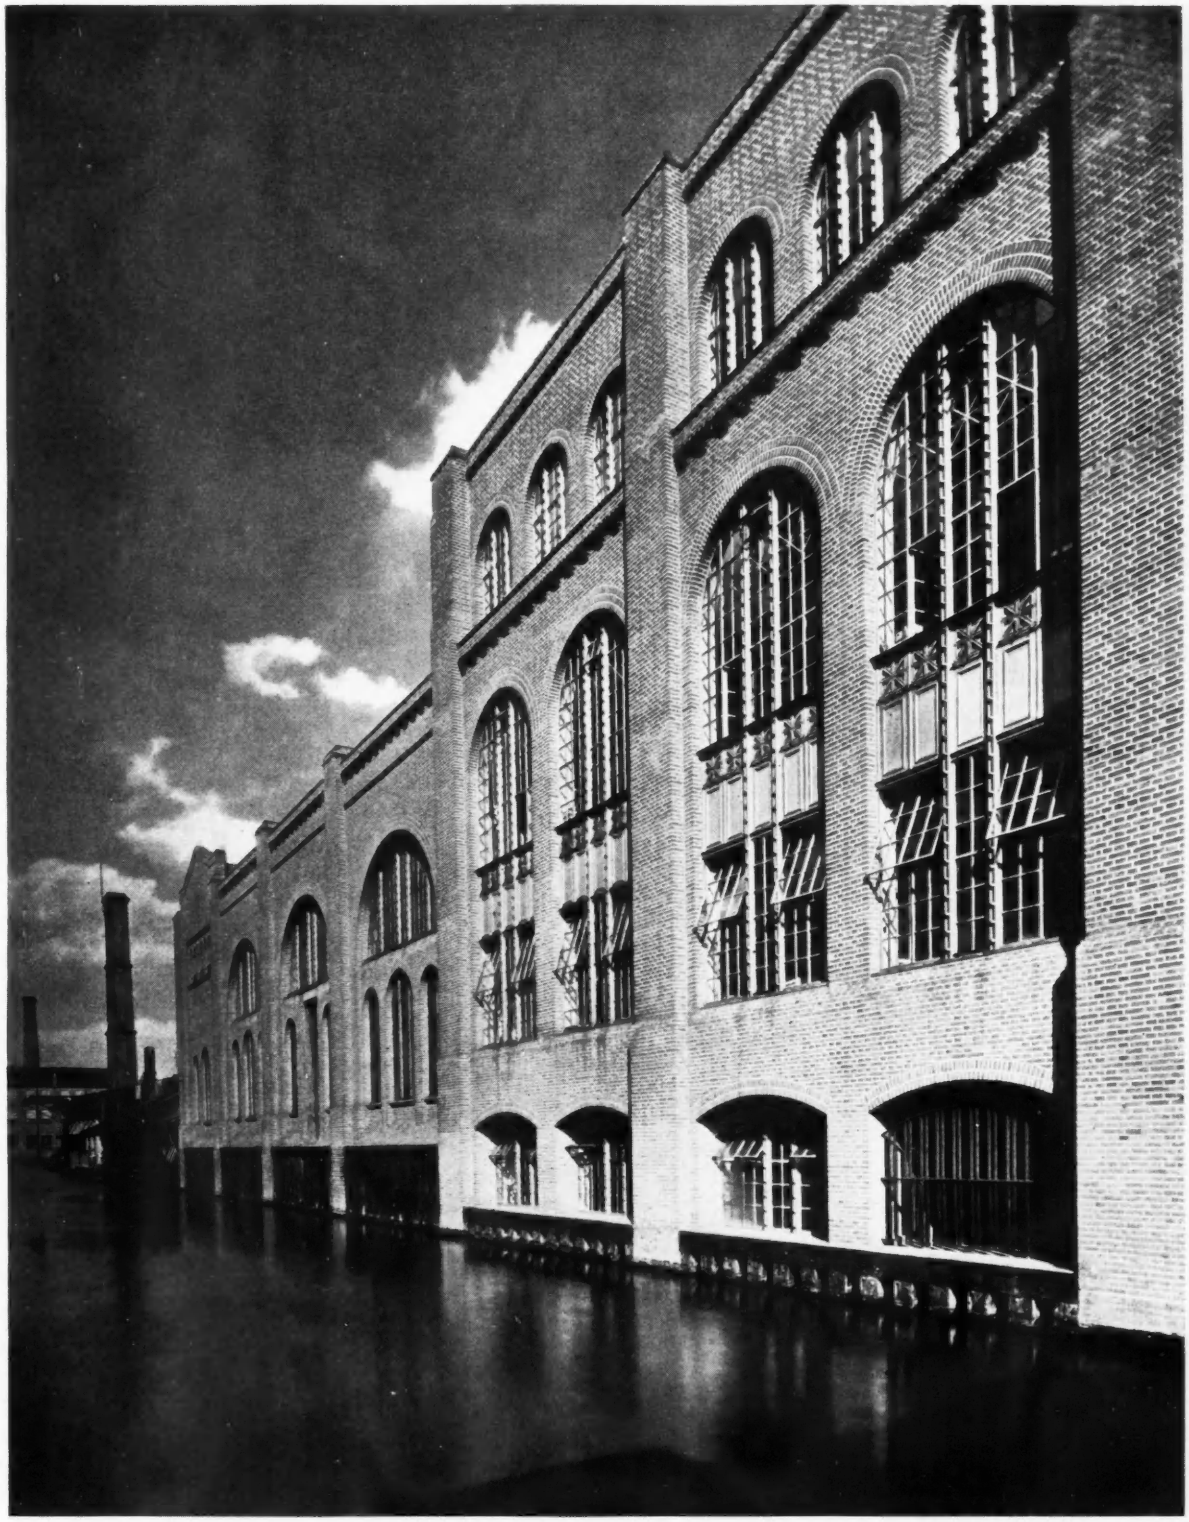
One of their most recent depots is illustrated on this and the following three pages and on one of the special supplements this week. It is situated in Shepherdess Walk and forms a distributing centre for London and its surrounding districts. It is created not to compete with the merchant but as a medium between him and the works. In fact, the building has been aptly described as the fairy godmother of the glass trade. Here large stocks



Glass Warehouse, London, N.]

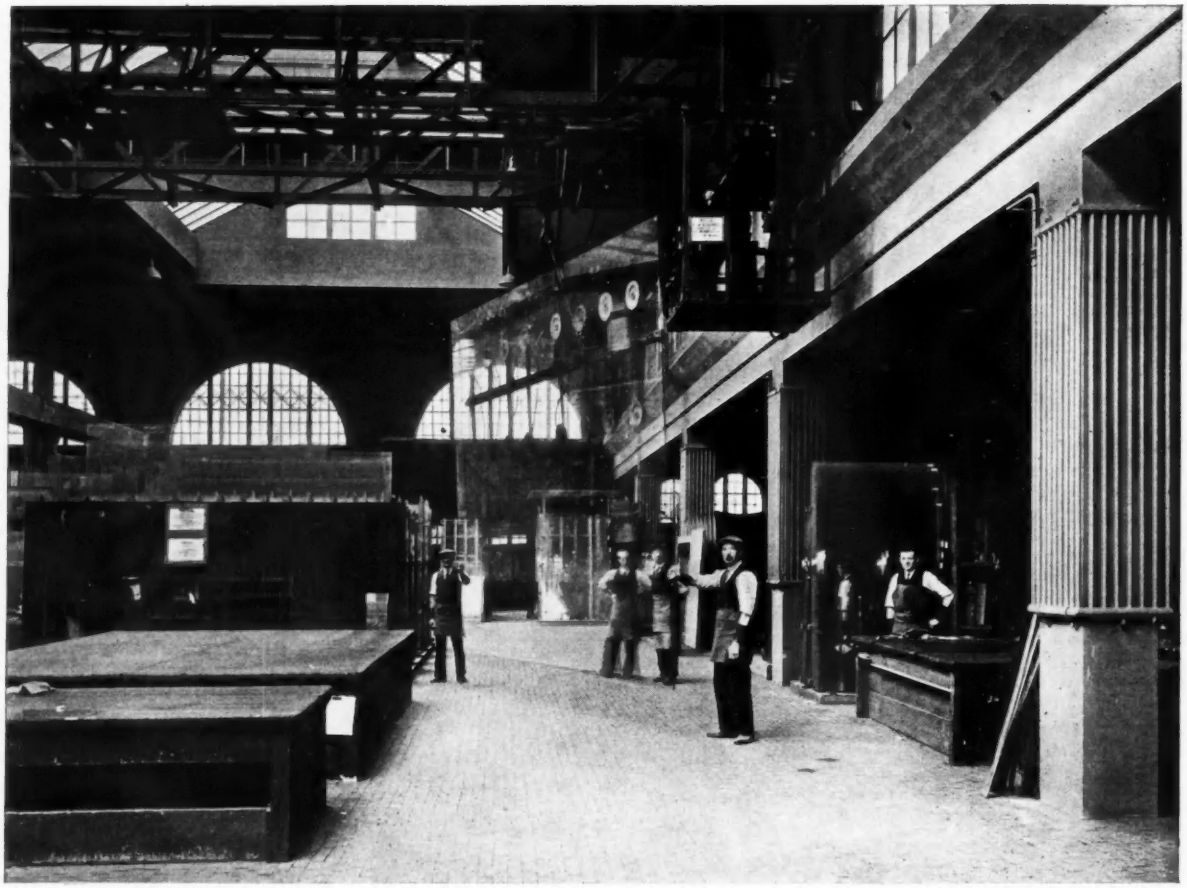
Ground floor plan. The building consists of a small basement, ground, first and second floors and a caretaker's cottage, on the flat roof above.

[*By Sir John W. Simpson, K.B.E.*



[*Glass Warehouse, London, N.*] [*By Sir John W. Simpson, K.B.E.*

The northern portion of the building stands on what was formerly a part of Regent's Canal. The reclamation work was carried out by forming a continuous wall of massed concrete by means of sheet piling, and filling the space enclosed with concrete of a weaker mix.



Glass Warehouse, London, N.] [*By Sir John W. Simpson, K.B.E.*

The "sucker" used to pick up and convey big sheets of plate glass. It consists of a frame of vacuum rubber rings which fix themselves on the flat surface of the glass and hold on to it by suction while the crane moves the frame in the direction desired.

are carried of every type of glass for modern building construction, from the smallest square of 15-oz. sheet to polished plate up to 170 ins. high and 285 ins. long, and spares for the largest shop fronts in London. Most architects at the mention of "shop fronts" will readily recall "the window of the Empire," the exhibit of the firm at the British Empire Exhibition, 1924. It consisted of a sheet of plate glass 288 ins. long by 168 ins. wide, weighing 1,700 lb., and is believed today to be the biggest achievement ever made in the glass-making industry.

The site of the new depot is practically level, but the northern portion originally formed part of Regent's Canal, and this was reclaimed for the purpose of the building by a system of sheet piling and concrete construction.

The main structure is of reinforced concrete. It comprises a small basement, ground, first and second floors; and on the flat roof above is a caretaker's cottage. The floors were specially designed to carry heavy loads of glass, the heaviest sheets, plate glass, etc., being accommodated on the ground floor. The first floor has an open end forming a dock which, together with the ground-floor dock, is served by a travelling crane for loading and unloading direct from the lorries, which draw into a yard occupying the whole of the frontage to Eagle Wharf Road. In the eastern half of the ground floor are two travelling cranes which run the whole length of the warehouse from north to south. In addition, a goods lift serves all floors. The offices, for which the architects designed all the furniture, occupy the north-west corner of the warehouse.

The most spectacular feature of the building is the "sucker," concerning which the following story was told recently by Sir Basil Clarke in *The Liverpool Express*: "An American traveller walked into the St. Helens works not long ago to show them the 'newest thing ever invented' for the delicate task of picking up big sheets of plate glass. It was a queer-looking frame of vacuum rubber rings which fixed themselves on to the flat surface of the glass like the suckers of an octopus and held on by suction while cranes pulled the frame in any direction wanted. They would be forced to buy it, he said, for once seen, it could not be done without. They said nothing (Lancashire fashion), gave him a good luncheon (again Lancashire fashion), and then took him into the works and showed him an appliance just like his—*at work!* He gazed open-mouthed. It had been at work there for years. They had quietly invented the machine themselves and put it into practice long before the idea had ever reached America." In the photograph on this page the sucker is carrying a sheet 203 ins. by 161 ins.

The sucker, however, is not the only innovation. The motor lorries of the firm are fitted with an ingenious side frame made to take extreme sizes for delivering the glass to its destination.

In the construction of the warehouse the fire-resisting glazing is of the new Georgian wired type and the essential windows in the offices are in Vita glass — all the products of Messrs. Pilkington Bros.

THE FORUM CINEMA, LIVERPOOL

DESIGNED BY WILLIAM R. GLEN

THE Forum, Liverpool's latest cinema, has been erected on a slightly sloping site at the corner of Lime Street and Elliott Street, having a frontage to the former of about 150 ft. by an average depth of 75 ft. A steel-framed building, founded on solid rock, and faced with Portland stone, its erection occupied some fifty men for ten months and involved the use of a million bricks and 48,000 cubic feet of stone. It is roofed with hollow concrete blocks, finished with asphalt. Over 1,800 persons are accommodated.

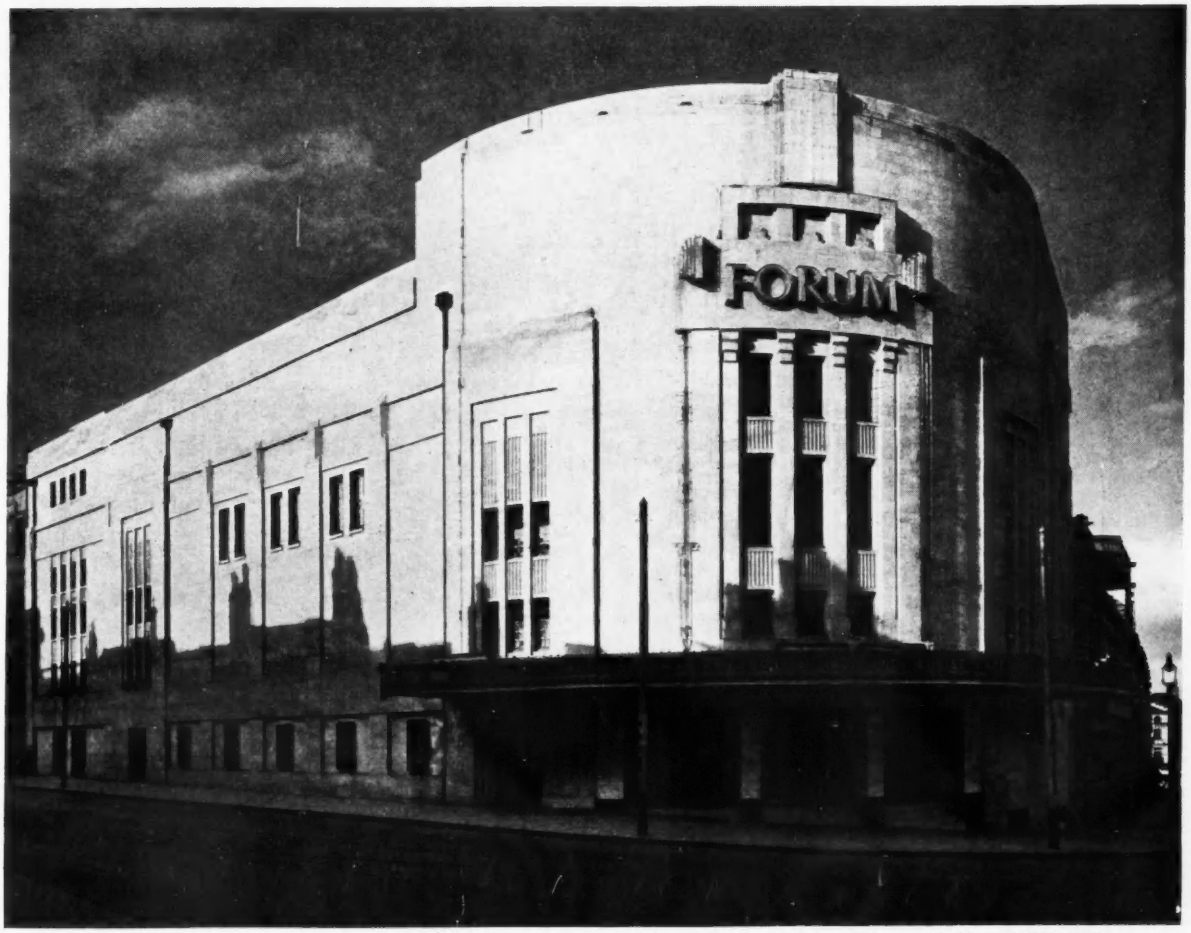
The position, at a busy traffic junction, influenced the planning. It was desired to avoid any clash with the authorities on the question of theatre queues interfering with street traffic: hence the layout includes ample indoor waiting spaces for the accommodation of intending patrons—in the basement, on the mezzanine floor, and on the balcony floor, where there is also a tea lounge. Moreover, the rounding off of the street corner, where the main entrance doors are placed, has resulted in an access of pavement space, while a canopy shelters people actually entering or leaving the house.

On passing one of the four pairs of inner doors, visitors find themselves in a spacious entrance vestibule, paved in Tinos and white marble. Almost opposite are flights of stairs, leading upwards and downwards to the balcony and basement waiting spaces. On the left are two pairs of double doors, leading direct on to the main floor of the auditorium.

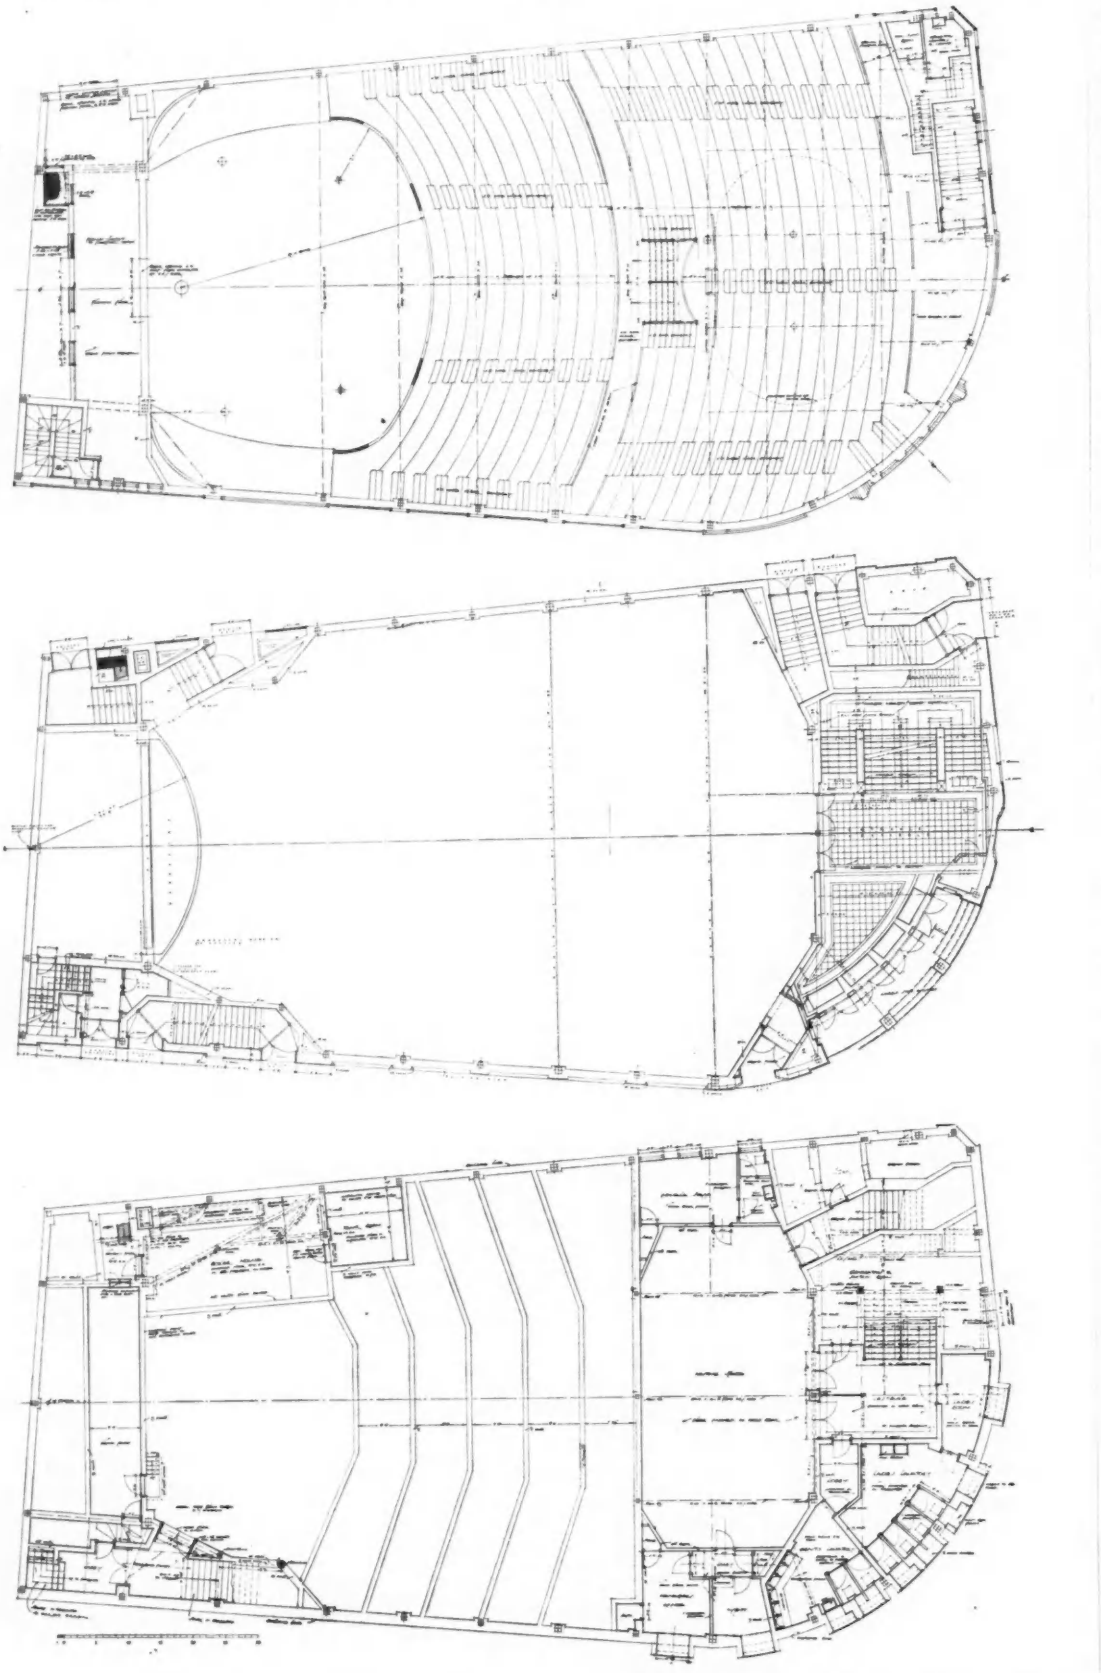
Within, golden tones prevail, graduating upwards to the main ceiling, which is finished in pastel blue tones, and has a central sunburst and radiating ribs, and forwards towards the proscenium, where lighter tones—of silver and of mother-of-pearl—are introduced. The sunburst gives an amber light, and so do trough lights concealed behind the cornice. Two electric glass and mirror fountains, contained in recessed panels on either side of the stage, supply the high lights in a shadowless lighting scheme. As usual, there is automatic apparatus for the blending and changing of coloured flood-lights, which in this instance play about the proscenium arch.

There is also very complete equipment for stage lighting—two three-colour battens and a footlight. The back stage setting is of deep Naples blue, throwing up the silk folding curtains, with their delicate-shaded panels and large tassels, which tone with the auditorium decorative scheme.

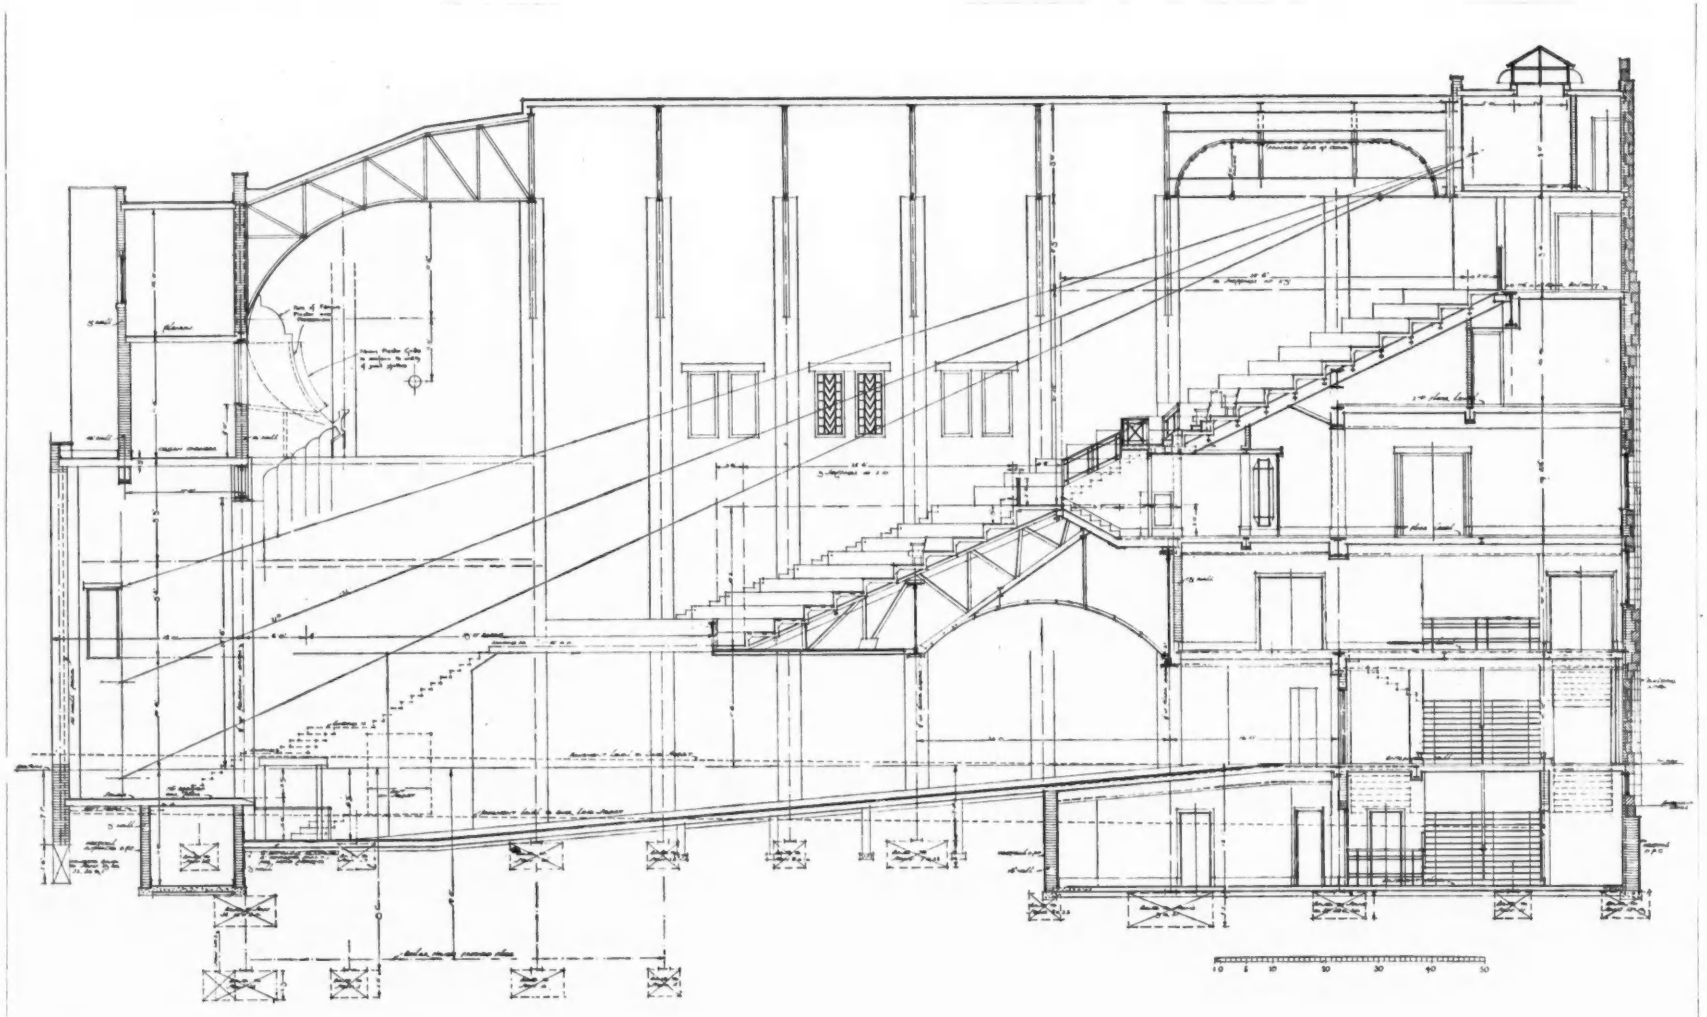
The projection room is eloquent of up-to-date practice, having walls of grey glazed tiles, with all switchboard and other electrical panels recessed, and a floor of parquet. But the planning throughout is a model of modernity.



A general view of the exterior, showing the main entrance on the curved corner of Lime Street (left) and Elliott Street. It is a steel-framed building, faced with Portland stone, occupying a site some 150 ft. by 75 ft.; the canopy is of bronze.

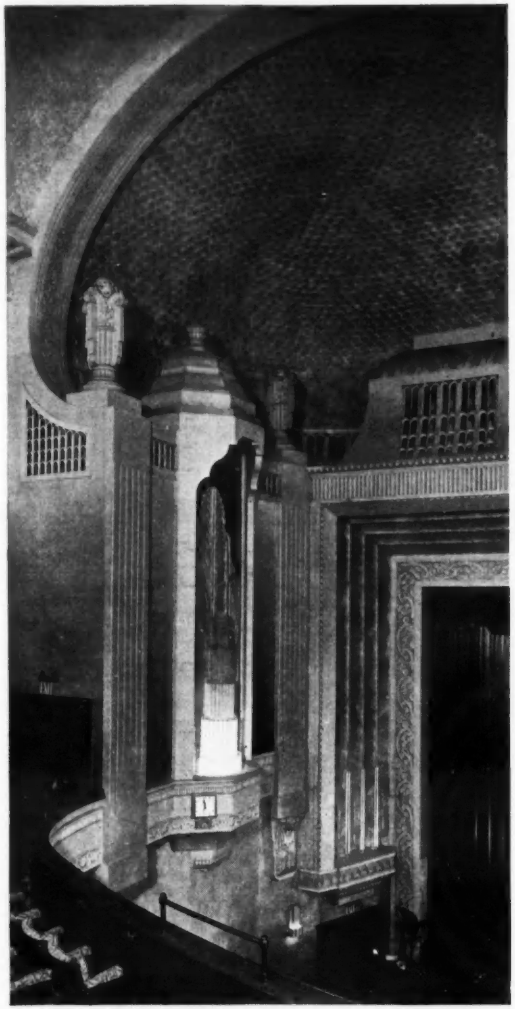


The basement, entrance and balcony floor plans. The first indicates the sleeper walls carrying the load of the main auditorium floor, and the large waiting space. The balcony has a large capacity in proportion to the site area, and this and the ground floor accommodate, together, 1,842 persons. The seats are at 20-inch centres and are 24 ins. deep.



The Forum Cinema, Liverpool.] [*By William R. Glen.*

A longitudinal section on the centre-line of the auditorium. There is a considerable rake to the ground floor, and a steeper one to the balcony: the angle of depression of the projection rays, as indicated on the central of the three sight lines, is 21°, and the throw is 136 feet. The organ chamber is above the stage, and the coved construction, springing from the proscenium arch, is clearly shown. Above the rear part of the balcony, coving also gives additional ceiling height. The large amount of space allocated to waiting rooms for incoming patrons adds to their comfort, but was, in fact, of prime importance to avoid any possibility of congestion arising from crowds collecting on the pavement outside the building at an exceptionally busy corner. The plans indicate how carefully the questions of easy entrance and exit, and circulation within the building, have been considered. It will be noticed that windows are provided in both side walls so that cleaning of the house can take place in natural and germ-destroying conditions.

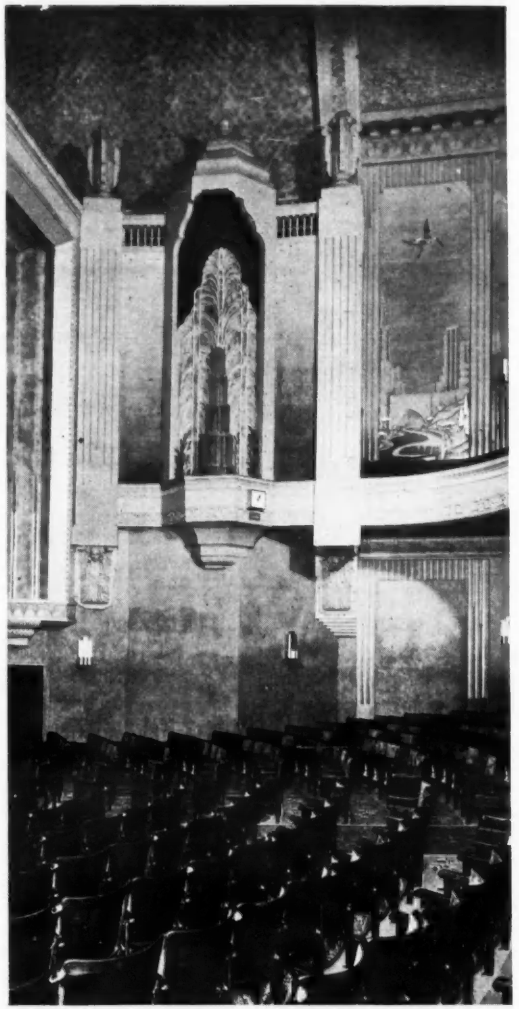


One side of the proscenium, seen from the balcony. Over the architrave is the organ grille; other grilles are fitted for ventilation. The coved modelled plaster ceiling is treated with pale tints of blue, pink and silver, and, illuminated by concealed trough lighting, produces an effect of mother-of-pearl. Behind the mirrored glass electric lighting fountain the modelled panel is similarly decorated. The warm gold and pastel colours predominant in the house thus take on, at the stage end, a lighter, silvery tone.

The entrance vestibule, with stairs leading up and down to waiting-rooms; and the café on the balcony floor, which has 40 tables and is decorated in a colour-scheme of golden brown.

THE FORUM CINEMA, LIVERPOOL

By William R. Glen



The side of the auditorium, in proximity to the stage, from ground-floor level. The colour-scheme is graduated upwards, from the carpet, with light-brown ground and brightly coloured patterns, to the old ivory cornice. The skirting is black, the dado a deep gold-brown, with honey shades above. The wall panels are of Venetian subjects. The main ceiling is of stippled plaster, tinted pastel blue; it has a sunburst as central feature, and is further embellished with radiating ribs modelled in fibrous plaster.

Bernard Whistlow, F.R.I.B.A. : An Autobiography : ix

TRIALS OF A CLERK OF WORKS

BY KARSHISH

(H. B. CRESWELL)

MY difficulties as Clerk of Works were mainly of my own making, and arose from my involving everyone in my perplexities. No man properly knows anything until he has done it himself; nor at all understands any kind of craft until he has, at least, closely observed another at work. Thomas Huxley—as readers of the fine biography by his son, Leonard Huxley, will recall—never accepted the authority of any investigator, but informed himself by actual dissection; and the same principle is true in building.

What, for instance, does anyone know of cast and wrought iron, and cast and forged steel, until he has seen them broken, bent and torn asunder, and has examined the fractures? An hour's demonstration by an intelligent bricklayer will give a knowledge of bricklaying that a fortnight's study of books will not do—or a lifetime's for that matter; and the case is stronger for the more highly-skilled crafts. To be informed by books is to have merely a rote knowledge which gives little more power to think—to have, that is, a mind's eye and a clear imaginative perception—than is possessed by the creature which most closely rivals that accomplishment, namely, the parrot. Nothing but assimilated knowledge counts for much in the world—except the passing of examinations in order to teach others to pass them for the purpose of coaching others to the same end and for the same purpose; and assimilated knowledge, which approaches perfect or intuitive knowledge, can only be gained by intimacy with materials and craft methods.

If any youthful aspirant to architectural practice doubts this, he may speedily dispel that doubt by accompanying any architect of undoubted attainments when he visits one of his jobs. It was only after many years that I came to understand this matter, and I here give it a paragraph as a direction post that would have greatly succoured me when, at Brayness, I first began to discover it for myself.

My job was to get the Post Office properly built with sound materials and workmanship according to the full intent and meaning of the drawings and specification; but although the Bradshaws were strictly conscientious according to their lights, the fact that I knew myself powerless to prevent them from deceiving me led me to fear they would do so.

How was I, who regarded bricks merely as bricks, to know how hard hard bricks ought to be; or what constituted their being well burnt, square, true, and uniform in size? How was I to know whether they were free from those unspecified "other defects"; and whether they were free from lime? I could only settle these and other questions by cross-examining the unlucky Bradshaws and by meeting their every assurance by new objections until they had found answers to every suspicion my imagination could conjure; and, as I had an active one, unhampered by any practical knowledge, their patience and ingenuity were severely tested. If I did not ask them to satisfy me that the sun would not melt the bricks nor rain dissolve them, it was only because those dangers did not occur to me, for I should certainly have done so if they had.

The matter that gave me the most tortured perplexity was, however, the ground stone lime and the Portland cement. The fact that both were of a well-known brand did not weigh with the Clerk of Works: they were materials for the building, and it was his duty to see they were the best of their respective kinds; and he discovered that both had such serious defects as to be probably unsuitable for any purpose of building whatever, and certainly wholly unsuitable for the alterations and additions to Brayness Post Office. This startling fact was revealed by certain textbooks on building materials which I had luckily brought with me.

The cement passed the test for fineness imposed by the meshes of a cook's sieve of appropriate gauge bought for fivepence at a chandler's shop, but passed without distinction. It almost satisfied the test for weight on the Post Office letter scales, after tormented calculations of the due weight of one-eighth of a pint and of the number of pins to the half ounce; but when mixed with water and the grout filled into a medicine bottle, the bottle became warm—evidence of *heating!* And, after the grout had set, its level in the neck of the bottle seemed, to acute perception, higher—proving that the cement *swelled!* When similar grout was poured on to a bit of glass and allowed to set (in the air), the edge of the cake showed cracks—showing that it also *shrank!*

Of the stone lime, I can only say that it proved more dissolute and unmannerly than the cement. When, however, I laid my bottles and mud pies in ceremonial evidence before Father, he first stared as though he did not know what I was talking about, and then, when I pointed out that both the cement and lime were defective, he laughed with a deep, silent, throbbing convulsion of the belly that shook his whole body. His uncontrollable merriment did more to put me out of countenance with my doubts than his assurances did—convincing though they were.

"Well, sir, you beat all I ever heard," he said, wiping his eyes after he had sat to recover himself. "You must excuse me laughing so, but I've used Milson's cement thirty years, and their lime too, and you couldn't get better. Why, they used Milson's down in the river when they put in the new swing bridge two years ago. You must expect a bit of heat in cement until it's air-slacked, and this is new out of the bags. I never heard tell of bottles and bits of glass before, but you couldn't ask for anything to set harder, could you, now? Milson's ground stone lime sets pretty near as hard as their cement. Do you know, sir, I used that lime, five-and-one, in those cottages I built six years ago down Merlington Avenue, and they're so hard as rocks." And he began laughing again.

It might be supposed that, with my textbooks, the experience of the builder, and the acute observation of the foreman—as already recounted—to guide me, I should have been informed of what was what in stone lime and cement; but each of these authorities stood on different ground, and, by discrediting both the others without directly challenging them, threw confusion upon the issue I sought, so that I retired to the position of frustration I have ever since occupied; for though I have since enforced air-slacking and installed testing machines on some of my jobs, I should to this day never use lime or cement of an origin or make that did not guarantee its quality. In this I have taken Father's position, which I proved, by care-worn daily notes of the setting of concrete and mortar in Brayness Post Office, to be a sound one.

It will be seen that the difficulties in carrying out the work under my supervision were considerable; they might well have been insuperable but for the tactful roguery of Joe Richards, the foreman. He had various methods of reducing my obstruction. His most deadly was by a gesture of acquiescence; and I learnt to take alarm when, instead of replying to the cross-

questioning by which I sought to arrive at decision, he said, "All right, sir," cheerfully tossed his hand up to his hat-brim, and glided away with smooth, effortless strides to give effect to my wishes; for it was a trick of his to make a futile pretence of beginning the work and then come to me, turn up his inscrutable face to mine and ask, innocently, "And what do you want me to tell 'em to take and do now, sir?" When, however, he wished to reconcile me to what was already done, he had recourse to that understanding insight and sympathy which is the source of all true humour, and which, in this humble workman, has always seemed to me to be not merely a wonderful, but even an exquisite thing.

The method employed by the Office of Works was that which is now established in American practice: the specification and contract drawings gave complete and full particulars of every detail of the building—even to the adapting and extending of counters and fittings in the public office—so that no further drawings or instructions were, from first to last, needed. It happened, however, that the postmaster clamoured so unceasingly for access to the roofs and flats in the rear of the building that Tallard sent me a brief specification of a dormer in which a door from the demolished building was to be hung. It was no part of my duty to improve on Tallard's instructions; the thing was duly fashioned with all the baldness of the bald instructions, and the result, as seen from some of the back windows was, to the fastidious architectural eye, dreadful. A huge, leaded dormer, roofed as with a lid, and with vast cheeks each bearing a great raw solder dot like the bull's-eye of a rifle range, jutted out from a low-pitched slated roof which it completely dominated. I was looking at the thing with deep dissatisfaction when Richards came up. I made no remark, and scarcely knew he was at my side, when his cheery-singing voice sounded in my ear:

"Looks like some stoopid old woman, don't it, sir?"

This sticks in my mind as the most discerning bit of architectural criticism I ever heard. It was complete—for nothing added could improve it; and it was perfect—for it was vivid and exactly true. I doubt whether the writings of Mr. Howard Robertson or Mr. Frederick Towndrow or Mr. Trystan Edwards, or of any other modern analysts of architecture, furnish a more trenchant image. The dormer exactly expressed the exasperating futility of a stoopid old woman, and it was precisely in the measure that it did so that it provoked disgust as a design.

My shame at being associated with this dormer was forgotten when Richards made me laugh at it; and this device of ridicule was at his service on occasions when I had ructions with Father. One of my duties was to certify to Tallard the weekly sheets showing the men's time and the materials expended on certain bits of extra work which were authorized. Father was apt to grow restive at my questionings of the hours charged—for the money involved was of no sort of consequence in relation to the contract sum—and one day he burst out in a spluttering rage, and told me, roundly, that if too much time had been charged he would sack the men concerned, and that that was the long and short of it and the last he had to say, so now he had told me and I could do what I liked—and he walked off.

The trouble was about a wretched little bit of cutting away in a man-hole, by a bricklayer. I objected to a labourer's time being also charged, for, to my knowledge, no labourer had been concerned. Father's threat was merely one of reprisal: it settled nothing; for, though it might silence me, the men were not to blame, and, if they had been, it was impossible for me to countenance their dismissal. My sense of duty would, however, have made me hang on like a bulldog if a threepenny-bit only had been in dispute; but Richards put all right with a word. Directly Father was beyond range, he sang out:

"Don't you know, sir, that a bricklayer *can't* work unless he's got a labourer a-standing by a-looking at him?"

The dispute instantly took its right proportions and was dismissed in laughter; and, I may add that I was illuminated, for a considerable experience of building has persuaded me that Richards was right.

Richards used different methods in dealing with Father: he never allowed his whimsicality to peep out in the presence of his employer, nor was his serious, dutiful air ever, on those occasions, lightened by a touch of humour. He took matters serenely into his own charge and did the thing that was wise and tactful in his master's interests, and I never observed him to get into trouble for thus over-riding instructions: his divergences were either not noticed or, if noticed, they were unquestioned. There came an occasion, already alluded to, when the last straw was added to Father's burdens and his back broken: he mutinied and point-blank refused to do what I told him; and I then had good reason to be grateful for the wise intervention of his foreman.

It happened—in the confusion of pulling down and rebuilding piecemeal—with temporary screens and gangways everywhere, and the postal workers crawling like dispossessed ants over everything, and snow on the sorting tables and dust in the Morse machines, and the postmaster inarticulate with indignation—that both Richards and I overlooked a step which was shown on the drawings at a door that opened from the front to the back premises, with the consequence that Richards levelled through from a wrong datum, and foundation work in rough bricks from the demolition was carried up two or three courses above the due level of a paved and enclosed yard that there was at the back. Luckily for me, but unluckily for Father, I noticed the mistake before, in my opinion, it was too late to put things right. Father, however, held a contrary opinion, for the facings were up four or five courses, and some 15 ft. run of wall was involved.

"Oh, well," said he, lightly, "Richards will just take and put a bit of a cement skirting round to cover up and make a job."

A cement skirting round the yard would, on several counts, no doubt have made a better finish of wall to paving than was provided by the contract; but I had not enough experience to perceive the fact, and should have held that I had no authority to sanction the variation, if I had.

"The drawings show the facings going down to the level of the paving," I said.

"Well, sir, but it's been and done now, ain't it? It's too late to alter. We shall have to take and do the best we can."

"I have no power to order any variations. I have to see that the contract is carried out."

"Well, that's what we expect, sir! So you have been doing. You saw what we were at; why didn't you check us if you weren't satisfied?"

"But that's what I'm doing now!"

"After the work's been and done, sir! And then ask us to pull it down to please you! I never had a job with all these objections there has been here. It don't seem we can give satisfaction however hard we try. If you will say what you want before we put it in hand, we'll do all that's in reason, as we have been ever since the start; but if you don't know what's got to be done why—how are we to know? Come, that's fair, ain't it?"

"You've got the drawings and specification and . . ."

"I'm sick and tired of hearing of the drawings and specification, sir! If you don't know what's in the drawings and specification, how the blazes are we to know! *Now* then!"

"I'm here to see the contract properly carried out."

"And so you are doing; as you'd never hope to see a contract better carried out. What's wrong I can't see;

but you're never satisfied from one day's end to the next."

"The work has got to be done right."

"And so it is being done right! You got him check the levelling to your bench, didn't you?" he turned to Richards.

"Yes, sir," Richards sang out.

"Well, now, that flat beats anything I ever heard tell of in all my experience! You good as take and tell my foreman to build one way, and when he's done it you expect us to pull down and do it another way to suit."

"The contract says——"

"Damn the contract! How the hell are we to know what's in the contract if you don't? I'm fair fed up with the job! I'm sick and tired of the everlasting piddling little objections and interferences. I've had enough. Richards has took and done what you told him to do, and as you haven't accepted my offer to give you a cement skirting free and for nothing, why, I'll have an order for an extra whether I'm to pull down or to run the skirting. I won't do a hand's turn till I get an order for extra, and the work can stand till I get it. That's flat! So now you know, sir! That's the last I've got to say."

"Then Mr. Tallard . . ."

"Let Mr. Tallard come down and see how things are for himself. I'm ready, sir. I'm not afraid of Mr. Tallard finding fault with my work." And poor Father, greatly heated and trembling with agitation, walked off the site, with Mr. George silently following on his heels, leaving Richards and me standing.

I was greatly distressed at the intensity of Father's feelings, filled with remorse at having so provoked the honest man, and overcome with the feeling that he had far better grounds for his indignation with me than I had for any dissatisfaction with him. The idea of calling upon Tallard to enforce my authority hurt my vanity, and also impressed me as the act of a school "sneak," so that I was sorely tempted to retract and persuade Father to run his bit of skirting to cover up, and to chance the discrepancy being noticed by Tallard, or, if noticed, objected to. On the other hand, I felt the humiliation of conceding to violence what I had denied to reason. These thoughts absorbed me as I stood in a stunned silence while Father and Mr. George went off, when I was called to life by Richards whistling piercingly on his fingers, at my elbow. This particular whistle was his signal when he wanted the attention of his men. These stopped work, and Richards then waved his arm and shouted instructions somewhat as follows:

"George! Bilks! Young Dick along! Right down: two below damp course; whole length! Look sharp!" Then, turning to me, he said, as he glided away: "That'll be all right, sir."

Sure enough, by the end of the day the faulty work had been pulled down and in great part rebuilt. The cost was probably no more than the proposed skirting would have been; but that point was a small matter beside the ending of a dispute that would have dislocated the work, given ground for future quarrels, and perhaps established bitterness and a sense of grievance. Richards prevented that misery, for he understood the souls of men as well as their bricks and their mortar; and the result of the upset was that I became more alive to the interests of the builder, and the builder more patient—if that were possible—of the shortcomings of the Clerk of Works.

NEXT WEEK: X—A NEW FIELD OF VENTURE

The previous instalments appeared as follows:

LETTERS FROM READERS

Morecambe's Fall from Grace

SIR,—Astragal, in his criticism of this town, has evidently only a superficial knowledge of it. One feels there is need for a few remarks on, and corrections of, his cold comments.

First, please allow the place its correct name — Morecambe and Heysham. Then, to the best of my knowledge and belief, the plan of the new town hall was not designed by the borough engineer. This official, like so many of his brethren, has two or three architectural assistants, and it may be fairly presumed these men are responsible for the plans of the building. Astragal has not struck quite the right note here; methinks he would have done the profession a service if he had expressed in strong terms the need for architectural assistants in municipal service to be allowed to append their signatures to the plans for which they are responsible, instead of the engineer's name being applied to all and sundry drawings, as obtains so often at this present.

Whilst I agree with all your contributor has said respecting the L.M.S. hotel, and admit there are monotonous streets and streets of boarding-houses of cheerless elevation, let me say we do possess some buildings which, if not worthy of great encomiums, must be lifted above the common level described as "dull in the extreme and oft-times definitely ugly." Sir, believe me, there are in this seaside resort quite a few churches of good taste, a bank or two of dignified appearance, an extension to post office of architectural merit, with the adjoining building of "the town's newspaper," a fair example of a modern commercial building. In domestic work too (despite the very flourishing and evident energies of the speculative builder), one can find a few quiet and dignified homes.

Morecambe and Heysham certainly is ambitious, and there is a growing desire for an improvement architecturally as in every other direction. The town is much above the doleful spot Astragal would have readers believe, and the action of the Corporation in calling upon outside architects (who are also involved in certain large and progressive municipal schemes here) to design elevations and interiors of the town hall is surely a tribute to private practitioners.

RICHARD DOBSON

The Decay of Craftsmanship

SIR,—As a reader and subscriber of the JOURNAL since its early days as *The Builders' Journal*, I protest in the strongest possible language against the impudent accusation, in the grossly ignorant article in "News and Topics" in your issue for July 1, on the "Decay in Craftsmanship."

The charge laid against teachers in technical schools is entirely false in its premises and, being void of any constructive idea or suggestion, is not acceptable as a piece of normal criticism. As one who has engaged in teaching for over thirty years in different parts of the kingdom, and having had a first-class practical training, and also taken a leading hand in the training of a very large number of "practical men" as teachers, I can testify to the sound guidance for traditional and progressively scientific craftsmanship which is encouraged through the courses of study to be followed over four or five sessions by the young entrants to the building industry.

The writer of the article is evidently enviously jealous of the "practical man." I, therefore, commend that he should closely study the excellent and most truthful serial by Karshish, now given in the JOURNAL. If he is satisfied with Whistlow's form of training to fill a post charged with the onerous "practical duties" of clerk of works, he is to be sympathised with, and much pitied.

Whistlow is more truthful when he magnanimously states that the practical man " is the salt of this earth."

The system of building education is still far from perfect, and many of us well know of the uphill work still to be done for students and for teachers; but of this we must rest assured: the door must be kept wide open for the " practical man " to enter the teaching profession; otherwise, as has happened in other phases of educational effort, the work will become artificial and untruthful. We cannot safely leave " practice " to pure " theorists," and especially to artists. Practice and theory are truly inseparable.

If it can be shown that the whole scheme of building education, which includes architecture, requires in England generally to be overhauled thoroughly, and its control and direction economically unified in proper institutions under teachers who are practically experienced and qualified for their respective forms of work, then we shall realize what to many of us has long been a dream and a desire.

During the past few decades our industry has been of the most progressive with regard to the adoption of new materials and new methods, and I most strongly emphasize that the institution where the properties of the new materials, and the principles to be used in proper construction, can best be taught is the school; the knowledge cannot be gained in the modern workshop, or in the office.

E. HOLDEN

Lowest Tenders

SIR,—Referring to the letter of " Suburban Builder," an architect acts only as agent for the building owner in such matters, but I agree that architects should make all reasonable inquiries as to the suitability of contractors to carry out a contract before inviting them to tender, and that, unless there is some unusual circumstance making such a course inadvisable, the lowest tender received should then be recommended for acceptance.

In the case of works for public authorities, where a general invitation to tender is advertised, the architect may sometimes be justified in recommending the acceptance of a tender which may not be the lowest.

H. F. T.

SIR,—I am generally in sympathy with the views expressed by " Suburban Builder " in his letter. As a general rule, the client makes his own selection of builders for tendering, and frequently has a man or firm for whom he has preference. Often a client does not realize that it is unfair to include any contractor in such a list if there is any intention of setting him aside when his price is actually the lowest.

I invariably advise clients to accept the lowest tender or to toss up in the event of a tie, but, unfortunately, I am not always able to get them to concur.

J. LEIGHTON FOURACRE

SIR,—They say on-lookers see most of the game. That is possibly why all your correspondents on the subject of tenders so far have missed what is to me, neither a builder nor an architect, a perfectly obvious point.

If I am buying an article—for instance, a car—I select a few models that suit me, and get full particulars of performance, price, etc. Then I say to myself: " The Slumber Six is £50 more than the Moonbeam Midget, but it is definitely a rather better car. Is it worth the extra £50 ? "

In choosing a builder, I am not buying an article, but I am buying service and workmanship—qualities which naturally vary with the firm I select. Though all the contractors who have been asked to tender are capable of doing the job decently, obviously some are better than others. If the lowest tender is not from one of the best builders, I have to consider whether the extra outlay involved in going to the best builder will be justified by the superior workmanship I expect to get. Surely in building, as in all other directions, I must buy on the principle of value for money, and not that of getting the cheapest article I can.

Apart from this, other considerations often come in, such as the time required by the builder for finishing the job. I imagine that for buildings in Central London a difference of two months in the contract time is worth a difference of hundreds of pounds in the tender.

MAN OF AFFAIRS

SIR,—" Suburban Builder " desires to add yet another law to an already overburdened statute book.

In the course of nearly forty years' practice I have only once advised a client to accept a higher tender than the lowest, and in that case the lowest tenderer was so far below my own estimate that I considered it impossible for him to carry out the work without loss.

Should a client of mine desire to employ a particular builder, I find no difficulty in fixing a contract with him at a fair price, without competition.

I do not think that any architect of repute would invite tenders merely as a check, or allow a competitor to reduce his tender after hearing the result.

ARTHUR H. OUGH

SIR,—I quite agree with the points raised by " Suburban Builder " in his letter with regard to the practice of accepting tenders which are not the lowest in competition—that is, when the tenders have been obtained by invitation. Personally, I always impress on clients that, if a builder is invited to tender and his tender is the lowest submitted, they are morally bound not to pass him over in favour of anyone else. I may say that I cannot recollect any case under my direction where the lowest tender has been passed over in favour of a higher one, although the temptation is very great sometimes, when tenders are very close and some particular builder is preferred.

In cases of open tendering, when tenders are advertised for—as, for instance, in the case of public work—I do not consider that the lowest tender should necessarily be accepted, as probably one is not familiar with the capabilities or reputation of all the builders tendering—nor should I recommend the acceptance of a tender which is very much below the next or average of the tenders submitted, as probably there is some bad mistake in the pricing of the bill of quantities.

G. BERKELEY WILLS

Inglesham Church

SIR,—The ravages committed in the way of " restoration " in hundreds of old churches are but too often lamentable; but, quite lately, I came across this particular church, and in my limited experience it appears to be unique, as from its state I imagine that nothing has been done to it for quite 150 years. The oak-framed box pews are grey with age, and there are two screens almost falling to pieces, which appear to have been highly decorated in colour — and there are other interesting features.

Inglesham is at the extreme N.E. boundary of Wiltshire, and within about a mile of Lechlade (Gloucester).

Do any of your readers know anything of it ?

A. SAXON SNELL

The I.A.A.S.

SIR,—Referring to the Payne *v.* Marshall case, perhaps Mr. Athoe will be good enough to tell us if a builder who keeps draughtsmen is eligible for Fellowship of the I.A.A.S.?

Also what proportion of architect members were articled or passed through a recognized school ?

Also are house agents, factors, borough engineers and sanitary inspectors eligible ?

WILLIAM DAVIDSON

SCHOOL WORK: LIVERPOOL

For " commercial," in Mr. W. Dougill's critique, page 87, July 15 issue, " communal " should have appeared. The change of sense is regretted.

THE SPECIFICATION WRITER

Some Concrete Appliances from Abroad

THE increasing use of concrete construction in modern work has led to the introduction of special appliances, which the specification writer should be prepared to call to his aid, both for the heavy structural work and for the finishing. While many of these novelties are in use in this country, others already familiar abroad seem to be little known.

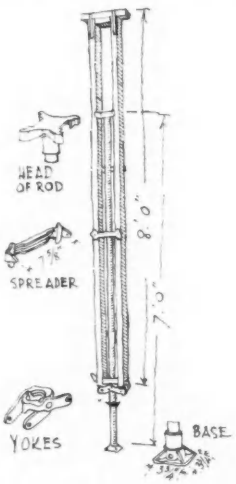

Figure one. Sketches illustrating the construction and use of the Rooshor, an appliance taking the place and functions of timber shores. It is very strong, adjustable, and capable of being used repeatedly.

The Rooshor (figure one) does away with the old method of shoring with posts and wedges under the form work and shuttering of concrete floors and beams. A concrete-filled steel rod is fitted with a shoe and fixed to run between two pieces of timber, these latter being connected at the top by a T-shaped head. To the lower end of these timbers is attached a special form of steel yoke, through which the rod runs freely in a downward direction, but which grips it firmly as soon as any pressure is put upon the timbers from above. To erect the Rooshor the foot of the rod is placed on the ground vertically under the point to be supported; the workman then lifts the wood frame until the head is in contact with the shuttering above. The yoke holds the shore automatically in this position, and a final tightening-up is done with a small hand-jack. The whole operation can be carried out by one man with great rapidity. To dismount the shore all that is needed is a sharp blow with a hammer on the yoke.

The saving in time over the old method is great, and an even greater saving in cost is effected, as these shores can be used over and over again, being suitable for any height up to 14 ft. By the addition of an extension piece, even greater heights can be supported without any wasteful cutting of timbers. The shores when closed are about 7 ft. long and pack closely together for storage and transport, thus forming a very economical item in a builder's plant. The Rooshor will bear a considerable load when fully extended. A test made at the University of Pennsylvania showed that under a weight of 11,850 lb. the shore began to deflect, but regained its alignment when the load was released. The maker's claim that each shore can support a safe load of 3,000 lb. gives an ample margin of safety.

Another standardized apparatus for the shuttering of reinforced concrete and cased steel columns also comes from America. This is a binding clamp (figure two) made of metal strips hinged together, which open to an angle of 90 degrees. Two of these strips form a clamp, and each arm is perforated with a number of slots. A running link, to which is attached a wedge, runs over the arms and connects them together round the shuttering, so that the size of the pier is of no consequence as the arms can be adapted either for large or small without cutting and fixing. To release the clamps a light upward blow with a hammer is all that is needed, and they can then be folded up for re-use. In a column about 12 ft. high the lowest clamp should be within 12 ins. of the bottom, the next three spaced 18 ins. apart, and the remainder approximately 24 ins., with the topmost one within 6 ins. of the head. For a higher column the lower clamps should be closer in order to withstand the greater pressure of the liquid when first poured. These clamps are manufactured in various lengths to hold the shuttering of oblong as well as square piers, and there is also an ingenious arrangement, with a rod and lug attachment, whereby the shuttering can be secured when a pier is built close against an existing wall.

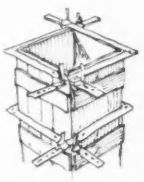

Figure two. An American binding clamp.

While dealing with shuttering it should not be forgotten that there are other materials besides common planking. Masonite has a substance which is much lighter and as effective, when strengthened by battens, for all forms of vertical shuttering. The material has also the advantage of being perfectly smooth, and when removed it leaves the face of the concrete without the impression of the grain of wood boards, so that no rendering is necessary before decorating.

In many countries concrete sleepers have been adopted on the railways, but among the various drawbacks to their use—the perfect concrete sleeper, capable of resisting the complicated strains set up by a train, has yet to be designed—one of the worst is the difficulty of fixing the rails or chairs to the concrete. The common method of embedding some form of wood plug in the sleeper, and driving into it the rail spike, is unsatisfactory, as the plugs invariably become loose in time from vibration or from heat. A novel method (figure three), which is also suitable for the holding down of any heavy machine subject to vibration, is to thread a greased spiral on a spike about 6 ins. long and bed this in the concrete when the sleeper is being cast. After the material has set, the spike is unscrewed, leaving the thread alone firmly fixed in the block. The hole is then lined with bitumen, and a permanent holding-down bolt of a similar thread is first dipped in boiling pitch and then screwed in. This method has been adopted by the Italian State Railways and is apparently a success.

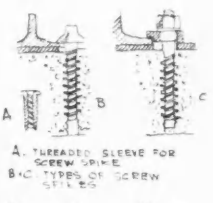

Figure three. Device for holding down bolts in concrete sleepers.

The reinforcing of concrete strong-room walls is another problem. Bricks are fire- but not burglar-proof, and even concrete walls, constructed in the usual manner with steel rods, can be cut through with little difficulty by means of the oxy-acetylene blowlamp.

A recent invention which has been adopted in some Continental banks consists of a reinforcement of twisted steel bars (figure four) composed of two metals, the exterior coat being mild steel, while the centre of the bar is composed of an anti-blowpipe metal. These bars are placed about 3 ins. apart vertically in a double or treble row in the thickness of the concrete wall.

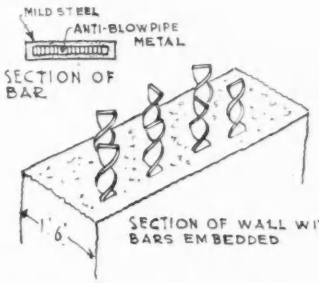

Figure four. A twisted bi-metal, anti-blowpipe form of reinforcement for strong rooms.

The twisting of the rod, which exposes the edge as much as the side to the blowlamp, as well as the nature of the inner metal, which dissipates the heat, will be more than a match for a cracksman, who nowadays cannot look forward to long undisturbed periods of work.

Another gadget comes from Germany. This is the Ancobar (figure five),

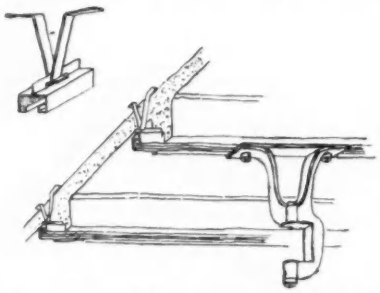

Figure five. The Ancobar, a German device for fixing overhead shafting, etc.

manufactured by the Deutsche Kahneisen Gesellschaft, and it consists of a hollow steel rectangular tube with a flanged slit running down the length of the underside. These bars take the fixing for overhead machinery and transmission gear shafting. The old method required that the engineer should set out all his machinery before the factory was completed, so that the various rag bolts could be built in, and frequently when the floors were clear of scaffolding a better scheme was apparent which could not be adopted without expensive cutting and punching of holes in floors and beams. With the Ancobar the exact position of the machinery need not be settled till the building work is complete. The Ancobar tubes are embedded in the underside of the concrete beams, the lower face of the bar flush with the soffit. They are incorporated in the reinforcement by means of a series of steel straps with hooked ends extending upwards at intervals into the mass of the beam. Care should be taken when pouring the concrete not to fill the slit in the Ancobar, although a small amount of cement is easily cleared out when the shuttering is struck. The main Ancobars extend from pier to pier in the manner of the common reinforcing rods, and are manufactured in various sizes, those of the largest section being capable of supporting a weight of over two tons per foot run. Ancobars let into the floors of machine-rooms allow power units to be moved from place to place without the dreaded dislocation of business usually associated in the factory owner's mind with " calling in the builder."

LL. E. W.

PHOTO-REPRODUCTION OF PLANS

Some Modern High-Speed Methods

MODERN architectural practice tends to the multiplication of drawings and at the same time demands an ever-increasing speed in their production. If at times one regrets the spacious days of careful tracings and meticulously-coloured details, it is abundantly clear that in this high-speed age no architect or engineer can carry on without the aid of photographic reproduction. Many of the processes carried out at Messrs. B. J. Hall's new premises at Stourton House, Dacre Street, Westminster, S.W., are familiar up to a point, but unless the many improvements that have been made during the last few years are fully realized, time is frequently wasted in the drawing office over doing by hand much that can be carried out more quickly and economically by the machine.

The Ordoverax process, besides copying tracings in the ordinary way, can also be used for making alterations without retracing the whole sheet. The portions of the drawing to be revised are blocked out on the composition table, and a print taken on tracing cloth. This is returned to the architect, who then makes the necessary alterations in the empty spaces, and, from the tracing thus completed any number of copies can subsequently be taken, either by the Ordoverax or other processes. Dirty tracings can be made to give clear black-and-white reproductions, the blemishes being removed from the etched surface of the composition before inking with the roller. It is realized that the opacity rather than the thickness of the line is of importance; good inked reproductions either on tracing cloth or on paper can be made from pencil originals on to transparent detail paper or Stirling pencil cloth.

Speed in the wet process of blue printing is regulated by the rapidity with which the prints can be washed and dried, and sometimes the white line and dark surface of a blue print is considered objectionable. To meet the demand for greater speed and to give a positive result from a positive original, Messrs. Hall have introduced the Coralin and Ilex processes, which are developed in a small machine at the rate of about ten feet per minute and require no washing. Prints made by these processes can be developed entirely without trays or machinery, by just sponging the surface with a pad impregnated with developer. As the prints dry the lines grow darker and, there being no fear of offsetting, they can be rolled up and dispatched with safety before becoming bone dry.

The speed of exposure is taken care of by the Hall-Mark copier, which makes use of a patent horizontal lamp and distributes the light with great accuracy, so that in conjunction with the copier the Coralin and Ilex processes offer the most rapid means of plan-reproduction known.

The maximum size of a finished sheet by the usual type of reproducing cameras used is 18 ins. by 24 ins., and anything larger had formerly to be done on separate sheets and joined together. By the Radioscript process it is possible to make prints up to 40 ins. by 50 ins. in one piece, and the studio in which this work is carried out resembles a miniature Hollywood, with floodlights and batteries of powerful lamps to give perfect illumination for the enormous camera, which focuses by travelling backwards and forwards on a pair of rails. The direct Radioscript produces negative copies in white lines on a black background, but by the indirect method a positive from any opaque original can be reproduced as a positive.

In an adjoining dark room, by means of a camera with a mercury-vapour lamp, copies of drawings can be made in facsimile or to any required scale, and can be printed, if required, on translucent celluloid as a negative for obtaining prints by other processes. Thus a set of $\frac{1}{8}$-in. scale drawings can be reduced to $\frac{1}{16}$-in. scale in the time it would take a draughtsman to sharpen his pencils. It is perhaps not generally known that an opaque drawing can be transparentized and copies taken from it in a similar manner as from tracings.

The lithographic process is worked on two machines in the basement, where everything is as clean and twinkling as the engine room of a warship. This process is similar in result to Ordoverax, but can be economically employed only for a sufficiently large number of copies to make the preparation of the necessary zinc plate worth while.

Among many interesting fittings and instruments exhibited in the showrooms on the ground floor is a drawing table and stool which seem to have forestalled every possible criticism of the most finicky draughtsman. The table can be adjusted to various heights and to any angle, under the control of a single foot pedal. The height of the stool is adjustable—the draughtsman does not need to leave his seat when wishing to elevate or reduce the height of his position. Indeed, everything is there except the Robot draughtsman himself, with his self-filling fountain drawing pen. But Messrs. B. J. Hall have an experimental department, and we may yet see these invented.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigation may, in the course of time, indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for general application to all similar problems.

Failure of Roofing Tiles

AN architect wished to know the cause of the failure of clay roofing tiles which had been laid on a roof about three years ago, and now show distinct signs of disintegration at the edges. The pitch of the roof is 40°, and it is fully torched on the underside with haired mortar. The failure of the tiles is confined to one slope having a north-west aspect.

From an examination of specimens of the tiles it is apparent that they are of rather a poor quality, distinct signs of lamination being evident in all. This and the appearance of the damage, together with the fact that disintegration had occurred on the north-west side of the roof, make it practically certain that failure was due to the action of frost. This side of the roof would probably dry out less rapidly than the others, since the heat of the sun would only reach it late in the day when the temperature is already somewhat low. Thus, conditions tending to keep the tiles saturated would arise and freezing would easily cause failure. In this connection it is interesting to note that on an experimental roof at this Station, the deterioration of some tiles having a northern aspect is much more marked than that of similar tiles having a southern aspect.

The practice of torching is considered to lead to an increased danger of penetration of moisture and, in so far as it provides an additional reservoir of moisture in capillary contact with the tiles, it is probable that failure by frost action will be accelerated.

Failure of Cement Renderings on Salty Bricks

A contractor complained of the continual breakdown of a cement and sand rendering applied over brickwork, and asked if the Building Research Station could suggest the cause and any possible cure. It appeared that the renderings first developed hollow areas and ultimately cracked and fell off, the face of the brickwork exposed being covered with a white material of pasty consistence. Rendering with cement and sand had again been carried out on the affected areas, but a similar type of failure had occurred.

From the specimens submitted it appears that the bricks contain a very high proportion of calcium sulphate, and for this reason Portland cement rendering would be expected to fail where moisture conditions in the brickwork are favourable to the conveyance of the salt to the rendering. It is very doubtful whether it would be possible to renew Portland cement rendering direct on brickwork of this kind. No experimental work has been carried out with aluminous cement rendering over materials containing a high proportion of calcium sulphate, but it is possible that the likelihood of failure would be reduced by its use. If it is decided to try out an aluminous cement rendering, every care should be taken to obtain a dense coating. The sand should be clean and well graded from coarse to fine, an excess of water in the mix avoided, and the work kept moist for several days after application.

An alternative which should ensure complete immunity from further deterioration would be to apply an impervious membrane to the brickwork and then render in Portland cement. A bitumastic paint has been suggested for the purpose, and it has been found possible to apply plasters direct over materials of this kind. It would be possible to ensure a completely satisfactory key by nailing expanded metal lathing to the face of the treated brickwork.

Protection of Concrete from Petrol and Accumulator Acid

Information was required on the effect of petrol on concrete and the most suitable means of protecting concrete from the effects of accumulator acid.

The effect of petrol on the wearing properties of concrete has been investigated at this Station over a period of three months. Concrete specimens were cured in air for one month, and then completely immersed in petrol for a further three months. The amount of wear, measured by a standard abrasion test, was found to be practically the same for concrete which had been placed in petrol as for the control specimens kept in air. Similar results were obtained with specimens cured in water. So far as these tests show, the effect of petrol on concrete is practically negligible.

With regard to the action of accumulator acid, no simple treatment is known which will render the concrete resistant. It is suggested that the portion of the floor over which accumulators are handled should be covered with a good bitumastic composition.

Disintegration of Floors in Bakehouse

A builder requested the opinion of the Station as to the most suitable type of floor for a bakehouse, mentioning that the floor would be subject to high temperatures and considerable trolley traffic. A concrete floor had been laid originally, but had disintegrated under these conditions. A patent composition floor was then laid, but had also failed.

The failure of the concrete and composition floors was probably due to high thermal movements produced by the adjacent ovens. These would tend to develop cracks in any type of monolithic construction, and the rolling of heavy trucks over the surface would aggravate the trouble and lead eventually to the disintegration of the floor. A construction in which separate units are employed is desirable in order that some of the movement caused by the change in temperature may be taken up by the joints.

The materials which appear suitable for this purpose are hard stone or concrete paving flags or bricks, as these are not likely to deteriorate under the effect of the variations in temperature likely to be experienced, and are very resistant to wear when subjected to heavy traffic.

An extremely hard-wearing floor can be obtained with paving bricks, and these would in themselves be quite immune from injury by exposure to very high temperatures.

Attack of Fibrous Wallboards by Rats and Mice

An architect inquired whether fibrous wallboards were particularly liable to attack by rats and mice.

No investigations have been carried out at the Building Research Station in this direction, but the following remarks may be of assistance.

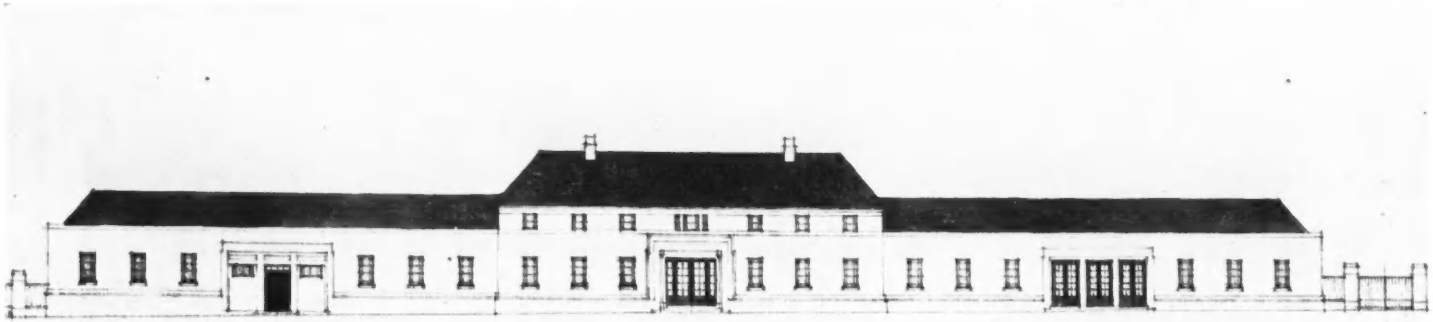
Wallboards have little, if any, food value, and it is unlikely that rodents will be attracted to a building where these materials are employed, unless some other source of food supply is available. The gnawing teeth of rodents grow continuously and have to be rubbed down on some hard material, and it is this tooth-wearing process which accounts for much of the damage caused by rats and mice. If the site is already infested, it is to be expected that some damage will be caused to the boards. The nature of the constituent material of wallboards is such that it might be used by rodents for nesting purposes; it is not, however, likely to be preferred when paper, cloth, or similar materials are within their reach.

It is, of course, well known that the presence of rats and mice is, to a large extent, dependent on the available food supply, and if the source of food is cut off they will be compelled to migrate. If precautions are taken in this direction, we do not see that the use of wallboards is likely to be an important factor governing the presence of rodents in a building.

COMPETITION FOR

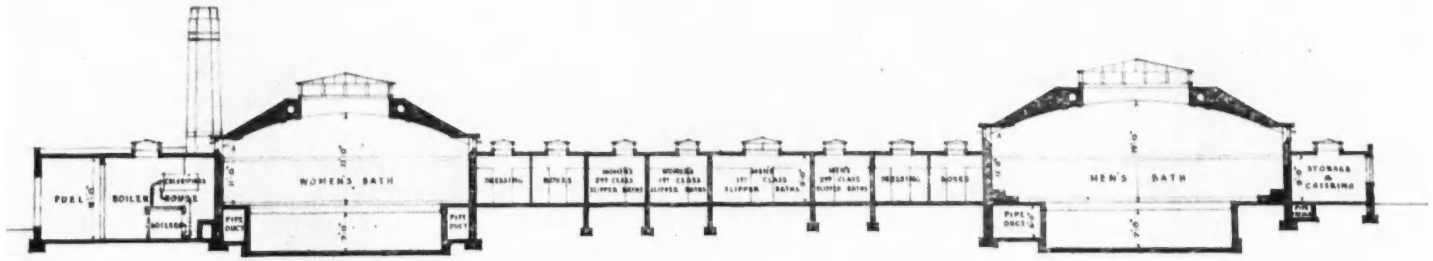
FOLESHILL, COVENTRY, BATHS

Winning Design : By Adshead, Topham & Adshead



. FRONT ELEVATION .

The front elevation to Livingstone Road. The City Council, while not binding the competitors, had in mind an expenditure of £45,000 for the building and equipment, excluding all movable furniture.



SECTION C. C.

Section. Two swimming baths were asked for, with approximately 80 dressing boxes for each, arranged in separate annexes. The men's bath is designed to be used for galas, and in the winter as a public hall with a temporary stage.

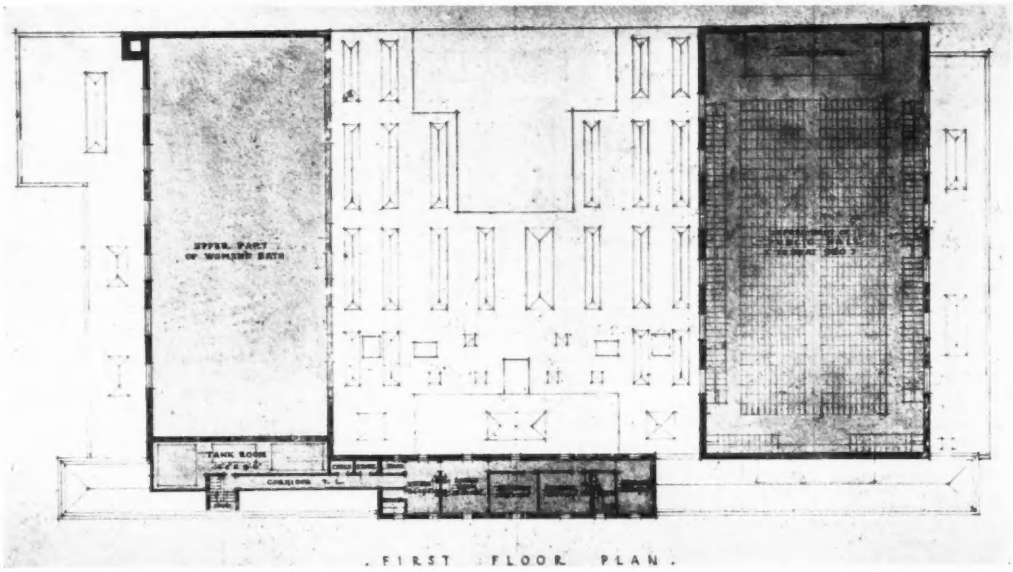
MESSRS. ADSHEAD, TOPHAM AND ADSHEAD, of Manchester, have been awarded the first premium of £210 in the competition, promoted by the Coventry City Council, for designs for branch baths at Foleshill. Mr. Frederick J. Horth, F.R.I.B.A., was the assessor. The second premium (£105) was won by Messrs. Sutton and Burnett, Nottingham, and the third (£52 10s.) by Mr. Arthur G. Porri, London. Seventy-four designs were submitted.

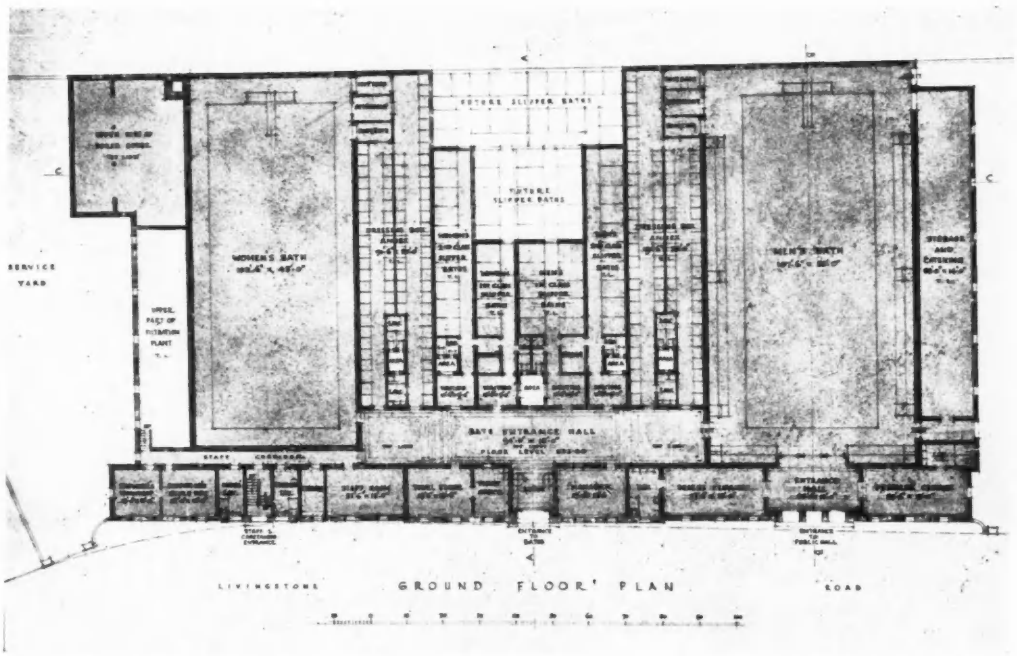
The assessor, in his report, says: "The winning design is one of the most economical submitted, but it will be necessary for the author to exercise care in the choice of materials and strict economy in the drawing up of his specification to keep the building within the amount of his estimate. The general layout, including the engineering services, is excellent, each department being entered direct from the entrance hall, this facilitating easy supervision and control.

"The detail planning is well arranged, but I desire to draw your attention to the following minor points which might with advantage be re-considered:—(a) Position of doors to cloak rooms should allow of a counter along the full length; (b) the top lights to the slipper baths should be increased in width for the purpose of more effective ventilation; (c) the connecting duct between the two baths should be brought in line with that across the front end of the smaller bath hall to afford a direct run from the filtration plant to the shallow end of the larger bath hall; (d) I would suggest that a duct be formed round the fourth side of the large swimming bath to permit of the easy stopping of any "weeping" should this occur in the pond walls.

"The elevation is pleasing and suitable for this type of building, the author relying on sound fenestration and good proportion for architectural effect, the use of ornament having been entirely omitted.

"The response from architects to this competition should be exceedingly gratifying to the Corporation, the standard of design, for an admittedly practical subject, being, on the whole, very good."





Foleshill Baths Competition: Winning Design.] [*By Adshead, Topham and Adshead.*

Plans of the ground and first floors. The slipper baths are planned so that the accommodation may be doubled as a future extension. Other features of the scheme are a boiler-house, engineers' workshop, and store-rooms.

LITERATURE

MODERN DUTCH BUILDINGS

IN these latter days when modern architecture has become an important ingredient of the newspaper paragraph and the very life-blood of the "home beautiful" page, and is even condoned by (some) Royal Academicians, it behoves the serious upholder of sensible building to survey with a jealous eye all that is published in the name of modernism. We therefore turn such a burning eye on Mr. Yerbury's latest work on *Modern Dutch Buildings*, and although we find there a good deal of work which in our opinion is wilful and strives too hard to be expressive, we find very little that seems insincere, a great deal that very well maintains a special quality of Dutchness. As in sixteenth- or seventeenth-century Dutch painting, so in twentieth-century Dutch architecture there exists a remarkable feeling for surface. All the most successful buildings in this book have that. Their windows are like pictures hung on a wall; and they enliven without destroying its surface. Those which, like the offices of the Netherland Trading Company, show their bones and sinews and fail to achieve surface, seem harsh and disagreeable. The "Volkandinj" Co-operative Societies,

building at The Hague is an interesting example of the (almost) all-glass structure, but in looking at it one asks oneself whether it complies with the nursery counsel of perfection on the subject of remarks. Is it true? Is it kind? Is it necessary? That was a hard saying and unduly restrictive of conversation. No doubt it would be so of architecture too, but we do think the question may be asked occasionally, and we are sure that the vigorous architect of this most vigorous composition of contrasting masses would almost persuade us that it was all three. And yet we have a feeling about it and about some others not unlike that experienced by the quiet man in a railway carriage whose fellow-traveller insists on telling him, in dramatic fashion, his whole life history.

But then there is Mr. Dudok to charm us to a smile. His schools at Hilversum account for twelve pages of illustrations and they are the most attractive things in the book. He is a master of happy groupings, his masses are well defined, and whether the buildings are in the streamline manner or roofed over in the archaic manner, they have the same qualities of clearness and graciousness. How happy is he born and bred that goes to school at Hilversum! Mr. Oud is another who has achieved urbanity and character. His housing scheme at The Hook has a quite maritime note. Commercial buildings are represented by the Van Nelle factory at Rotterdam, a magnificent essay in the all-glass manner, and by the silos at the same port—an equally fine structure in the all-concrete manner.

Holland is shaking off both the excessive Frank Lloyd Wright influence, and the too fantastic efforts of the post-war period. There can be no question that her architects are shaping a style that is flexible, interesting and in genuine accord with modern needs and with Dutch culture. That style is so definitely national that we may even hope it will not be copied here.

It is superfluous to say that Mr. Yerbury's photographs are admirable. (See frontispiece to this issue.—ED.A.J.) There are some—but not quite enough—plans, and there is no list of contents nor index. The author's introduction brings out some interesting facts—notably how the speculatively built blocks of flats come by their elevations. But it is not clear whether the architects' remuneration is at the rate of £1 per lineal or per superficial metre. We hope the latter.

Modern Dutch Buildings. By F. R. Yerbury. London: Ernest Benn, Ltd. Price 32s. 6d. net.

A BOOK FOR PLUMBERS, ETC.

I CAN only suppose that a plumber's waistcoat pocket is more accommodating than mine, for having been given this book to review, and finding it described as "waistcoat-pocket size," I inserted it, and felt its pressure all day; it is not a comfortable pocket companion, and, in common with most indecently fat books, after twice opening it, showed a tendency for stray pages to come adrift. It contains, however, all that any decent plumber or sanitary engineer would want in the way of tables and memoranda, and some very useful facts relating to the practice of plumbing, heating, and gasfitters' work. The electricians' section is less convincing, and some of the information as to carbon filament lamps might surely be discarded, while it might reasonably be expected that, as well as the information on Leclanché and dry batteries for bell work, some mention would be made of the method of running domestic bell services by a transformer off the lighting current. To be really up to date some particulars of base-exchange water softeners might also be looked for. E. G.

Tables and Memoranda for Plumbers, Builders, Sanitary and Electrical Engineers, Etc. By J. Wright Clarke. London: B. T. Batsford, Ltd. Price 2s. 6d. net.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Rural Housing

IN Committee of the House of Commons on the Housing (Rural Authorities) Bill last week, several interesting points were raised. On Clause 1 (Government contributions to housing expenses), Sir K. Wood moved an amendment to provide that such contributions should be made in accordance with conditions specified in a schedule. He said that unless some conditions were inserted, the Bill would practically give a blank cheque to the Minister and the committees that were to be set up under the Bill.

Mr. Greenwood, Minister of Health, said that it would be an entirely new precedent in housing finance if the words of the amendment were adopted. There was need for flexibility, because they were dealing with this problem in a new way. In a rich county there was not the same urgency for financial help from the State as there was in a poorer county. He was, however, prepared to move an amendment providing that the Ministry should proceed by Orders, and that such Orders should be laid before the House, thus giving opportunities for debate. The amendment was withdrawn.

Captain Cazalet moved an amendment to provide that the Committee which is to advise the Minister shall consist of not more than twelve persons, of whom at least one shall be a woman, with representatives of the Treasury, County Councils' Association, rural district councils, Chartered Surveyors' Institution, C.P.R.E., industry, commerce, and farm workers. This body, he said, was no packed jury, but a businesslike committee representative of the community.

After discussion, in which Captain Gunston, Miss Lloyd George, Captain Henderson, and Mr. E. D. Simon took part, Mr. Greenwood said he hoped the Committee would not press for the insertion of the amendment, but would leave it to the Government to appoint a Committee, which would be as small as was practicable and as widely representative as possible. The amendment was negatived by 248 votes to 94.

Mr. Hurd moved an amendment to provide that directions as to the cost, size and material of the houses proposed to be built should be included among the directions of the Minister which should guide the Advisory Committee.

Mr. Greenwood said the Committee would determine the size of the houses within the limits of the existing law. As to houses of various types, he saw no reason for having precisely the same number of cubic feet in a house, whatever the means might be. As to cost, last year local authorities built between 7,000 and 8,000 houses, at a cost of less than £300. He had suggested £350 as a reasonable figure. Transport might, however, be an important element of cost. In particular cases the figure might be raised a little. Therefore, he would not wish to see the figure of £350 in the Bill.

After Viscount Wolmer had said that the Minister ought to use his influence with the Committee to prevent the use of building materials which would be an eyesore; Major Owen that as public money was being used, the Minister ought to insist that British building materials were used; and Mr. Womersley had urged that British doors and windows should also be used in the houses, the amendment was negatived by 262 votes to 102.

An amendment by Mr. Albery to the effect that the cost of a financially-assisted house should not exceed £350 was rejected.

Mr. Greenwood moved an agreed amendment providing that any directions or conditions laid down by the Minister under Clause 1 should lie before the House of Commons for twenty-one days.

On the question that Clause 1 stand part of the Bill, Captain Gunston hoped that the Minister would give some indication as to what he proposed to do in regard to the fixing of rents; and Mr. Hurd said that rent was the basis of success or failure, and he hoped that the Minister would keep in mind the figure of 3s. a week.

Mr. Greenwood said that it would be impossible to give a definite undertaking as to rents in all parts of the country, and in all circumstances. He had given a rough estimate of 3s. per house, or 4s. 6d., inclusive of rates. But that was considerably below the rent prevailing for new houses built under post-war schemes.

The clause, as amended, was agreed to, and the Committee Stage concluded.

Underground Dwellings

The problem of the slums was discussed in the House of Lords on the initiative of the Bishop of Southwark, who drew attention to the large number of persons who, in London and elsewhere, were now living in unhealthy underground dwellings, and asked for information as to the number of houses which the local authorities proposed to build in the next five years. He also asked if the Government would appoint a Central Housing Committee to encourage and supervise the building of houses for the working-classes. He said that the Medical Officer to the London County Council had stated that there were about 30,000 basement dwellings in London which were unfit for human occupation, but in which 100,000 people were living. The results to health were deplorable. It was said that continued progress was being made in the closing of basements, but he found that in 1929 only 174 had been closed. His information, in fact, was that the occupation of basements was extending. He asked the Government for legislation to strengthen the existing law if it required to be strengthened, and to make inquiries and publish the results.

Lord Buckmaster's solution for the slum problem was birth control.

Lord Snell, replying for the Government, agreed with the main principle of the speech of the Bishop of Southwark. The slum problem was one of great urgency, but the great difficulty was to rehouse the people, and the closing of a basement did not provide a new site. People would submit to bad living conditions in order that they might live near their work. The Housing Act of 1930 was an earnest of the Government's intention to deal drastically with the whole problem of the slums. Five-year building programmes had already been submitted by 280 local authorities, covering five-eighths of the population of England and Wales, who proposed to build 340,000 houses. In the opinion of the Government it would be unwise to set up a Central Housing Committee. If it meant substituting that Committee for the Housing Department of the Ministry of Health a new and untried body would take the place of an experienced body. If it meant that the Committee should themselves undertake the building of houses, so far-reaching a proposal was open to grave objection. Housing was essentially a matter of local government. The Government were watching the situation. They believed they were reducing the problem of slum clearance to manageable proportions. They did not deny that there was much still to be done.

LAW REPORT

ALLEGED INFRINGEMENT OF A COPYRIGHT OF A GARDEN

ACTION AGAINST BUILDERS

H. Vincent and Son v. *Universal Housing Co., Ltd. Chancery Division. Before Lord Justice Romer*

THIS was an action by H. Vincent and Son, landscape gardeners and builders, of Northwood, Middlesex, against Universal Housing Co., Ltd., of Rickmansworth, for an injunction to restrain infringement of copyright.

Mr. Henn Collins and Mr. Shelley appeared for the plaintiffs and Mr. Jenkins, K.C., and Mr. MacGillivray for the defendants.

Mr. Henn Collins said the defendants were a firm of builders and erected houses of any type, but had a preference for erecting houses of which they issued a catalogue. The plaintiffs received instructions from a Mr. Conant to design a garden for him and thereupon Mr. Ralph Vincent designed a garden, drawing out a plan which was submitted to Mr. Conant. He approved of it, and it was duly made, consisting of terraces and walls, etc.—in fact, an artistic design and a structure, in counsel's submission. This was the subject-matter of plaintiff's copyright. After the garden had been made Mr. Conant had it photographed and he supplied the defendants with a copy or they had one themselves. One of those photographs, said counsel, found its way into the defendants' catalogue, in which the defendants most clearly claimed it as their particular design and construction. The catalogue, and in particular the photograph of the garden in it, met the eye of a Mr. Wilkinson, who put himself into communication with the defendants and ultimately letters passed between the defendants and Mr. Wilkinson, and these came into the possession of the plaintiffs. The plaintiffs now sought an injunction to restrain infringement of copyright of the design of their garden. The garden was finished in the autumn of September, 1929, by the plaintiffs.

The letter in question was written by Mr. Wilkinson to the defendants inquiring the price of the garden illustrated in the catalogue (which plaintiffs said was their garden design taken from another angle). Defendants in their reply enclosed a photograph of the garden and added that it happened to be one of their own design and could be constructed to suit any type of house. Defendants wrote another letter saying that the garden would cost about £237.

Counsel said the garden in question really cost a great deal more than that.

His lordship: What right of action have you?

Mr. Henn Collins: Infringement of copyright.

His lordship: What!

Mr. Henn Collins: It is an architectural work of art.

Counsel added that the plaintiffs drew out a plan of the garden. He stood on the footing that the garden itself was an architectural work of art which was defined in the Act as subject-matter of copyright.

Mr. Jenkins said he did not support the letters which had been written by servants of the defendant company. They were written without authority and should not have been written.

Mr. R. Vincent, of the plaintiff firm, gave evidence in support of counsel's opening. He superintended the work of the garden, which took four months. Defendants had nothing to do with the layout of the garden.

Cross-examined: Plaintiffs objected to the photographs being put in the defendants' catalogue.

For the defence, Mr. Philip Beeson, secretary of the defendant company, said his company took up landscape gardening round about the time the garden in question was made. Defendants got the photograph of the garden in question from Mr. Conant. In fact, Mr. Conant handed defendants the negative. There was a motion in Chancery and as a result the defendants destroyed the catalogues containing the illustration of the garden. Defendants never intended to make another garden like the plaintiffs'. Witness thought that they were entitled to reproduce a similar garden.

Cross-examined: Witness understood that he had given an undertaking not to reproduce the garden and did not intend to reproduce it.

Mr. Richard Sudell, landscape architect, expressed the view that there was nothing new in the plaintiffs' design. Every garden was individualistic in a sense. He had never seen an exact combination like the plaintiffs' garden before.

Mr. Arthur S. Gilhain, landscape architect, thought there was nothing

new or original about the plaintiffs' garden.

JUDGMENT

His lordship, in giving judgment, said this was a ridiculous action and, like most ridiculous actions, raised a considerable point of law. The photograph showed that the garden had features which were common to all gardens, but it contained a combination of features which were novel and of which he had never seen the like before. His lordship thought the letter written by defendants' representative, without authority, was misleading in stating that the design was defendants'. The photograph published was not an infringement of plaintiffs' copyright. The question he had to consider was whether plaintiffs had any copyright in this garden. Was this garden a structure having artistic structure or design? In his lordship's opinion it was. It seemed to him it was impossible to say that it did not possess artistic character or design. It therefore came within the Copyright Act. The defendants had infringed the copyright in offering to construct a garden in accordance with plaintiffs' design.

Under the circumstances, he should order the defendants to give an undertaking that they were not to offer to construct gardens substantially similar to the garden designed by the plaintiffs. As the plaintiffs were largely to blame for all the trouble, he should not give them any costs.

COMPETITIONS OPEN

July 31.—Sending-in day. Proposed Nurses' Home at the Royal Asylum, Montrose. Limited to architects practising in the counties of Aberdeen, Angus, Fife, Kincardine and Perth. Assessor: John Watson, F.R.I.B.A. Premiums: £75, £50 and £25. Conditions, etc., obtainable from C. K. Alexander, Clerk and Treasurer, Royal Asylum, Montrose.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

SOCIETIES AND INSTITUTIONS

R.I.B.A. EXAMINATION RESULTS

THE R.I.B.A. Intermediate Examination qualifying for election as Student R.I.B.A. was held in London from June 5 to June 11, and in Manchester, Newcastle and Edinburgh from June 5 to June 10, 1931.

Of the 226 candidates examined 113 passed and 113 were relegated. The successful candidates are as follows:

Aikman, A. E.
Alp, W.
Armitage, H.
Baddiley, F. O.
Barker, H. M.
Barlow, L.
Beard, P. B.
Beattie, W. H.
Beaumont, M. G.
Beecham, T. W.
Bell, M.
Bennett, H.
Benson, E. S.
Benson, J. F.
Bent, J. A.
Betts, C.

R.I.B.A. ELECTION OF MEMBERS

At a recent council meeting the following members were elected:

As Hon. Associate

Moore, Lt.-Col. T. C., C.B.E., F.R.G.S., M.P.

As Fellows

Bernton-Benjamin, H.
Gayton, H. J.
Hartley, J.
Hembrow, J.
Jones, M. C.
Liddiatt, E. T.
Lloyd, N., O.B.E., F.S.A.
Logan, Major P. N., O.B.E.
McMillan, Capt. D. S.

As Fellows—cont.

Mitchell, R. M.
Rose, G. A.
Ross, L. H., M.C.
Shenstone, Bt.-Col. G., T.D.
Stewart, J.
Taylor, R. M.
Westrup, G.
Whitaker, H.

As Associates

Challen, Margaret C.
McNicol, W. H., B.A.
O'Rorke, E. B.
Smith, C. H. B.
Thompson, H. R.

As Licentiates

Aldridge, J.
Aldridge, V.
Ashby, L. J.
Barron, A. D.
Boucher, D. G., F.S.I.
Clark, A. N., F.S.I.
Connor, P.

THE ARCHITECTURAL ASSOCIATION

The A.A. School of Architecture annual prize giving was held, on July 10, under the chairmanship of the President, Mr. A. B. Knapp-Fisher, F.R.I.B.A. The prize-winners were as follows:

Public School Entrance Scholarship (value £75 12s.): A. G. Ling (Christ's Hospital School). Open Entrance Scholarship (value £75 12s.): R. R. Wilkins (Eltham College); Honourable Mention: Miss M. A. Trent (Chelsea School of Art).

Renewal of Annual Scholarships: E. V. Tibbitts, J. C. Charter, A. Cooper, R. A. Kirby, R. Wilson.

A.A. Measured Drawings Prize (Books, value £20): Miss J. Balstone, R. G. M. Chase.

A.A. Essay Prize (value £10 10s.): Not awarded. Consolidation prize (value £2 2s.): G. G. Laidler.

"Alec Stanhope Forbes" Prize (for the best colour work during the session, value £5, books): A. G. Savill.

Medal, presented annually by the Société des Architectes Diplômés par le Gouvernement, Paris, to the best Diploma student of the session: A. G. Gibson.

Royal West of England Academy School of Architecture (affiliated with the Architectural Association). (Prize in Design. Value £5 5s.) P. K. Pope.

First Year Course "Howard Colls" Travelling Studentship (value £15 15s.): N. C. Westwood. Second Prize (Books, value £5 5s.): F. C. Keel. Honourable Mentions: V. H. Seymer, R. S. Tubbs.

Second Year Course A.A. Travelling Studentship (value £26 5s.): Miss J. Blanco-White. Second Prize (books, value £10 10s.): M. J. H. Bunney. Honourable Mentions: Miss S. M. Cooper, Miss C. L. Gray, C. J. E. Marshall, H. Tayler.

Third Year Course Holloway Scholarship, tenable for two years (value £250): R. L. Banks. A.A. Travelling Studentship (value £31 10s.): P. E. Cornu. Second Prize (books, value £10 10s.): C. Y. Koh. Honourable Mentions: C. P. Dickinson, E. T. Dowling, Miss C. J. Johnson, R. E. Moira.

Fourth Year Course Year Prize (books, value £10 10s.): Miss M. B. Crowley. Honourable

Mentions: L. A. Drake, E. C. Kent, E. Mayorcas, B. P. Westwood. R.I.B.A. "Henry Jarvis" Scholarship for Construction (value £50): B. P. Westwood. Honourable Mentions: E. C. Kent, E. Mayorcas.

Fifth Year Course A.A. Travelling Studentship (value £50): A. G. Gibson. "Henry Florence" Travelling Studentship (value £50): Miss J. G. Ledeboer. Honourable Mentions: J. R. Atkinson, F. W. Mudd, H. R. M. Walker.

List of First Mention Prizes awarded during session: 1st Year, —; 2nd Year, Miss J. Blanco-White, C. J. E. Marshall; 3rd Year, —; 4th Year, Miss B. Bickerton, L. A. Drake, E. Mayorcas; 5th Year, D. C. McDonald, F. W. Mudd.

A.A. Diplomas awarded since July, 1931: Miss B. A. Blades, I. Forbes, E. Freeth, L. D. Harris, G. Jenkins, R. S. Lavers, R. E. Lee, G. R. Linfield, H. S. Luke, G. F. Nicolls, J. V. Nisbet (Honours—General Work), W. H. Penn, E. Playne, G. F. Randall, J. M. Richards, J. C. Rose, Miss B. Scott, R. D. Scott, Miss K. Veitch, J. C. Wilson.

Mr. Frank Pick, Managing Director of the Underground Group of Railways, presented the prizes. In his address, he said, as an amateur, he looked round him at London, and saw far more experiments in the way of building than London could fairly be asked to bear. All these buildings could not all be right. While it was difficult to apportion praise or blame to any particular building or style, he could not but feel that it was somewhat regrettable that many of them had been constructed in materials that would endure for hundreds of years. Centuries hence, someone might come to explore London, and he would delve about and come across the remains of these various buildings. He would have to interpret these blocks, he would have to reconstruct this London of ours, but he certainly would not be able to reconstruct London satisfactorily, because he would be without a clue to it. The reconstruction of Rome or Athens would be child's play in comparison.

The essential of a school was its collective character; they went to school as a place where something was taught, indeed, as a place where something particular was taught, as in that school, where architecture was taught, and from that notion it was an easy progression to the idea of a school; that was to say, the school ceased to be a building in which they were taught: it became a body of persons taught some particular thing, and that idea of discipline was reflected in another word closely allied—they became disciples of that school. If they carried this idea into a collective body of persons taught architecture, and would remember that they were disciples of this school, then one would find some definite impress placed by the school upon the multiplicity of buildings growing up in London so rapidly. By so doing, we would not find that our buildings were so widely separated in style, or diverse in character; or were in such inharmonious juxtaposition as we find today.

Mr. Howard Robertson, in seconding the vote of thanks, which was proposed by Dr. Raymond Unwin, said that Mr. Pick had given a perfectly sound working creed for any school of architecture. He had perhaps omitted one little thing, and that was the influence of the client on architecture. They had not all clients like Mr. Pick, and buildings were often in the unsatisfactory condition they were, solely because of the distinct instructions of the client, who could not be gainsaid.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Warehouse, Shepherdess Walk, N. (pages 105–108 and supplement). General contractors, Harold Arnold and Son, Ltd. Sub-contractors: S. and E. Collier, Ltd., and Daneshill Brick and Tile Co., bricks, including special size hand-made facings; Pilkington Bros., Ltd., glass; Helliwell & Co., Ltd., patent glazing; J. Jeffreys & Co., Ltd., central heating; Gas Light & Coke Co., gas fixtures; Malcolm and Allan, Ltd., electric wiring; Clark Vigilant Sprinklers, sprinklers; James Gibbons, Ltd., door furniture; Crittall Manufacturing Co., Ltd., casements; Standard Telephones and Cables, Ltd., telephones; A. L. Gibson & Co., Ltd., "Kinnear" rolling shutters; Charles Kerridge, Jnr., office fittings; Smith, Major and Stevens, Ltd., lifts; Royce, Ltd., cranes; Synchronome Co., Ltd., clocks; G. T. Friend, signs.

Forum Theatre, Liverpool (pages 109–112). General contractors, J. A. Milestone and Son, Ltd. Sub-contractors: E. C. Smitton, Ltd., Portland stone; Concrete, Ltd., reinforced concrete; Maclean & Co., metal casements; Shanks & Co., Ltd., sanitary fittings; Robert Adams, door furniture; A. D. Dawnay and Sons, Ltd., steelwork; W. and A. Piercy, Ltd., plumber work; H. H. Martyn & Co., Ltd., decorative plaster; Adams Bros. (Liverpool), Ltd., plain plaster; Chas. Walker & Co., Ltd., marble, terrazzo, etc.; J. Jeffreys & Co., Ltd., heating and ventilation; Barr & Co., vacuum cleaning; Garton and Thorne, Ltd., canopy, metal work, etc.; Permanent Bronzing Syndicate, bronzing; Pearce Sign Works, Neon signs; John Compton Organ Co., Ltd., organ; W. J. Furse & Co., Ltd., organ console lift; Carpets and Curtains, Ltd., carpets, curtains, hangings, etc.; W. Draper & Co., Ltd., electrical work; H. Morris & Co., Ltd., seating; F. H. Pride, electrical fittings; Holophane, Ltd., trough lighting, etc.; Electric Construction Co., motor generators; W. Lusty and Sons, woven fibre furniture in café; General Acoustics, Ltd., Acousticon - Seatphone-System for deaf people.

The photographs of the interior of the Forum Theatre, Liverpool, are reproduced by courtesy of H. H. Martyn & Co., Ltd.

THE ARCHITECTS' DIARY

WEDNESDAY, JULY 22

SIR JOHN SOANE'S MUSEUM, Lincoln's Inn Fields, W.C.2. Exhibition of watercolour drawings by Professor C. R. Cockerell, R.A., representing the buildings of Sir Christopher Wren in a composition dominated by the dome of St. Paul's. Until August 28; except Sunday, Monday and Saturday. 10.30 a.m. to 5 p.m. **10.30 a.m.**

INCORPORATED INSTITUTE OF BRITISH DECORATORS. Exhibition of Decorative Art to be held at Painters' Hall, Little Trinity Lane, E.C.4. Also July 23. 10 a.m. till 4 p.m. **10 a.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to St. Mary-le-Bow, Cheapside, E.C.2. Tickets obtainable from the Secretary. **3 p.m.**

THURSDAY, JULY 23

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to new Offices of *Punch*, Bouverie Street, E.C.4. Tickets obtainable from the Secretary. **3 p.m.**

BRITISH MUSEUM, Bloomsbury, W.C.1. Lecture on "Origins of Architecture."—II. (Roman, etc.) **12 noon.**

SATURDAY, JULY 25

Sunrise, 5.11 a.m. Sunset, 9.0 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Tour to Luxembourg, visiting Dinant, Lesse Valley, Ardennes Forest and Treves. Return August 4. Full particulars may be obtained from the Secretary.

MONDAY, JULY 27

INSTITUTE OF PUBLIC CLEANSING. International Conference, Guildhall, London. Until July 31.

TUESDAY, JULY 28

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to Welwyn Garden City. Tickets obtainable from the Secretary. **3 p.m.**

THE BOARD OF EDUCATION. "Pattern." Lecture by Mr. Paul Nash, to be delivered in the Lecture Theatre of the Victoria and Albert Museum. **2.30 p.m.**

WEDNESDAY, JULY 29

THE BOARD OF EDUCATION. "What is Industrial Art?" Discussion to be opened by Mr. F. W. Burrows, H.M.I., at the Victoria and Albert Museum. **2.30 p.m.**

THURSDAY, JULY 30

NATIONAL PORTRAIT GALLERY, St. Martin's Place, W.C.2. Lecture on "Inigo Jones." By John Steegmann, M.A. **3 p.m**

SATURDAY, AUGUST 1

Sunrise, 5.22 a.m. Sunset, 8.50 p.m.

VICTORIA AND ALBERT MUSEUM, Cromwell Road, S.W.7. Lecture on "Ecclesiastical Metalwork." **12 noon.**

MONDAY, AUGUST 3

Bank Holiday.

SATURDAY, AUGUST 8

Sunrise, 5.33 a.m. Sunset, 8.38 p.m.

SATURDAY, AUGUST 15

Sunrise, 5.44 a.m. Sunset, 8.24 p.m.

MONDAY, AUGUST 17

Closing date of THE ARCHITECTS' JOURNAL July Holiday Sketches Competition.

SATURDAY, AUGUST 22

Sunrise, 5.54 a.m. Sunset, 8.11 p.m.

SATURDAY, AUGUST 29

Sunrise, 6.5 a.m. Sunset, 7.55 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Tour to Vienna, visiting Munich, Salzburg, Linz, Budapest, Zurich and Lucerne. Return, September 13. Full particulars may be obtained from the Secretary.

SATURDAY, SEPTEMBER 19

Sunrise, 6.39 a.m. Sunset, 7.8 p.m.

TRADE NOTES

The London office of Messrs. Gent & Co., Ltd., manufacturing electrical engineers, has been moved to 47 Victoria Street, S.W.1.

*

Messrs. John Stubbs and Sons have moved their London office from 32 St. James's Street, S.W.1, to new premises which they have had erected at their works in New Road, London, S.W.8. Telephone No.: Macauley 4514 and 4515. Telegrams: Marbles, Phone, London.

*

The panel system of heating, a British invention covered by British and U.S.A. patents, installed in the new British Embassy at Washington, has attracted widespread attention. So much so that American social leaders are following the example of the embassy. A case in point is the new house for Mrs. William Goadby Loew at East Ninety-third Street, New York, which is to have "panel" heating incorporated in the principal rooms. The embassy is the first building in the United States to be equipped with the system. A curious instance of the interest aroused was provided by one of the big American banking companies, which was so impressed by the economy effected by the system that a description, with the heading "Hidden Heat and, for Some, Hidden Wealth," was given in a series of full-page advertisements. The advertisements paid tribute to the fact that the system was a British invention that had far-reaching possibilities for many American industries.

*

The India Rubber, Gutta Percha and Telegraph Works Co., Ltd., have recently installed at their Silvertown works a new press, illustrated on this page, which is claimed to be the largest of its kind in the world. This latest addition to their plant will mean much saving in time, and higher quality in the production of rubber flooring. The press has a curing surface 30 ft. long by 7 ft. 7 ins. wide. The platens are of polished steel, drilled out for steam heating and water cooling. There are twelve rams supplied with hydraulic pressure and they are capable of exerting a total pressure of 10,000 tons. The press has a daylight of 14 ins. and sheets can be produced with the thickness correct within a tolerance of $\pm$0.004 in. The press table is made of one steel casting and weighs over 34 tons, while the total weight of the press is 260 tons.

*

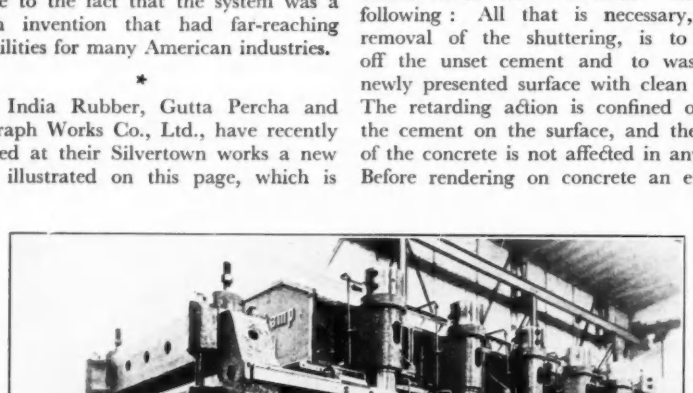
"Retardo," a specially prepared liquid to use for providing a key for rendering or to expose the aggregate in concrete, is the subject of a booklet recently issued by the Cement Marketing Co., Ltd. In explaining how "Retardo" should be used, it is stated that it can be painted on shuttering, moulds, pallets or other surfaces against which freshly made concrete is placed. This liquid, it is claimed, has a retarding action on the setting of cement with which it comes into contact, so that when the shuttering is released the concrete is capable of simple treatment in order to remove the surface film of cement, thus exposing the aggregate. Among other claims made for "Retardo" are the following: All that is necessary, after removal of the shuttering, is to brush off the unset cement and to wash the newly presented surface with clean water. The retarding action is confined only to the cement on the surface, and the body of the concrete is not affected in any way. Before rendering on concrete an efficient key has to be provided. This is usually obtained by hacking the face of the existing concrete. This key is automatically presented, it is also claimed, if "Retardo" is painted on the inside of the shuttering before the concrete is placed.

*

The Silicate Paint Co. are holding an open competition for students, apprentices, operatives or masters of the painting and decorating trades, for decorative designs on panels. The company have issued the following conditions: The panels when finished and mounted by the company, will measure 5 ft. 6 ins. by 2 ft. 3 ins., and are to be vertical, not horizontal. Cartridge paper in roll 6 ft. by 2 ft. 6 ins. will be supplied to competitors on application; such roll to be grounded in Duresco by the company, with any colour selected by the competitor. The design to be carried out on such ground with Duresco supplied by the company direct to the competitor. Five panels will be selected from those sent in, and prizes as follows will be awarded: First, £6 6s.; second, £4 4s.; third, £3 3s.; fourth, £2 2s.; fifth, £1 1s. Such panels will be exhibited at the forthcoming Decorators' Exhibition, to be held by the National Federation of Master Painters and Decorators of England and Wales, at St. George's Drill Hall, Newcastle-on-Tyne, September 23 to October 3, 1931. The following are the assessors: Messrs. L. Drinkwater, B. Phelps, and J. G. E. Holloway, B.A., Editor of *The Decorator*. The finished panels must be delivered to the company at Charlton, S.E.7, by August 31, and will become their property. Entries close on August 1, 1931.

*

As the result of many years' research, a synthetic resin finish, known as "Dulux," has been produced by Nobel Chemical Finishes, Ltd, a subsidiary company of Imperial Chemical Industries, Ltd. There are two types of "Dulux" vehicle, oil and gum, which are claimed to dry fast and show great flexibility. The oil vehicles are used for paints and the gum for enamels. A unique quality of the film obtained with the "Dulux" finish is said to be that it resembles ivory closely in feel and hardness, and that it is particularly suitable for use where fast drying, great hardness and an enamel-like appearance are required; whereas "Dulux" oil finish is used for house decoration. Rigorous tests in busy industrial districts, on the sea coast, and under tropical conditions have, it is claimed, proved that these finishes show unusual elasticity and flexibility, that they are weather-resisting, that the air-drying types are surface dry in about four to six hours, and that the stoving types stove at unusually low temperatures for a short time. They are also claimed to resist the action of heat, alcohol, petrol and oils, and to be extremely resistant to the action of soap and washing compounds. They are obtainable for application by spraying, brushing or dipping.



The new press at the works of the India Rubber, Gutta Percha and Telegraph Works Co., Ltd., claimed to be the largest in the world.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The Essex Education Committee is acquiring a site in Lodge Avenue, BARKING, for the erection of a secondary school.

The managers of St. Jude's School, BETHNAL GREEN, have approved plans for structural improvements at the school premises.

The L.C.C recommends a grant of £200,000 to the Court of the London University towards the cost of the erection, on the BLOOMSBURY site, of buildings for the London Day Training College and the Birkbeck College.

The Essex Education Committee is to erect new classrooms at the County High School, BRAINTREE, at a cost of £1,600.

The Essex Education Committee is to purchase land at BUCKHURST HILL for the erection of a boys' secondary school.

The L.C.C. has voted £26,000 for the provision of furniture and equipment for the new technical institute at DEPTFORD.

SOUTHERN COUNTIES

Plans passed by EASTBOURNE Corporation: Parish hall, Victoria Drive, for Messrs. Stonham and Son, on behalf of the Watson Trust; two houses, Willingdon Road, for Messrs. Scales and Baker; three houses, Dacre Street, for Mr. A. Ford; additions, Eastbourne College, Old Wush Road, for Messrs. Tatchell and Wilson; three houses, Park Avenue, for Mr. A. E. Bailey.

The Surrey Education Committee has decided to prepare plans for the erection of extensions at the GUILDFORD Grammar School.

The Surrey Education Committee has approved plans for the erection of a boys' secondary school, at Raynes Park, MERTON, at an estimated cost of £46,000.

The Surrey C.C. is to modernize the MORTLAKE Court House at a cost of £1,025.

Plans passed by NORTHFLEET U.D.C.: Two houses, Perry Street, for Mr. A. E. Wells; three houses, Napier Road, for Messrs. Dumbrill and Son; three houses, Perry Street, for Mr. Obee.

The Hampshire Education Committee is to remodel and extend the SOUTH HAYLING school, at a cost of £10,000.

The Surrey Education Committee has acquired a site near TOLWORTH for the erection of an elementary school.

The Surrey Education Committee is to adapt the Knaphill School, WOKING, as a central school, at a cost of £9,635.

SOUTH-WESTERN COUNTIES

The PLYMOUTH Corporation is to obtain fresh plans for the erection of thirty houses and sixteen flats in St. Budeaux.

The PLYMOUTH Watch Committee has approved plans for the provision of a station for public service vehicles and a car park at an estimated cost of £150,000.

Plans passed by the PLYMOUTH Corporation: Eighteen houses, Weston Park Road, for Mr. M. Cohen; ten houses, Cranmere Road, for Messrs. J. Davy and Son; three houses, Stangray Avenue, for Mr. S. Jackson; four houses, Dale Gardens, for Mr. T. Roberts; home, Catherine Street, Devonport, for the Salvation Army; four houses, Beacon Down Avenue, for Messrs. T. Doney & Son; forty-two houses, Ernesettle estate, for Mr. F. J. Stanbury; streets and houses off Trafalgar Road, Stoke, for Stoke Ideal Estates, Ltd.; four houses, Breen Park Road, for Messrs. S. Tellam and Son; ten bungalows, Plaistow Crescent, for Messrs. A. E. Searle and Son; six houses, Furneaux Road, for Mr. C. G. Edgcombe; eight houses, Trelawney Road, for Mr. J. T. Capell; four houses, Elms estate, Devonport, for Mr. W. H. Webb.

MIDLAND COUNTIES

The BIRMINGHAM Corporation is to enlarge the Perry Barr fire station and provide living accommodation for firemen at a cost of £5,500.

The BIRMINGHAM Education Committee is to erect an elementary school on the Weoley Castle estate at a cost of £27,000.

The BIRMINGHAM Education Committee is to remodel the City Education Council school at a cost of £5,500.

The BIRMINGHAM Education Committee recommends the purchase of premises at Towyn, North Wales, for the provision of a summer school to which groups of children from special schools may be sent.

The BIRMINGHAM Corporation is to modernize the Western House Institution at a cost of £46,700.

The DUDLEY Corporation has approved a layout of land in Wolverton Road for the erection of ninety-two houses and twenty-four flats, for the erection of which tenders are to be obtained.

The DUDLEY Corporation has instructed the Borough Engineer to prepare plans for the erection of a municipal common lodging-house.

Plans passed by DUDLEY Corporation: House, Bowling Green Road, for Mr. B. Hubble; mission hall, Hellier Street, for Mr. E. Biggs; house, Cole Street, for Mr. J. Read; machine-shop, 200 High Street, for Messrs. J. Naylor and Son, Ltd.; Sunday school, Chapel Street, for the Primitive Methodist trustees; workshop, Hagley View Road, for Mr. D. Jakeman.

The DUDLEY Corporation has approved plans by Mr. Harvey for alterations and extensions to the municipal buildings.

The DUDLEY Corporation is obtaining tenders for the erection of 186 houses on the Priory estate.

The NORTHAMPTON Corporation has asked the Borough Engineer to prepare plans for the erection of a new meat and fish market.

The NORTHAMPTON Corporation has passed plans prepared by Mr. S. F. Harris, architect, for the erection of a pavilion at the racecourse.

Plans passed by NORTHAMPTON Corporation: Two houses, Enmerdale Road, for Mr. James Collier; two houses, Delapre Crescent, for Messrs. T. Wilson and Son; eight houses, Murray Avenue, for Messrs. Chowns, Ltd.; extensions to club, Cheyne Walk, for the Chamber of Commerce; food warehouse, Ransome Road, for the Northampton Co-operative Society, Ltd.; school, Park Avenue, for the Park Avenue North Baptist School trustees; extensions to mission hall, Lower Hester Street, for the Mission trustees; factory extensions, St. James Street, for Messrs. Wareings, Ltd.; alterations, St. Giles's Church buildings, St. Giles Street, for the Parochial Council.

The NORTHAMPTON Corporation has requested the Borough Engineer to prepare a sewerage scheme for Bants Lane, in view of the contemplated development of the lane for a housing scheme.

NORTHERN COUNTIES

The BIRKENHEAD Corporation has prepared a scheme for a new outfall sewer for the drainage of the southern portion of the town at a cost of £175,000.

The BIRKENHEAD Education Committee is shortly to invite tenders for the extension of the Brassey Street school.

The BIRKENHEAD Education Committee has submitted plans for the erection of a nursery school, St. Paul's Road, to the Board of Education.

Messrs. T. Wainwright and Son are to lay out an estate in the vicinity of Manor Hill, BIRKENHEAD, for Hamilton Estates, Ltd.

Plans passed by BIRKENHEAD Corporation: Presbytery, Gautby Road, for Holy Cross Church trustees; meeting-room, Church of the Holy Name, Beresford Road, for the trustees.

The Ministry of Health has held an inquiry into the proposal of the BIRKENHEAD Corporation for a slum-clearance scheme, involving the construction of a new road, at a cost of £65,000.

The CHESHIRE C.C. is to reconstruct and enlarge the police station in Hazel Grove.

The ECCLES Corporation is to erect a fire station in Liverpool Road.

The ESTON U.D.C. is seeking a grant for the development of the Grangetown Garden Village estate, where the Surveyor reports that 278 houses can be erected.

The HULL Education Committee is to prepare plans for the erection of a second department of the Ainthorpe Grove school to accommodate 400 junior children.

Plans passed at HULL: Three houses, Bricknell Avenue, for Mr. C. Lee; sixteen houses, Ring Road, for Mr. P. Smith; five houses, Hessle-Beverley Road, near Anlaby, for Mr. J. W. Robinson; two houses, Hall Road extension, for Mr. P. Cheeseman; six houses and shops, Endyke Lane, for Mr. J. W. Jordan; sub-station, Municipal Golf Course, Wolfreton Lane, for the City Electrical Engineer; two houses, Boothferry Road, for Messrs. A. H. Evans & Co.; nineteen houses and four shops, Ring Road, for Mr. E. Batty; seven houses, Watt Street, for Mr. J. Needler; nine houses, Marfleet Lane, for Mr. R. Boddy; two houses, Willerby Road, for Mr. F. C. Polley; sixteen houses, Ring Road, for Messrs. Loveridge and Taylor; sixteen houses, Hall Road, for Mrs. Z. Lawrence; eight houses, Wymersley Road, for Mr. R. Cleminshaw; forty-four houses, Hall Road extension, for Mr. S. H. Wrighton; eight houses, Bricknell Avenue, for Mr. A. J. Dalby; three houses, Waldegrave Avenue, for Messrs. Simmonite, Curtis and Holtby; four houses, Cayton Road, for Mr. S. Bays; nineteen houses, James Reckitt Avenue, for Messrs. R. Finch and Sons.

The LEEDS Corporation has passed plans of the proposed new stand, etc., on the grounds of the Leeds Cricket, Football and Athletic Club, Ltd., Headingley.

Sir H. B. Bacon is to erect shops on land at the junction of Harrogate Road and a proposed road north of Gledhow Valley Road, LEEDS.

The LEEDS Corporation has authorized Messrs. Kitson, Parish, Ledgard and Pyman, architects, to make arrangements to resume the pointing of the Temple Newsam Mansion up to a cost of £500.

The LIVERPOOL Education Committee is to erect a secondary school for girls at Fazakerley.

The LIVERPOOL Corporation is to enlarge the Walton hospital, provision being made for new massage and X-ray departments.

The MANCHESTER Corporation is obtaining tenders for the erection of 1,100 houses at Northendon; 550 on the Moston estate; 400 at Blackley; and 120 at Heaton Park.

The MANCHESTER Education Committee is to reconstruct the Hyde Road school, Gorton, at a cost of £7,000.

The MANCHESTER Education Committee is to erect an elementary school at Crowcroft Park, at a cost of £17,000.

The RAWTENSTALL Corporation is to erect thirty-six houses at Ashworth Lane, Waterfoot.

Plans passed by ROTHERHAM Corporation: Four houses, Broom Lane, for Messrs. G. Bolton and Son; house, Wickersley Road, for Mr. H. Illingworth; house, Wickersley Road, for Mr. W. Hayes; development of land, Wickersley Road, for Rotherham Co-operative Society, Ltd.; house, Wortley Road, for Mr. W. Catchpole; house, Masboro' Street, for Mr. O. Tummon.

The SHIPLEY U.D.C. Highways Committee is to remove the weir across the Bradford Beck, in Valley Road, at an estimated cost of £228, as a part of the Valley Road widening and improvement scheme.

Plans passed at SHIPLEY: Two houses, Redburn Road, for Mr. J. Chippindale; ten houses, Wrose Grove, for Messrs. A. and F. Mellor; six houses, High Busy Lane, for Mr. A. Booth.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

EIGHTEENTH-CENTURY MINERS' COTTAGES

MEASURED DRAWINGS OF TWO ROWS AT GUISBOROUGH (CLEVELAND DISTRICT), YORKSHIRE

SEVEN STONE COTTAGES IN BELMANGATE, EAST SIDE

BEFORE the advent of the industrial era, Guisborough, the capital of the Cleveland district of Yorkshire, was a quiet and dignified country town, and in spite of the horrors perpetrated in the boom years of the mining industry in the nineteenth century, there are still evidences that good building was at one time thoroughly understood there.

The photographs on the first and last pages of this Supplement, and the measured drawings within, show two rows of labourers' cottages in Belmangate, a side-road running from the Market Place in a southerly direction to the foot of the Cleveland Hills.

The stone row, on the east side, comprises seven cottages, and was built towards the end of the eighteenth century—a good example of straightforward and unaffected design.

The two doorways with stone architraves (painted a light buff colour, as are all the keystones to doors and windows alike) each lead to a passage from which two cottages are entered—left and right. A single cottage, therefore, has but two windows facing the street and these are of wood, of the traditional Yorkshire sliding type, with enormous stone cills. One of them is fitted with shutters. Originally the whole of the gutters were also of wood, but have unfortunately been replaced with iron as they decayed.

The row on the west side of the road consists of four cottages built slightly earlier, when the use of the local stone was already giving way to brick, and here again the middle cottages are entered from a common passage which gives access also to the back yards of the four. The very charming little bay window, like which there are many in the town obviously by the same hand, is an afterthought in excellent taste.

In both rows it will be seen that the rainwater from the pantiled roofs is allowed to discharge over the generous pavement and find its way to the gutters at the sides of the roadway. In some cases channels have been cut in the stone paving to facilitate this.

A TOWER OF INDUSTRY

AT A GLASS WAREHOUSE BY THE REGENT'S CANAL, LONDON, N.

[*Sir John W. Simpson, K.B.E., Architect.*

A VIEW FROM THE CORNER OF SHEPHERDESS WALK AND EAGLE WHARF ROAD

THIS tower, the architect's working drawings of which are reproduced on the following three pages, forms the dominating feature of the glass warehouse of Messrs. Pilkington Brothers, Ltd., in Shepherdess Walk, N. It reaches to a height of about 75 ft. above ground level, and contains a staircase serving all the upper floors of the building.

The main structure is of reinforced concrete, and the exterior is faced with $1\frac{3}{4}$-in. bricks. The roof is covered with tiles. The staircase and landings have a granolithic finish.

Further illustrations and a description of the warehouse appear on pages 105–8 of this week's issue.

SELECTED PRECEDENTS:

CIRCULAR PLANS FROM SCOTLAND

1. *THE RETREAT, ST. BATRAN'S, BERWICKSHIRE: GENERAL VIEW FROM S.W.*

THE predominance of curves in the plans of the Scottish Baronial style might almost have been expected to exert an influence on the work of the eighteenth century. However, it is rather the reverse, and the tendency for bleak square houses, churches and towers is rather a marked contrast to the flamboyant playfulness of the earlier style. There are, nevertheless, some very charming exceptions to this rule, and one of the most amusing is a little hunting lodge built towards the end of the century in Berwickshire, in the "Gothick Taste."

It combines in a small way some relics of the grand manner with a very distinct leaning towards the increasing love for the picturesque. It is set on a haugh by the banks of the Whiteadder amid fine trees and, for its size, makes an admirable display (figure 1). For the plan of the main block (figure 3) is a circle, which has, at a little distance on either side, symmetrical wings making a frontage of nearly three hundred feet. The east block is connected to the cylindrical centre by a passage, and contains the dining-room and kitchen accommodation, while the westerly block houses the groom, coach, horses and hounds.

The "Gothick" windows are symmetrically set in white roughcast walls, and in the centre block the conical slate roof leads up to a stout round chimney-stack (figure 2). The plan of this block is most ingenious, for it achieves two rooms of reasonable shape on each floor, the drawing-room, without doubt, being rather charming with its semicircular ends. The staircase is in the dark, since it did not occur near enough to any of the windows, whose strict placing has led not only to some being sham, but to others having two or three real panes (figure 4), and the remainder paint! In some of the rooms the ceilings are curious, for, instead of being flat, they rise and fall in waves around each joist.

Another and much more remote example of the circular plan is the curious church of Kilarrow at Bowmare, on the Isle of Islay (figure 5). It was built in 1767, a time when even the most obscure village was laid out to some plan. In Bowmare the opportunity was taken to show off the town from the moment of arrival, for the main street is built on a hill with the jetty at the bottom and the round church dominating it at the top. It closes the vista admirably; for its curved body, clad in white roughcast, leads the eye to the central feature, a rather stunted freestone tower, beneath which is the main entrance. Above this door is a pompous Latin inscription, giving the date and making clear that one "Daniel Campbell, Lord of this Island, built this church at his own charges." The interior is uninteresting except for a certain speculation as to how the roof is constructed beyond the plaster ceiling (see plan, figure 6) and just what the timber post in the middle contributes towards the strain!

THE ARCHITECTS' JOURNAL

WEDNESDAY, JULY 29, 1931

SLUM BY SLUM

THIS is an age pre-eminent in its capacity for being bored. We find the business of abolishing slums is especially tedious. Our forefathers had all the excitement of the matter, those voluble reformers and politicians who attacked the problem with the forgotten art of rhetoric, and conducted ferocious public controversies over water-closets, and cut down phalanxes of liars and unbelievers in drains. The shouting is over now. The captains have left us with their Acts of Parliament for us to carry out.

The series of Acts from 1868 to 1930 has made it possible to abolish slums, and if we implemented our birthright with sufficient energy there need not be a single insanitary or overcrowded house in thirty years' time.

It is true that we have just come to the most difficult part of the work. For the easier part, the building of housing estates such as Becontree, Dagenham and Downham and the thousands of housing schemes throughout the country, involved the buying of sites still bare and the provision where necessary of adequate transport. Moreover these estates on the fringe of the town gave accommodation for the more highly-paid and "respectable" workers, who know how to appreciate them.

The hardest problem is to rehouse the poorest city workers in cities already saturated with population. The procedure is difficult and complicated. First, a site has to be found large enough for a sufficient number of flats to make the proposition economically sound, and such sites are difficult to find in built-up areas. It has to be valued and its several interests purchased. At the same time the slum area chosen for abolition will have been scheduled, and the houses classed as unfit for human habitation. The claims of the owners for compensation must be examined and met or the slum itself purchased. The lay-out and plans of the new dwellings are prepared and criticized by committees, the Council concerned, and the Ministry of Health, and all reasonable objections are considered and given effect. Eventually the building will rise, will be completed. Then comes the exhausting business of "decanting," i.e. of moving the slum-dwellers from their filth, their spacelessness, their lack of sanitary conveniences, and, also, it must be remembered, from their homes. In many cases they refuse to go to their new quarters, but prefer to wander off to relations in other slums and pay an exorbitant rent for one room. Others have to be persuaded or even bribed into the Council's flats. The best go gladly.

At last the old site is cleared of its inhabitants and at once is cleared of its buildings; the slum has disappeared. The process of scheduling another slum area and erecting another block of flats on the site just cleared is commenced. And so it should go on, it may be slowly and surely. But in too many cases the first step, the step which matters, is never taken. The force of public opinion is proving too weak for effective and rapid action, and for the overwhelming of those vested interests which always regard Councils and committees as dug-outs provided for their refuge.

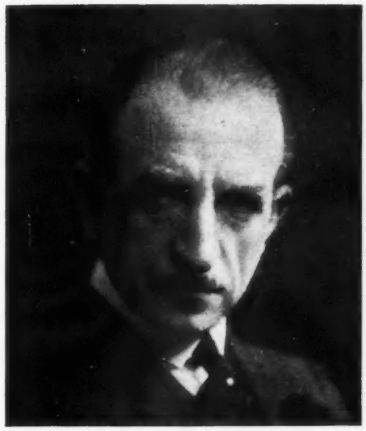
We take pride in believing that the professional class has just a little more altruism, a little more spiritual driving force, than the ordinary citizen. And so we do not hesitate to ask architects that they shall realize a special moral responsibility, along with the clergy and the doctors, in this matter of slum clearance. For architects by virtue of their professional experience know the evil effects on the nation as a whole which follow from lack of space in living and bed rooms, from lack of sanitary conveniences, and from lack of larders. They are more shocked than the ordinary citizen by the Bishop of Southwark's account of basement dwellings, in the House of Lords, the other day. When they hear that in a Newcastle building each room is occupied by a single family, seventy-eight people in all, of whom over forty are children, they are more distressed than the average voter. The nation wants a Raymond Unwin in every parish.

[*By J. L. Ball and H. W. Simister.*

THE NEW BLUE COAT SCHOOL, BIRMINGHAM

A study of the central administration block and other buildings, from the south. The houses to right and left, and facing the camera in the distance, are children's houses. For other illustrations, plans and a description of the new buildings on the twenty-five-acre site at Edgbaston, see pages 137–140 of this issue.

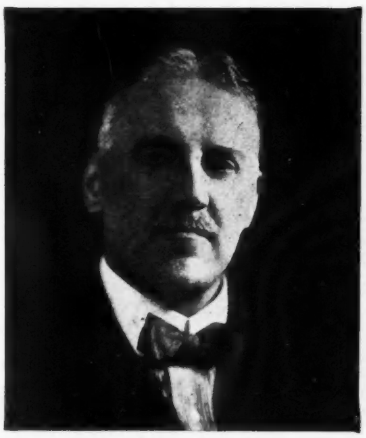
NEWS & TOPICS



Lt.-Colonel T. C. Russell Moore, M.P.

On this page are illustrated portraits of six personalities of the Architects Registration Bill, now awaiting Royal assent before being placed on the Statute Book.

Dr. Raymond Unwin, President-Elect of the R.I.B.A.



Major Harry Barnes.

Astragal's note on the celebration dinner held on Monday of last week to mark the passing of the Bill through Parliament, is printed below.

THE R.I.B.A. REGISTRATION DINNER

THE passing of the Registration Bill through Parliament, celebrated by a dinner to which both sides of the battle were invited, presented the happy opportunity for a fit and proper recognition of the services performed for this great advancement of architectural education by men of widely differing outlook. Dr. Unwin's speech was, therefore, a thank-offering from the Institute to a body of public men, headed by Lt.-Col. Russell Moore, whose four years of active time and thought have ended in the successful pilotage of the Bill through both Houses. Dr. Unwin's list was a long one, and included Major Harry Barnes, the Chairman of the Registration Committee, who has directed the course of the long and chequered campaign; Sir Clement Kinloch-Cooke, Bt., who introduced the Bill in 1927, and presided over the Select Committee; Mr. Ben Tillett, Mr. George Hicks, and many others whose efforts were directed to the same end—not forgetting the House of Peers and the Civil Servants who made straight and understandable the thorny way.

As Major Harry Barnes said, the Bill has not been successful in safeguarding the title "architect"—which is a severe loss—but it has assured that architecture will in the future be served as a profession, more co-ordinated, better trained, and more representative of the whole body of society. This is an advance which time alone will consolidate.

THE "EXPEDIENT" CHARING CROSS SCHEME

The Charing Cross Bridge Advisory Committee, which was reconstituted in order to reconsider Scheme No. 4, could find no ground for altering their opinion that the scheme would be too costly, and told the Improvements Committee of the L.C.C. that further consideration could not affect the original document so far as its main findings were concerned. The Council has therefore resolved to accept Scheme No. 6 as the only scheme left for them to carry on with; "second best," as Sir Percy Harris said, with no certain chances of being any more acceptable to Parliament than the last one—but perhaps the only thing left to be done.

Sir Clement Kinloch-Cooke, BT.

Mr. Ian MacAlister, Secretary, R.I.B.A.

Mr. George Hicks.

It is difficult to believe that the Council of the L.C.C. can put forward a scheme which even its authors and sponsors cannot support by the normally accepted canons of town planning, and must label *expedient*: still more difficult to see what measure of improvement, financial or social, this scheme can bring to the district south of the river. If I thought there was a chance that the scheme offered a possible basis for a fine development, these columns would radiate goodwill towards the L.C.C. I cannot so think, and see no reason why *expediency* should make a fool of all reasonable principles.

RENT DECONTROL

The Report of the Rent Restrictions Act Committee, which has been sitting for some time, is now available. It is a fairly involved document, because the question of rent control has become very complicated during the years it has been in use. The main conclusions of the Committee flow from the premiss that decontrol of any class of house is dependent upon whether the shortage in that class is being rapidly overtaken. They, therefore, divide houses into three classes of rents, and advise the immediate decontrol of class A, for which an abundance of accommodation exists; the gradual decontrol of class B, which is a type of house rated at over £20 but under £45 in the London area, in which new building is rapidly overtaking the deficit. Class C, for houses under rateable values of £20, they regard as being still suitable for control and for recontrol where they have been allowed to be decontrolled. Building has hardly touched this lower class housing, and as the report remarks, the social change brought about by the security of tenure of sixteen years of control is not lightly to be thrown aside. When the shortage is finally ended, it will be time to abolish control. To do so now would occasion untold hardship, and I am glad to see that the report recommends the formation of Advisory Committees to act informally in instructing tenants in their position under the Acts. There is, one knows, much unfair bullying of ignorant tenants that proper guidance can circumvent.

LIVERPOOL'S NEW AERODROME

It has now been decided by the Liverpool Finance Committee to spend between £30,000 and £50,000 on laying out and equipping an aerodrome at Speke, on the outskirts of the city. It will be remembered that the city were advised in the choice of site and in the design of the aerodrome by Sir Alan Cobham, with whom Sir John Burnet and Partners worked in collaboration. Their plans and drawings have been already reproduced in these pages.

THE SALE OF LITTLEHAMPTON

The Duke of Norfolk's sale of Littlehampton to Percy Hoovey Estates, Ltd., has been the great deal of the moment. To the local Council it must have come as a great disappointment, for they had hoped to be able to purchase certain sites and foreshore rights, which the Duke could not find it possible to sever from the main sale. The actual control of Littlehampton passes, therefore, into the hands of estate developers, and we shall be able to see which of the two is better at laying out a seaside town. I passed in a car last week-end along that particular stretch of coast, and found little evidence of anything but haphazard growth. In Bognor were some very charming Regency houses built round squares running inland from the sea front—a very economical and pleasant form of development, securing the sight of the sea to the maximum number of people—but all the recent development appeared to be built to no good plan and in a variety of styles. In truth, these places are in need of a sustained course of architectural discipline.

"BIG BEN" BLUSHES

A rehearsal of part of the scheme for floodlighting prominent buildings in London during the period of the Triennial International Illumination Congress and the Faraday centenary celebrations to be held in September, was given on Tuesday evening of last week. Among the buildings floodlit were Westminster Abbey and "Big Ben," as will be seen from the accompanying photograph. The Abbey particularly showed the great potentialities of the floodlighting of our ecclesiastical buildings. The western towers stood out as a remarkable picture against the dark sky. The face of "Big Ben" took on a healthy blush, from the amber-sprayed lamps behind the face of the clock, which, when flooded from below, gave a pink colour relief. Well, London during the past few months has seen brighter cricket; now we are to see a brighter London!

ASTRAGAL

A photographic study of the floodlighting of the western towers of Westminster Abbey and "Big Ben," a rehearsal of which was held on Tuesday of last week, in preparation for the Triennial International Illumination Congress, and the Faraday Centenary Celebrations in September.

The main, or south-westerly, front of the administration block. The single-story section seen on the left is the dining-hall; behind it are the kitchens, flanked by service quarters and stores. The building surrounds an internal courtyard with paved causeway.

BLUE COAT SCHOOL, BIRMINGHAM

DESIGNED BY

J. L. BALL & H. W. SIMISTER

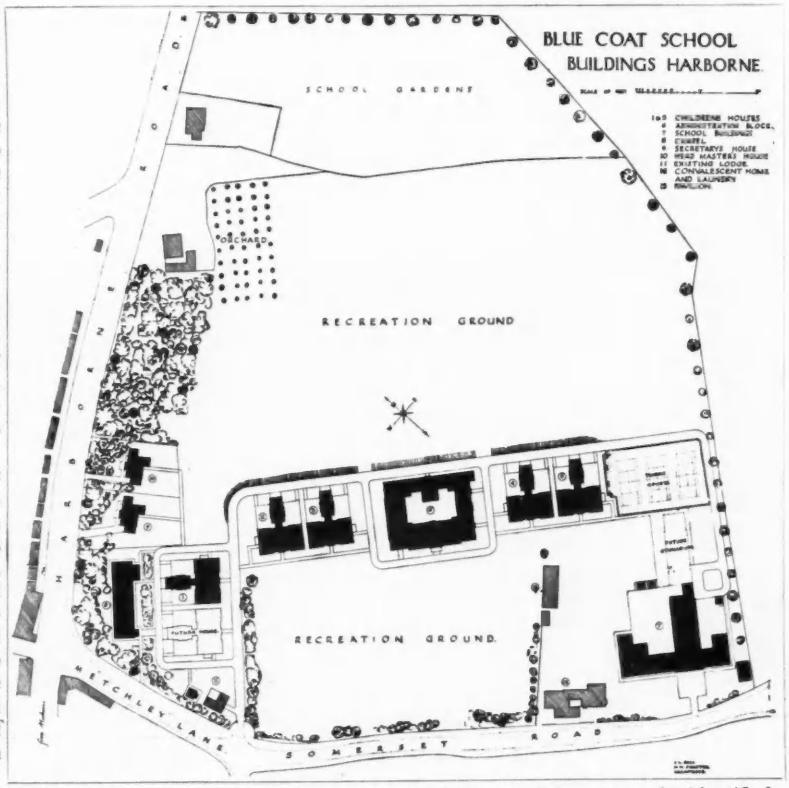
MOST people who know Birmingham at all will remember the fine building of the Blue Coat Institution, the grey stone front of which faces, across the churchyard, towards the east end of St. Philip's Procathedral. Its foundation carries back the mind to forgotten times, and to names fallen into oblivion. During two hundred years it has adorned the town with the antique grace and unpremeditated charm of the eighteenth century.

It was with regret that the Governors parted from a place which had become a memorial. But in the course of two centuries the old school has become crowded upon by masses of building; miles of streets now separate it from playing fields and open country.

An unusually beautiful site of twenty-five acres was secured in Edgbaston, and there the new Blue Coat School has been built. Better sanitation and better air, more light and space, wider horizons, the beauty of trees and grass, and in time the amenity of gardens—such things compensate for what has been relinquished.

The new institution consists of five homes, each for thirty-six children, with space for more when needed; an administration building, containing a dining-hall (all meals are taken here), kitchens, matron's department, and secretarial offices; and a school building designed for both primary and secondary education. There are also two separate private houses for the headmaster and the secretary; and a chapel—for this is a Church of England institution—is to be built in the near future.

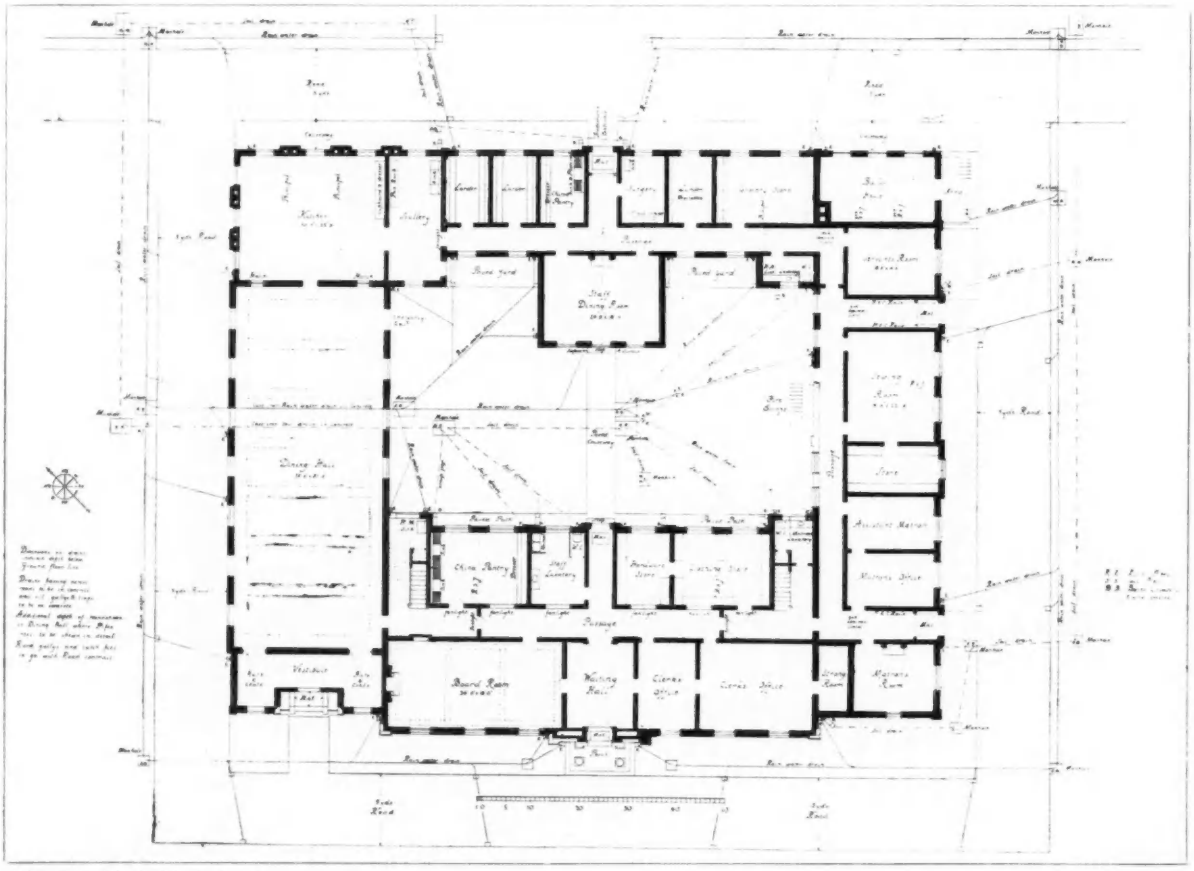
For the buildings a pleasant mottled red facing-brick has been used in combination with dressings of Hollington stone. The roofs are covered with slates; the sash windows are painted white. The various buildings have been arranged principally along the north side of a large area of grass; the group is seen very well from the entrance drive. This aspect is presented in the frontispiece to this issue.



This key plan gives the layout of the school buildings, and from it can be identified the positions of the various blocks, the chief of which are illustrated here. The site is twenty-five acres in extent, and is at Edgbaston.

D

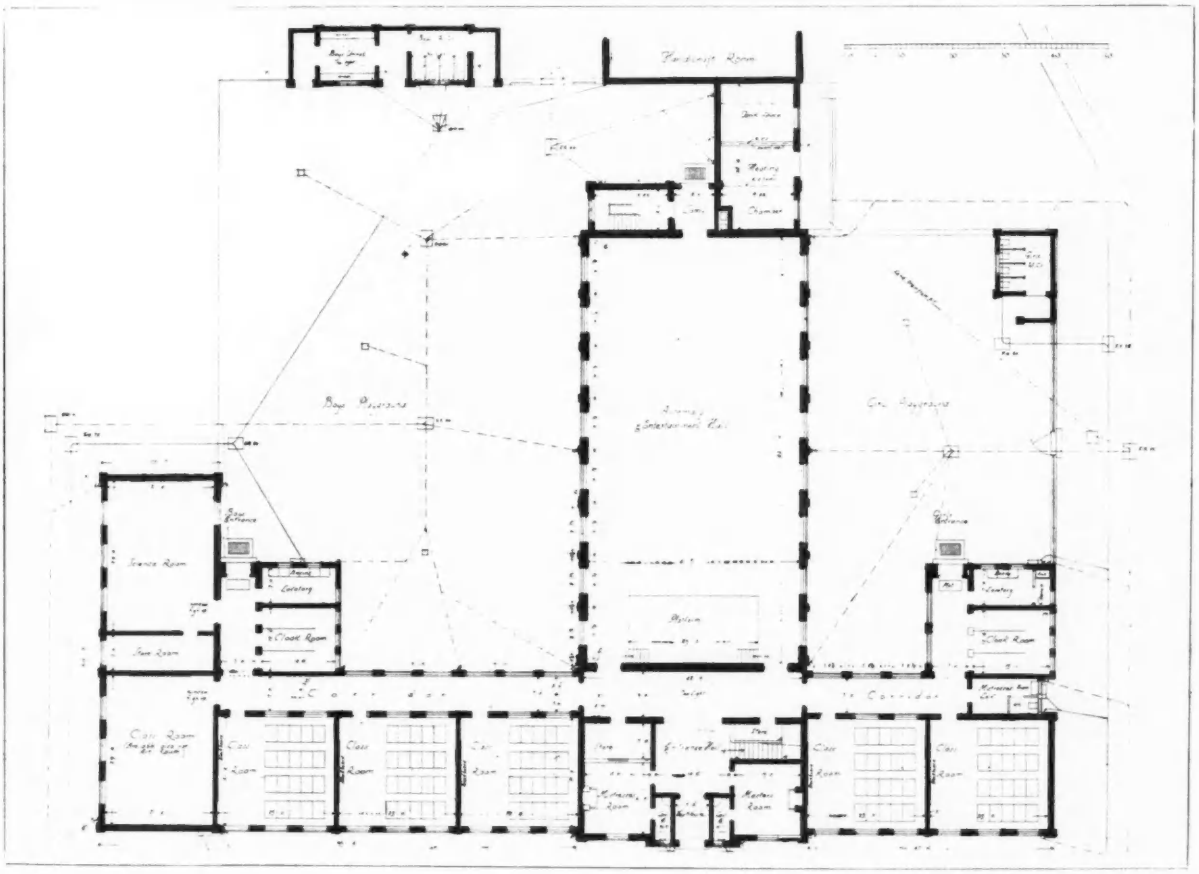
The administration block from the east. The boiler-house is seen in the foreground, and the rooms in both the back and the end of the building are mainly occupied by service and administrative quarters.



Blue Coat School, Birmingham.]

The ground-floor plan of the administration block, the arrangement of which speaks for itself. On the floor above are fifteen bedrooms, baths and lavatories. About half the ground area—e.g. the dining-hall and service wing—is of one story only.

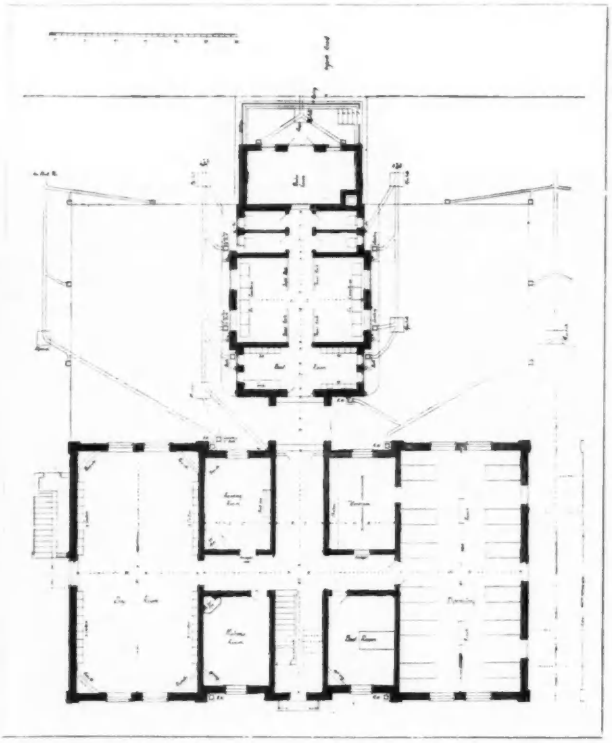
The south-westerly front of the school block. Mistresses' and masters' rooms are planned on either side of the entrance seen in the centre of the façade. In the wings are class-rooms.



[*By J. L. Ball and H. W. Simister.*

The ground-floor plan of the school block. Placed centrally is the assembly and entertainment hall, extending upward into the first floor. On the right is the girls' playground; on the left, the boys'. Class-rooms range along the south-westerly front.

The main entrance doorway of the administration block, showing the statuettes of girl and boy scholars above the porch, and the clock tower which surmounts the whole.



The ground-floor plan of a typical children's house. Above are two dormitories, with bath accommodation, including spray baths, and a dressing-room, wardrobe and bedroom.

This view of the headmaster's house (left) and secretary's house (right) serves also to suggest the sylvan character of the site of twenty-five acres, at Edgbaston, chosen as the school's new home.

THE ARCHITECTS (REGISTRATION) ACT

Its History and Provisions

[BY OUR SPECIAL PARLIAMENTARY REPRESENTATIVE]

NOW that the House of Commons has considered and agreed to the Lords' amendments to the Architects (Registration) Bill, the measure only awaits the Royal Assent. At the time of writing this has not yet been given, but when this article appears in print it is probable that the Bill will have found its way on to the Statute Book.

A CHEQUERED CAREER

It will be remembered that, after some years of controversy, there appeared to be little hope of the Bill becoming law when Lt.-Col. Moore introduced it again in the House of Commons last autumn. But by one of those strange pieces of good fortune which so often happens in the most unexpected fashion at Westminster, the Bill immediately before it was quickly disposed of, and the Architects Bill secured a second reading.

Some little time then passed before it was considered by Standing Committee "B," and readers of this JOURNAL do not need to be reminded of the drastic changes that were made there, nor of the wholesale concessions which the promoters—always ready to do their best to appease the implacable dislike of the R.I.B.A. which was uppermost in the minds of a handful of Labour members—agreed to during the Committee stage. Indeed, so extensive and hurried were some of the alterations that, when the measure came before the House of Lords, it was necessary almost entirely to redraft it, without, however, altering it in any fundamental respect.

Obviously, therefore, the Bill differs very greatly from the original draft. It was on October 31, 1930, that the measure was first of all printed after its formal introduction into the House of Commons. Its main purpose then was to empower the Council of the R.I.B.A., within six months of the passing of the Act, to set up and maintain a Register of Architects.

THE REGISTRATION COUNCIL

Opposition from Mr. MacShane and some of his Socialist friends rapidly developed, and, after exhaustive negotiations, Lt.-Col. Moore accepted a very large number of amendments in order to save the Bill. It was agreed to set up a Registration Council —"an independent, composite body," as Labour members described it—consisting of representatives of many bodies who have some connection, however vague, with architecture. One of the great dangers seems to be that this Council will be so unwieldy as to be unsuitable for the work for which it is designed.

A REGISTER WITHIN SIX MONTHS

The Registration Council, within six months of the passing of the Act, is to set up and maintain "the Register of Architects," which will be published. The Council is also empowered to grant a certificate of registration. The aim of Mr. MacShane and his friends in getting such a Council established was to take away all semblance of power from the R.I.B.A., and this, to a large extent, they have succeeded in doing. The new Council is empowered to appoint annually a Board of Architectural Education, composed of one nominee of each of the leading schools of architecture, and representatives of other institutions and associations.

THE ADMISSION COMMITTEE

The Council also has the duty of appointing annually an Admission Committee, made up of one person nominated by each of the following bodies: The Institution of Municipal and County Engineers; the Society of Engineers; the Chartered Surveyors' Institution; the Institution of Structural Engineers; the Institute of Builders; and also of not less than twelve or more than eighteen registered persons, of whom four shall be nominated by the R.I.B.A., four by the Incorporated Association of Architects and Surveyors, one by the Faculty of Architects and Surveyors, and the remainder by the Council.

The duty of the Board of Architectural Education is to recommend to the Council: "(*a*) The recognition of any examinations in architecture the passing of which ought, in the opinion of the Board, to qualify persons for registration; and (*b*) the holding of any examinations in architecture which ought, in the opinion of the Board, to be passed by applicants for registration under this Act; and to hold examinations in architecture in accordance with this Act." The Admission Committee is to consider every application for registration and to report to the Council whether or not the applicant is, in the opinion of the Committee, qualified for registration.

THE PRESCRIBED QUALIFICATIONS

Both the Council and the Board, as now constituted, will be very cumbersome bodies, composed of many conflicting interests, and the work of registration is likely to be long and complicated. The Council is to prescribe the fee to be paid on registration, and a person is to be qualified for registration if the members of the Council are satisfied, on a report of the Admission Committee, "(*a*) That he is an architect member of the Royal Academy or of the Royal Scottish Academy; or (*b*) that his application for registration was made within two years from the commencement of this Act, and that at the commencement of this Act he was, or had been, practising as an architect in the United Kingdom; or (*c*) that he has passed any examination in architecture which is for the time being recognized by the Council; or (*d*) that he possesses the prescribed qualifications."

These "prescribed qualifications" may include "the passing of any examinations in architecture, the holding of which may have been recommended to the Council by the Board, and in that event the Council shall direct the Board to hold those examinations, and those examinations shall be held by the Board accordingly and at least once a year and at such times and places as the Board may determine."

Power is given to the Council to remove from the Register the name of any person guilty of criminal offence or professional misconduct. To assist them in their unpleasant task the members of the Council are to appoint annually a Discipline Committee. A right of appeal to the High Court against removal from the Register is given. The Bill prohibits the use of the title "Registered Architect" by any person not duly registered under the Bill, under penalty of a fine not exceeding £50 for the first offence, and £100 for each subsequent offence. Penalties are also laid down for fraudulent misrepresentation.

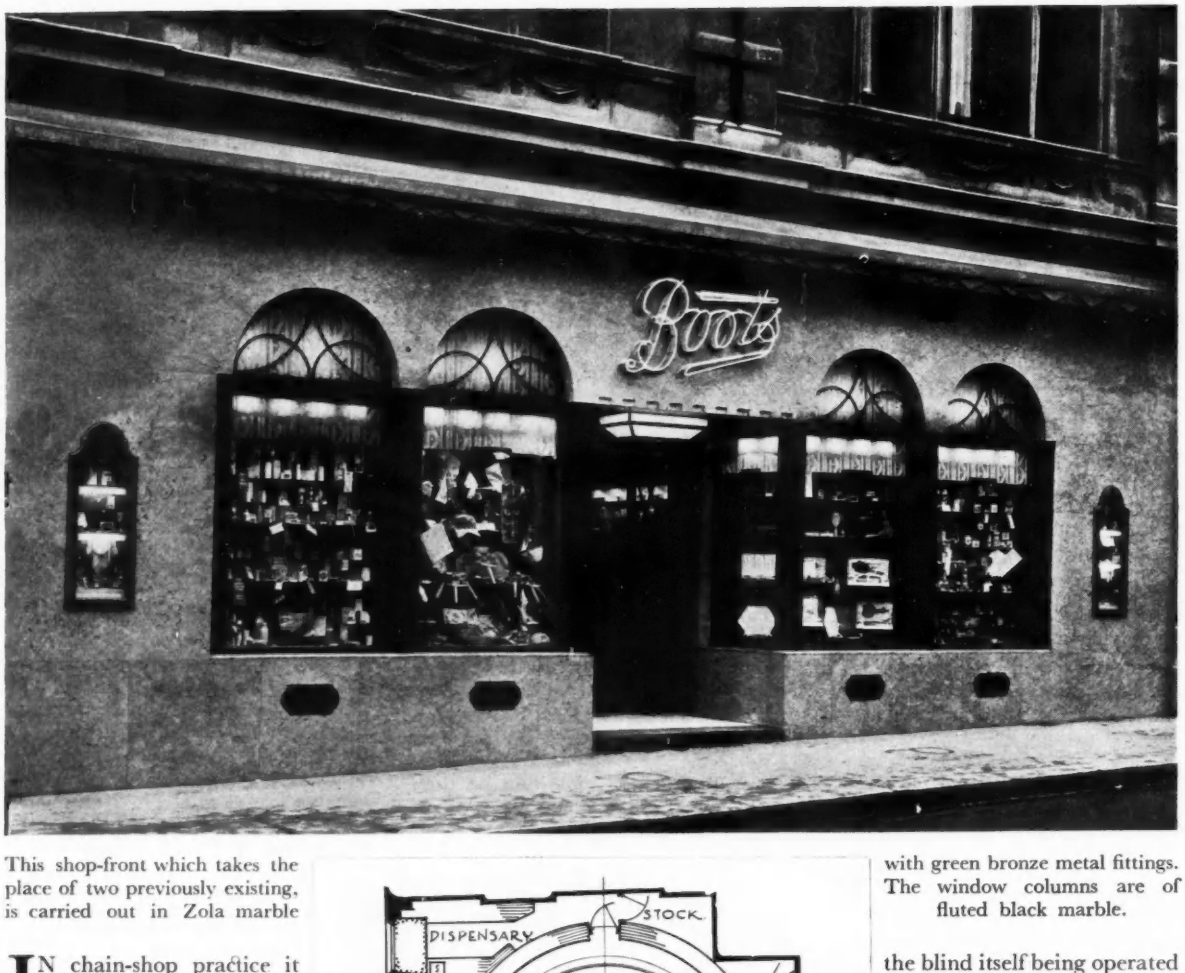
FEES ALLOCATED TO SCHOLARSHIPS

It is provided that "at least half the total amount of the fees received in each calendar year by the Council under this Act shall be devoted, in such manner and on such conditions as the Council may determine, to the provision of scholarships and maintenance grants for the assistance of students in architecture whose means appear to the Council to be insufficient to enable them to pursue their studies."

The measure is not to come into force until January 1, 1932, and is not to apply to Northern Ireland until an Order-in-Council to that effect is made.

TWO SHOPS MADE INTO ONE IN BOND STREET, W.

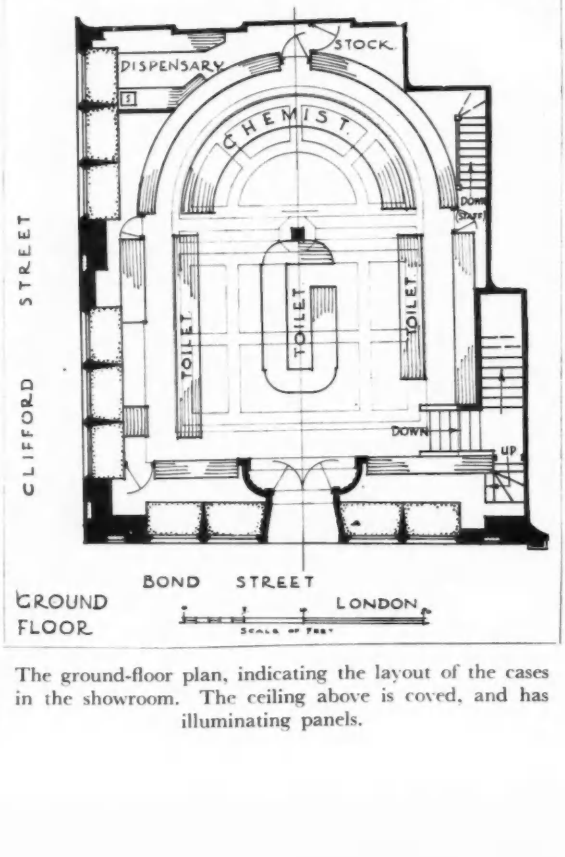
FROM DESIGNS BY PERCY BARTLETT



This shop-front which takes the place of two previously existing, is carried out in Zola marble with green bronze metal fittings. The window columns are of fluted black marble.

IN chain-shop practice it not infrequently happens that adaptations have to be made of premises not primarily designed for the purpose immediately in view, in order to bring them, from both utilitarian and decorative points of view, into line with precedents that have become more or less standardized and identified with the undertaking concerned. An alteration of this kind is the subject of the photograph and plan reproduced on this page, which show, after completion of the work, shop premises in Bond Street that have recently been converted from two shops into one.

The exterior is designed generally in Zola marble, and has black marble fluted columns to the windows. The shop-fronts and doors are executed in green bronze, together with the blind casing, the blind itself being operated by internal winding gear so as to eliminate the necessity for unsightly blind arms.



The ground-floor plan, indicating the layout of the cases in the showroom. The ceiling above is coved, and has illuminating panels.

The provision of heavy steelwork to carry the superstructure of the building above the ground-floor showroom called for a false ceiling. This has been carried out with coved sides, most of the flat portion being occupied by illuminating panels. It is formed of fibrous plaster, enriched with a chevron motif, finished in silver leaf, lacquered, while the fibrous plaster beams have been painted a rose colour in high gloss paint.

Black marble is used for the columns and pilasters, and the floor is in ceramic mosaic in shades of black, buff, white and green. The interior fittings were carried out in a silver alloy and walnut.

Bernard Whistlow, F.R.I.B.A. : An Autobiography : X

A NEW VENTURE

BY KARSHISH
(H. B. CRESWELL)

IF this was a treatise, instead of being a narrative, the rebuilding of Brayness Post Office would supply materials for a bulky one. My first encounter with bills of quantities is, however, a matter of narrative; for I knew nothing of them till Father slammed me on the head with his, and the experience fortified me for the rest of my life. I should scarcely have known of the existence of bills of quantities if Grig had not, from time to time, sent me to ask his quantity surveyors, whose offices were next door, what they had "taken" to cover a particular detail of the work; but directly we got going at Brayness, Richards or Mr. George or Father were continually complaining: "I can't find that there shuttering in the quantities, nowhere"; or, "It don't seem the surveyors have included the cutting away of the chimney breast"; or, "From all we can see, there's a lot of work got to be done that isn't allowed for in the bills."

I was entirely incapable of finding my way among the items, and could not understand many of the descriptions; but I was impressed by the apparent deficiencies, and had no recourse but to refer to Tallard by conscientiously noting all the questions raised and embodying them in a report which ran to two-and-a-half foolscap sheets of arduous penmanship. Tallard answered the whole of them almost by return of post, in green ink, at the head of page 1, as follows :

"Quantities nothing to do with you. R. T. 7/6."

He offered no aids to the digestion of this gritty morsel, but left Nature to provide relief, which she did by forcing me to discover for myself that the quantities were no part of the contract, except as a schedule for estimating variations; and that any question of their accuracy had to be answered by the quantity surveyors who, though nominated by the architect, prepared the bills on behalf of the builder, who paid them for that service, and to whom they were liable.

"Yes! Well! Oh! All right! I suppose we shall have to see how things come out," Father said, when I showed him Tallard's comment; and I have no doubt things came out well, for I heard no more complaints; but it was borne in upon me that there was, in fact, a defect in the bills that Father was not aware of. I gained this knowledge from Mr. Andrew Reece, the sub-contractor for the masonry—for the Post Office was architectured in Bath stone.

He was a red-haired little Welshman, with a skin the colour of milk, who, though he was unfailingly civil to me, seemed always in a bad temper; and he worried the six or eight journeymen he employed, like a wasp. I noticed that Reece seemed reluctant to explain the descriptions of labour in the bills which perplexed me so greatly; and one day when I pressed him he coloured up and frankly confessed that he did not know their meaning.

"Then, how were you able to price the bill?" I asked.

He then told me that he noted the cube measure, and judged from the drawings what the worked stone was worth a cubic foot. He then fixed a rate for the cubed item in the bill, and deducted the extended total from the total given by the value he had fixed for the worked stone. The difference, which represented the value of the labours, he divided up judiciously among the labour items, and he then worked the extension of each through backwards to find the measure and rates, thus completing a picture of a quantity surveyor making laborious detailed bills which the person they were designed to inform, scarcely less laboriously, *un*made. Reece, no doubt, arrived at a true estimate; but had variations in the work been ordered, the Office of Works would either have paid too much or Reece would have been hit in the pocket.

It was this over-itemizing of the bills that so confused and worried the builder, and my own clients in later years benefited from my thus early becoming aware that over-detailed quantities bring high costs, and that, however instrumental to close tendering the exact definition of the London system of measuring may be in London, rough bills of quantities serve their purpose better than elaborate ones in the provinces.

Reece gave me a chance of sticking a feather in my cap by warning me that the Box Ground stone specified for sills and weathered members was subject to decay at Brayness, although the Coombe Down ordered for the ashlaring and other features stood well. I reported accordingly to Tallard, and in ten days received back the sheet minuted at foot somewhat as follows :

Mr. Benson. For immediate attention. R.T. 17/6.

Mr. Tallard. Yes. I find Box Ground has this reputation on parts of coast. G.F.B. 20/6.

Mr. Phrendigast!!! Your observations, please. R.T. 21/6.

Mr. Tallard. I am surprised to learn this. We have used Box Ground in London suburbs, and in Midland manufacturing towns and sea ports, and have had no failures. I cannot think fears will be justified, but have noted the matter. C.P. 23/6.

Mr. Whistlow. Coombe Down to be substituted for Box Ground throughout. R.T. 24/6.

Mr. Whistlow, to note with endorsement, and return. S.K.D. for Sec. 24/6.

The foregoing is characteristic of the inter-departmental methods of the Office of Works of those days, which, with the greatest brevity and economy of stationery and clerical work, informed everybody concerned, and set up a concise and complete record. Tallard, it will be seen, is cognizant of every step; Benson makes himself responsible for accurate research; Phrendigast, who presumably wrote the specification, is trounced with three notes of exclamation and called upon to promise to be a better boy in future; Tallard records his decision, and "S.K.D. for Sec." secures that the document shall be duly filed.

There was a strain of remorselessness in Tallard; for once—but only once—he even tickled up his clerk of works. The matter is of more interest as an example of his methods than as a record of my sufferings. I had been called upon by him to supply plans showing the whole of the gas, water and heating pipes as they existed in the old building. The task was complicated by various lengths of obsolete tubing and by the accumulations of rubbish; but I got the drawings completed and laid out all clearly in four different-coloured inks, and described further in a report. In four days the drawings came back to me, and with them the report, minuted :

"Mr. Whistlow : It is not clear how the rising main reaches tank above ceiling. You are required to complete information without delay. P.T.K. 4/7."

Then in Tallard's green ink :

"You are employed by this department to . . ."

The writing broke off, and Tallard had scribbled his pen over the words, thus conveying a reprimand without, in fact, reprimanding; and I have no doubt that this device of making the stick whistle was commonly employed by him in maintaining the rigid discipline he enforced.

Thus did my months at Brayness run their course. Tallard came down five or six times—twice without notice. He was always strictly official; scarcely spoke a word—unless grunts of acceptance or comprehension are parts of English speech; and, by disregarding my questions, warned me that I was

framing them so as to call attention to my own merits. Even Father's volubility was chilled to silence by Tallard's Arctic presence, and thus Father, Mr. George, Richards and myself wandered about the building on Tallard's heels like hens attending a cock in desultory exploration of a thoroughly scratched-out fowl run. Tallard, however, had quite another manner with the Postmaster: he buttered him in exactly the place where butter would most soothe, by greeting him as a colleague. I was at first afraid that Mr. Taylor would unload the burden of his grievances on Tallard, and stage the worn-out wrangles anew; but Tallard's tact in establishing a footing of equality discouraged Taylor from saying anything that would dim the glory shining upon him, and from first to last he never uttered a word of complaint, but basked in Tallard's formal regrets at the inconveniences caused to so important a Government official.

If, however, I expected that my chief's benign influence would soften the Postmaster's antagonism to myself, I was mistaken. It had the opposite effect of thrusting us farther apart; for Mr. Taylor, having been honoured by the condescension of the master, was by no means inclined to demean his importance by familiarity with the man. The thing was diverting, for I had pecking power over Taylor and could laugh at him.

On one of the occasions when Tallard came to the building without warning, he surprised a grotesque instance of the Postmaster's childish vanity. The scene that confronted him, when he walked straight through from the street into the new sorting office, was as follows. Two plasterers were on a trestled scaffolding for the purpose of running a cornice. The Postmaster was standing on the floor below, with his face the colour of a boiled lobster, telling them off in a shrill, agitated voice, to which they were replying with surly resentment. I was advancing from the farther door to learn what the row was about, and Richards gliding up behind me. The plasterers saw Tallard, and at once resumed their work; Taylor fell silent in the middle of a word as though someone had struck his head off, and then slipped past me out of the place; I went forward to greet Tallard, and Richards touched his hat to him. Tallard's eyes seemed to bulge more ominously than usual through his glasses, and his nose to take a fiercer crook, but he made no comment on our little family tiff, though his inspection of the work was conducted with even a deeper hush than usual.

When, however, I accompanied him to the station and he had ordered tea in the refreshment room—for he unbent in some degree when business was over—he said:

"What was going on when I arrived today?"

"Mr. Taylor was annoyed with the plasterers, sir."

"For what reason?"

"He objects to being called 'Charlie.'"

"Do you mean that the men had been impertinent?"

"No, sir. They are all most civil fellows; but Mr. Taylor thought he heard them say, 'Charlie,' and supposed they were referring to him."

Tallard grunted, "Were they?"

"They said they were *not*, sir; but Mr. Taylor is known among his postal people and all the workmen as 'Charlie,' and he feels his dignity is slighted and is always lying in wait to catch someone—in fact, I believe this is his chief preoccupation, sir. He tortures himself by imagining people are speaking of him as Charlie, and, of course, everyone plays up to it by talking of *other* Charleses, and of Charts or Charwomen, when he is at hand."

Tallard grunted again. "He will go mad if he does not take care," he said.

So, in due course, was Brayness Post Office completed; and in the elation of achievement all memory of past chaffering was forgotten. The Postmaster was delighted by his accretion of dignity; the Bradshaws grateful for the support I gave to their claim for extension of time, for they were seven weeks behind—and no wonder—and Tallard diplomatically held the threat of penalties over their heads as he might a tomahawk. We all parted good friends, and I shook no hand more warmly than the thick and hard one of Joe Richards. From first to last, through all those long months, I had never been told a fib by anyone, nor made aware of shiftiness of any kind whatever; and for myself it may be said that, though Tallard's approval was only to be measured by the quality of his grunts, the building was sound and tight from top to bottom, so that neither the Bradshaws, nor anyone else, was called upon to renew or complete any part of it, and that I left Brayness a vastly more competent architect and better man of affairs than I was when I arrived there—which, however, is not saying much.

One other capacity I acquired; and as it influenced my immediate future, and in after-years saved my (professional) life; and as it also stands as an object-lesson in the rough hewing by which alone a man gives opportunity for that miraculous shaping of his ends which is the affair of destiny, I must say something of it.

When I turned my back on the gay distractions of the delightful little watering-place to amuse myself with a sketching block on Saturday afternoons and Sundays, it was merely by an impulse to avoid empty relaxation: I had no idea that I possessed any gift for water-colour drawing, and no inkling of the passion that instructs that gift. My experience was a remarkable one. My early attempts were hopeless failures, for I was quite untutored; but I became fascinated by the transparency of the washes, and by the colours that revealed themselves in sea, land and sky; and then, because calm water was easier to handle than wind-swept, and because the old masonry jetty, with lighthouse at one end and harbour-master's office at the other, gave me subjects familiar to my pencil, I formed the habit of choosing my pitch in the fishmarket or on the rocks at the end of the wharf. Here my eyes were opened to the wonders of reflections in water.

There was one evening a moment when I was overpowered with my sense of the loveliness of what I beheld. One cannot fully speak of these unexplained intensities of feeling—flashes struck from midnights—which are part, I take it, of our spiritual make-up; but for me those few seconds, in which I seemed to go out from myself and co-mingle with the sublimity of the universe, was an experience which, though it has since been in measure repeated, has never been equalled. My pursuit of this thing that I, in part, saw with my eyes and which, in part, was within me, continued, as it seemed vainly, until one day, glancing at a sketch I had made a week before, I found I had somehow or other actually done the trick! That unexpected glance had shown me what the drawing conveyed to a stranger.

To cut a long story short, by studying the wherefore of the effect I had blundered on, I learned the way of it; and in time acquired precision and a certain style—for my work owed nothing to others. Later on, when I made drawings of churches and old houses in the neighbourhood, I showed them against rainy skies and set off by wet roads in which they were amazingly reflected, and in this way achieved what others had not the knack of doing. It is long since I have had time to make architectural perspectives, but thirty years ago my work was not unknown. This was how it began, and this is the reason that my best and most characteristic work shows buildings standing behind pools or on puddle-laden ground.

When I got back to London, I went to see Grig and took the opportunity to show him some of the things. He first piqued me by seeming amused at them, but I saw a moment later that it

was partly in surprise and partly in pleasure that he smiled.

"These sketches are most promising, Whistlow," he said; "I have no doubt you have it in you to make a name for yourself if you persevere." And he went on to say that if I cared to try my hand with two perspectives of a house, for exhibition at the Royal Academy Exhibition, and he liked them, he would buy them for that purpose.

This design was his very beautiful Cotswold House, "Clister Long Barn." The paved courtyard on the entrance front gave the "puddle merchant"—as Garston called me—just the opportunity he craved; and the terrace on the south was the wettest ever seen. The drawings were duly given the prominence which the design and the eminence of its author deserved, and made, I thought, a brave show. They won me the admiration and envy of friends, and also fifteen guineas which Grig paid me for them; but my hopes that this success would bring me similar commissions and enable me to advance a step towards architectural practice, were disappointed. Other things were in store for me.

For three or four months I worked at two competitions with Garston, who rented a small room in the office of a dirty fellow who called himself Architect and was agent for the sale of badly-built houses, of the Bigwash Estate Development Association Limited, in Norfolk. We worked all day, and sometimes till two in the morning, and I was riotously happy, as I always was in the company of Garston, whose caustic fun bubbled from inexhaustible springs. I had, however, only £53 to my credit when I left Brayness; and I was vainly looking about among architects for work which I could do in my own time at Garston's office—where my name, also, was painted up—when, as a consequence of going to a "small and early" dance in the house of social acquaintances in Notting Hill, I became Resident Architect to a firm of Agricultural Implement Makers at Nollingborough, in Huntingdonshire.

The mechanism employed by destiny to this good end was very simple. All it did was to arrange that, at the moment I was leaving my friend's house after the ceremonial call, which in those days was a fixed social ritual after a dance or dinner-party, a son of the house should be returning to the front door after seeing other guests to their carriage. He said good-bye to me, and then turned and called to me from the top of the steps:

"By the way; you're an architect, aren't you?" and when I assented, went on: "Well, I know some people who want a resident architect down at Nollingborough. Would that be of any use to you?"

I had no idea what a resident architect might be, and did not know where Nollingborough was; but I accepted the suggestion without too much warmth, and my friend said he would write to these obliging people at Nollingborough and he noted my office address for that kind purpose.

NEXT WEEK—XI: THE RESIDENT ARCHITECT

July 22. ix: Trials of a Clerk of Works.

LETTERS FROM READERS

Official Patronage for Industrial Design

SIR,—I was very pleased with the welcome accorded by you in your issue for July 22 to the Committee appointed by the President of the Board of Trade to consider the desirability of forming certain exhibitions of articles of everyday use and good design.

I feel sure that every member of the Committee will be encouraged by this, and by your expressions of appreciation. Doubtless, these will go a long way in counteracting the effect of the relatively few captious criticisms which have appeared elsewhere.

The scope given to the Committee is necessarily restricted, but it may be hoped that the outcome of its deliberations may be of value in achieving the objects which you so well express.

C. A. RICHTER

(MANAGING DIRECTOR, THE BATH CABINET MAKERS' CO., LTD.)

Lowest Tenders

SIR,—Referring to the letter from "Suburban Builder" which appeared in THE ARCHITECTS' JOURNAL for July 1, I, personally, think:

Invitation to tender for a small job without quantities should be restricted to a few builders and only those in whom confidence can be placed should be asked. In these circumstances I am of opinion that, if any, the lowest tender should be accepted.

It does happen, sometimes, that a client wishes for a certain builder to be included, in whom the architect cannot place complete confidence, knowing from experience that to employ such a man may mean much worry and extra trouble both to client and himself. For this state of affairs the builder in question is probably responsible, hence he would know the reason should he be passed over in favour of another man whose estimate was a little more. Obviously, it would be most unfair to ask a firm to reduce their price in order to compare favourably with the lowest tender.

Advertisements for tenders are in a different category, and applicants for quantities in such cases doubtless realize that where only a slight difference exists between the lowest tenders received, a bias in favour of a man not quite the lowest may easily result in his being employed, especially where committees are concerned. This bias may be by reason of a definite knowledge of good work or a desire to employ a local man.

Cases have been known where the price submitted was so low as to be either a mistake or a display of ignorance of the undertaking. In such a case, the acceptance of the lowest tender would mean trouble all round. In spite of the safeguarding clauses in the contract, the bankruptcy of a contractor means that it will cause an employer to spend considerably more than he bargained for to complete the work, and the slightest fear of this happening must influence the selection of a builder. C. W. PIKE

SIR,—The difficulty that "Suburban Builder" has encountered is one that I hope has not occurred in connection with any job sponsored by a member of the Institute. If I recollect aright, I learned, when I was articled, that in a limited competition amongst builders for a job, when each builder is invited by letter to submit a price, the lowest tender must be accepted, if any tender is. After all, this must surely be the only fair and reasonable procedure.

In the course of my practice I do, in fact, often come across clients who do not fully realize the point until it has been specially referred to and explained. I find it wise always to mention to all clients how a limited tendering amongst builders should be conducted, and, having done this beforehand, I have never found any difficulty when the results of the tendering are known. F. G. TROUP

SIR,—Your correspondent "Suburban Builder" appears to have a grievance in regard to the acceptance of tenders which are not the lowest in competition and in which he has been a victim. He distinctly refers to being *invited* to tender, and this is not to be confused with tenders which are *advertised* for, and

where it sometimes happens that the lowest tender is from a builder who, upon inquiries being made, is considered unsuitable for some special reason and the client obviously is recommended by his architect accordingly.

Your correspondent writes of preparing tenders from drawings and specifications and it is to be supposed that builders take out their own quantities. This can only be for small jobs, and should not take up a considerable amount of time. However, when builders are invited to tender under these conditions I am of opinion that architects, through personal inquiries, should be in a position to assume that the builders are of equal standing and, all things being equal, we should recommend our clients to accept the lowest tender. It sometimes happens, however, that a time for completion of the job is to be stated with the tender. In such cases of urgency it may be worth extra cost in saving of time and a client would be justified in accepting the best tender on a time basis.

The particular case quoted by your correspondent where a builder favoured by the clients was fourth on the list and was given an opportunity of reducing his price to compare favourably with the lowest tender is, of course, taking a grossly unfair advantage of competitive tendering, and it is to be hoped that such is a very isolated case. Presumably the architect was not in a strong enough position to stand up to his clients and insist upon a fair deal with the builders invited to tender.

It would certainly strengthen the business relationship between builder and architect if the former could be assured of a straight deal regarding competitive tendering, but I am afraid most architects come up against unreasonable clients occasionally and protection is sought behind the usual clause " that the lowest or any tender will not necessarily be accepted." If " Suburban Builder " is not satisfied, his remedy is to refuse to tender in competition.

A. A.

SIR,—I entirely agree with " Suburban Builder " that it is unjust to ask a contractor to tender merely for the purpose of checking another man's price. I do not think any fair-minded architect would do so. Now and then, a client, not realizing all that is involved, may suggest it, but I have always found that he will give way when the unfairness of the proposal is explained.

There is, however, a point of view that is open to argument. Suppose you have five men tendering. Assume that they are all good enough to put on your list and any of them will give you work to which it would be difficult to object on any definite non-compliance with the specification. Nevertheless, no two men are exactly alike, and there may be one who is an artist at his work and sets on it that indefinable touch which lends distinction to the plainest type. In that case would it not be fair to say to the client that the difference is well worth the few pounds that may separate the figures?

You may say, " If so, why ask the others? " to which, of course, the answer is that until you see the relative prices you are unable to say whether the enhanced cost is justified.

If it were known that the choice would be so influenced, it would tend to encourage the better workman. The case may not often arise, but it certainly does so occasionally.

G. REAVELL

SIR,—Architects all realize that if a builder is a suitable person to invite to tender, his tender should be accepted, if the lowest. But difficulties arise when a client has a preference for the work of a particular builder, but insufficient confidence in his willingness to give a keen price without competition. This circumstance should be dealt with in advance by the architect pointing out to his employer that highly skilled and expensive labour is involved in the preparation of an estimate for building work. The building owner only thinks of a merchant who can often make a quotation for the sale of his goods by merely writing a letter involving the use of information already to hand in his office.

My practice is to invite all the builders tendering to send a representative to hand in their tender at the moment of opening. The tenders are passed round and everyone takes a note of the figures, thus avoiding the uncertainty of waiting indefinitely for a knowledge of the result.

All precautions having been taken, there is still the risk of a client insisting on the acceptance of a tender other than the lowest. The architect has, then, to rely on his reputation with the building trade for a fair verdict.

QUESTIONS THAT ARISE

Bituminous Paint

S. and G. write: " *We should be glad of your expert's advice regarding the use of bituminous paint. In carrying out some repairs to a large city building of six floors, we are faced with the expense of repainting several iron escape staircases. These have not been painted for some years, and portions of the paint have peeled off and rust has begun to eat into the ironwork. Do these parts require ordinary priming before applying bituminous paint?*

Would one coat effectively cover the existing paintwork? "

Bituminous paint can be satisfactorily applied in two coats to new ironwork, without the usual priming coat.

Unless old painted work is extremely bad, one coat should suffice.

The work should be thoroughly cleaned down, the rust removed with wire brushes, and the bare parts touched up with bituminous paint.

Bituminous paint has very good covering capacity, and lays on thickly. It is most satisfactory for work of this kind—in fact, to any ironwork where a decorative finish is of a secondary importance and cheapness is a necessity.

Whilst manufacturers attempt to combine its preservative powers with decorative qualities, very few colours are obtainable.

To apply ordinary oil paints to ironwork previously treated with bituminous paint, it is first necessary to treat with two coats of knotting.

M. R.

Cavity Walling

B. B. writes: " *I should be glad to have your expert's opinions on the two following practical points in connection with cavity wall constructions:*

1: Is it usual to build the base of a cavity wall in 14-in. brickwork, or to carry the two thicknesses of brickwork down to the concrete foundation?

2: Is it considered advisable to continue the cavity at backs of fireplaces, or to stop the cavity against fireplaces? "

I consider that the better method of construction is to carry the two 4½-in. thicknesses of brickwork down to the concrete foundation, unless the latter is at an unusual depth, and to fill in the cavity with fine concrete to a level of 6 ins. below the damp course. This difference in level should prove a safeguard against dampness rising from moisture penetrating the mortar droppings, which inevitably accumulate at the bottom of the cavity. The practice of building a 14-in. wall nearly up to the dampcourse is wasteful and unnecessary. Despite the fact that a number of architects provide for stopping the cavity at the fireplaces, I consider that it is necessary to continue the cavity behind the fireplaces as well as keeping a 9-in. fireback. By stopping the cavity there is always a possibility of rain finding its way into the walling and showing at the angle between the cavity wall and chimney breasts, a defect which may be encouraged by the nearness of trimming joists to this angle.

W. A. D.

SCHOOL WORK: LONDON

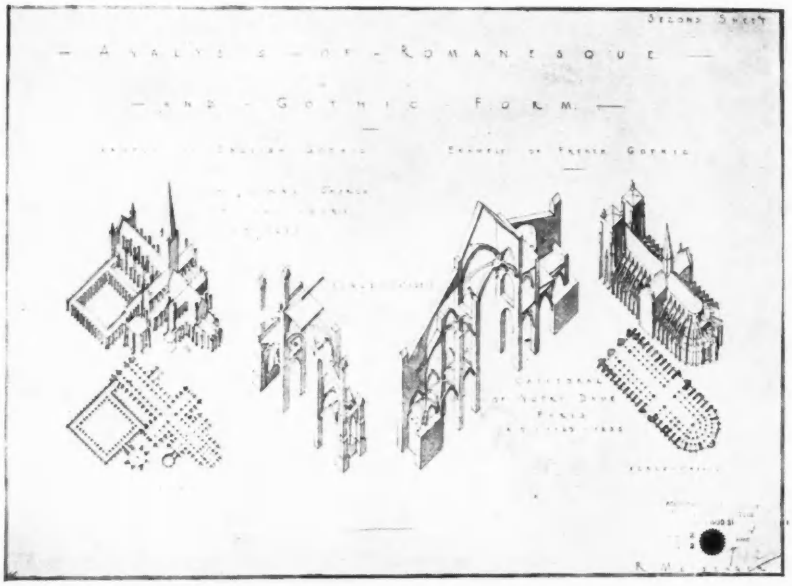
i: Architectural Association

BY M. L. ANDERSON

THE last comprehensive exhibition of A.A. students' work, which was held just a year ago, gave indications that some sort of upheaval was going on in the inwards of the school curriculum; and foreshadowed some developments which, given time to make their way to the surface, should be a great advance not alone in what was being taught, but, more important, in the whole manner of teaching.

Any drastic change, such as is here taking place, must be a gradual one, if it is to avoid breaking the continuity of a course which some proportion of the students have already started; and one of the remarkable points about the present exhibition is the way in which the new regime seems to have permeated even to the advanced years. The senior students, naturally, having been more or less plunged direct into their new mental surroundings without being carefully acclimatized by long association from the very beginning of their course, can only be assumed to have suffered to some extent through having been denied the firm groundwork which has been offered to the lower years.

So far as the standard of work itself is concerned, it is of the normal high quality; but the ingenuity of the method of teaching is not so apparent, and, as a result, it is the lower years which provide the thrill and "punch" of the exhibition.

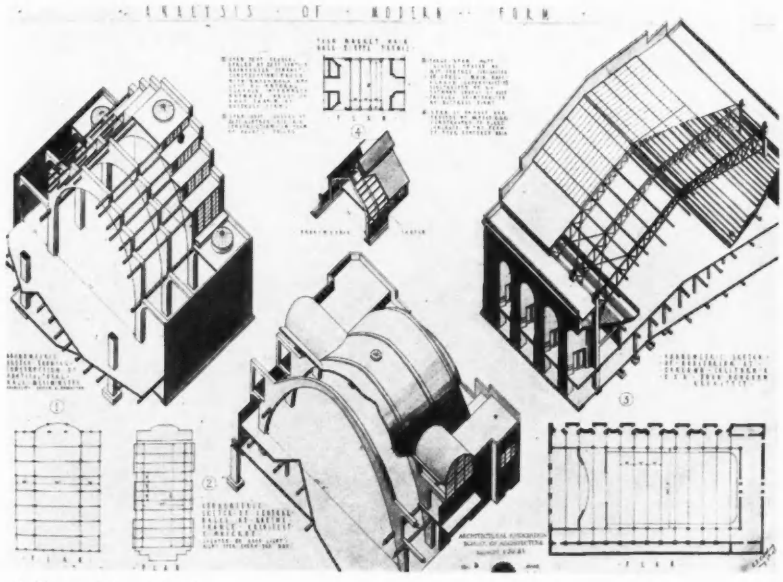


Architectural Association.]

An analysis of vault form. By R. Messenger (second year).

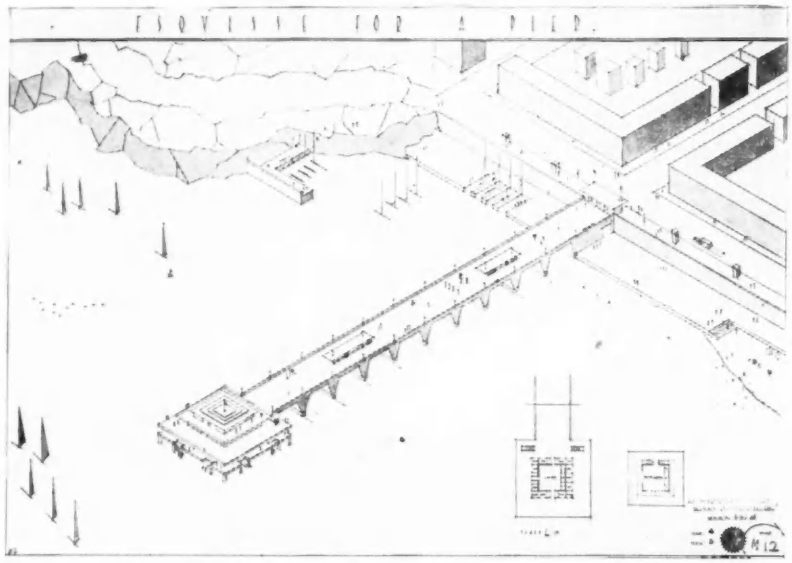
The keystone of the curriculum may be summed up by the single word "synchronization." The course no longer consists of a number of subjects and lectures, each virtually an entity in itself. After the first term of the first year all the drawings which the students produce, all the lectures which they attend, are interdependent and progressive; the construction depends upon the design, and *vice versa*, and both are influenced by the lectures. Instead of setting a subject in design and collecting the completed drawings at the end of a month, thereafter basing a construction subject on the design, it is now realized that nobody can derive real educational value from designing anything and ignoring its construction, any more than he can construct without knowing what it is that he is building.

The A.A. has long been regarded as one of the strongholds of modernism, and quite a number of people have felt a little uncomfortable about it all, and have wondered "where it's all leading to." For these people there is comfort to be had from this exhibition, because here are the Orders, large as life—but the Orders in a new way. They are no longer held up merely as Design with a big D—as forms which are a very present help in trouble. Research plays a very large part in the work of the school, and it may be said that there must be a sound reason for everything which a student does. In the first year the research takes him, for instance, into post and lintel construction, and here he meets the Orders and learns to regard them as design and construction, inseparably welded to produce fine architecture. It may be a matter for speculation as to whether this "fundamentalism," if one may so term it, will lead to the continued use of the classic forms by these students when they get into practice, and, if so, whether they will be intelligently and amusingly used—it will certainly be interesting to watch. But in the meanwhile it is worth pointing out that there are no "-isms" about the A.A. work, and, so far as one can gather, there is no attempt to harp on "styles"; that question is left open for the student, with the reservation that what he does must be based on the logical and reasonable application



Architectural Association.]

An analysis of modern form. By E. T. Dowling (third year).

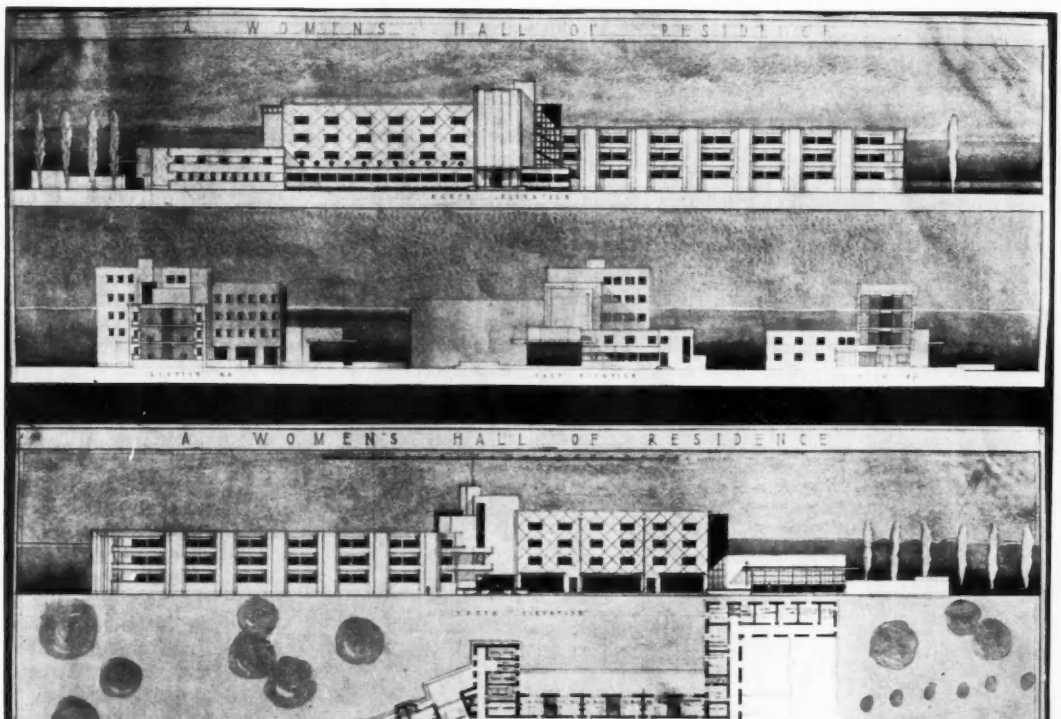


Sketch design for a pier. By G. A. Gamble (fourth year).

of the knowledge gained by research. "Modernism," therefore, may be said to be non-existent, but there is evidence of a leaning towards a knowledgeable or "contemporary" movement.

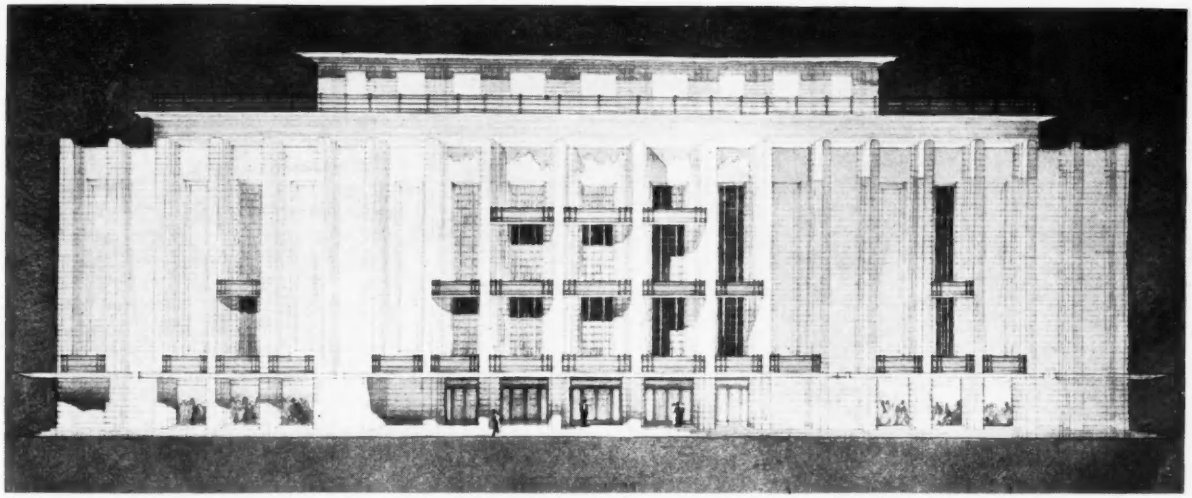
In the second year, design and construction again appear, interlaced; and the traditional aspect of the two is represented by a study of Romanesque and Mediæval work with particular reference to the development of forms and methods of vaulting. Later the same system brings a progressive study of Renaissance design and construction on the same lines and, finally, of modern forms in relation to particular types of buildings.

Any brief summary of the work of the school is liable to leave the impression that the course errs on the side of being too theoretical; perhaps a school should not attempt too far to teach the severely practical, but should concentrate upon those subjects which cannot easily be learnt out of school.



[*Architectural Association.*]

A women's hall of residence. By A. G. Savill (fourth year).



University College : Bartlett School of Architecture.]

An opera house. By R. Seifert.

But an interesting addition to the A.A. curriculum is a series of lectures to advanced students giving a groundwork to the complex subject of building finance.

As a lively adjunct to the exhibition (which remains open until July 24), the booklet describing the work is worthy of note, because it reflects the character of the school by its refusal to accept blindly or unreasoningly the mannerisms by which one is becoming entrammelled. But one criticism of it : the use of thick-bodied sans-serif type faces demands more open leading for legibility's sake.

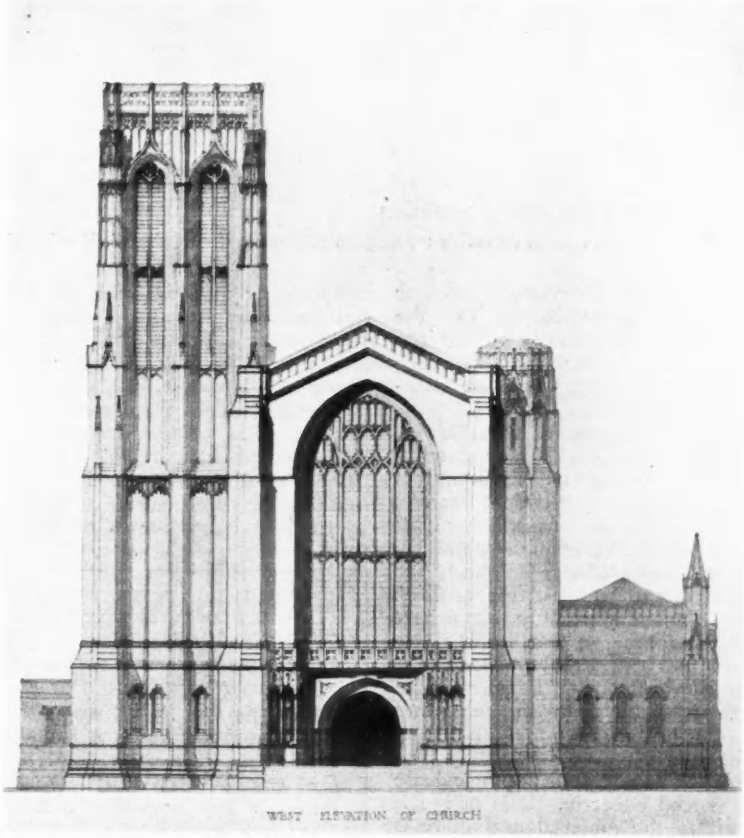
ii : University College

BY JOHN GREENIDGE

NO less a person than Sir Edwin Lutyens has recently stated that the older generation in the profession has misgivings as to the use that is being made by youthful practitioners of the new materials which are now at their disposal, the new needs that have to be satisfied, and the strange sources of ideas which are ready to be tapped. It requires a designer of mature judgment to be able to resolve his knowledge of tradition, modern technical methods and the various mechanical characteristics of his profession and bend them to his artistic will. Today the proper solution of an architectural problem is achieved, through all these complicated conditions, by something akin to a miracle; he must be in the end a sensitive and experienced man to be the vehicle of such a grace.

It is inevitable, in viewing an exhibition of students' work, that one should speculate in what directions the future tendencies are going to run, stimulated by what is being taught and encouraged.

In the present exhibition at University College, one recognizes the old sound classical foundation, represented by a brave display of Greek compositions and various adaptations of the pure classical style. Historical development is traced through Renaissance motives until more modern problems have to be tackled. Here one notices a distinct divergence of manner and conception. The Continental treatment of concrete, the mechanized industrial building or block of flats, is well understood, and in most cases ably treated. But one seems to notice in much of this work a dislike of the attitude of cynicism towards the personal factor which has recently been so apparent. Is it possible



University College : Bartlett School of Architecture.]

A small block of flats : front elevation ; and plan of ground floor. By W. Rowley Hall.

that the human element has become too much subordinated to the mechanical pouring-in of concrete into the shuttering? Are we, in fact, returning to a more personal, man-handled architecture?

There are indications that this is where the present-day uncertainty in design lies. But in this exhibition it is refreshing to see mechanical motives kept in their place—that is, being used for mechanical purposes—while in domestic and urban building the rhythm is rounder, less rigid; and the human heart may possibly miss a beat without becoming de-synchronized.

M. F. Sander's Railway Dock is a sound interpretation of the mechanical motif. It is an essay in cleats and gusset-plates, but neat and absolutely to the point. B. J. Ashwell's Fish Market exhibits a perfectly logical use of reinforced concrete. The design is attuned to the material and there is no unpleasant self-consciousness about the building that, as architecture, it is not quite out of the top drawer. In these two subjects one would not expect any particular human factor to be apparent. However, in the design for a Landing Stage for Cross Channel Service it is present by derivation. The concrete hangar which acts as a railway terminus is designed on a train-motif. The marine-motif is expressed by the long barge-lines of the Customs shed and the lighthouse, combining ideas of land and marine transport which are essentially of human scale and value.

R. Seifert's Opera House is a magnificent and ambitious building. But it seems to epitomize all the complications of modern existence. In the mass it is terribly worried, and rather like an old-fashioned radiator in motif. As an important municipal edifice it would have nothing of the calm and strength that is essential to keep order amongst the smaller buildings. Even the figures drawn on the elevation seem almost an impertinence. Magnificent as the conception is, this is not the sort of inducement to the public that grand opera needs, especially in this country.

But, in addition to this idea of what is merely fitting, there seems to be a definite return to old loves for the sake of fresh company. The designs for a Royal Chapel and a Town Church almost all follow mediæval forms which, in a school exhibition, would have caused surprise even three years ago. Here opinion is divided between the Gothic revival revived and the Liverpool-Scott precedent. Of the former type are the designs for a Royal Chapel by E. A. S. Houfe and E. C. O. Farrell. The stuff looks somehow machine-cut and the arcading of a type that one associates with ornamented capital letters in a mid-Victorian book of verse. In C. P. Saurin's Town Church a later aspect of the Gothic revival is illustrated; what might be called the post-Street period of about 1890. The treatment of the same subject by F. E. Kers will is infinitely more successful. Such a modernized form of Perpendicular Gothic is probably the only possible re-rendering of mediæval church architecture.

An interesting solution to a topical problem is provided by W. Rowley Hall's design for a small block of flats. The central staircase feature, with a continuous perpendicular light, which divides the façade into two bays, is particularly successful.

The exhibition is interesting as a study of style, but perhaps this year even more as a study of character.

THE HOLIDAY SKETCHES COMPETITION

The result of the July competition will be announced in THE ARCHITECTS' JOURNAL *for August 12.*

Entries for the August competition should reach the Editor at 9 Queen Anne's Gate, Westminster, S.W.1, by first post on August 17. Motto labels for this competition will be found on page xxxviii.

Competition Result

Mr. E. Berry Webber, A.R.I.B.A., the assessor of the competition for the Corporation Offices, Leicester, has made his award as follows :

First premium (£300), Mr. H. Spencer Silcock, A.R.I.B.A., and Mr. Leonard Barnish, F.R.I.B.A. (Grayson and Barnish), of Liverpool.

Second Premium (£200), Messrs. G. H. Shepherd and J. G. Sidebottom, of London.

Third premium (£100), Messrs. Stockdale Harrison and Sons, and W. F. Cartwright, F. & A.R.I.B.A., of Leicester.

The veranda provides the principal approach to the club-room. Entrances on either side give access to the dressing-rooms.

LOMBARD SPORTS CLUB PAVILION, ELTHAM

DESIGNED BY GORDON AND GORDON

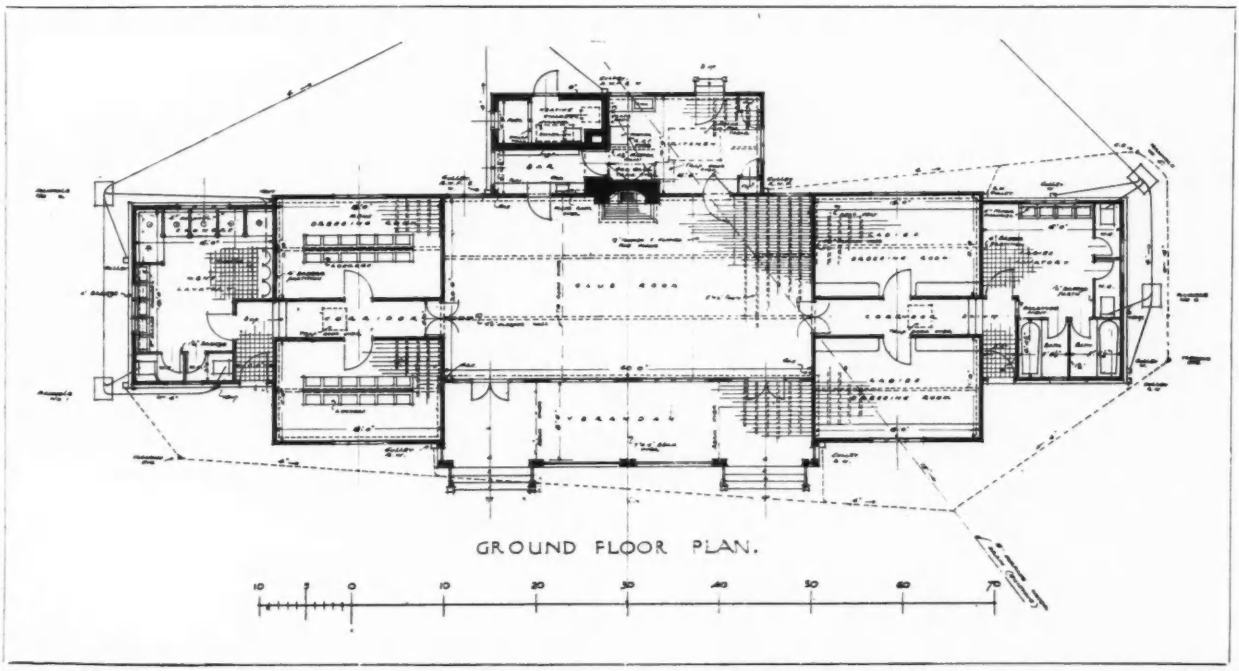
THIS sports pavilion has been erected in Footscray Road, Eltham, Kent, for the Lombard Sports Club. The main front faces approximately north-east, and has been designed with a veranda, 40 ft. long by 8 ft. 6 ins. wide, as the central feature. The veranda is approached by two flights of steps and leads to a club-room, 40 ft. long by 20 ft. wide by 12 ft. high, having a floor of 1¼-in. tongued and grooved pitch pine laid on 5-in. by 2-in. fir joists.

Symmetrically planned on either side of the club-room are, on the left, the men's dressing-rooms and, on the right, the ladies', each dressing-room being 18 ft. long by 11 ft. wide. Beyond the dressing-rooms are the respective lavatories, each having a separate entrance on the principal front from the sports ground.

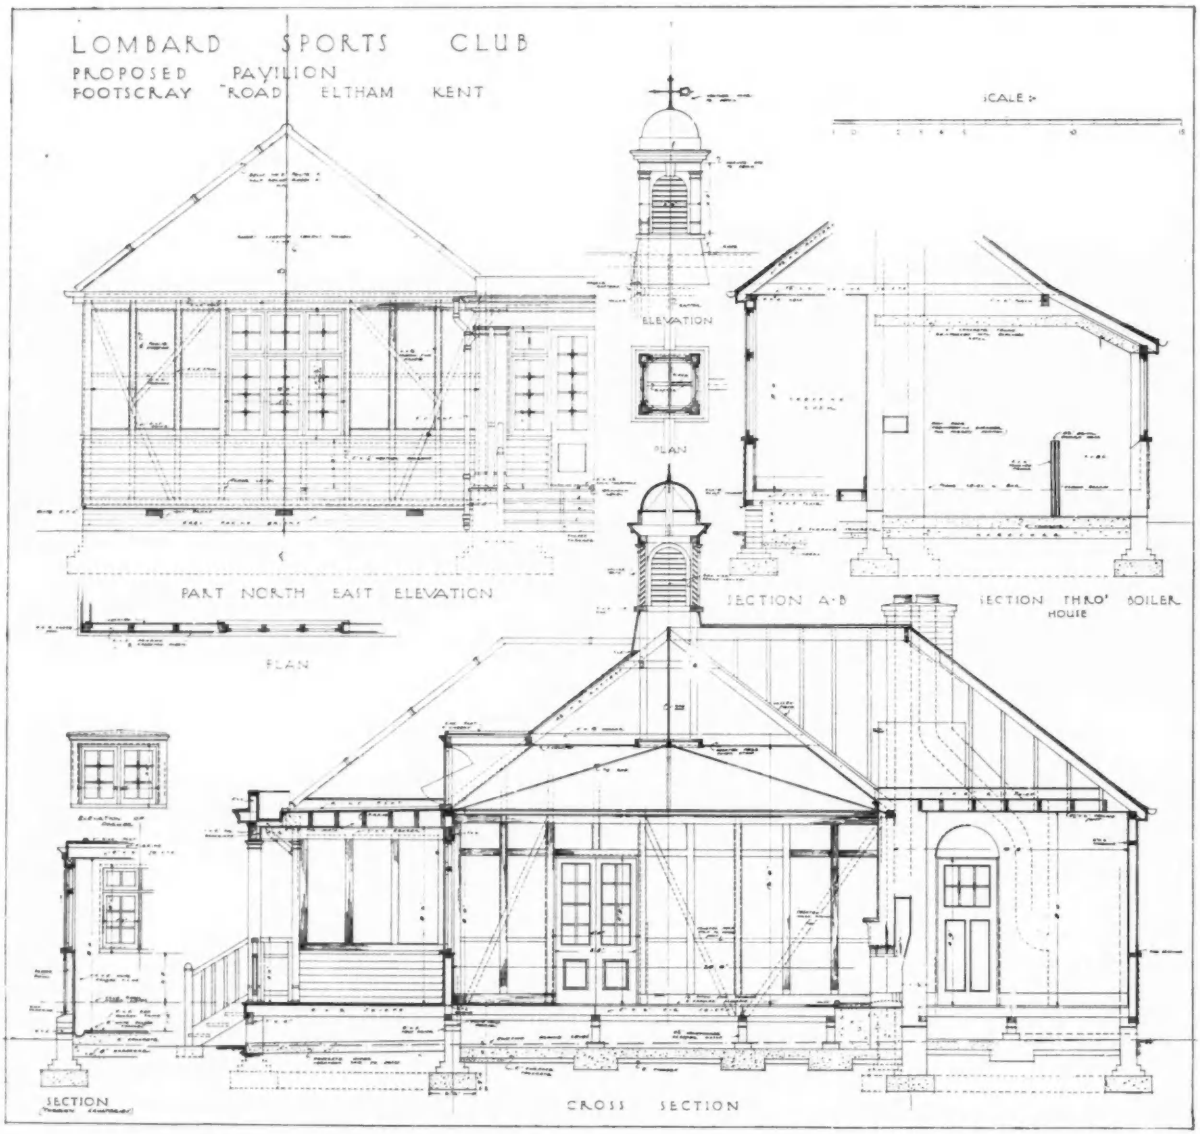
Behind the club-room are a bar, a kitchen, measuring about 17 ft. by 11 ft., heating chamber and fuel store. All of these can be approached also from separate entrances at the rear of the pavilion.

The pavilion is of timber-framed construction, consisting of 4-in. by 3-in. braces and studs, lined on the interior with wallboard, and infilled on the exterior with asbestos sheeting. The base is of weatherboarding, and the roof is covered with asbestos cement Duchess tiles, the whole structure being supported on brick sleeper walls on a concrete foundation.

The pavilion has just been erected at



Ground-floor plan. Approximately the pavilion is 108 ft. long, and has maximum and minimum widths of 45 ft. and 20 ft. respectively.



The architects' working drawings, showing among other details the constructional methods adopted for the timber framing.

a cost of about £3,000, representing approximately 1s. 6d. a foot cube.

It is designed in a direct and simple manner and is intended not only for use as a sports pavilion, but as a social centre.

The club-room. On the right of the fireplace, which faces the screen to the veranda, are the entrance to the kitchen and the doors leading to the ladies' dressing-rooms. On the left is the bar.

A general view of the garden front, showing the simple treatment of the plaster-finished walls, and, on the left, the loggia, enclosed by a sheet of plate-glass.

A SMALL HOUSE AT BOSHAM

DESIGNED BY
IMRIE AND ANGELL

"MILL MEADOW" is a small house, compactly planned for easy working, and designed for one of those attractive sites that overlook Chichester Harbour at Bosham. Externally, its walls are plainly finished in plaster, but interest is added by a simple treatment of bands and panels in the plaster. The surface is whitewashed, while the external wood and iron work is painted black.

An interesting point about the ground-floor loggia, which opens out of the principal room, is that it is rendered capable of use all the year round by being totally enclosed, the front opening being filled in with a single sheet of plate-glass. The combined kitchen and scullery has a large washing-up space, and the fixtures are a feature.

Over the living-room is the main bedroom, and, leading out of it, over the loggia, is a dressing-room, with bath and lavatory basin. There are three other bedrooms, all fitted with basins, a linen cupboard and a bathroom. Ample cupboard-room is provided.

LITERATURE

LAMINATED BOARD AND ITS USES

THIS treatise on laminated board is a collection of contributions which, had he lived, Sir Lawrence Weaver would have himself published in something of the form which Mr Christopher Hussey has given them.

They serve to remind us how much we have lost, architects, craftsmen and laymen, by the untimely death of one who did so much to unite us in the common appreciation of good things. That quality of easy exposition that always masked his complete grasp of a complicated technical process, places this last work among his most notable contributions to architectural journalism. Here is a material about which most architects know little or nothing, and would continue to know little or nothing, were it not for this treatise and others that will no doubt follow it. It is a strange material, bringing with its new processes of manufacture infinite possibilities of new and varied design; yet to this slim volume little could be added that would not repeat or elaborate what has been already said.

Chapter I. describes the manufacture of laminated board, connecting it with the earlier practice of veneering, of which it is a logical extension, into the twentieth century.

As one reads this chapter one begins to appreciate, through an understanding of its manufacture, some of the virtues and qualities peculiar to this material, so that when, in the later chapters, its use by modern designers is discussed, one realizes at once how it comes about that the best examples have a character unlike that of any woodwork that has gone before. One senses both its possibilities and limitations.

The range of illustration is wide, despite the novelty of the material, and covers, with, of course, furniture design, the interior decoration of ships and buildings of all sorts.

Sadly enough, we have to look to Sweden and Germany, to the *Kungsholm*, the *Bremen* and *Europa*, for the most beautiful examples of laminated wood. The *Kungsholm* is now well known enough to English architects, but the *Europa* and *Bremen* provide photographs of interiors quite new, at least to me.

The Swedish Match Company's headquarters and Asplund's Stockholm library are both buildings which can show laminated board being used in an entirely understanding way, giving an air of modernity even when the design looks backwards rather than forwards for its motifs.

In furniture alone, it seems, have English designers shown a selective and appropriate sense of this new material. If only a good English architect could design the interiors of a new English ship, the art would take a great stride forward. E. M. F.

Laminated Board and Its Uses. By the late Sir Lawrence Weaver, K.B.E., F.S.A. London: The Fanfare Press. Price 7s. 6d. net.

ROOF TILING

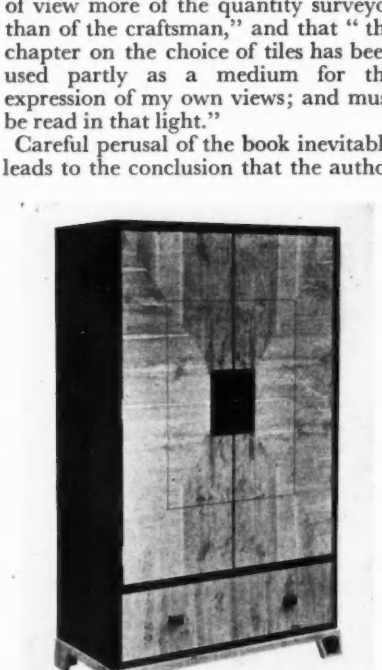
THE author of this book, who holds diplomas of the Surveyors', Engineers' and Sanitary Institutes, is head of the building and surveying department at Croydon Polytechnic. The ground covered includes 1: A Short History of the Craft; 2: An outline of Modern English Methods of Manufacture and of Modern Practice; 3: Hints on Choosing a Tile and on Writing a Tiling Specification; 4: Methods of Measuring Roof Tiling. The book is addressed to quantity surveyors and members of the building profession, and is illustrated by twenty plates from photographs, two folding sheets of drawings and thirty-one figures. A foreword by Sir Edwin Savill introduces the book as "an authoritative textbook" on roof tiling and worthy of acceptance as "a standard textbook on the subject." In the preface the author states that the chapter on Modern Practice is "from the point of view more of the quantity surveyor than of the craftsman," and that "the chapter on the choice of tiles has been used partly as a medium for the expression of my own views; and must be read in that light."

Careful perusal of the book inevitably leads to the conclusion that the author has little acquaintance with the better class of building and of its craftsmanship, but even a casual glance at the photographic illustrations of roofs would have led to this conclusion. The illustrations of tiling in Plates Nos. xvi, xvii and xviii show work carried out after the manner of the speculative builder, of which countless examples may be found in the neighbourhood of Croydon. Unfortunately, most of the technical schools propagate this class of craftsmanship. The standards of design of subjects set for practice are bad, and these, being assimilated by pupils, are reflected in their subsequent daily works. Much of the matter in Mr. Dobson's book is useful, but it "lacks the one thing needful" which is the setting of a high standard of craftsmanship.

The chapter on Manufacture is, perhaps, the best short summary of tile-making processes that has been written. The twelve plates of tiles (each half full size) by which it is illustrated bring out the several textures of each make of tile shown, and are silent testimony to the virtue of coarse sanding, but, of course, give little idea of colours. One feels that the same number of plates would have been used more profitably to illustrate details of construction, of which only verbal descriptions are given.

It is in the chapter on Modern Practice that the conventional outlook of the author is proclaimed, although from the restricted point of view of strong workmanship he is sound enough. Open battening is commended as "the ideal form of preparation for plain tiling," subject to "danger from driving rain." Assuming a pitch of not less than 45 degrees (the usual minimum) the danger is not from rain but from fine driven snow, which may be blown under the tiles and, in melting, drip inside the building. The prevention of this was the chief reason for such crude devices as bedding in mortar, torching, etc. Again, boarding, felting and battening is stated to be "an excellent form of preparation for plain tiling," and the addition of counter battens or counter laths is recommended "where considerations of cost will allow." The omission of counterlaths or counter-battens should *never* be condoned, because for lack of these all moisture passing the tiles will lie on the ledges formed by the tile battens, instead of running down to the eaves.

Other instances show ignorance of detail, as on page 39, where an imaginary difficulty of a "step" between the valley-board and tile battens is to be "eased" with feather-edged boarding each side. To have drawn a section would have shown the futility of this provision. Frequently, terms employed are the author's own



[*From* Laminated Board and Its Uses.

Wardrobe of Ibus laminated board veneered with yew and ebony. Designed by J. Dugald Stark.

rather than those current in the building trades, but his meaning is never thereby obscured. Some useful information is given respecting light passed through glass tiles, but, had the author realized that these are only tolerable when symmetrically arranged, as in a diamond, he might have condensed his table considerably.

The chapter on specifications is a valuable one, because it treats in detail what most textbooks pass over or specify briefly. There are, however, important omissions: as in failure to specify treatment of the final or heading course of vertical tiling, for lack of which a contractor would probably cobble the work, either by using a full length tile and so not keeping the gauge or by rendering the upper six inches of such a tile with mortar listing, with or without combed ornament. The specification should require the gauge to be kept also under window sills, etc., and state how this is to be accomplished, and exactly what modified gauge is required for heading courses. There are several better methods of stopping ends of ridge tiles than that specified, the illustration of which on Plate xviii is a deplorable piece of work, as, also, is the lump of mortar between the eaves course and the lowest hip-tile—not mentioned in the specification.

The chapter on "The Science of Roof Measurement" develops a subject which has some novelty. The author shows that not only does the area of a hipped roof equal the area of a gabled roof of the same pitch covering the same plan, but that "on any given plan, there may be made any number of different arrangements of sloping surfaces of any given pitch, and all of them will have the same area." The proof of this he demonstrates by a variety of instances of which he gives diagrams.

THE EARLY AGES

IT is no doubt true, although it is sometimes forgotten, that history and pre-history are very different things. The presence or absence of written records is what makes the difference between the two. But this does not mean that prehistoric research can rightly be despised. After all, if earthworks, weapons, and cave drawings are discovered, they must have been produced by human agency, and certain deductions can be drawn from them. It is the irresponsibility of some investigators in making these deductions that has tended to discredit this type of research.

Such pitfalls are almost wholly avoided by Mr. and Mrs. Quennell in their excellent little work on some of the later "ages" of prehistoric times. Although intended primarily for public schoolboys—and girls—it is distinctly the type of book that can bring pleasure and profit to adults as well; which is another way of saying that it keeps to facts together with reasonable deductions, and that its style is simple and readable without being childish. Perhaps, however, there is too great a tendency to use terms such as "Nordic," which have very little real meaning, or relation to fact.

Basing their description of the daily life of the periods with which they deal on the traces and relics which the people concerned have left behind—but rightly insisting that in archæology people are more important than things—the authors treat of such subjects as housing, cooking, clothing, warfare and social life.

In some very sane remarks on the religious ideas of prehistoric man, the reader is warned against misinterpreting such a feature as human sacrifice, which, however rightly repulsive to ourselves, may have its origin in sound, although often perverted, instincts.

A practical characteristic of the book is found in the fact that examples are taken, whenever possible, from our own country; such are Badbury Rings, Stonehenge, Maiden Castle, and many others. The illustrations deserve high praise, whether they are pictures of actually existing things or skilful, but not too fanciful, representations of aspects of prehistoric life. As examples we may select the exquisite leaf-shaped sword (figure 45), and the hut interior at Glastonbury (figure 66).

Of direct architectural interest there is, naturally, not very much to be found here; but the description of man's early efforts to grapple with the necessity of shelter takes us back to first principles—an excellent thing if we are to keep near to Nature amidst the legitimate developments of art.

Every-day Life in the New Stone, Bronze and Early Iron Ages. Written and illustrated by Marjorie and C. H. B. Quennell. B. T. Batsford, Ltd. Price 5s. net.

THE NINETIETH BIRTHDAY OF "PUNCH"

THE issue of *Punch* for July 15 is a Special Ninetieth Birthday Double Number, with a charming cover design by Frank Reynolds, showing the presentation of a Birthday Gift to Mr. Punch by his grandchildren.

The principal cartoon is by Sir Bernard Partridge and is entitled "Memories." It depicts Mr. Punch showing his gratitude to some of those celebrated contributors who have helped him in the past. The special commemorative section is the work of "E. V. L."

The period covered by the survey is practically that of the reign of His Majesty the King. The history of this most eventful period is told in a most entertaining manner and is copiously illustrated. The Coronation of the King is one of the earliest items, followed by a glimpse at the "Votes for Women" campaign—in a picture of a window-smashing incident—the loss of the *Titanic* and the tragedy of the Scott Expedition.

Then comes the stupendous event of the Great War. F. H. Townsend's well-known cartoon, "Bravo, Belgium!" is reproduced, showing the gallant resistance to the invader, with Frank Reynolds's "Study of a Prussian household having its morning hate," and a picture by Fred Pegram.

References are made to enlistment, food coupons and regulations, battles, domestic privations good-humouredly borne, and many other details which will remind readers of those tragic years. Then we have the Armistice, followed by the blessings of peace, with a surfeit of strikes, culminating in the General Strike of 1926. The progress of the conquest of the air is noted in the achievements of Sir Alan Cobham, Lindbergh and Hinkler. The accession of Labour to office and, in the international field, the Kellogg Pact, are mentioned. The issue is priced at 1s., and every lover of *Punch* should make sure of securing a copy.

OBITUARY

STEPHEN SHAW: 1846–1931

WE regret to record the death, which occurred on July 15, of Mr. Stephen Shaw, F.R.I.B.A., of Kendal, in his eighty-fifth year. Born at Kendal in 1846, Mr. Shaw was educated at Kendal Grammar School under Mr. James Whittaker, and received his architectural training from his eldest brother, Mr. Richard C. Shaw. After his brother's death at the age of thirty, he successfully continued for over fifty years the practice already established.

During his long business career he designed many of the principal buildings in Kendal, including the Town Hall, the Grammar School and headmaster's house, the Zion Congregational Church, the Presbyterian Church, the Allan Technical Schools, the Museum, the old Post Office, and the old Public Library. He was also responsible for the design of many buildings outside Kendal.

He was elected a Fellow of the R.I.B.A. in 1889.

ARCHITECTS' WILLS

Mr. Frederick Edward Fellows Bailey, F.R.I.B.A., of The Poplars, Mellish Road, Walsall, left gross estate of the value of £27,999 (net personalty, £2,518).

Mr. Robert James Rich Beswick, of Swindon, left £6,129 (net personalty, £6,074).

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Town and Country Planning Bill

THE Town and Country Planning Bill has passed its Committee stage in the Standing Committee of the House of Commons, and, in the autumn, will come before the House for report and third reading. It will then come before the House of Lords.

Housing (Rural Authorities) Bill

Mr. Greenwood, the Minister of Health, announced that Sir Tudor Walters would be the chairman of the new advisory committee under the Housing (Rural Authorities) Bill. He added that no payment for services would be made to the chairman or other members of the committee, but any travelling or subsistence expenses required to be incurred would, of course, be refunded.

The Waterloo Bridges

Mr. Mills asked the Minister of Transport what work, if any, was proceeding on the damaged portion of Waterloo Bridge; for how long a period was there a guarantee of safety with the temporary bridge; and whether any steps were contemplated for the demolition of Waterloo Bridge.

Mr. Morrison said he was informed that apart from occasional maintenance repairs to the temporary staging, no work was at present proceeding on the damaged portion of Waterloo Bridge. The most perishable portions of the temporary bridge were the pile supports, which, he understood, should have a life of ten years without repair. They had now been in use for seven years. He was not aware of any steps in contemplation for the demolition of Waterloo Bridge pending a decision on the proposed new road bridge at Charing Cross.

Charing Cross Bridge: Financial Considerations.

During a debate on the vote for the Ministry of Transport, Mr. Morrison said that he had received a letter from the Clerk of the L.C.C., intimating the decision of the Council on the matter of Charing Cross Bridge, and asking if the Government approved of the scheme, and would be prepared to make a grant of 75 per cent. of the cost. The matter, said Mr. Morrison, would be considered by the Government, but he must point out the serious nature of an expenditure of this kind at a time when great difficulty was being experienced in the field of national finance. An outlay of £12,500,000 was a matter that must be considered with a deep sense of responsibility at the present juncture. He hoped, however, that a decision would be reached at an early date.

Progress of the New League of Nations Building

Mr. Dalton, Under Secretary for Foreign Affairs, informed Mr. Mander that work on the excavations and foundations of the new League of Nations building at Geneva was begun on March 1 last, and was progressing steadily. The time allowed for the work under the contract was eighteen to twenty months. He believed that five architects were in control of this work. He would convey to the Foreign Secretary a suggestion that one architect should be appointed in charge to see that the work was really pressed forward in a proper manner.

Preservation Work at Acton Burnell

Mr. Mander asked the First Commissioner of Works if he would state what steps he was taking to preserve the castle and tithe barn at Acton Burnell where the Lords and Commons sat at the assembly of Parliament in 1283.

Mr. Lansbury said that the castle of Acton Burnell was now in the charge of his Department and the necessary work of preservation was in hand. His Department was not in charge of the barn. He was informed that very little was left of the latter structure, but he would inquire whether any steps need be taken to preserve what was left.

Proposed New Railway Station

The House of Lords has held up the passage of a Bill promoted by the London Underground Group of Electric Railways which, among other things, provided for the building of a railway station on Camberwell Green. Lord Dickinson said that, as the Green came under the Act for the protection of London squares, he thought the local borough council had no authority to sanction building on it.

Lord Crawford described the proposal as an outrage, and hoped that the Bill would be recommitted so that the proposals could be fully examined.

Eventually, the debate was adjourned to allow consideration to be given to the proper course to be taken.

SOCIETIES AND INSTITUTIONS

MANCHESTER ARCHITECTS' SUMMER VISITS

THE first of the Manchester Society of Architects' summer visits was held on Wednesday evening, July 15.

The building visited was the New Manchester Grammar School, now nearing completion, the associated architects being Mr. Francis Jones, F.R.I.B.A., and Messrs. Thomas Worthington and Sons.

The historic buildings of the Grammar School in the centre of the city are being vacated in favour of a more airy situation in Fallowfield, where playing fields can be obtained in close proximity to the School. The opportunity has been well used by the architects in the design of a fine group of buildings, culminating in the great Memorial Hall.

A large number of members were present and made an exhaustive and most instructive tour of the buildings.

An interesting programme of visits has been arranged by the Summer Visits Committee of the Society, which will afford the members opportunities of inspecting buildings, both old and new, which are included in the list.

THE WELSH SCHOOL OF ARCHITECTURE CLUB

About thirty students of the Welsh School of Architecture, Cardiff, spent the day in London on July 15, accompanied by Messrs. W. S. Purchon, M.A., A.R.I.B.A., the head of the school, Mr. Lewis John, M.A., B.ARCH., A.R.I.B.A., and Mr. A. MacLean, B.A., A.R.I.B.A.

The party first visited the Architectural Association, Bedford Square, where they inspected a comprehensive exhibition of the work of the students in each year of the Five Years' Course, the work and the methods employed in producing it being explained by Mr. Howard Robertson and other members of the staff.

The party were entertained to lunch by the Architectural Association. Mr. W. S. Purchon proposed, and Mr. J. P. Ward (vice-chairman of the Welsh School of Architecture Club) seconded, a vote of thanks to the A.A. for its hospitality, and to the Principal and other members of the staff for the excellent arrangements which had been made. Mr. F. R. Yerbury responded.

The visitors were then taken on a tour of a number of modern London buildings, including the British Museum extension, Adelaide House, Bush House, the B.B.C. Headquarters, Grosvenor House, Dorchester Hotel, the Underground Building, Westminster, and the Royal Horticultural Hall.

THE BARTLETT SCHOOL OF ARCHITECTURE

The following awards have been made at University College, London, in the Faculty of Arts—Bartlett School of Architecture:

Entrance Exhibitions: 1st, A. G. Ling, Christ's Hospital; 2nd, N. E. Block, Whitgift Middle School, Croydon; *Proxime accessit:* S. P. Jewitt, William Ellis Endowed School, Gospel Oak.

Donaldson Silver Medals: F. E. Kerswill and C. P. Saurin—subject to confirmation by the R.I.B.A.

Herbert Batsford Prize: Dorothy V. Cargill.

The Architects' Journal Prize (for the best final design produced in the Day School by

a fourth-year Degree or Diploma Student) : A. G. Wise.

The Builder Prizes (for the best sets of measured drawings of old work) : Senior—1st, P. B. Dunham; 2nd, A. G. Wise. Junior—R. H. C. Finch and S. Sanmuganathan (equal).

Building Prize (for best set of drawings, combining construction and design, by a fourth-year student) : R. Seifert.

Prize for Design in Ferro-Concrete : 1st, D. A. Stewart; 2nd, W. M. Goode-Smith.

The following have obtained the Certificate in Architecture : P. B. Dunham, D. C. Earle, R. H. C. Finch, E. A. S. Houfe, R. H. Martin, M. Packer, N. F. Sanders, R. Seifert.

The following have obtained the Certificate in Decoration : Agnes K. Johnston and Mary E. Wilson.

The following have obtained the Certificate in Town Planning : F. G. Costello, W. A. Eden, P. V. Mauger.

BRISTOL ACADEMY OF ARCHITECTURE

At the annual exhibition and prize-giving of the Royal West of England Academy School of Architecture, held at Bristol, Mr. W. J. Stenner, F.R.I.B.A., who presided, said a confidential report from the Educational Board of the Royal Institute stated that the Visiting Board were very much impressed with the work of the school. They offered no adverse criticism, made one minor criticism of a helpful character, and expressed pleasure at the high standard of draughtsmanship maintained. He contrasted the conditions enjoyed by the modern architectural student with those prevailing a century ago, when much depended on the man to whom the student was articled. Today the risk taken was not quite so serious, for should the architect principal be not all that was desirable, the school counteracted any bad architectural influence. "The founders of this school," he continued, "were all practising architects and adopted a dual system in a curriculum which allows simultaneous training in school and office."

Mr. G. D. Gordon Hake, F.R.I.B.A. (Headmaster), in the course of his annual report stated that the numbers at the school were about the same as last year, but judging by the inquiries and bookings there would be an increase next year, which would raise the question of additional accommodation at the school, where already they were cramped.

Councillor Walter Bryant, in distributing the awards, congratulated the school on its progress during the year, and said nobody could have anticipated a more satisfactory report. He remarked that it was rarely that an architect could put his or her best thought into action. Economy today was so interpreted that he feared posterity would sit in severe judgment on them in respect of modern buildings.

In conclusion he addressed the students upon the importance of selecting the right materials in carrying out their work.

The prizes were awarded as follows :

Savory Design Medal—A. R. Taylor; Mrs. Yda Richardson's bursary for fifth year—A. R. Taylor; Dame Janet Stancomb-Wills travelling studentship (£25)—E. W. Ayre; Architectural Association Design Prize (£5 5s.)—P. K. Pope; Chairman's prize for best second place—T. H. B. Burrough; R.W.A. Silver Medal and B.S.A. Prize of £3 3s.—W. R. Stenner; R.W.A. Bronze Medal and B.S.A. Prize of £2 2s.—A. E. Carter; Headmaster's Prize (£2 2s.) for most marked progress—Miss K. Gibbons; Eustace Button Measured Drawing Prize (£2 2s.)—P. K. Pope.

COCKERELL'S WATER-COLOUR DRAWING

The famous water-colour drawing by Professor C. R. Cockerell, R.A., representing all the buildings of Sir Christopher Wren in a composition dominated by the dome of St. Paul's Cathedral, is now on exhibition in Sir John Soane's Museum, Lincoln's Inn Fields, W.C.2, and will be on view until August 28. It has been lent by Mrs. F. Pepys Cockerell for the purpose of a reproduction as the frontispiece to vol. ix of the Wren Society, dealing with the fifty-four churches that Wren built after the Great Fire of London.

The Museum is open free on Tuesdays, Wednesdays, Thursdays and Fridays, from 10.30 a.m. to 5 p.m.

THE ARCHITECTS' DIARY

THURSDAY, JULY 30
NATIONAL PORTRAIT GALLERY, St. Martin's Place, W.C.2. Lecture on "Inigo Jones." By John Steegmann, M.A. **3 p.m.**

SATURDAY, AUGUST 1
Sunrise, 5.22 a.m. Sunset, 8.50 p.m.

MONDAY, AUGUST 3
Bank Holiday.

SATURDAY, AUGUST 8
Sunrise, 5.33 a.m. Sunset, 8.38 p.m.

FRIDAY, AUGUST 14
ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, Bloomsbury, W.C.1. Last day for submission of photographs for the Society's Annual Exhibition.

SATURDAY, AUGUST 15
Sunrise, 5.44 a.m. Sunset, 8.24 p.m.

MONDAY, AUGUST 17
Closing date of THE ARCHITECTS' JOURNAL July Holiday Sketches Competition.

SATURDAY, AUGUST 22
Sunrise, 5.54 a.m. Sunset, 8.11 p.m.

SATURDAY, AUGUST 29
Sunrise, 6.5 a.m. Sunset, 7.55 p.m.
ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Tour to Vienna, visiting Munich, Salzburg, Linz, Budapest, Zurich and Lucerne. Return, September 13. Full particulars may be obtained from the Secretary.

TUESDAY, SEPTEMBER 1
INTERNATIONAL ILLUMINATION CONGRESS. London, Glasgow, Edinburgh, Sheffield, Buxton, Birmingham and Cambridge. Until September 19.

SATURDAY, SEPTEMBER 5
Sunrise, 6.17 a.m. Sunset, 7.40 p.m.

MONDAY, SEPTEMBER 7
SANITARY INSPECTORS' ASSOCIATION, 27 Moreton Street, S.W.1. Annual Conference. Bridlington. Until September 12.

SATURDAY, SEPTEMBER 12
Sunrise, 6.28 a.m. Sunset, 7.24 p.m.
ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

THURSDAY, SEPTEMBER 17
Closing date of THE ARCHITECTS' JOURNAL August Holiday Sketches Competition.

FRIDAY, SEPTEMBER 18
NATIONAL SMOKE ABATEMENT SOCIETY, 23 King Street, Manchester. Annual Conference. Liverpool. Until September 20.

SATURDAY, SEPTEMBER 19
Sunrise, 6.39 a.m. Sunset, 7.8 p.m.

COMPETITIONS OPEN

July 31.—Sending-in day. Proposed Nurses' Home at the Royal Asylum, Montrose. Limited to architects practising in the counties of Aberdeen, Angus, Fife, Kincardine and Perth. Assessor : John Watson, F.R.I.B.A. Premiums : £75, £50 and £25. Conditions, etc., obtainable from C. K. Alexander, Clerk and Treasurer, Royal Asylum, Montrose.

August 27.—Sending-in day. Proposed all-Scottish House for the Ideal Home Exhibition. Limited to architects practising in Scotland or of Scottish birth. Assessor : John Watson, A.R.S.A., F.R.I.B.A. Premiums : £150, £100 and £50. Conditions, etc., obtainable from *The Daily Mail*.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor : Percy Thomas, O.B.E., F.R.I.B.A. Premiums : £500, £400, £300 and £200. Conditions from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor : Andrew N. Prentice, F.R.I.B.A. Premiums : £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor : Francis Jones, F.R.I.B.A. Premiums : £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Hayes Farm, Sulley, near Cardiff. Assessors : Ernest Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums : £400, £300, £175, and £100. Conditions, etc., were obtainable from F. J. Alban, General Secretary, Memorial Offices, Westgate Street, Cardiff, before June 29.

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor : Sydney Tatchell, F.R.I.B.A. Premiums : £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius from Liverpool Town Hall. Assessor : A. H. Moberly, F.R.I.B.A. Premiums : £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions : August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1 Assessors : Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium : £500; also a further amount of £750 will be awarded to other designs according to merit.

LAW REPORT

SPECIFIC PERFORMANCE : AN UNDISCLOSED COVENANT

Charles Hunt, Ltd. v. *Palmer. Chancery Division. Before Mr. Justice Clauson*

THIS was an action by Charles Hunt, Ltd., of Brownhill Road, Catford, against Arthur Horace Palmer, of Hither Green Lane, for specific performance of an agreement dated January 21, 1931, for sale by the plaintiffs to the defendant of certain leasehold premises, 238 and 240 Brownhill Road, Catford, for £725.

Plaintiffs are the owners of the leasehold premises in question held by them on lease from 1919 for the residue of the term from December, 1918. Plaintiffs' case was that the defendant purchased the property for £725 and paid a deposit of £72 10s. Plaintiffs alleged that the defendant accepted the title and had refused to carry out the agreement.

Defendant said the property was offered for sale by auction on January 21, 1931, being described as valuable leasehold premises, two spacious shops and ground-floor factory. Defendant was a dairyman and he said the description of the premises implied that any business could be carried on there. Neither at the auction nor at any time was reference made, the defendant said, to any unusual covenant in the lease under which the property could only be used for the purpose of a ladies' clothing factory, unless the leave and license of the freeholders were obtained. Defendant bid £725 for the property, and his intention was to use the property for the purposes of his business, subletting the shops. Defendant said no disclosure was made of the unusual covenant. He denied that he ever accepted the title. Defendant now counter-claimed for a rescission of the contract and the return of the deposit.

Mr. A. J. Spencer appeared for the plaintiffs and Mr. C. D. Myles for the defendant.

His lordship, in giving judgment, reviewed the facts of the case and said the question was whether in the circumstances the plaintiffs were entitled to require the defendant to take the property. The defendant was a dairyman and his lordship had no doubt that if he purchased the property it was with the idea of using it for his business. Here there was a covenant that the premises were only to be used for a ladies' clothing factory, and it was clear that the defendant would not have bid for the property if he had known of this covenant. The plaintiffs had replied to the defendant that the leases were with their solicitors and were available to be seen. His lordship did not take the view that this was a disclosure of the covenant. He came to the conclusion that the action failed and would be dismissed with costs. The counter-claim also failed, and there would be judgment for the defendant on the counter-claim, with costs. The defendant would be entitled to the return of his deposit.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

New Blue Coat School, Edgbaston, Birmingham (pages 134, 137–140). General contractors, J. B. Whitehouse and Sons, Ltd. Sub-contractors : Ellis Partridge & Co., facing bricks; Wragge and Son, stone; Kleine Co., Ltd., fireproof construction; Blockley, tiles; Wormells, slates; Merrick and Heath, glass; H. Hope and Son, Ltd., patent glazing and cast lead; Hollis Bros., wood-block flooring; Marbello Co., small quantity of patent flooring; Hopes Heating and Lighting Co., Ltd., central heating and boilers; Parker Winder and Achurch, grates and door and window furniture; Pratt, Ltd., gas fixtures, plumbing, cloakroom fittings and gas-fitting; T. Glover, electric wiring, electric light fixtures and bells; Farrer, Ltd., sanitary fittings; Hayward Bros., Ltd., iron staircases; W. J. Bloye, decorative plaster; J. R. Pearson, Ltd., metalwork; Traley and Sons, marble; Craven Dunhill, Ltd., tiling.

Boots' Shop Premises, 16 New Bond Street, W.1 (page 142). General contractor, Bovis (1928), Ltd. Sub-contractors : Moreland, Hayne & Co., Ltd., structural steel; Siegwart Fireproof Floor Co., Ltd., patent flooring; F. F. Docking & Co., central heating; H. Arnault, Ltd., electric light fixtures, sunblinds and green bronze windows and doors; Matthews and Yates, Ltd., ventilation; Empire Stone Co., Ltd., stairtreads; Cashmore Art Workers, fibrous plaster; J. Whitehead and Sons, Ltd., marble front; Carter & Co., Ltd., ceramic mosaic; Geo. Parnall & Co., shop fittings; Claude General and Neon Lights, Ltd., signs.

Sports Pavilion, Eltham, Kent (pages 151–152). General contractors, John Harrison & Co. Sub-contractors : E. B. Bain & Co., heating; En-Tout Cas Co. (Syston), Ltd., hard tennis courts; Francis Polden & Co., Ltd., electrical work; Asbestos Cement Building Products Co., slates to roofs; F. Braby & Co., Ltd., zincwork; Pontifex and Sons, Ltd., sanitary fittings; A. B. Sports, turfing and land drainage; W. B. Simpson and Sons, Ltd., tiling; Merchant Trading Co., Ltd., Celotex boarding, used internally.

Mr. W. A. Kellett, L.R.I.B.A., has removed his office from Lloyds Bank Chambers, Barnard Castle, to 8 Lendal, York. Telephone No. : 3523.

TRADE NOTES

The rehearsal of the floodlighting of London for the International Illumination Congress and the Faraday celebrations, was held on Tuesday of last week. Experiments proved that given the increased intensity and the complete scheme as will be carried out in September, remarkable results will be achieved.

Those on the Big Ben tower and Westminster Abbey were carried out jointly by Messrs. Holophane and Messrs. Siemens. Westminster Abbey particularly showed the great potentialities of the flood-lighting of our ecclesiastical buildings.

Regarding the actual installation, twelve Holophane-Siemens "F.L. 1,000" 1,000 watt flood projectors were installed, by the courtesy of the Central Hall authorities, on the flat of the roof of the Central Hall. The western front of the Abbey is approximately 225 feet high by 95 feet wide, and the throw for the floods from the Central Hall 300 feet. The Holophane double parabolic floods give an approximate 200 times magnification of the bare lamp candle-power, and therefore one would estimate a maximum beam candle-power from each unit of 250,000, a total of three million candle-power for the twelve units.

A similar number of Holophane 1,000 watt floods were used for the trial on the western front of Big Ben.

The battery of twelve floods was erected in the courtyard, 150 feet from the face of the tower. For the section directly above the clock-face, there is a belfry set back, so that the ordinary projection of the floods would cut out the colonnade arches, and here a series of Siemens concentrating reflectors with 100-watt lamps was installed. Behind the face of the clock the white normally used 100-watt lamps were replaced by Siemens 150-watt amber sprayed lamps. This gave a red colour to the clock face, which when flooded from below gave a pink colour relief.

The tower is approximately 320 feet from the base to the top of the lantern, and 200 feet to the centre of the clock face, the width being approximately 50 feet. The mean throw of the beams was 170 feet.

The illustration on page 136 is reproduced by courtesy of Messrs. Holophane, Ltd.

*

Messrs. W. H. Gaze and Sons, Ltd., have recently secured the following contracts : New house, Eltham, for Messrs. Grace and Hughes; new dwellings at St. Marylebone, for the L.C.C.; alterations and decorations to London School of Economics, for Messrs. Trehearne and Norman, Preston and Co.; and Midland Bank, Tolworth, for Mr. J. D. Hossack, F.R.I.B.A.

*

The Elsan Manufacturing Co., of 34–5 High Holborn, London, W.C.1, were awarded a bronze medal for their exhibit of the Elsan chemical closet at the Royal Sanitary Institute Health Exhibition, held at Glasgow this month.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed at BLACKHEATH: Thirty-one houses, Kidbrook Park Road, for Messrs. Walker, Clinging & Co.; house, Kidbrook Park Road, for Messrs. A. Shore & Co.; corner blocks of houses, Kidbrook Park estate, for Messrs. Coleridge, Jennings and Soimenow; four houses, Beaconsfield Road, for Mr. J. Douglas Scott.

Mr. Allen W. Reid is to extend the school premises at the Trinity Congregational Church, Church Road, BRIXTON.

Plans passed by CAMBERWELL B.C.: Buildings, College Road, for Mr. F. A. Llewellyn; workshop, 9 Hever Road, for Messrs. Tarr and Leonard; additions, Camberwell Grove and Church Passage, for Messrs. H. P. Wyatt, Son and Partners.

Plans passed at CATFORD: Thirteen houses, Holmesley Road, for Messrs. W. T. Champion and Son; six houses, Danevy Road, for Mr. G. T. Harman; water tower and extensions, sports pavilion, Whitefoot Lane, for Messrs. Geo. Parker and Sons, Ltd.

The CROYDON Corporation is to erect twenty-six flats in Windmill Hill, Upper Norwood.

The CROYDON Corporation recommends the preparation of plans for a crematorium at Mitcham Road cemetery.

The CROYDON Corporation has prepared plans for the erection of a fire station in Lower Addiscombe Lane. The cost is estimated at £20,000.

The CROYDON Education Committee has appointed Mr. A. Sunderland as architect for the proposed elementary school on the Waddon housing estate.

Plans passed by CROYDON Corporation: Twenty-two houses, Hayling Park estate, for Mr. J. G. Cooper; factory, Mitcham Road, for Messrs. J. C. Brewer & Co.; four houses, Beauchamp Road, for Mr. E. W. Prichett; hall, offices, etc., Bedford Park, for Mr. E. H. Smith; twenty-four houses, Davidson Road, for Mr. J. W. Hall; alterations, 99 George Street, for Mr. E. Bates; seven houses, Croham Valley Road, for Mr. G. W. Peachey; four houses, Stonecroft Way, for Mr. H. Macintosh; rebuilding "Duke of Cambridge" public-house, Holmesdale Road, for Mr. C. R. Riches; twelve houses, Shirley Road, for Messrs. Paish, Tyler and Crump; drapery store, Frith Road, for Messrs. G. Baines and Sons; cinema, 793–5 London Road, for Mr. A. C. Matthews; nine houses, Orleans Road, for Mr. M. D. Wilde.

The governors of Addey and Stanhope school, DEPTFORD, are to improve and enlarge the school premises, at a cost of £12,000.

Plans passed by EAST HAM Corporation: Extensions, East Ham Labour Club, Katherine Road, for Mr. E. Meredith; house, Brancaster Road, for Mr. S. W. Bedford; eight houses, Shaftesbury Road, for Mr. W. H. Binns; four houses, Sheringham Avenue, for Mr. J. W. Lohden; twelve houses, Grantham Road, for Mr. W. Reeves; four houses, Nelson Street, for Mr. C. Griffiths; additions, lodge, Woodgrange cemetery, for Mr. T. L. Danial.

Plans passed at ELTHAM: Ten houses, Sidcup Road, for Messrs. Sykes and Pomfret; shop, Pound Place, for Mr. W. Childs; meeting hall, billiard room, etc., High Street, for Mr. Thomas Stott; four houses, Avery Hill Road, for Messrs. H. Smith & Co.; shop premises and meeting-room, Footscray Road, for Royal Arsenal Co-operative Society, Ltd.; bank and shops, High Street and Roper Street, for Messrs. Sykes and Pomfret; eight shops and flats, Sidcup Road, for Messrs. Eley and Allen.

Plans passed by GRAVESEND Corporation: Eight houses, The Fairway, for Messrs. W. E. and H. E. Thomas, Ltd.; seven houses, Hollybush Road, for Messrs. W. H. Black and Son.

The Essex Education Committee has purchased a site in Windsor Road, HORNCHURCH, for the erection of an elementary school.

The Essex Education Committee has approved plans for the erection of a junior school for 450 children in Suttons Lane, HORNCHURCH, at an estimated cost of £13,500.

The L.C.C. has passed plans submitted by Mr. B. George for the formation of a dome at Messrs. Derry and Toms, Ltd., High Street, KENSINGTON.

The L.C.C. is to improve the engineering services and provide a new boiler-house at the LAMBETH hospital, at a cost of £26,000.

Plans passed by LEWISHAM B.C.: 128 houses, Grove Park Central estate, for Mr. W. J. Brise; partially rebuilding "Prince of Wales" public-house, Perry Rise, for Messrs. Charrington & Co., Ltd.; thirteen houses, Holmesley Road, for Messrs. W. T. Champion and Son; two houses, Baring Road, for Mr. G. W. Crosby; buildings, corner of High Street and Myron Place, for Mr. S. W. Ackroyd; houses in Bexhill Road, Salehurst Road, and Stillness Road, Brockley, for Mr. G. T. C. Harman.

The Essex C.C. has purchased The Gables, MALDON, for conversion into a boys' home.

The L.C.C. is to remodel the Sidney Road school, SOUTH HACKNEY, at a cost of £9,180.

The L.C.C. has passed plans submitted by Messrs. Wallis, Gilbert and Partners, for the erection of buildings in Mabledon Place and Flaxman Terrace, ST. PANCRAS.

The L.C.C. Education Committee has approved plans for the erection of a central school on the Furzedown site, STREATHAM, at a cost of £21,000.

EASTERN COUNTIES

The COLCHESTER Corporation has decided to erect sixty-four houses on the Old Heath estate, and obtained sanction from the Ministry of Health for the scheme for the erection of 100 houses on the Harwich Road site.

Plans passed by COLCHESTER Corporation: Store, goods station, The Hythe; workshop, Sheepen Road; central warehouse, Wimpole Road, for Mr. E. E. Orrin, on behalf of the Co-operative Society, Ltd.; extensions, Hythe Bridge Ironworks, for Messrs. F. W. Brackett & Co., Ltd.; alterations and additions, Soldiers' Home, Queen Street, for Mr. J. G. P. Meaden.

The COLCHESTER Corporation has asked the borough engineer to report with regard to the provision of a municipal aerodrome.

The Board of Education has approved the plans of Messrs. Duncan Clark and Beckett for the erection of a central school for the COLCHESTER Education Committee in Barrington Road.

The Essex Education Committee is to enlarge the Council school at SOUTH BENFLEET, at a cost of £8,500.

The Essex Education Committee has acquired a site in Spinks Lane, WITHAM, for the erection of a central school.

SOUTHERN COUNTIES

The HASTINGS Corporation Water Committee is to obtain tenders for a new chlorinating plant for Brede pumping station.

The HASTINGS Corporation Water Committee recommends relaying the water main from Battle Road to Hollington schools, at an estimated cost of £380.

The HASTINGS Education Committee recommends carrying out alterations, painting works, and additions to various schools, at an estimated total cost of £2,440.

Plans passed at HASTINGS: Alterations, 132 Hollington Old Lane, St. Leonards, for Mr. H. Burleigh, architect; bungalow, Linton Terrace, for Messrs. Ward, Son and Wray, architects; office, North Terrace, for Mr. L. Towser, architect; conversion into flats, Tampenis, St. Helen's Park Road, for Messrs. Ward, Son and Wray, architects; two houses, Athelstan Road, for Mr. H. Burleigh, architect; alterations, Freemasons' Institution, Wellington Place, for Mr. P. H. Oxley, architect; dressing station, Bexhill Road, St. Leonards, for the St. John's Ambulance Brigade; conversion into flats, 14 Grosvenor Crescent, St. Leonards, for Messrs. Callow and Callow, architects; additions and alterations, Carisbrooke Road, for Messrs. Ward, Son and Wray, architects; house, Bexhill Road, St. Leonards, for Mr. H. H. Ford, architect; showroom, Hastings and St. Leonards Gas Co.'s office, Queen's Road, for Mr. C. F. Botley, architect; lecture-hall and covered way, Buchanan Hospital, Springfield Road, St. Leonards, for Messrs. Ward, Son and Wray, architects; alterations, 52 and 53 Havelock Road, for Messrs. Callow and Callow, architects.

MIDLAND COUNTIES

The KIDDERMINSTER Corporation is to construct a steel roof at the borough retail markets.

NORTH-WESTERN COUNTIES

The LIVERPOOL Corporation is to remodel and enlarge the Rawden Library, Anfield.

The WREXHAM Corporation is to erect 178 houses on the Acton Park estate to the plans of Messrs. Lockwood, Abercrombie and Saxon, architects, of Chester.

NORTHERN COUNTIES

The BRADFORD Education Committee is to inspect sites in the Wapping district for the erection of a nursery school.

Plans passed at SOUTH SHIELDS: Assembly hall and gymnasium, Barnes Road, for Mr. T. Taggart; two houses, Sunderland Road, for Messrs. J. H. Morton and Sons; two flats, Sunderland Road, for Mr. T. B. Carr; seven houses, Sea View Terrace, for Mr. F. Wills; twenty-four houses, Lisle Road, Harton, for Mr. J. H. Woolgar; alterations, "Victoria" Hotel, Harton, for the Newcastle Breweries, Ltd.; alterations, 25, 27, 29 and 31 Denmark Street, for Messrs. W. C. Rippon & Co.; alterations, premises, corner of Berwick Street and Bertram Street, for Mr. F. W. Newby.

Messrs. W. J. Robertson and Sons, Ltd., are to erect sixteen semi-detached villas in Tynedale, Readhead and Lavington Roads, SOUTH SHIELDS.

The managers of the St. Denys' School, YORK, are preparing plans for the provision of handicraft and housecraft rooms at the school.

The YORK Corporation is to erect baths at Marygate, at a cost of £15,000.

Plans passed at YORK: House and business premises, Campleshon Road, for Mr. W. H. Lacy; additions, "Light Horseman" Hotel, Fulford Road, for the Tadcaster Tower Brewery Co., Ltd.; additions, 20 Blake Street, for the Britannic Assurance Co., Ltd.; house, Green Dykes Lane, for Mr. F. Bell; additions, "Kingston" Hotel, Tanner Row, for John Smith's Tadcaster Brewery Co., Ltd.; additions, Argyle Street, for South Bank Working Men's Club; additions, 1 Low Ousegate, for Jay's Furnishing Stores; covered stand, Clarence Street, for York Rugby League Football Club; four cottages, Terry Street, for Mr. C. Walker; additions, 141 Walmgate, for Messrs. Oman, Ltd.; additions, Coney Street, for Messrs. Leak and Thorp, Ltd.; additions, 71 East Parade, for Mr. Robinson; six houses, Huntington Road, for Messrs. Culliford and Tindall; additions "Spotted Cow" Hotel, Barbican Road, for Tadcaster Tower Brewery Co. Ltd.; layout of estate, Middlethorpe Lodge, for Mr. T. Place; two bungalows, Bishopsthorpe, for Mr. C. K. Kirk; two houses, Rawcliffe Lane, for Messrs. Simpson Bros.; two bungalows, Monk Stray, for Mr. A. Hearld.

SCOTLAND

The GLASGOW Corporation is to ascertain what firms are prepared to quote for rebuilding works at Lennox Castle.

The GLASGOW Education Committee is structurally to improve further schools at an estimated cost of £48,000.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

A TRAMWAY SHELTER-KIOSK

ERECTED IN PINK AND GREY CONCRETE AT BRÜNN, CZECHOSLOVAKIA

SEAT, KIOSK, AND FLOWER-DECKED ROOF ABOVE

THE subject of the above photograph and the detail drawings overleaf is a combined kiosk and shelter erected by the Tramways Department of Brünn on a wide V-shaped strip of pavement at the junction of two main routes.

The roof is supported at one end by the kiosk and at the other by a square concrete pillar, around which is a wood seat on a concrete base, and, at a higher level, a showcase for the display of time tables and general information. The kiosk is divided into four parts, the two larger for the sale of chocolates and tobacco, while the smaller ones serve as telephone box and Tramways Department store. The roof slopes away from the edge, and rain-water gets away down the centre of the column and within the walls of the kiosk.

A gay appearance is obtained by the planting of bright flowers in a channel formed on the roof to hold earth. Moreover, the concrete, with the exception of the steps, which are grey, has a pinkish colour; all the woodwork and metal is painted white.

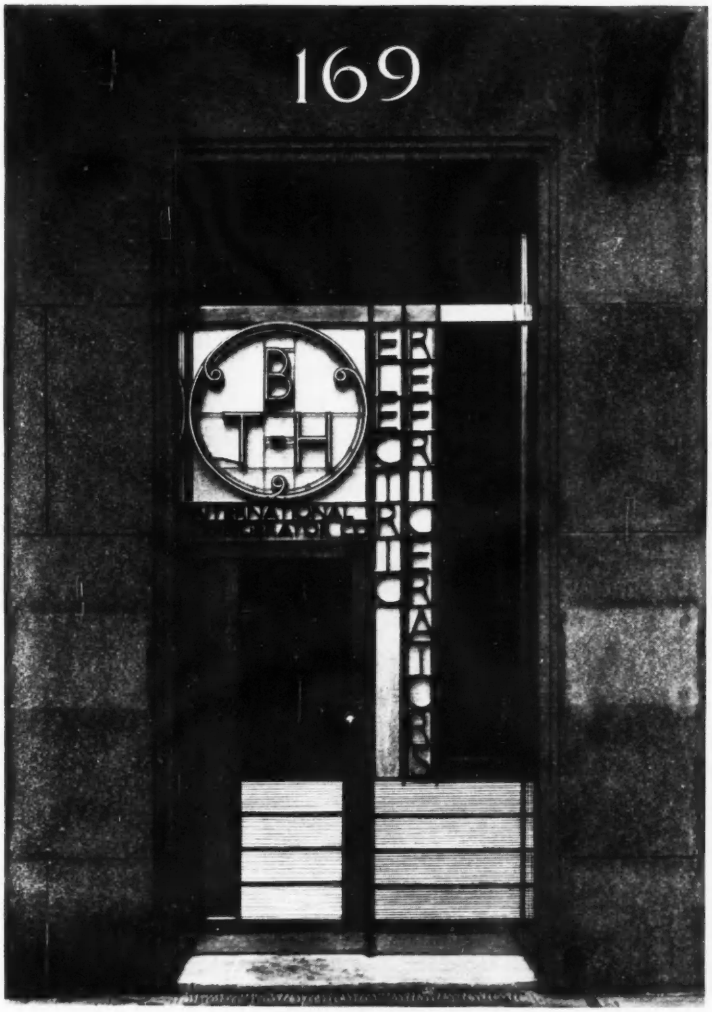
IN BLUE AND GREEN LIGHT

AN ELECTRIC SHOPFRONT IN REGENT STREET, W.



[*Joseph Emberton, Architect*

A DESIGN IN HIGH-TENSION LIGHT-TUBES

THE corner doorway shown above, and by detail drawings on the inner pages of this supplement, is the chief feature of the shop front illustrated as a whole on the last page.

The arrival on the scene of the electric high-tension glass light-tubes, filled with mercury vapour, neon and other gases, which, in the absence of anything that could be dignified by the name of design, too often affront the eye in glaring outlines, has here been turned to architectural advantage. They are made to take an integral part in the composition, the metal letters having been specially designed to accommodate the electrodes and wiring for them. The backing to the letters is executed in mirrored glass, with bright, acid-stippled finish. In some other portions, ribbed glass figures as a decorative element.

The doorway has a surround of granite, and the window frames and other metal parts of the shop front are carried out in stainless steel.

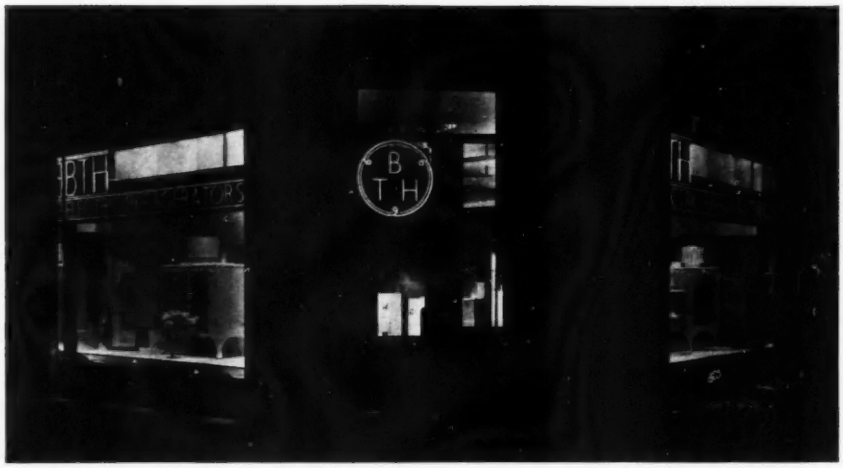
THE SHOPFRONT, BY DAY



[*Joseph Emberton, Architect*

THE SHOPFRONT, BY NIGHT

SELECTED PRECEDENTS:

FLAT ENTRANCES IN GERMANY AND FRANCE

INCREASING standardization of plan in flat buildings has resulted in enrichment being restricted to a few prominent details.

In Germany, where the communal spirit is, if anything, stronger than the family, flat doorways are often enlivened with sculpture, or whimsicalities in stucco and terra-cotta; the doors themselves being usually picked out in gay patterns based on the almost universal glass squint. In France, a country of formality, where the family is a defensive unit against the community, wrought iron, which symbolizes exclusion, is the decorative medium preferred.

The "Plain Jane and No Nonsense" functionalism of figure **1** *— in which the heavy concrete raft separating ground- and first-floor flats is protracted beyond the re-entrant angle of the main elevation to form a rather ponderous canopy—disdains any concession to ornamental graces. Yet the parallel strips of steel-plating and opaque glass make the door itself something of a decorative feature. Figure* **2** *shows stucco modelling round the jambs and lintel characteristic of the larger German housing estates, known as "Siedlungen." Here again the door strikes a fresh note, although the design is a very simple one. Figure* **3**, *a more elaborate composition, combines a somewhat heavy surround of patterned brickwork and the conventionalized floral motifs of the wrought-iron grilles on the side windows with a sculptured figure crowning the keystone bracket over the fanlight. Figures* **4** *and* **5** *are examples taken from Parisian "luxury" flats, where tenants are presumed to be motor-owners. In the former, the doorway for pedestrians is still the central feature, the garage entrance being on the right. In the latter (which has an exit as well as an entrance for cars), pedestrians are relegated to the narrow doors.* P. M. S.

THE ARCHITECTS' JOURNAL

WEDNESDAY, AUGUST 5, 1931

ANOTHER CART BEFORE THE PLANNING HORSE

LAST week the Government's latest Housing Act received the Royal Assent. The Housing (Rural Authorities) Act provides £2,000,000 as a special subsidy for rural housing, in addition to about £8,000,000 to be paid for the same buildings under the Wheatley Act of 1924. It is anticipated that this substantial amount contributed by taxpayers will lead to 40,000 houses being built within the next twelve months in agricultural parishes. But what control will there be? Will a few farmers serving on a Rural District Council tell the local surveyor to produce ugly cottages at the minimum cost?

The Town and Country Planning Bill has been shelved until the autumn, although it provided much-needed powers to control the layout, the design and the materials of all new buildings, including the proposed 40,000 cottages. By all the laws of common sense the Planning Bill should have been passed first, and the Rural Housing Act afterwards. But, exactly as happened last year in the case of the Greenwood Housing Act, so again in 1931 the cart has been placed before the horse. Without a plan, these ten millions will go far to continue the desecration of rural Britain.

The latest Rural Act was not seriously resisted by the Opposition. Only a few economists, such as Mr. Geoffrey Drage, criticize it on the grounds that a total extra capital subsidy of £10,000,000 is a serious burden in these days; that it will probably check the fall in building costs; that it strikes a blow at private enterprise; and that it is, in fact, "a wasteful piece of window-dressing." A safer guide than Mr. Drage on the essentials of the problem is the Report published a few days ago by the Committee on the Rent Restrictions Act. This pointed out that, although new dwellings sufficient to accommodate 6,000,000 persons have been built since the war, and the population has only increased by 2,000,000 since 1919, yet only about one-third of the new accommodation consists of houses to LET. The heart of the problem today is the provision of three-bedroomed houses to be let at a rent of about 10s. in urban districts, and at 4s. 6d. a week, or less if possible, in country districts.

The new Act aims at providing houses in agricultural parishes at low rents. By a new development, on lines proposed by Sir Tudor Walters, the administration of the Act is to be placed in the hands of a Committee, which will press councils to hurry up, will determine the number and kind of houses for which this extra subsidy will be given, the date by which they are to be built, and the rents at which they are to be let. Sir Tudor has agreed to be the Chairman, and among the other members will be Sir J. Walker Smith, representing the Building Trade Employers, and Mr. Richard Coppock, representing the Operatives. Those qualified to express an opinion expect that at least 300 rural councils will jump at the bait of a double subsidy now offered, and that the new legislation will produce a lusty family of new houses. If only more adequate planning powers were now available, the risks of waste and vandalism would be less.

Readers, however, may well wonder whether these new houses will not simply add 40,000 more disfigurements to the countryside. In the Commons, Captain Cazalet asked that a representative of the C.P.R.E. should serve on the Central Committee, so that some regard might be paid to the architectural character of the new houses, but the proposal was abruptly declined by the Government. Accordingly, unless action is taken by voluntary means, we may see many of our beauty spots irretrievably spoilt by the erection of cottages, designed by inept and untrained surveyors, and constructed of Belgian bricks and French tiles, utterly out of harmony with the traditional designs and materials of the district. Politicians find it hard to realize that the haphazard ways of the past must now be set aside, and that considered planning is essential if we are not recklessly to throw away the heritage of the centuries.

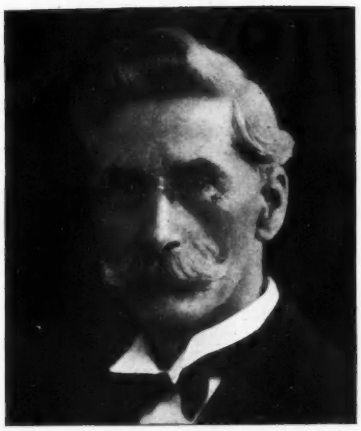
Where local authorities have shown the necessary foresight to set up advisory architectural panels, there is, at any rate, some brake upon the untutored activity of rural surveyors, into whose hands so much of the responsibility for carrying out the new Housing Act will be committed. But panels are few and the dangers of haste are many. It will be uphill work reconciling, during the coming few months, the needs of housing development and of rural preservation.

[*Shreve, Lamb and Harmon, architects.*

THE MAIN ENTRANCE TO THE EMPIRE STATE BUILDING, NEW YORK

This photograph represents the main entrance from Fifth Avenue, New York, to the world's tallest building. The base is of black granite, the remainder of the front of grey limestone. Aluminium is largely used for the metal work; the bands above the windows are, however, of bronze, like some of the divisions of the large lobby window, of which the glass is frosted, to avoid reflections, so that it appears as a dull note in an otherwise glistening composition. A series of articles on the Empire State Building is in progress in *The Architectural Forum*, of New York, from which this picture is taken.

NEWS & TOPICS



Sir Robert Tasker, Chairman of the L.C.C. New Building Act Committee, who has recently returned from America, where he studied the possibilities of skyscrapers for London.

Mr. C. F. A. Voysey, the pioneer of modern architecture, whose work will be exhibited at the Batsford Galleries, commencing on October 2 next. He recently received a Civil pension.

NO CHARING CROSS BRIDGE

DESPITE the delays and the disheartening wastage of money which Charing Cross Bridge has involved, the Government's decision not to finance scheme No. 6 is based undoubtedly on the new conception of the matter which is the outcome of determined opposition. Had the state of the Road Fund been the only reason for non-participation, nothing else would have been said, but in Mr. Morrison's letter to the L.C.C. he clearly states that the prospect of electrification in the near future puts a new complexion on the matter, and that, in short, scheme No. 6 is not a scheme which has a reasonable chance of serving London well.

★

It is rather galling to recall how the low-level scheme, which THE ARCHITECTS' JOURNAL has so consistently advocated, was damned by the Advisory Committee for daring to imagine that electrification might one day be general, even while we may have reason now to congratulate ourselves that the authors of that scheme had principles which they thought too good to leave undefended against the committee's censures. It is an ill wind that blows no one any good. It seems to me now that it should be forgotten that Waterloo Bridge was ever bound up with Charing Cross. The L.C.C. should put in hand the work of widening—not demolition, as Sir Percy Simmons threatens—and London should at once set about the work of making a *real* plan for its centre, a plan based, as that of New York's is, on investigation and research. Into such a plan Charing Cross will be fitted without the possibility of controversy, since controversy can be silenced by well-founded planning.

SKYSCRAPING

Sir Robert Tasker has just returned from America as little disposed as ever to the idea of skyscrapers in London. They took him up to the top of the Empire State Building, and five floors below ground in the Palmer House Hotel in Chicago, and told him the old story of how long skyscrapers last in New York, and so on, but he still thinks that New York is one place and London another. His faith in low buildings as opposed to sudden accretions of densely-packed skyscrapers is founded on, or has, at any rate, a very firm justification in, ascertained fact, and there are few sections of New York business communities that will not admit to having found serious deficiencies in the skyscraper system.

★

The truth of the matter is, of course, that skyscrapers were never prohibited, were, indeed, not looked for. They became possible in time, and as they became possible (and values rose to accommodate the possibility), started a vicious circle which threatens to meet in a strangle-hold of congestion, lack of light and air, and overhead expenses, which the first real downward movement of property values will accelerate most dangerously. One skyscraper gets all the light and air—and the profit from them. Fifty skyscrapers together fight for what light and air is left, and may one day be left fighting for life if no better system supervenes.

★

We have still to discover, I think, whether the varying street widths and the irregular plan of London can even stand the 100 ft. maximum at present enforced. It may well be that investigation will be inclined to a much more rigorous zoning, pending the replanning of central areas, perhaps even helping to direct attention to the areas where planning is most necessary.

AERODROMES OVER RAILWAY STATIONS

The economics of civil aviation will always be bound up with the time factor, measured more narrowly than it has been in the past for any other form of transport. With our cities spread out over vast areas of completely built-up land, it is not fantastic to assume that large railway stations could provide the aerodrome sites otherwise denied, and a scheme by Mr. J. Hembrow, F.R.I.B.A., for converting Victoria and Exchange Stations, Manchester, into a landing and taking-off ground for auto-giro planes must be considered as a reasonable suggestion, for which some demand already exists. The only point I would feel inclined to make is that this suggestion should be regarded as evidence in a really thorough examination of air-transport planning in relation to regional, national and international requirements, and not just as a new way of keeping Manchester in the sun.

THE DEVELOPMENT SCHEMES COMMITTEE

The Committee set up by the Government to see what development schemes might be suggested by an examination of Regional Planning reports has found very little to report. The suggestion, I believe, emanated from the Liberal Party, which has a name for being fairly sound in these matters, though it must have been obvious to town-planners that Regional Reports, except in so far as roads are concerned, do not set out to plan schemes of construction suitable for the employment of much labour, because they are in the first case advisory, and secondly, are guides for future planning more than suggestions for immediate action So *that* Committee sat to small purpose.

AN EXHIBITION OF C. F. A. VOYSEY'S WORK

On October the second, this year, an exhibition of the furniture, fabrics, and architecture of C. F. A. Voysey will be opened under the auspices of Messrs. Batsford's and the Architectural Press, at Batsford's Galleries, 15 North Audley Street, W. The exhibition will last for a fortnight. Mr. Voysey is one of the last architects of the old tradition, and the pioneer of modern architecture. He has always been an idealist who rightly considered that the architect should design not only the house, but the furniture, fabrics and colour schemes within it. This tradition had died out with Soane. While every other architect was busy reviving Gothic and Queen Anne, Voysey alone went beyond revivals and experimented in form. He inspired the student, C. R. Mackintosh, who as an architect was perhaps the greatest influence on modern Continental architecture. Such an exhibition is late recognition of a great leader. Mr. Voysey's designs are not only interesting historically, but their intrinsic merit will be ample evidence of how much good work one man may achieve in many branches of craftsmanship.

THE FUTURE OF LONDON

We are fortunate in possessing in the B.B.C. an institution with a lively sense of its best duties to society. This week's number of *The Listener* contains a supplement designed to awaken public interest to the need for planning. The supplement consists of an article by Dr. Raymond Unwin, on "Planning the Future of London," followed by another by Mr. Thomas Adams, on "Looking Forward Forty Years." Dr. Unwin's article is a graphic analysis of the growth of present-day London, based upon his fine work for the Greater London Regional Plan. Within the space of a few pages he covers the complete gamut of planning, though at some sacrifice of interest.

★

Mr. Thomas Adams, less technical, less comprehensive, perhaps, but more imaginative and understandable, is more likely to stir the interest of the average reader to know more about planning, and to want to have London planned for the future. It is significant that he expects no sweeping changes to alter the face of London in forty years, just as the last forty years have seen more changes of method than of actual scene, but he does indicate many things that will be the subject of discussion in other places. It is to be hoped that the B.B.C. will continue this excellent work of public education, upon the initiation of which they will be congratulated by all who realize its importance to us at this time.

DEATH DUTIES REMITTED ON NATIONAL TRUST PROPERTY

It was announced at the annual meeting of the National Trust recently, that the Trust has at last been successful in its efforts to get immunity from death duties on properties left to it. It was a very ridiculous state of affairs when land left for the enjoyment of the nation had to pay taxes, and we may congratulate the Trust on putting matters on such a sensible new footing.

★

The new land taxes now fill the committee of the Trust with the fear transferred, as it were, from the tax they have just escaped. They feel that the steady pressure of this tax burden will force land on to the market, irrespective of whether it is ready or not for development, and in this process much of what the Trust seeks to save will be lost for ever. On the other hand, the exemptions from tax are going to help the difficult job of zoning land for private open spaces, a denomination that has so far largely existed as a pious fiction. The balance, I fear, is not in favour of preservation.

SOMERSET'S COUNTY OFFICES

It is rather too early to say whether the new County Offices for Somerset are to be at Taunton or Weston-super-Mare, though the central position of the first place, and the fact that opposition to the Taunton site comes mainly from interests that will suffer financially and not administratively from the transfer, might possibly lead to the conclusion that the design which Mr. Vincent Harris has exhibited this year will eventually come to pass.

THE REDEMPTION OF HIGH WYCOMBE

The Royal Society of Arts has given a garden party at West Wycombe, the Buckinghamshire village which the Society has bought and is now carefully preserving. It was in 1929 that the Society took the bold step of buying the village, when it came into the open market. Sir John Dashwood made the purchase possible by agreeing to take only £13,500, and he has since contributed generously. Nevertheless, it was a large undertaking, and £8,500 is needed to pay off mortgages on the property, in addition to funds needed for reconditioning cottages.

★

The reasons why West Wycombe was chosen for preservation are first, that it is a village unspoiled for the moment but threatened by adjacent development; and second, that in and around there still is carried on the ancient but vigorous furniture industry that is dependent for its material upon Chiltern beechwood. The Society's action will have preserved what the Prime Minister has called "a fine picture of English life and history."

HASTINGS—

Astragal sometimes makes mistakes, and my recent references to alleged ineptitudes of Hastings Borough Council were founded upon a report which has proved to have been groundless. I apologise, therefore, for such reproving remarks as the occasion had seemed to warrant, and am only too glad to know that the only Pavilion that could have been referred to was that designed by Mr. Cowles Voysey.

—AND MORECAMBE

A week or two ago I breathed a pious hope that out of much worthless and dull architecture in Morecambe the one really charming building on the sea-front, the old L.M.S. Hotel, could be saved or used as a model for a new hotel instead of being pulled down. It seems from the articles and leading articles of local and north of England papers that I have been charged with a senseless attack upon Morecambe because I found the town very dull, and this old hotel charming. Among other things, I am charged with not having seen the town, of writing lightly from a casual visit, and so on. I am also accused by the Editor of the local newspaper of having no judgment in matters architectural, since I have failed to remark the beauty of the "Town's Newspaper Office." This is very distressing, because I write from a personal knowledge of the place, and can recall most vividly the thrill of finding that nice old building on the sea-front looking so much a gentleman out of his element. I know also that there are those in Morecambe that are very much of my opinion. The pity is that such people have little say in the disposition of things architectural.

ASTRAGAL

THE NEW WHITGIFT GRAMMAR SCHOOL

Haling Park, South Croydon

DESIGNED BY LEATHART AND GRANGER

The main entrance from the terrace to the assembly hall, which occupies a central position in the eastern façade. There is a similar secondary entrance at the south-easterly corner of the hall.

LIKE so many schools, Whitgift began life as a charitable organization. The original building, which accommodated "a warden, a schoolmaster, and twenty-eight poor brethren" was founded in 1599 by Archbishop Whitgift (b. 1530, d. 1603), and was known as the Hospital of the Holy Trinity: it stands to this day in Croydon on the corner of George Street and High Street.

The grammar school that is now superseded was opened in 1871, and was built from the designs of Arthur Blomfield.

Haling Park, the site of the new school, has historic associations. In 1456 Thomas Warham owned a manor-house at Haling. His son sold the estate to Henry VII in 1536 for £710. Queen Mary granted the manor of Haling to Sir John Gage at an annual rental of £15. The eldest son of Sir John Gage was subsequently committed to the Tower for conspiracy against the Crown in 1590, and the estate was forfeited.

Queen Elizabeth let it to Howard, Earl of Effingham, Lord High Admiral of the English fleet which defeated the Armada. Lord Effingham died at Haling in 1624. His association with the site is commemorated by a great bronze weather-vane on the turret, in the form of a sixteenth-century English galleon.

This view of the main east front, taken from the cricket field, shows the steps and terrace walls that are part of a scheme intended eventually to provide a ceremonial approach to the buildings from the Brighton Road.

The building of the new school was commenced in January, 1930. It is planned on the quadrangular principle, and accommodation has been provided for 750 boys. The great hall, with its stage and gallery, forms the east side of the main quad. Around the remaining sides are grouped the class-room blocks and the library. On the north and south ends of the hall are the main entrances, and adjacent to these are the boys' entrances, changing rooms and lavatories.

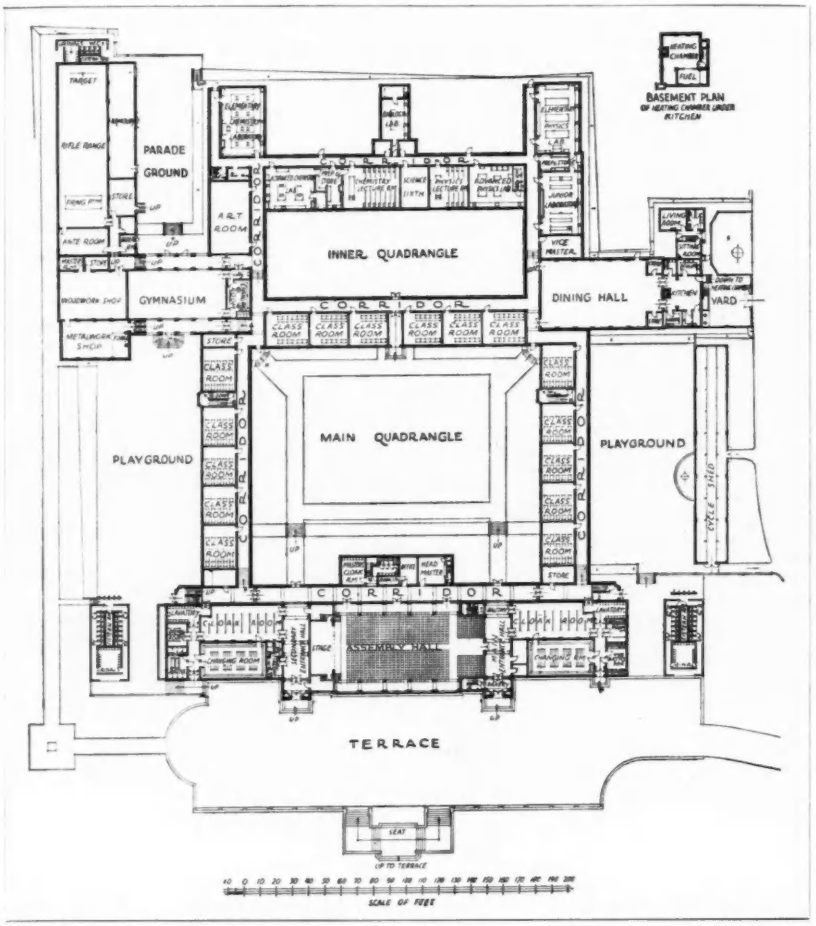
Behind is an inner court, lighting the laboratories and lecture theatres of the science section of the school.

On the north side, between the two quadrangles, are the dining-hall, kitchen and service, and caretaker's house. On the south side the gymnasium and manual training departments occupy a corresponding position. The O.T.C. department on the west of the gymnasium block includes a 75-yard miniature rifle range, armoury, serjeant-major's office, and a store, in addition to a parade ground.

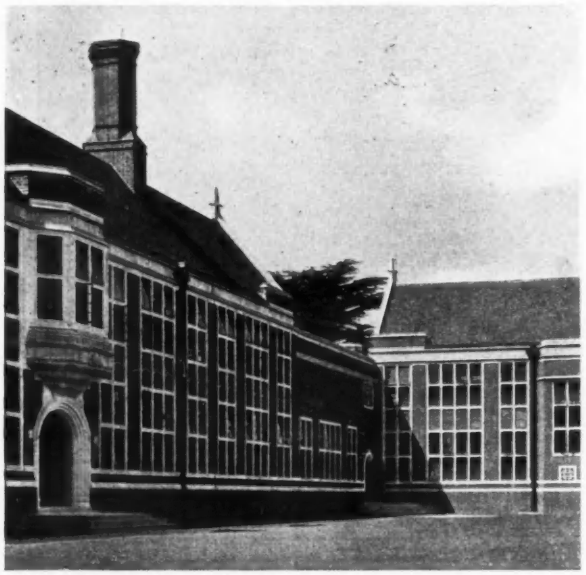
The entrance to the school at present is from a side road, and the entrance gates are flanked by a porter's lodge and a cricket pavilion. Eventually the ceremonial approach will be from the main Brighton road.

At the request of the Governors of the school, the architects have designed the building to accord with the Elizabethan associations of the Whitgift Foundation.

Red brick walls, Bath stone dressings, tile roofs, with oak joinery and flooring, are the main materials employed in the building, the cost of which, on completion, will be about £120,000.

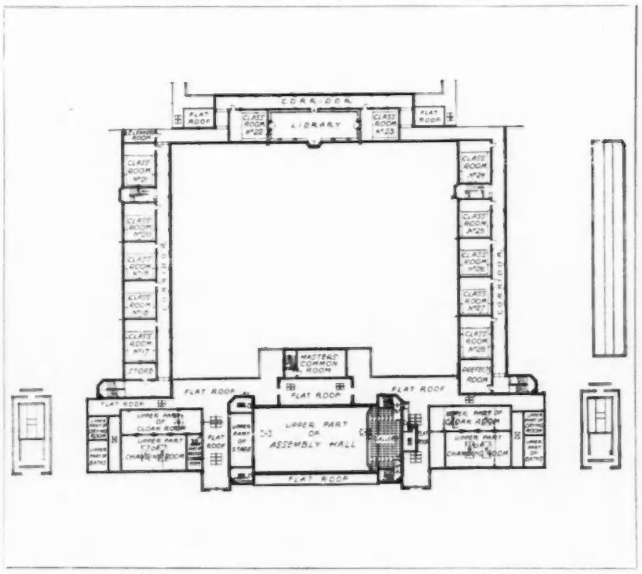


The ground plans, showing also the layout of the terrace and the playgrounds which flank the main part of the building, planned to enclose a quadrangle. The front, facing the terrace, looks east.

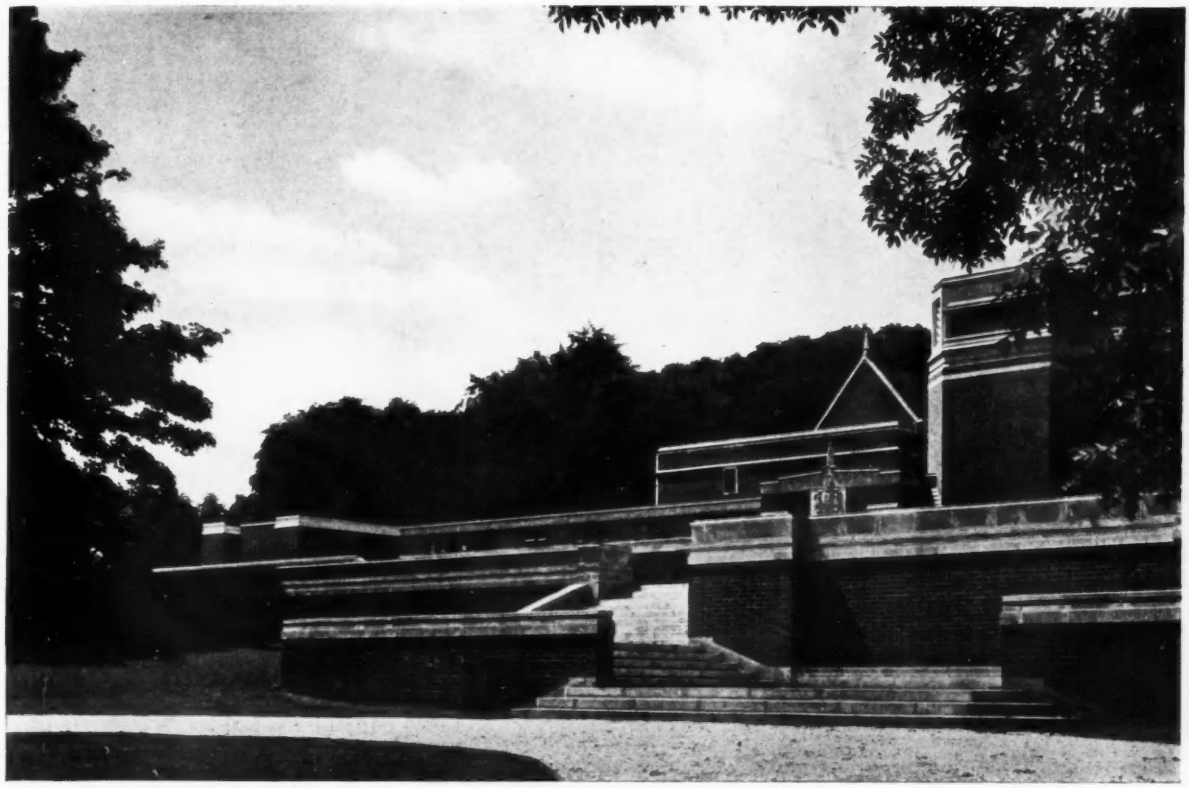


Whitgift Grammar School, Croydon.]

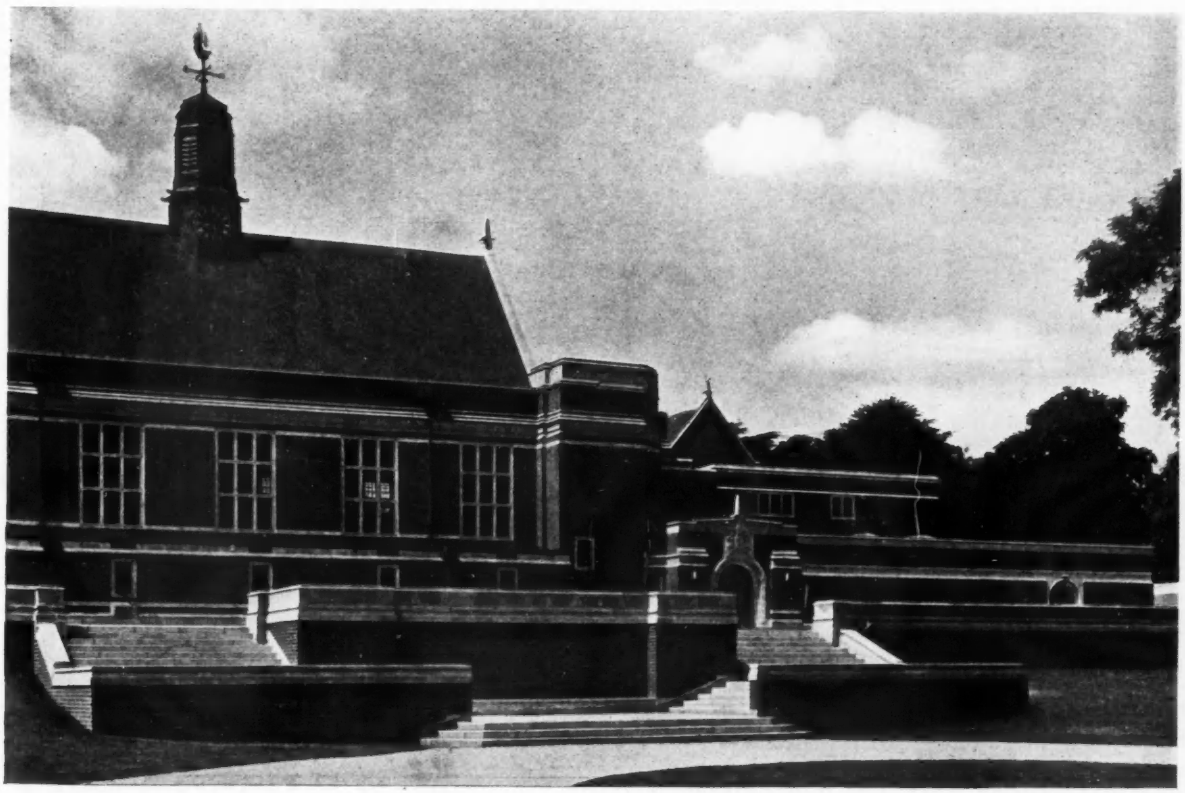
A view in the main quadrangle, showing the junction of the north and west classroom wings. The library is marked by the first-floor bay window seen on the left.



The first floor of the central building. The assembly hall extends into the first story, and opposite to it, on the other side of the quadrangle, is the library; classrooms are arranged in either wing.



The end of the south classroom block, with the south changing rooms, seen from below the lower terrace. The buildings occupy and enclose 3½ acres of a 33-acre site.



[*By Leathart and Granger.*

The assembly hall from the lower terrace, showing the main entrance and staircase tower to the public gallery, with beyond, on the right, the end of the north classroom wing.

[*By Leathart and Granger.*

The interior of the assembly hall, from the public gallery, looking towards the stage. The designs show, in general, a modern expression of the Elizabethan flavour.

Whitgift Grammar School, Croydon.]

A view looking across the southerly playground, and showing, on the right, the south classroom wing, with the gymnasium arcade in the distance.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xi

THE RESIDENT ARCHITECT

BY KARSHISH

(H. B. CRESWELL)

GARSTON and I did not have to wait long for the fruition of Hargreaves' introduction. We were, at this time, bound in that unreserved intimacy of friendship which only youth allows so that Garston's interest in the opening of this new door was almost as great as mine was. The inward solitude which sunders human beings, as though—in the words of R. L. Stevenson—they were "islands shouting to one another across seas of misunderstanding," belongs to later years. Four days after my meeting with Hargreaves, I received the following letter:

THE EUREKA PLOUGH CO., LTD.
Albion Works,
Nollingborough.
Date .. February 14th, 1899.

Mr. Barnard Whistlom,
14, Charles Street,
Adelphi,
London.

Dear Sir,

re ARCHITECT.

We are desirous of filling the appointment for the situation of Resident Architect in connection with alterations and additions to above, and understand from Mr. L. P. Hargreaves, of Messrs. Brandon, Hargreaves and Stook, Consulting Engineers, that you are open to apply for same.

Our Chairman and Managing Director, Mr. Steffinson Stevenson, J.P., will be in Nollingborough Wednesday and Thursday next, and Tuesday week following, and we will thank you to inform us the earliest you can attend at these offices for the purpose of discussing the business, and which we trust will suit your convenience so that same will not be delayed.

The favour of your earliest reply is solicited.

We are, dear Sir,
Yours faithfully,
for THE EUREKA PLOUGH CO., LTD.,
p.p. H. T. FOULKES,
Secretary.

This letter dashed expectations, but fortified hopes. It is true Garston jeered at the diction, pointing out that alterations and additions to an architect were required, that I was asked not to delay my convenience and that not the following Tuesday but Tuesday in the week after it was named; but I felt much flattered by the value the firm appeared to attach to my services. Garston, who was a powerful thumb-and-fore-finger typist—for he always grasped at new devices—stumped out a reply on our jointly-headed letter-paper. I named Thursday so as to avoid the ambiguity of Tuesday, and also any appearance of breathless eagerness in my response; and I overbore Garston in his proposal to sign for me "per sec." At ten minutes to eleven on the appointed day I found myself walking from Nollingborough station through the central "Cow Street" of a queer diminutive town; past its little, new, abject clock-tower, boasting itself in the Market Place with a bell like the clang of a crow-bar, making my way to "Winchcombe" in the Luffport Road—the private residence of Mr. Steffinson Stevenson, J.P.—as instructed by telegram the day before.

"Winchcombe" proved to be an enormous, showy villa, standing in the country at the limits of a residential quarter. The house had evidently been accidentally dropped, forty years before, from a passing balloon; and, by great good luck, had landed in a large garden of the "landscape" class, where assorted evergreens had been planted out by birds and squirrels in those places where, in the past, chance had disturbed them at their meals. This fortunate circumstance disarmed astonishment at the lack of any relation between the house and the grounds, for no other position could be either better or worse. The scene, therefore, left nothing to be desired and nothing to be regretted, and (philosophic) perfection was, accordingly, satisfied.

I passed up the entrance drive between a pair of monkey-puzzle trees of unequal growth—like a father attended by his crippled son—to the front door, which was opened by a large flabby butler, suffering from advanced diabetes, who wore a black tie and full evening dress marked with food-stains.

By him I was invited into an entrance hall inadequately lighted, partly by a skylight high up over the stair-well, and partly by a window blocked with a shrubbery. Here—while the invalid went heavily off to find out what he was to do with me—I was left standing on a Turkey carpet in company with a thickly-carved mahogany grandfather clock with a glass front to display its brass weights, and a smell of hot apple tart.

I believe myself to be unusually sensitive to small towns, villages and houses; they have for me the instant appeal of individualities, and nothing in the world gives me a more insatiable joy than experiencing the beauty of them, or a happier preoccupation than allowing my mind to take colour from their expressiveness. The whole atmosphere and significance of Nollingborough and "Winchcombe," at that time, was entirely new to me, and the occasion has stamped my first impressions in my memory. I was engaged by a queer kind of amused wonder which touched on contempt; and this was in great measure sustained when I was ushered into the ominous presence of Mr. Steffinson Stevenson; for I had never met his kind before, and he exactly fitted his pinchbeck setting. I found him in a large room, surrounded by glazed mahogany bookcases in which handsomely-bound files of *The Illustrated London News* were prominent; and he stood up behind his heavily-carved pedestal table of pollard walnut, to receive me.

He was a tall, well-set-up man of forty-five, with luxuriant, wavy, chestnut hair and a long stiff beard of which I tasted the full magnificence when he thrust it forward in throwing back his head to look at me under his spectacles. This action had the added convenience of allowing him to scratch himself behind the chin with the tips of his fingers, which he held straight and rigid, knuckles outwards, hingeing at the elbow, for the purpose. The ritual did not, as I was to learn, merely accomplish an act of refreshment; it served also as a gesture signifying contentment of soul, so that I ought to have been greatly encouraged, instead of mildly amazed, when he deliberately indulged this solace of the toilet with audible thoroughness in my face. I got to know him so well and esteem him so highly—although he greatly tormented me—that it is curious now to recall the moment of our first contact.

Mr. Stevenson ended his chin-congratulations and his scrutiny of me with a short cough; invited me to a chair placed conveniently for visitors; seated himself; and referring to papers lying before him, began:

"Ahem—I understand you have completed your apprenticeship, Mr. Whistlom?"

I told him what experience I had had, and added: "My name is Whistlow, sir; and Bernard, not *Bar*nard. I think Mr. Hargreaves' writing could not have been clear."

"I see—ahem. Yes," he said, making a note. "Ahem, I will now invite your attention, Mr. Whistlow, while I commence with a brief resume of the proposition."

He then told me that his firm had three years before built the Albion Works at Nollingborough, whence they had removed from Ipswich. He

and his co-directors had "become tired" of their Nollingborough architect and wished to have someone in their employ to look after the maintenance of the existing works and direct the numerous alterations and additions immediately needed to enable them to cope with orders for their "Rockingham Reapbinder."

"You were not perhaps aware, Mr. Whistlow," he said, "that we are the manufacturers of the celebrated 'Rockingham.'"

"I don't think I ever heard of it before, sir."

"You astonish me! Surely you have observed our world-famous poster—the picture of Mont Blanc with the words: "The Rockingham is supreme among Reapbinders as Mont Blanc among Swiss Mountains?"

"French."

"I beg your pardon?"

"Mont Blanc is in France, sir, not Switzerland," I said.

He stared at me. "I would desire you to know, Mr. Whistlow," he said, "that we have used that advertisement for a great number of years and never heard one word of complaint."

"Really! But as a fact, sir, Mont Blanc is, I assure you, in France."

"Ahem. Possibly—as a technical refinement, no doubt, that may perhaps be said," Mr. Stevenson decided; and he resumed his description of his Works which were evidently very fine ones indeed.

Will it be believed that two minutes later I put him right again! I was, I suppose, strung up to give a good account of myself, and my lingering callowness and native tenacity led me to this folly. He spoke of an occasion "At Hyde Park Corner—opposite the Marble Arch," and I at once said:

"You are thinking of the Collonade, perhaps, sir."

"Mr. Whistlow, I will thank you to allow me to asseverate that I am *not* thinking of *any* Collonade."

"Oh! Perhaps, then, the arch at the top of Constitution Hill, sir."

"I am doing nothing of the sort. I am speaking of the MARBLE ARCH."

"Then you do not mean Hyde Park Corner, sir. The Marble Arch is at the west end of Oxford Street."

He stared at me in blank amazement, and then, abruptly and with an air of retribution, brought a great atlas from a bookcase and turned to a map of London in an early page of it to settle my miserable hash; but poke his heavy nose, as he did, ever so closely down to it, he could find no consolation.

"Ahem—er—you are perfectly correct, Mr. Whistlow; and I am astonished how I obtained such an inaccurate impression; but—ahem—I am not very frequently in that district of the Metropolis."

If the map could have shown me to be wrong, I should never have settled at Nollingborough. I was afterwards told by those who knew him, that Mr. Stevenson was probably enormously impressed at my not appearing to want what he had to offer—as will appear; but it was undoubtedly the idea of my firmness and self-confidence which my gaucheries gave him, that led him to offer me the appointment. I record the interlude because, if I did not do so, what follows would be inexplicable. The thing befell exactly, and almost word for word, as I will now recite; for my memory of the scene has always been a vivid one, and nothing but the fact can persuade credulity. I can only comment that things happen in life which would do violence to our sense of what is admissible in fiction.

After Mr. Stevenson had pushed aside the atlas, he gave me a precise account of what the duties and conditions of service were to be; and he then opened a quarto manifolding book and prepared to write.

"I take it, Mr. Whistlow, that you have a thorough acquaintance with constructional steelwork," he first said.

"Well, sir," I replied. "I am afraid my experience is limited to its general uses. I have no knowledge of the stanchions with the overhead traveller girders you speak of." In saying even so much as this, I did myself full justice.

He wrote, and then addressed me again.

"You, of course, thoroughly understand quantities, Mr. Whistlow?"

"No, sir; in London quantity-surveying is a separate profession," I told him, and added, with a sincerity that was evidence of complete ignorance—had my questioner but known: "I could, however, no doubt acquire the necessary knowledge."

Again he wrote, and then asked me his third and last question:

"You have, I understand, had experience of commercial building."

"No, I'm afraid not, sir," I said, frankly; and then, with the last flame of hope extinguished, added: "It is almost the only class of building I know nothing about."

Mr. Stevenson continued writing industriously for some minutes after this. Then he looked up in the middle of a sentence, with his pencil poised, and said:

"I have assumed that you desire to make application for appointment to the situation, Mr. Whistlow."

I was so much taken by surprise at this that I hesitated, while my mind span in an effort to realize what I was committing myself to.

"——Subject, of course, to you finding everything at our Albion Works to your satisfaction," Mr. Stevenson added hastily.

"Yes. Oh, yes. Subject to *that*, certainly," I blurted, perceiving the door would remain open to retreat.

Thus this astonishing interview ended. Mr. Stevenson finished his letter; tore the sheet from the book; addressed an envelope and gave me *The Times* to look at while his carriage was being got ready. He then accompanied me to the entrance hall—where the apple tart was triumphantly drawing more near, like a drum-and-fife band; asked me to hand his letter to Mr. Foulkes, the secretary; explained that there was a mid-monthly board meeting that day which he was not going to attend as he had taken a slight chill; said good-bye, and gave me a protracted chin-salutation from his threshold as I drove away.

I was taken back through the town and down a hill to iron gates blazoned ALBION, which stood a hundred yards in front of the offices of the Eureka Plough Coy., Ltd. This was a formidable red brick building, sparsely trimmed with Mansfield stone skewbacks to the flat window arches, and saddles to the gables, and in other tasteful ways. The many gables were further enriched with an outbreak of blue and red Ruabon fireplace tiles, arranged chequerwise and each embossed with a *fleur-de-lys*; while the central entrance was marked by a Romanesque arch of noble proportions carrying a fourteenth-century moulding and label and supported on semi-detached columns with caps left boasted—the whole, in fine large blocks of Mansfield, built on to the face of the wall as a decorative feature to mark the square-headed, panelled and stop-chamfered, varnished, pitch-pine double doors;—the whole so varied and handsome that my effort to describe it in one sentence makes me breathless. I supposed that I was looking at some sort of architecture; but the only association in my mind was the picture on the bags containing Tidd's chicken feed, familiar to me in childhood. This, however, was the building that had made the voice of the company's chairman thrill when he described it to me, and my swelling enthusiasm for commercial architecture was checked.

At the door I was met by an ex-sergeant of the Dragoon Guards in a toffee-coloured tunic and two medals. His name was Bates, and he took my letter and my name to Mr. Foulkes, and after a few minutes a little, fair, bird-like man came down to greet me. By him I was conducted upstairs, and after exploring silent and deserted upper corridors—for the hour was that known in provincial commercial life as

"dinner"—I was introduced to Mr. Peterson and Mr. Gregory Hart in the directors' lavatory, where they—so to speak—belonged, for these were two of his co-directors referred to by Mr. Stevenson.

I was first invited by these gentlemen to lunch with them in the directors' dining-room, where we were served by Bates with leg of mutton and two veg., pud., cheese-and-butt. and three coffs. The food was excellent, and my companions agreeable. Peterson was a landed gentleman of considerable estates in another county, and was a director by virtue of his large holding in the company and without any other sort of qualifications whatever, for he was no more than a large, inquisitive, petulant child. Hart was a very different man—a mechanical engineer of high attainments who was a well-known consultant in Victoria Street, Westminster. Not a word of any business was spoken, and I was made completely at my ease—a circumstance that owed not a little to Peterson's asking: "Are you any relation to Captain Whistlow, the Newmarket trainer?" When I replied that he was my father's first cousin, Peterson turned to Hart and broke out in a tone of astonished admiration that was almost half-witted:

"Why, Walter Whistlow has trained my brother's horses for twenty years!"

His amazement at this coincidence was absurd: he stared at me and then at Hart, by turns, and seemed almost scared.

Hart said: "Well, we most of us have cousins, you know, Peterson!"

Punctually, at two o'clock, Hart got up. "You had better have a look round the works, Mr. Whistlow," he said; and I went out with them into an entirely new world. Of that world I shall have occasion to speak later.

When, in an hour's time, we returned to the offices, Hart told me that a board-meeting was about to be held, and that I should be called before it shortly; and I was then turned into a luxuriously furnished private office by Foulkes to await the event. Ten minutes later an inner door was opened, and he reappeared and asked me to "be so good as to step this way, Mr. Whistlow"; and I passed into a much larger room, with a cloth-covered table down the middle of it, where the board of the company's directors was assembled to the number of two: Hart was in the chair, and Peterson at the side of the table next to him. The atmosphere was, however, entirely different from that of our luncheon party.

I perceived at once that they had decided to appoint me. A few formal questions were asked by Hart, and some trivial and rather foolish ones by Peterson. I felt a mistake was being made and, almost in protest, I said: "Really, I could not undertake the kind of steel construction I have seen today."

"That will be all right, Mr. Whistlow," said Hart, brushing my objection aside. "We are all engineers here, and will see you through." So was it settled; but after various subsidiary matters had been agreed and I found myself walking to the gates between beds of geraniums which showed off the piles of broken packing cases that covered the place, I wondered, with some uneasiness, whether I had been wise in engaging myself; and although my doubts were well justified—for both the town and the works were antipathetic to me, and both seemed remote from associations of architecture—those doubts would probably have been far less pressing had my success proved more difficult. If Mr. Stevenson was impressed by my not appearing to want what he had to give, I, on my part, was suspicious of his readiness to give what I hesitated to accept.

It is well we cannot know what lies ahead of us; for if that day I had been able to foresee the frustration, discouragement and spiritual enervation that the future held in store for me, I might well have turned tail and quitted the place: yet what, I wonder, would have happened to me if I had done so? I might never have got fairly on to my own legs as an architect at all, for I can see, now, that it was necessary for me to take deep draughts of gruel before I truly found myself; and it was gruel, thick and slab, I got at Nollingborough, and plenty of it. Whether for good or for evil, my move to Nollingborough was the crucial event of my life, and it is for this reason that I have recited the circumstances of it in such detail.

NEXT WEEK—XII: AN ARCHITECT'S EARLY GRUEL

The previous instalments appeared as follows:

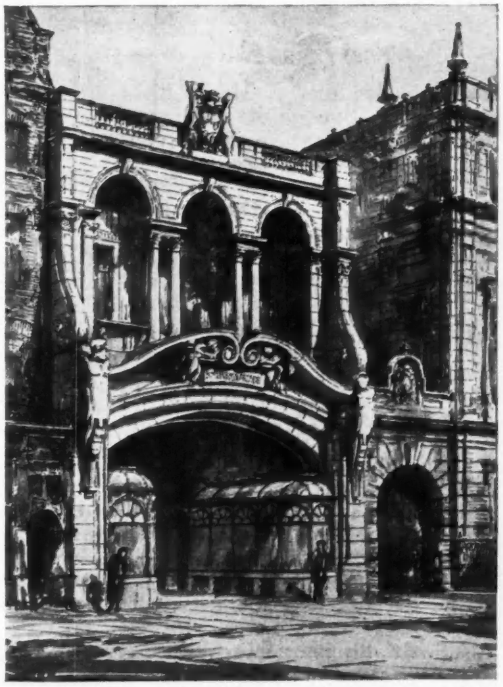
May 27. i: I am Articled.
June 3. ii: Episodes of Pupilage.
June 10. iii: Episodes of Growth.
June 17. iv: My First Job: The Sewer.
June 24. v: My First Job: The "Pipes."
July 1. vi: I Turn Clerk of Works.
July 8. vii: Bradshaw & Son: Builders.
July 15. viii: Joe Richards: Foreman.
July 22. ix: Trials of a Clerk of Works.
July 29. x: A New Venture.

LETTERS FROM READERS

Burlington Arcade

SIR,—Professor Beresford Pite's design for a new lower story to the Piccadilly entrance to the Burlington Arcade is, surely, a valuable contribution to West End architecture. Viewing the composition without stylistic prejudice it is an amazingly ingenious solution of a very difficult problem.

It is evident that the architect was presented with the very reasonable demand for the maximum unobstructed entrance space to the Arcade; and it would evidently be desirable to effect this without modifying to any great extent the upper story. To support satisfactorily a triple arcade on a single arch is a matter of the utmost difficulty, but the double arch which has been introduced satisfies the eye completely from a structural point of view, whilst the softer lines of the broken pediment above serve to make a harmonious transition between the vigour of the lower arch and the delicacy of the upper arcade. The adjustment of planes in order to give all portions of the design their due emphasis, is managed with all the subtlety of the fully-developed baroque. The whole composition is closely studied in relation to its neighbours, so that the low archway of Burlington House slips into place as a harmonious connecting link. The ingenuity of the omission of the orthodox central motif between the scrolls of the broken pediment, in order to avoid a feature competitive with



A sketch of the new Piccadilly front of Burlington Arcade, designed by Professor Beresford Pite and Partners.

the achievement of arms in the upper story, should surely delight anyone who can appreciate the finer points of composition.

The placing of the sculpture might serve as a model for the placing of the human figure in relation to architectural forms. The figures by their mass fit into the composition of the whole, but they seem, in addition, to be themselves aware of the intention of the composition and to direct their glances where the spectators' eyes will naturally follow them.

If the design is technically of exceptional accomplishment, it is something more. The sentiment which pervades it shows keen appreciation of the peculiar character of Piccadilly. It is perhaps not too fanciful to observe in all the detail a suggestion of gentlemen's haberdashery; something of the ornamental but substantial; a nice appreciation of the lighter side of respectability, producing an association of ideas in sympathy with the kind of trade for which the Arcade has become famous. The terminal figures, if not very distinguished, regarded as pure sculpture, should be sympathetic to the older and gayer members of clubland.

Modernists will regret that the design is not in what they hope to be the main stream of architectural development, but a work which combines the quality, so rare in modern architecture, of vitality with the even rarer quality of humour, rises above purely temporary considerations of style and should be judged on its own merits.

H. LEWIS CURTIS

The I.A.A.S.

SIR,—I notice that a Mr. William Davidson asks, through the medium of your JOURNAL, some questions concerning the I.A.A.S. (see issue for July 22). Is there an ulterior motive?

However, perhaps Mr. Davidson is a virtuous young architect seeking information and endeavouring to uphold the dignity of the profession we serve.

A builder who has a sympathetic instinct for design, which is developed and encouraged by good architectural tuition, is perfectly at liberty to give up the trowel for the pencil, and I consider that such a man makes a far better architect than the academic architect.

If Mr. Davidson chooses to borrow the *I.A.A.S. Year Book* and study it, he will no doubt find a great number of names of men who have, at least, had a fair architectural education. It is a pity that he did not take the trouble to have applied to the secretary of the I.A.A.S. for his information, since it might have saved him an admission of apparent ignorance.

For Mr. Davidson's information the I.A.A.S. has two sections, one for architects and the other for surveyors. It often happens that a *bona-fide* and qualified surveyor combines estate agency with his business, which surely is not a crime! And I have also heard of borough engineers, etc., having the audacity to call themselves surveyors. I was recently told of a case of a gentleman holding a senior architectural degree practising as a rating surveyor, and I personally know of another of like degree who runs a separate firm of house and estate agents, under his name and that of a partner.

In conclusion, if Mr. Davidson is a man of riper years and desires to join the I.A.A.S. on practice qualifications, he should apply, and if his credentials pass the standard set by the Council of that Association, he would be privileged to belong to a virile and progressive architectural body, which watches the just interests of young and older architects alike. WILLIAM HORSMAN

Architects (Registration) Act

SIR,—The Council of the R.I.B.A. have received with the deepest satisfaction the news of the passing of the Architects (Registration) Act, which has been one of the main objects of their policy for many years past. They know how greatly they are indebted to the architectural journals which have given their support to the campaign for so many years. Their help has been invaluable at every stage in forming and steadying opinion within the profession, in giving convincing expression to the underlying principles which have inspired the campaign, and in dealing, where necessity arose, with the objections of the opponents of the Bill. Without this steady and disinterested support, it is very doubtful whether the Bill could ever have reached the Statute Book.

The Council have directed me to send to you personally, and to THE ARCHITECTS' JOURNAL, a very cordial expression of their gratitude.

They are confident that, in years to come, it will be universally recognized that the passing of the Act has been a real service to the community, as well as to the architectural profession.

IAN MACALISTER
(SECRETARY, R.I.B.A.)

QUESTIONS THAT ARISE

Plastered Walls

H. J. E. writes: "*I have recently experienced trouble with plasterwork to brick walls in some building work which has come under my supervision. Portions of the walls, when tapped, give out a hollow sound and in places have become detached from the wall. I was quite satisfied with the materials used, and I approved these. The mixture was one of lime and putty to three of sand for the floating coat, and plenty of hair was added. I have noticed a number of houses in course of erection in the locality where the floating coat is badly cracked. Would this be caused by poor materials?*"

The cause of the failure of the rendering to the plastered brick walls is not necessarily the use of poor material. It may be found that the bricks are too smooth, and in that case the joints should be well raked out. A brick with a smooth face will not absorb sufficient moisture and will not allow the plaster to adhere, causing the work to dry too quickly and crack or fall away.

Another point which is frequently overlooked is that the brickwork is not wetted prior to rendering. It is essential, to obtain a good job, that the walling is properly prepared. It is surprising the number of workmen who avoid the use of water to wet the brickwork when engaged in building brick walls. W. A. D.

Canadian Timbers

F. J. L. writes: "*I find the names of Canadian woods very confusing. One reads about Douglas fir as an excellent Empire wood, but in Canadian papers I come across such timbers as Alaska pine, Prince Albert fir, Douglas spruce, Oregon pine, hemlock spruce and a wood called Norway pine.*

Are these woods confined to Canadian use only?"

The bewilderment of your correspondent is very natural and is shared by many. Most of the names quoted are in reality different descriptions of the same wood.

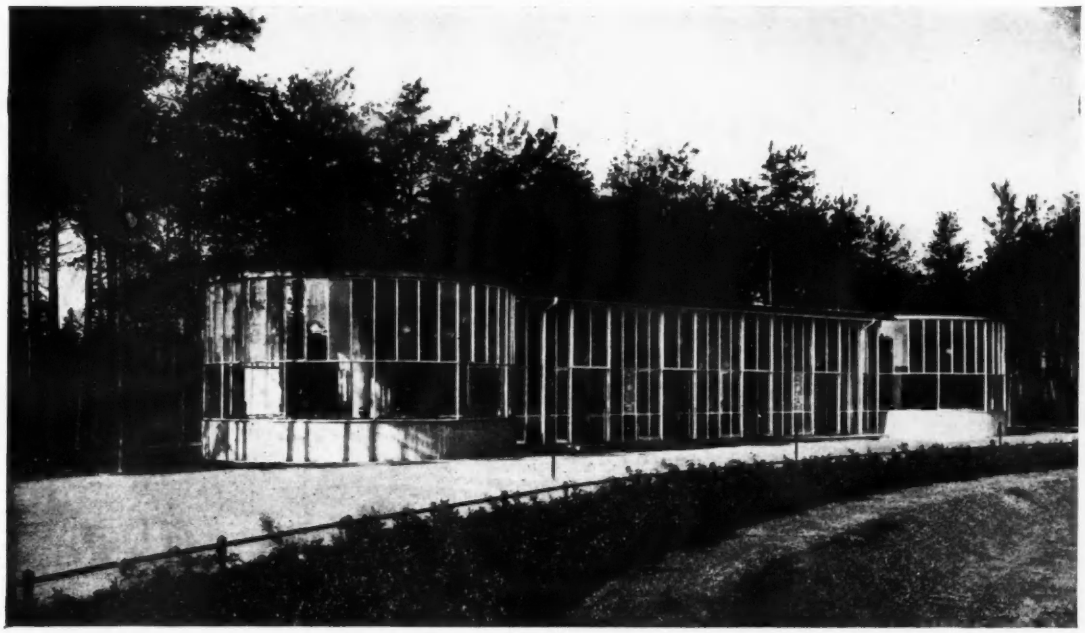
Douglas fir is also called Red fir, British Columbian fir, Douglas spruce, and Oregon pine. As the wood is not a true fir it was in the early days exported as a pine or a spruce, but now it is so well known, the term Douglas fir ought to be standardized.

Eastern hemlock is also known as hemlock spruce and hemlock fir. Western hemlock goes by the name of Prince Albert fir, grey fir, Alaska pine and silver fir. Perhaps the most confusing term is Norway pine to describe Canadian red pine.

At present, in this country, there is a deplorable vagueness in specifying, some woods being described as from their place of origin, and others in accordance with species. LL. E. W.

A GLASS-CONCRETE STADIUM CAFÉ IN GERMANY

DESIGNED BY O. E. SCHWEIZER



The whole of the front of the café is formed of glass screens, the two circular ends being entirely enclosed. For rigidity, reliance is placed on the substantial back wall.

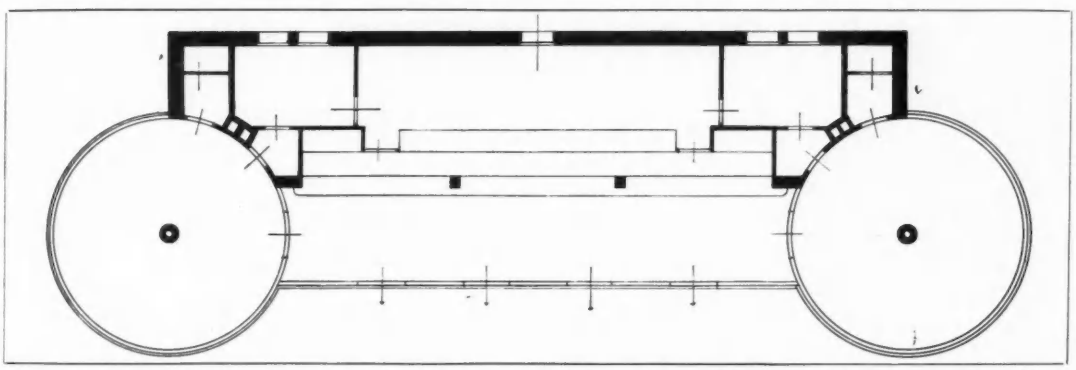
THIS is the second of two cafés, designed by O. E. Schweizer, to be erected in the grounds of the Nüremberg Stadium, Germany. It is situated at the head of the horse-shoe-shaped garden enclosure, and adjoins the back of the grand stand.

Schweizer has contrived, by his skilful placing of this little building, to give the grand-stand area a more defined and spacious compactness, and at the same time, by means of the delicacy and cheerful lightness of a glass building, to create an offset to the severe back elevation of the grand-stand itself.

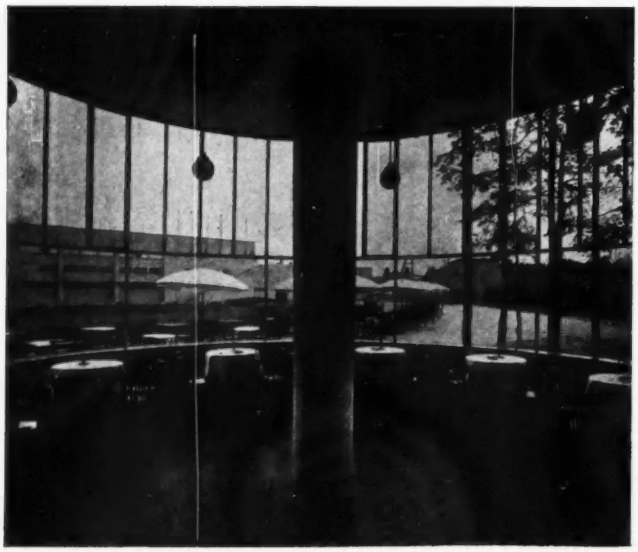
The attractive layout of a buffet linking up two circular lounges arises from the necessity of combining a large buffet space, that makes feasible the convenient service of numerous visitors, for the most part circulating in the open air, with a certain amount of space under cover and enclosed. The desire to make these two circular rooms also available as spectators' rooms, like the garden service with the free space of the buffet, dictated the construction of the entire front in glass screens, which are supported by the concrete roof.

The circular rooms are constructed separately from the buffet building. They represent shelters of concrete construction, with central pillars supporting the circular roofs. A slight slope of these roofs towards the central post allows of rainwater draining away down the hollow pillars. The building retains rigidity from the massively-built back wall of the buffet, which contains, in an ingenious plan, also lavatories and two separate rooms for kitchen and store.

The charm of the elevations is enhanced by the impalpability and transparency of the glass construction. An unusual impression arises if, in perambulating in the grand-stand enclosure, the round glass kiosks are seen in front of the grand stand. The great severe building contrasts well with the glass architecture, which owes its individual and fanciful character to architectonic unity : to wit, the application and blending of the architectonic elements of today.



The ground plan, showing the two circular kiosks, connected by a large buffet space. The planning also affords lavatories, and a kitchen and store-room.



Stadium Café, Nüremberg.]

A view from inside one of the circular lounges, looking across the grand-stand enclosure towards the stand itself, which was designed by the same architect.

[*By O. E. Schweizer.*

A progress photograph, looking the length of the buffet space, showing some of the constructive details in concrete.

HOLIDAY SKETCH CLUB COMPETITIONS: RULES

1. Two more competitions are to be held to cover the 1931 holiday season, the closing dates of each being in the middle of August and September respectively.

2. The competitions are open to any reader of THE ARCHITECTS' JOURNAL.

3. Two prizes, a first prize of Ten Guineas and a second prize of Five Guineas, will be awarded in each month's competition for the best and next-best sketches sent in.

4. Competitors may enter for either or both of the two months indicated, if they choose, but no competitor can win more than one prize.

5. A maximum of five drawings may be submitted by individual competitors for each month's competition. Such batches must be sent complete under the same cover.

6. The size of the drawings is not to exceed that of Royal drawing-paper, i.e. 24 inches by 19 inches.

7. All drawings should possess some definite architectural or craftsmanship interest, but they need not be exclusively concerned with buildings, and drawings of boats, vehicles, etc., will also be eligible.

8. The drawings will be judged by the Editor of THE ARCHITECTS' JOURNAL, whose decision will be final.

9. Entries for the first competition, that for July, have already reached the Editor of THE ARCHITECTS' JOURNAL. The result of this competition will be announced in THE ARCHITECTS' JOURNAL for August 12.

10. Entries for the August competition should reach the Editor of THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, Westminster, S.W.1, between the first post on July 15 and the first post on August 17. The result of the competition will be announced in THE ARCHITECTS' JOURNAL for September 9.

11. Entries for the September competition should reach these offices between the first post on August 18 and the first post on September 15. The result of this competition will be announced in THE ARCHITECTS' JOURNAL for October 7.

12. A motto of one word is to be chosen by the competitor, who will remain known by this motto until the award has been made. Only then will his identity be divulged.

13. Each entry must be accompanied by a sealed letter giving the competitor's name, address and occupation (whether principal, assistant or student). The letter should also state that the competitor will observe the rules of the competition and that the drawings submitted are his work, executed on his holiday this year. It must be enclosed in an envelope sealed with a blank seal and bearing nothing but a motto label on which is written the motto chosen by the competitor and the number of drawings entered. Copies of this label will be found in THE ARCHITECTS' JOURNAL during the period covered by the competitions.

14. Each drawing must bear on the back a similar motto label bearing the competitor's motto and the number of drawings entered. No other means of identification must appear on the drawing. Drawings bearing a signature will be disqualified; so will drawings not bearing the printed motto label.

15. Owing to the drawings being submitted under a pseudonym no acknowledgment can be sent.

16. THE ARCHITECTS' JOURNAL will publish a selection of the drawings submitted.

17. No responsibility can be taken by the Architectural Press for loss or damage.

The front of the building at present provides living accommodation for the secretary, intended, later, to be used as offices. The site is some twenty-five acres in extent, and is to be used partly for training camps.

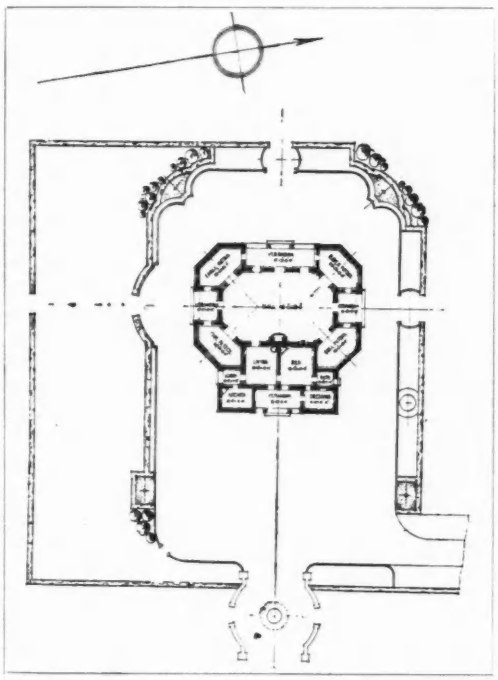
HEADQUARTERS FOR THE PUNJAB BOY SCOUTS

DESIGNED BY R. W. H. VALLIS

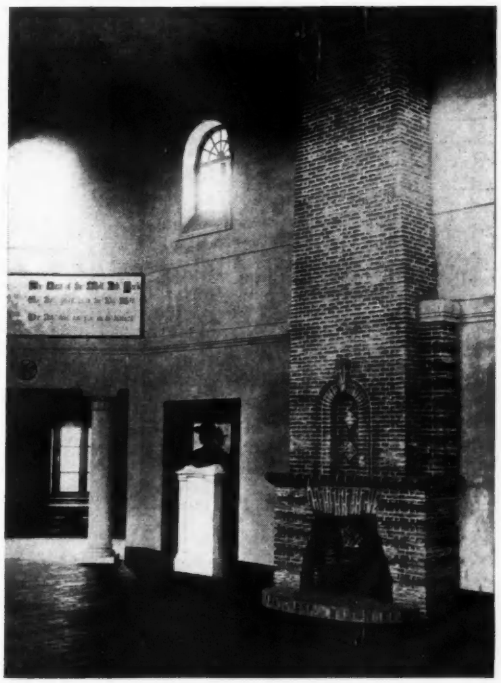
THE accompanying two photographs and plan illustrate a new building situated about eight miles from Lahore. It will form the permanent headquarters of the Punjab Boy Scouts' Association and a rallying-place for scoutmasters' training camps.

The building consists of an octagonal lecture and drill hall, 42 ft. by 28 ft., at the corners of which are rooms for the four patrols—Eagle, Owl, Raven and Bull—fitted with teak wood lockers and seats. The main hall, which is 27 ft. high, has a coved ceiling, formed in wallboard, and a polished teak wood floor. The fireplace is built in 2-in. bricks, set in white cement, and is fitted with a cast-iron dog grate.

The front portion of the building provides accommodation for the secretary, consisting of living-room, bedroom, dressing-room, bathroom and kitchen. It is proposed in the future to build a separate bungalow for the secretary: these rooms will then be used as offices. The building cost Rs. 40,000 (about £3,000).



The plan and layout, showing the main octagonal lecture and drill hall, placed centrally, with patrol rooms at the corners, and the secretary's quarters on the front.



The chimney in the central hall is in 2-in. bricks, set in white cement. Over the openings to the patrol rooms are scout mottoes; in the frieze a fresco is to be placed, illustrative of scouting activities.

A general view of the front of the house. The economy of a flat roof enabled an extra story to be built.

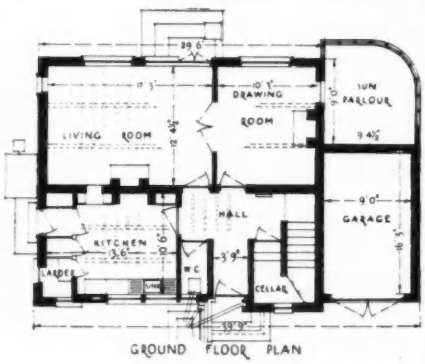
A TEN-ROOMED HOUSE BUILT FOR £1,368

FROM DESIGNS BY FREDERIC E. TOWNDROW

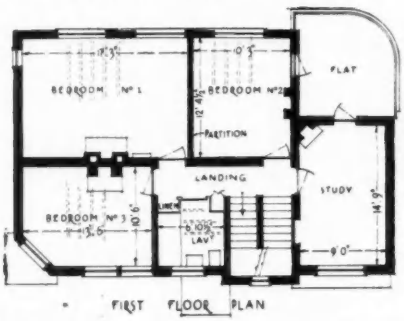
"FORSYTE," Hockley, Essex, represents a serious essay in the provision of certain stipulated accommodation at the absolute minimum of expenditure. It is claimed by the architect that its external form arose chiefly from this consideration, coupled with the determination to secure abundant light. It was arrived at only after detailed pricing of half-a-dozen different methods of construction, some of the variations being as follows :

	Price
For "Cellular" Fletton walls externally, cement slurry finish	£12 less
For 11-in. external cavity walls ($4\frac{1}{2}$-in. Fletton inside and $4\frac{1}{2}$-in. hard stocks seconds outside)	£30 extra
For 9-in. Fletton external walls, rendered $\frac{3}{4}$ in. ..	£5 extra
For hardwood floor to living room and drawing room	£10 10s. extra
For Flettons on edge (for coping) dipped in black composition instead of blue brick	£3 less
For dog-legged staircase with carriages and strings	

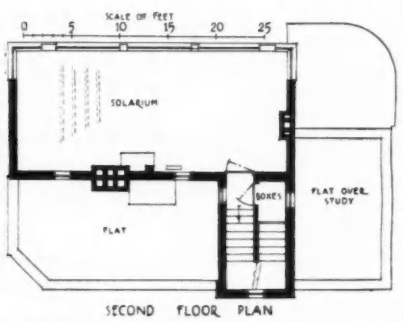
In the planning, the idea was to obtain the largest amount of accommodation on a small external area without costly breaks or projections. This, in its most logical form, gave a block almost square on plan—another important reason against a sloping roof. The splayed corner above the ground floor on the entrance frontage was arranged to give a distant view of the sea from the bedroom concerned. There is direct sunshine on the entrance side up to about 11.30 a.m.; from noon onwards the sun is on the garden side. The bathroom, kitchen and first-floor bedroom, therefore, reap the benefit.



GROUND FLOOR PLAN



FIRST FLOOR PLAN



SECOND FLOOR PLAN

and boxed up and plastered balustrade 2½ ins. thick, and with deal coping stained black and polished (instead of with newel wall) ..	No difference

Nine-inch solid walls of hard burnt stocks, in Portland cement, with ⅞-in. external rendering in the same cement, colour-washed, gave the best value for money. It was found that there would be so great a saving with flat roofs that an extra story could be built. Constructed of timber, the roof boarding is covered with three-ply bituminous felt, laid in boiling bitumen, with half-an-inch of shingle on the top. Eaves and gutters are dispensed with by draining to a shallow centre trough, falling towards either side of the building. The windows are standard metal casements, with wide frames; doors and other fittings are also of standard pattern.

A feature of the ground floor is the spacious reception room accommodation provided by the adjacent living- and drawing-rooms, connected by folding doors. On the first floor are three bedrooms, study, with opening to flat roof over sun-parlour, and tiled bathroom, fitted with a built-in marble-fronted bath, low pattern w.c. and pedestal basin. The large room on the top floor serves several purposes—child's playroom, billiards room and smoking room, as well as being available for dancing, since it has an oak floor.

The following are some of the cost figures :—

	£
Contract price (including external drainage, paths and gates)	1,273
Roofing contract	35
Electrical contract	30
Extras on fireplaces and special fittings	30
	£1,368

The back elevation, showing the sun parlour. Colour plays an important part in the external effect. The walls are coated with pale cream distemper, waterproofed with Russian tallow. The fascia to the top flat is painted blue-black to match the Staffordshire bricks and tiles : the copper kerb will give a line of green above this. Eaves soffits are brilliant enamel-yellow; steel windows and doors, a cheerful green; reveals to windows, sunshine yellow, a tone also extensively used internally.

["*Forsyte*," *Hockley, Essex. By Frederic E. Towndrow.*]

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

No New Charing Cross Bridge

THERE is to be no new Charing Cross Bridge. In reply to a question put to him by Col. Ashley last week, Mr. Morrison said he had caused the following letter to be addressed to the L.C.C. :

"I am directed by the Minister of Transport to refer to your letter of the 22nd July (E.2/43555), informing him of the decision taken by the London County Council at their meeting on the 22nd July that, subject to His Majesty's Government agreeing to contribute from time to time 75 per cent. of the actual ascertained expenditure on the Charing Cross Bridge scheme and on the scheme for the reconditioning of Waterloo Bridge, as recommended by the Royal Commission on Cross-River Traffic in London, and on the understanding that the net cost of carrying out the former scheme would not exceed £12,500,000, the Council would be prepared to promote a Bill in the next Session of Parliament for the construction of a road bridge at Charing Cross and the removal of Charing Cross Station to the south side of the river, in accordance with Scheme No. 6 recommended by the majority of the Advisory Committee presided over by Sir Leslie Scott, K.C.

2 : It is within the knowledge of the Council that at the time when the London County Council (Charing Cross Bridge) Bill, 1930, was rejected by the Select Committee of the House of Commons, the Minister caused an assurance to be conveyed to them that the Government would be prepared to support the Council should they decide to move the recommittal of the Bill. . . . .

3 : The Council are aware that the resources of the Road Fund are now insufficient to meet the heavy commitments undertaken in connection with schemes for the improvement and construction of roads and bridges in all parts of the country. . . . .

4 : Unfortunately, in spite of their thorough and arduous efforts, the Advisory Committee have been unable to submit a scheme which can be regarded as 'agreed.' The scheme recommended by the majority is, in fact, the subject of considerable controversy. Furthermore, on the question of the merits, the possibility cannot be ignored that future events such as a rapid development in the electrification of main line railways may profoundly affect the considerations which would determine the site of the railway station and the layout of the approaches on the south side of the river.

5 : The Government have most carefully reviewed the position in the light of all the circumstances of the case, including the present serious economic situation, and have authorized the Minister to convey to the Council their decision that it is not possible at the present time to renew the offer of a 75 per cent. grant from the Road Fund towards the cost of a new road bridge at Charing Cross."

Housing Progress

Mr. Simon asked the Minister of Health if he would state the number of houses completed during the nine months ended June 30 by local authorities and private enterprise, respectively, and the corresponding figure for the previous year.

Miss Susan Lawrence, who replied, gave the following figures :

Period	Completed by	
	Local Authorities	Private Enterprise
	*State-Assisted**	
9 months ended June 30, 1931 ..	43,968	1,384
9 months ended June 30, 1930 ..	35,279	1,164
	*Not State-Assisted**	
12 months ended March 31, 1931..	3,360	125,368
12 months ended March 31, 1930..	91,691†	

* Excluding houses with a rateable value exceeding £78 (£106 in Metropolitan Area). Returns related only to half-yearly periods ending March and September.

† Returns did not distinguish houses completed by local authorities from houses completed by private enterprise.

The figures shown above did not include houses erected by local authorities in replacement of houses demolished under improvement schemes.

THE SPECIFICATION WRITER

Modern Cathedral Lighting

WHEN considering the question of lighting a mediæval church it should be remembered that our forefathers' daily life was regulated by the sun, and that artificial illumination as understood today did not exist. Certain parts of a monastic church were dimly illuminated for the night offices, and on great festivals a wild and murky glare was provided by means of a multitude of pine torches, but these occasions not infrequently ended in a conflagration of the entire building.

The interior of a mediæval cathedral was designed to be seen by natural daylight, admitted partly through the aisle windows, but for the greater part through the clerestory windows of the nave and choir. The introduction of gas made it possible in Victorian days to hold services after dark. At Salisbury, to name one example, a long gas-pipe, with hundreds of naked burners, ran along both sides of the nave at triforium level, and these were solemnly lit by tapers from the triforium gallery. Generally a weird and wonderful assortment of Gothic Revivalist fittings were introduced at various points, and these have in many cathedrals gone through the three stages of evolution from fishtail burners, by way of incandescent mantles to electric light bulbs.

The adoption of floodlighting by electricity has revolutionized illumination, and made it possible to reproduce by artificial means the effect of daylight, for the sources of the electric light are concealed beside the windows of the clerestory. When the idea of floodlighting cathedrals and churches was first proposed certain ecclesiastically-minded bodies raised horrified hands that a method of illumination suitable to cinemas and theatres should be employed inside a sacred building.

> All our fathers have been Churchmen
> Nineteen hundred years or so,
> And to every fresh suggestion
> They have always answered "No."

The Oxford Diocesan Advisory Board published in 1929 a report on the lighting of churches, which was reactionary in outlook and condemned floodlighting as unsuitable for churches. Such documents often do more harm than good, showing a timidity of vision rather than a desire to explore the path of progress.

Fortunately the Chapters of several cathedrals have shown themselves more progressive than the members of the Oxford Board, and floodlighting has been successfully introduced into many churches, including famous cathedrals such as Peterborough, Durham and Southwell.

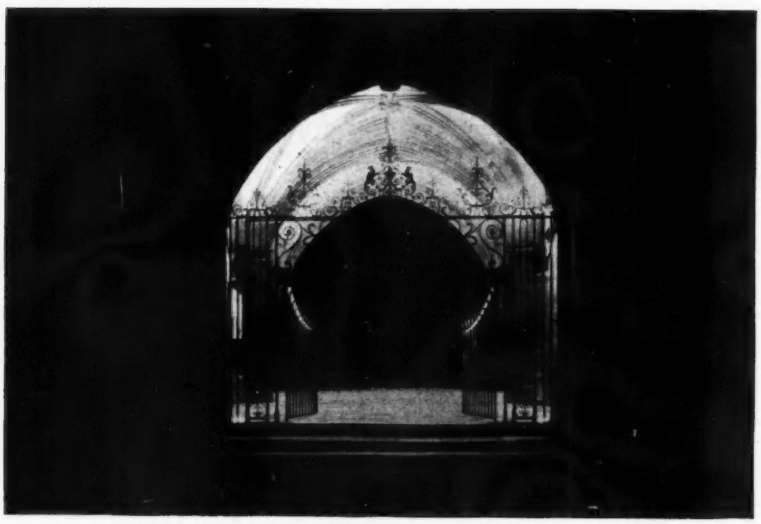
The advantage of providing light approximating to daylight is obvious. It prevents distortion of proportions and mouldings, the shadows fall naturally, and the eyes of the clergy and congregation are not irritated by glare from exposed fittings. A good over-all light of sufficient intensity is provided, and on this can be built up, if desired, any special high lights such as those thrown upon the pulpit, altar or choir stalls.

The pioneer installation was carried out at Peterborough. Early in 1924 the Dean and Chapter discussed the question of removing the inadequate gas illumination with the city electrical engineer, Mr. H. A. Nevill. After a series of experiments the work was carried out by the Edison-Swan Electric Company, and the present system was inaugurated in October, 1925.

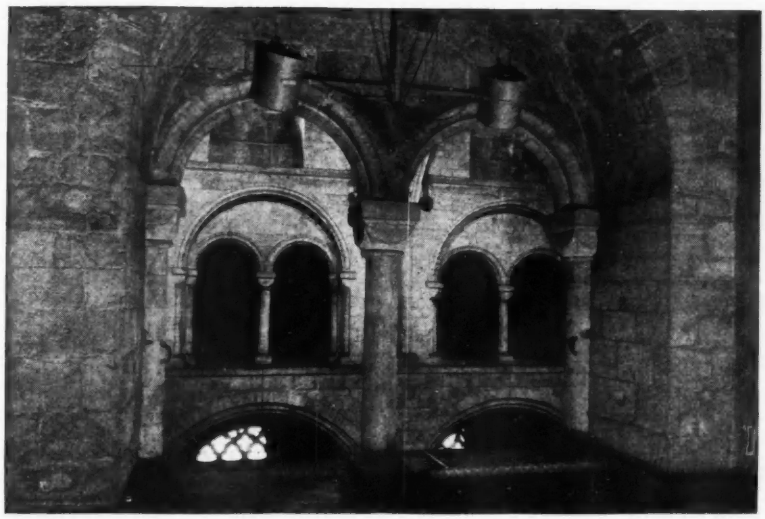
Peterborough Cathedral: the south aisle, by artificial light.

The light units are placed on each side of the clerestory windows and concealed in recesses which by daylight are in heavy shadow and almost completely conceal the lamps from sight. These lamps consist of specially-designed projectors, comprising three silvered glass mirrors mounted on a special case and equipped with a 250-watt lamp. The light beams are trained diagonally downwards so as to strike the floor approximately at the base of the piers on the opposite side of the nave. Part of the light which would be cut off by the edge of the clerestory wall and wasted is redirected upwards, and serves to illuminate the flat wooden cubing. At the crossing eight special units are mounted nearly one hundred feet above the floor, but all the fittings are so arranged that they can be cleaned and repaired from the upper galleries of the church without the need of scaffolding or ladders. The fittings themselves are painted to match the stonework and well camouflaged except that certain of the reflectors do catch the daylight, a defect which was remedied in the next installation carried out at Durham Cathedral.

In this famous church the principle first tried out at Peterborough is still further developed. Here the lighting is provided by means of eighty odd



Peterborough Cathedral: the west porch, by artificial light.



Durham Cathedral: flood units for lighting the choir from the triforium.

lighting units fixed in the clerestory and triforium. Each unit consists of a gas-filled projector lamp mounted in a case with silvered glass reflectors. These lights are so skilfully controlled that it is possible to read with ease small print at a distance of some fifty feet or so from the point where the light is installed.

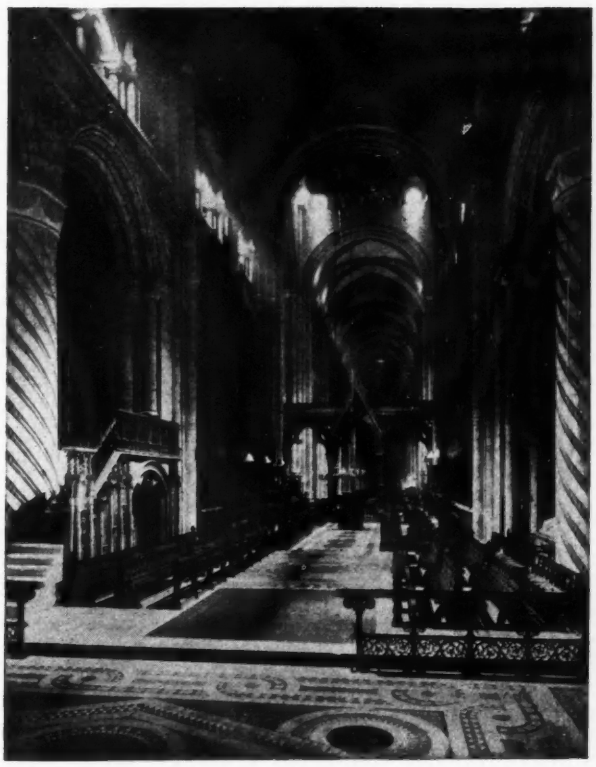
At Peterborough the whole building is illuminated with a gradual intensity of lighting, the highest being on or near the floor of the church, while the upper parts have a diffused light thrown upon them by means of reflectors. At Durham the cathedral architect, Mr. R. A. Cordingley, did not wish to have the upper levels and vaulting illuminated except from the natural reflection thrown back from the floor and pillars. Thus the clerestory and roof are at night shrouded in a dim mysterious gloom which is very impressive in this type of building. Another modification introduced at Durham is slightly to colour the floodlight by means of amber-tinted mirrors, a device which brings out the rich colouring of the stonework.

In both these cathedrals the aisles are sufficiently lit by the light spilled over from the nave and choir, which in direction and intensity resembles sunlight. A further ingenious piece of installation was placed in the west porch at Peterborough. Here the architect refused to allow any attachments to the walls or vault, and the light is provided by lamp holders sunk in the pavement.

Practically the whole of the controls in both cathedrals are located in the triforium, and these in turn are operated from buttons fixed at convenient points at floor level. At Durham these are concealed in the choir stalls, and are duplicated on both the north and south sides.

Southwell Cathedral lighting was carried out under the direction of Mr. W. R. Caroe, the cathedral architect, by the General Electric Company. The nave and tower are equipped with thirty-two 200-watt Osram lamps, concealed in a similar manner as at Durham and Peterborough, to give the effect of daylight. But here the aisles are lit by unconcealed lanterns, an effect which is less successful than that at Durham, where the spilled-over light has the effect of sunlight.

LL. E. W.



Durham Cathedral: the choir, looking east and west, respectively, by artificial light.

LITERATURE

CHURCHES AND CONVENTS OF RENAISSANCE ROME

IN this second volume in their "Scopas" series, Messrs. Tiranti complete the reprint of Paul Letarouilly's plates illustrating *Edifices de Rome Moderne*, by including in one book the whole of the drawings of ecclesiastical buildings.

The general index to this and the previous part, which appeared some months ago, is also included, together with Mr. Arthur Broadbent's translations of further selections from the *Renseignements Divers* which throw light on a variety of aspects on the subject. This part contains a table of linear measures of Renaissance and Classic Rome, also a chronological list of Popes from 1417 to 1831, and of the principal architects in Rome from the sixteenth to the early nineteenth century, as well as a list of the principal buildings of modern, as the successor of ancient, Rome down to the time of the nineteenth-century restoration of San Paolo fuori la mura.

The plates are alike valuable as monuments to the diligent draughtsmanship of a century ago, and as sources of inspiration to the student and practitioner of today. The variety of subjects within the category of ecclesiastical buildings, and the divers aspects from which they are approached, offer abundant material for experiment in relation to architectural problems and projects not necessarily ecclesiastical in character or purpose.

While many of the plans, sections and perspectives present a set of studies in general grouping and constructional detail of a particular architectural whole in its own setting, such as the Lateran palace and basilica, or the buildings of San Pietro in Montorio, there are also many smaller architectural accessories which are complete in themselves, such as fountains, tombs, holy water stoups, ambones, altars, balustrades, doors, well-heads, from which to derive inspiration for particular subjects. If details of mosaics and inlay, of capitals and pilasters, of floors, ceilings or entrances inevitably suggest, in these commercial days, their possible adaptation to banking, shipping or insurance purposes, rather than retaining an exclusively ecclesiastical quality, perhaps it is not unseemly, since it cannot be denied that Renaissance church buildings were in origin pagan and civil.

Among a hundred plates one may mention as an example of the complete single architectural object readily dissociated from its setting and capable of adaptation or reduction, the fountain at plate 232, probably the work of Fontana, and "one of the most picturesque of its kind." For sheer enjoyment of the drawings as depicting a phase of human life, plates 300 and 301, showing the harmonious simplicity of the Carthusian cloister, are particularly noteworthy.

The translator does not always seem entirely at home with his languages, but the meaning is generally made clear by the illustrations. On page xii the description of a pulpit as a "fine chair" is elucidated by reference back to plate 314, where the description remains in French as "*la chaire*." But such lapses are after all more or less trivial in the potpourri of tongues necessitated by an English edition of a French work on Italian architecture.

LES SCULPTEURS FRANÇAIS

ART, like civilization, generally decays when it resorts to excesses. It was an excess of ornament that caused the degradation of Byzantine art and reduced it to an unmeaning demonstration of facile technique.

From the fourth century, when Roman art reached bottom, ivories and stone sarcophagi were alike in their elaborated ornament. When Christian art succeeded, the dread of the idol served to keep the running on ornamental lines. In the sixth century, at Ravenna, ornament reached appalling

A view of the principal façade of the Basilica and Palace of St. Gio, in Laterano.

proportions and got seriously worse as Byzantium progressively prospered. The rigid figures of iconography ruled for centuries, together with the developments of the Roman excesses with regard to the Corinthian capital, treated comparatively in the fourth chapter of this book. Byzantium ruled for the next six hundred years, its influence being repelled only in Scandinavia, England and Ireland. Then architecture, good mother of the arts, stirred to new birth. Man in God's image and God's image in man asserted themselves, and one of the earliest results was the new sculpture as it appeared first in France—all over France. It was not a very vigorous child, but it was at least human instead of an ugly icon, for the Byzantine strangle-grip continued.

Romanesque architecture was the cradle of the new sculpture which grew up into the glorious strength of Gothic. Real figures of men and women appeared amidst the redundancy of floral ornament, and the absurdities of animal forms gave place to a better respect for the facts of Nature. Superstitions were bound to continue, but the rapidly increasing culture of the Church modified them and turned them into meaning symbolisms and often exalted narrative of religious story, and dignified it into fine teaching.

The title of this book tends to draw attention to the sculptors in the first place, but so much individualism could hardly be expected. The sculptors were rude men directed by the master minds of the architects employed by the ecclesiastics, so that, even if possible, a detailed study of the sculptors themselves was hardly worth while. A study of their works is very well worth while, if for no other reason than as an introduction to Gothic. It was a great and worthy introduction, and it was a struggle between life and death, to allow it its place as indicating the death of one great school and the birth of another.

Birth and death were very mixed in French twelfth-century sculpture. Confining herself largely to the capital, the tympanum and the figures of the piers, the author is generous in her descriptions and particular in their indications. With an admirably business-like faculty she gives a repertoire of 124 sites where this sculpture may be studied in France. Autun, Bayeux, Bourges, Cahors, Chartres, Cluny, Dijon, Le Mans, Moissac, Paris and Vézelay are obviously there; but there are things as important in a dozen other directions and of only lesser importance in still another hundred. To add to the practical value of the volume, Madame Lefrançois-Pillion provides a bibliography of sixty authors, all French with but six exceptions, these latter including the devoted R. K. Porter, in English, on the Romanesque sculpture of the pilgrimage roads.

The bibliography of the volume dealing with the sculptors of the thirteenth century is on a different plan. It enumerates the principal works with which the successive chapters deal, a considerable number in each case, so much has there been written on Gothic. The treatment is more general than that of the former volume, and the list of cathedrals has necessarily considerably increased. To the names of those given above, which are concerned with Romanesque particularly, must now be added Amiens, Laon, Reims, Rouen, Sens and Strasbourg. There are about eighty in all, the principal features of which are described, and the nature of Gothic, after the useful generalizations of the first chapter, is dealt with from all the points of view offered by so large a number of structures of importance. Some fresh plates have been added to this new edition of the volume on the thirteenth century, and the illustrations in the two volumes amount to seventy-five. The whole work is useful and practical. BUILDING SOCIETIES' YEAR-BOOK

THE Minister of Health (the Rt. Hon. Arthur Greenwood, M.P.), in the course of a foreword to this year's edition of *The Building Societies' Year Book*, voices his grateful appreciation of the valuable contribution building societies have made towards the solution of the country's post-war housing problems. Good health, he emphasizes, is intimately connected with good housing conditions, and it would be misleading to suggest that anything like enough accommodation has yet been provided for the lowest-paid workers. Until this is remedied, no one can say that the need for houses has been met. Private enterprise can only build houses so long as a market for the houses built is available, and it is not overstating the case, he thinks, to say that the market for small houses built for sale has been created by, and depends for its continuance upon, the assistance available to purchasers from the building societies.

The *Year Book* is the official handbook of the National Association of Building Societies, of which the 340 principal building societies are members, representing about 96 per cent. of the total assets of the building societies of Great Britain. An alphabetical and geographical list of these societies, the principal figures in their last balance sheets, and the names of the directors and managers, are published in the book, together with a mass of useful information indispensable to all who are interested in this remarkable social and industrial movement.

An interesting feature of the book is the section containing a series of articles written by experts, including Mr. Hartley Withers, Sir James B. Baillie (Vice-Chancellor of Leeds University), and Sir John Stewart Wallace, who writes on Land Registration.

The President of the Association, Viscount Cecil of Chelwood, in the course of his speech at the annual conference at Edinburgh, a full report of which is contained in another section of the book, refers to the suggested taxation of land values, emphasizing that as building societies represent some millions of the population they have a right to be heard on the subject and should insist that nothing should be done to increase the cost of building houses, particularly for the working classes.

Building Societies' Year Book, 1931. Compiled and Edited by George E. Franey, O.B.E. London: Reed & Co. Price 7s. 6d. net.

ELECTRICITY FOR EVERYBODY

MR. BORLASE MATTHEWS has completely rewritten and remodelled his electrical encyclopædia, a work which first appeared in 1908. The book is a work of reference which gives reliable and comprehensive information on the various practical uses of electricity. Much thought has been given to arrangement of the contents, and the several sections are subdivided in a logical and useful way. Each division (e.g. the home, factories, public buildings, etc.) is divided into five sections: lighting, cooking, water-heating, heating, power; and each of these sections has subsections dealing respectively with advantages, cost, accomplishment, wiring and necessary apparatus. The system necessitates a certain amount of repetition, but this is excusable in a work of reference, because of the added convenience, when referring quickly to any particular subject, of finding every aspect considered without looking elsewhere. The style is very simple, and minute details enable even an untechnical mind to understand the methods and suggestions described.

It would be hard indeed not to become infected with enthusiasm for electricity after acquainting oneself with the myriad activities of this versatile force, described here; no Victorian "Miss" ever had a list of accomplishments so enormously long and varied (see "accomplishments" in each section). The most valuable and interesting sections to the architect, and probably also to the general reader, are those dealing with wiring and with lighting; the tables and schedules throughout the book have been well drawn up,

and provide rapid access to the most diverse information. Practical and technical points have been dealt with most thoroughly and particulars of standard lighting practice are given for every possible case. Since this is usually of the conventional kind, the architect will seek æsthetic inspiration elsewhere, and be buoyed up by the belief expressed in the section "Lighting in the Home" that "the common arrangement nowadays is for architects to suggest lighting fittings just as they have always suggested fireplaces, and the range of fittings is so large that anything can be purchased in keeping, say, with an Adams fireplace or Jacobean furniture!"

A useful directory of towns gives the names of the electrical supply undertakings, electrical contractors and pressures of supply.

Electricity for Everybody—Handbook for 1931. By R. Borlase Matthews. London: Electrical Press, Ltd. Price 5s. net.

SOCIETIES AND INSTITUTIONS

R.I.B.A. COUNCIL MEETING

FOLLOWING are some notes from a recent meeting of the R.I.B.A. Council:

British Architects' Conference, Dublin: The Council passed a cordial vote of thanks to the members of the Royal Institute of the Architects of Ireland and all those who contributed to the success of the conference at Dublin.

Examination for the R.I.B.A. Diploma in Town Planning: On the recommendation of the Board, Mr. W. B. Oldacre was awarded the R.I.B.A. Diploma in Town Planning.

The School of Architecture, Auckland University College, New Zealand: On the recommendation of the Board it was decided—1: That the three years' full-time day course be recognized for exemption from the R.I.B.A. Intermediate Examination; 2: That the five years' course leading to the degree of Bachelor of Architecture be recognized for exemption from the R.I.B.A. Final Examination.

Prizes. Proposed Programmes for Tours: The Board reported that they had approved the programmes suggested by the following:

Miss K. A. Veitch (Owen Jones Student, 1930), and Messrs. K. H. Read (Henry Saxon Snell Prizeman, 1930), A. C. Collins (Tite Prizeman, 1930), G. H. While (Pugin Student, 1931), B. B. Lewis (Victory Scholar, 1931), and H. Jackson (Henry Saxon Snell Prizeman, 1931).

The Hunt Bursary, 1930: The Board reported that they had approved the report on "Norman Town Planning in Wales" submitted as the result of his tour by Mr. T. M. Daniel, A.R.I.B.A.

The Godwin and Wimperis Bursary, 1929: The Board reported that they had approved the report on "The Standard of Musical Tone from an acoustic analysis of good Concert Halls, Opera Houses and Churches" submitted as the result of his tour by Mr. Hope Bagenal, A.R.I.B.A.

The Soane Medallion, 1930: The Board reported that they had approved the drawings and sketches prepared as the result of his tour by Mr. J. L. Martin.

Admission to the Final Stages of three Competitions: It was decided that competitors awarded certificates of Hon. Mention in the competitions for the Tite Prize, Soane Medallion and Victory Scholarship be admitted, if they so desire and provided that they are eligible in other respects, in the year next following only, direct to the final stages of the respective competitions.

Reports prepared on their Tours by R.I.B.A. Prize Winners: It was decided that it be a regulation that prize winners must submit their reports within six months after the date of the conclusion of their tours.

Constitution of the Board of Architectural Education: It was decided to invite the Royal College of Art to nominate a representative to serve on the Board of Architectural Education.

Architectural Competitions: The Position and Duties of Assessors: On the recommendation of the Practice Standing and Competitions Committees it was decided to make certain amendments to the Regulations for the Conduct of Architectural Competitions, in regard to the position of assessors. These proposed amendments have been published in the *R.I.B.A. Journal* for the comments and criticisms of members. The following clauses proposed by the Practice Standing and Competitions Committees were approved for inclusion in the "Directions to Assessors."

New Clause 10. An Assessor must not act as consulting architect unless he has been appointed as such before the inception of the competition, nor in any other professional capacity in any matter connected with the work which has been the subject of the competition, provided always that he may act as arbitrator in any dispute between the promoters and the selected architect. If, under the special conditions referred to above, the assessor is acting as consulting architect, it should be clearly stated in the published conditions of the competition.

New Clause 11. If an architect is officially approached by the promoters for advice as to the holding of a competition with a view to his acting as assessor, and eventually it is decided not to hold a competition but to appoint an architect to carry out the work, the architect originally approached in an advisory capacity is precluded from acting as architect for the work in question.

New Clause 12. Assessors are urged to ensure that whenever possible competitions should be thrown open not only to architects established in private practice, but to all members of the R.I.B.A.

Addition to Clause 7. Assessors are urged to take all possible steps to ensure that the award is communicated to the competitors before it is announced in the Press.

On the recommendation of the Practice Standing and Competitions Committees, Clause 9 of the Code of Professional Practice was revised as follows:

Clause 9. An architect must not act as architect or joint architect for a work which is or has been the subject of a competition in which he is or has been engaged as assessor.

An assessor must not act as consulting architect, unless he has been appointed as such before the inception of the competition, nor in any other professional capacity in any matter connected with the work which has been the subject of the competition, provided always that he may act as arbitrator in any dispute between the promoters and the selected architect.

If the architect is officially approached by the promoters for advice as to the holding of a competition with a view to his acting as assessor, and eventually it is decided not to hold a competition but to appoint an architect to carry out the work, the architect originally approached in an advisory capacity is precluded from acting as architect for the work in question.

Award of the R.I.B.A. Ulster Architecture Medal for the year 1930: On the recommendation of the Jury for the Award of the R.I.B.A. Ulster Architecture Medal for the year 1930, it was resolved that the medal be awarded to Mr. R. S. Wilshere, A.R.I.B.A., Education Office, Belfast, for the Strandtown P.E. School, North Road, Belfast, and that the following buildings be commended: The Carryduff Church Hall, Carryduff, Co. Down, the work of Mr. John MacGeagh, A.R.I.B.A., and the Heyn Memorial Hall, St. Mark's, Dundela, Belfast, the work of Messrs. Henry Seaver, B.E., and R. H. Gibson, F.R.I.B.A. (Associated).

The British Engineering Standards Association: The following members were appointed to represent the R.I.B.A. on the newly-formed Building Divisional Council of the B.E.S.A.: Messrs. W. E. Vernon Crompton, J. Ernest Franck, Percival M. Fraser, and Alan E. Munby.

The 1931 Form of Contract: A memorandum containing suggestions for the guidance of members in dealing with the new Form of Contract was approved for publication in the *Journal*.

The Fellowship: The Council, by a unanimous vote, elected the following architect to the Fellowship under the powers defined in the Supplemental Charter of 1925: Mr. Donald MacGillivray, President of the Institute of Southern Rhodesian Architects.

Reinstatement: The following ex-member was reinstated: As Associate: Mr. J. J. Cresswell (Grimsby).

Election of Students: The following Probationers were elected as Students of the R.I.B.A.:

Gordon, Miss I. M. (Robert Gordon's Colleges, Aberdeen); Messrs. Kendall, W. (Architectural Association), Lay, G. Q. (London University),

Richards, G. D. L. (Welsh School of Architecture), Sharkey, E. P. (Robert Gordon's Colleges, Aberdeen), Sydney, P. A. (Liverpool School of Architecture), Thomson, W. K. (Liverpool School of Architecture), Tripe, A. C. (Architectural Association), Wright, J. P. M. (Robert Gordon's Colleges, Aberdeen).

HANTS AND I.O.W. EXHIBITION

Mr. Ingalton Sanders, F.R.I.B.A., presiding at the annual exhibition of students' prize drawings in connection with the R.I.B.A., and of work by members of the Hants and Isle of Wight Architectural Association, held at the Winchester School of Art, remarked that the architect's duties did not end merely with the design of new buildings, for he met with a fresh series of problems when he was called in to advise as to alterations and restorations of old buildings, in such cases requiring knowledge as to dilapidations, the law of light, questions as to easements, and other problems. To obtain the knowledge required for his numerous functions an intensive architectural education was necessary through many years of close study.

Mr. Sydney D. Kitson, Hon. Secretary of the R.I.B.A., who formally opened the exhibition, then delivered an address on "The trend of architectural taste."

Mr. Kitson said that an architect was bound more than any other artist to work in the current taste of his day. His livelihood depended upon it. It seemed to him that never, since the early days of the Renaissance in Italy, was there a more difficult and a more thrilling time for the young architect. Older men, brought up amid a sequence of revivals, followed the fashion of the day; and if they were men of ability (as so many of them were), they produced work which was often better than their models. But they lived on to see the revival which they had mastered displaced by another whose language they had to learn and whose significance they only half believed in. The young architect today would have the task and the opportunity of moulding the vital and elemental ideas which have been thrown up in recent years like lava from a volcano, into a living style of architecture. A modern school of thought, which flourished more abroad than in England, would have us rely only on functionalism; they would mechanize the most human of the arts, and they would use solely newly-invented materials — however crude and however hideous — solely because they were new. The study of history supported the belief that architecture could not be bounded by such narrow limits, but rather that it was the chronicle of the spiritual and economic forces of the time.

Another school of thought would have us follow traditions and draw from the buildings of the past all the inspiration which was required in designing the buildings of the present. It seemed to him that this school failed to take into account the fundamental, economic and political changes which were taking place at the present time.

THE WELSH SCHOOL OF ARCHITECTURE

The following awards have been made as a result of the sessional examinations at the Welsh School of Architecture at the Technical College, Cardiff.

Professors L. B. Budden, M.A., F.R.I.B.A., and A. C. Dickie, M.A., A.R.I.B.A., were the external examiners.

Fifth Examination for the Diploma awarded at the end of the five years' full-time course, exempting from the R.I.B.A. Final Examination: Messrs. J. P. Ward, Diploma (with distinction); C. Rosser, Diploma; W. H. Maton, Diploma; J. Lewis, Diploma; and C. L. Bugler, Diploma.

Fourth Examination: Messrs. N. D. Ayres, J. T. Darch, W. J. Davies, and G. D. Ll. Richards.

Third Examination for the Certificate awarded at the end of three years' full-time course, exempting from the R.I.B.A. Intermediate Examination: Messrs. F. G. Allen, H. J. W. Lewis (with distinction), S. G. Roberts, C. W. Williams, C. J. Fussell, and Miss M. Murray.

Second Examination: Messrs. C. H. Francis, and D. W. Roberts, T. Hill, L. F. Hurley, R. G. Peacock, A. S. Thomas.

First Examination: J. R. Shedden.

C.P.R.E. BRANCH FOR HEREFORDSHIRE

One of the most representative and important county meetings held in Hereford for some years took place at the Shirehall recently, when steps were definitely taken to form a county branch of the Council for the Preservation of Rural England.

Sir John Cotterell, Bt., Lord Lieutenant of Herefordshire, presided, and he was supported by the Earl of Crawford and Balcarres, K.T., President of the C.P.R.E., the Bishop of Hereford (Dr. C. Lisle Carr), Alderman F. Ballard, Chairman of the County Council, the Mayor of Hereford, Professor Patrick Abercrombie and Mr. G. H. Jack, the County Surveyor and Architect of Herefordshire.

The following message from the Minister of Health (Mr. Arthur Greenwood), was read:

I am very pleased to learn that steps are being taken to form a Branch of the Council for the Preservation of Rural England for the county of Hereford. Lovers of the countryside need no convincing that measures require to be taken for preserving its beauties and amenities. The Town and Country Planning Bill, which it is the intention to pass into law this session, will give additional powers to local authorities for this purpose. In order that this measure may produce good fruit, and for other reasons, it is necessary that a wide and instructed interest in rural preservation should be cultivated, and I wish the C.P.R.E. every success in its efforts in the beautiful county of Hereford.

Sir John Cotterell, proposing the formation of a branch of the C.P.R.E., laid stress upon the unspoilt beauty of the county.

[*From* The Modern Shop.

A photograph of a model shopping village in the wealthy residential quarter of Dallas, Texas, U.S.A. As will be noted, special facilities are provided for the parking of cars in the shopping area.

Lord Crawford urged the desirability of using local materials wherever possible in local building, since Hereford and the border counties had, in the very colour and constitution of the earth, the elements desirable in maintaining the beauty of the West Country.

The Bishop of Hereford urged upon incumbents the necessity for regarding this question of preservation of rural amenities as one of their duties.

A resolution to form a branch was passed unanimously, and a provisional sub-committee was formed to make the necessary arrangements to bring it into being without delay.

INSTITUTION OF STRUCTURAL ENGINEERS

Following are the names of the successful candidates in the Graduateship and Associate-Membership examinations of the Institution of Structural Engineers :

Graduateship Examination : Messrs. H. H. Apcar, V. A. Burrows, L. Bustami, L. A. J. Dyke, G. W. Edwards, J. H. Gandhi, E. G. Judge, F. D. Russell.

Associate-Membership Examination : Messrs. J. N. Aggarwal, S. Agnew, T. Bedford, A. Dunsmore, E. N. Browne, C. E. Fonseka, F. N. Grose, J. W. Harkin, T. Holmshaw, D. W. Hughes, H. C. Jones, E. G. Judge, C. B. McIntosh, N. N. Mehta, C. J. Morreau, G. Newell, H. Newell, S. Richards, H. Ross, M. Sharif, W. J. Storey, T. J. Tonge, E. N. Underwood, C. R. Wallace, G. Wheeler, G. G. Watkins.

ANCIENT BUILDINGS OF TODAY

Mr. A. R. Powys, speaking at a weekly luncheon of the Norwich Rotary Club, on " The Value of Ancient Buildings in these days," said in considering the value of old buildings today one could not separate them from the past, one did not, probably, admire them because they were old, but because they were the good work of good human beings in a period.

One of the important contributions which old buildings made to us in our day was that from them we learned, when we set about building on our own account, that the way to achieve this beauty and nobility was to do like those men did and not consciously survey the past and make suggestions as to the future. People who instead of repairing old work had attempted to give to new what was thought the necessary quality that people in the past had given it, made a big mistake. One could not do that in architecture any more than in business. Another folly was in trying to be modern; one did not make normal use of up-to-dateness in the ordinary sense by outstepping to catch something springing out of the future and presenting it in the present.

If one contemplated the beauty that existed in some tree which had grown in perfect conditions to unusual girth and height and great spread of its limbs, one would find that the beauty was nothing but normal to its kind. We were more kin to the natural things on the earth, and to live normally in the method of the time according to one's kin was the way in which to bring beauty into this world. Searching for beauty *via* theories so often brought with it disaster.

LAW REPORTS

WHAT IS A LINE OF BUILDINGS ?

Molins Machine Co. v. *L.C.C.—King's Bench Divisional Court—Before Justices Swift and Charles*

THE case of Molins Machine Co. *v.* L.C.C., which came before the Court was an appeal by the L.C.C. under the London Building Act, 1930, sec. 25.

Mr. Montgomery, K.C., for the appellants, said the appeal raised a question of some importance, having reference to the general building line to be defined on the south-western side of Crook Road, Deptford. The L.C.C. now appealed from a decision of the Appeal Tribunal under the Act. The main question was whether the Appeal Tribunal were right in fixing a building line differing from that fixed by the superintending architect of the L.C.C. The superintending architect took a line from the houses in adjoining property. The Appeal Tribunal took a line formed by a lodge, a small building, and the boundary wall between them, which was in front of the main buildings on the property and, in fact, came right up to the street.

Counsel contended that this street should have been treated as one street, and not divided into two parts as had been done, and he asked the Court to restore the superintending architect's certificate.

Mr. Cresswell, for the respondents, Molins, Ltd., contended that the tribunal came to a right conclusion.

JUDGMENT

Mr. Justice Swift, in giving judgment, said the Molins Co., desiring to build in Crook Road, applied to the L.C.C., and the superintending architect inspected the *locus* and gave a certificate defining the general line of building. He looked at the whole of the road from the railway bridge to the bend of the road. He determined the general line of buildings in August, 1930, and stated that the general line of buildings was the frontage of seven out of the nine buildings and not the frontage of the two out of the nine. The Molins Co. appealed to the Tribunal of Appeal, who also viewed the *locus* and came to a conclusion of fact that it was unnecessary and inconvenient to define a general line of buildings longer than the line between certain points and the line of the wall. The tribunal were not entitled to come to that determination.

His lordship did not think that the tribunal had any right to take into consideration the existence of the wall or the boundary or fence, which was not in itself a building. They were wrong in considering that this wall would enable them to fix a building line. They were bound to take the existing buildings, and look at them as a whole. The point at issue was a question of fact, and it was inconvenient and unnecessary to divide Crook Road into two parts. It should have been dealt with as one whole street, and there was no evidence justifying its separation into two parts as the tribunal had done. The tribunal came to a wrong conclusion in fact, and had no business to consider the boundary wall in determining what the building line was, and there was no evidence upon which they could fix the building line as they had. Their certificate would be set aside and the superintending architect's certificate restored.

Mr. Justice Charles agreed. The appeal was allowed with costs, and the tribunal's certificate set aside and the superintending architect's certificate restored.

ARCHITECT'S FEES

Shipwright v. *Lidiard. House of Lords. Before Viscount Dunedin, and Lords Warrington, Atkin, Tomlin and Macmillan*

This was an appeal by Mr. W. G. Shipwright, an architect, against a decision of the Court of Appeal.

Originally the case was tried by an Official Referee of the High Court, the plaintiff claiming from the defendant, Sir Herbert Lidiard, a building owner, £1,537 odd for fees as remuneration in respect of a scheme for the erection of eighty-four houses, twelve shops and twenty-one flats, on an estate at Woking, of which the plaintiff was appointed surveyor and architect. Twelve houses were at first erected, and the plaintiff recommended the use of aerocrete. Later, cracks appeared in the walls and chimney breasts, and thereupon the defendant discontinued the scheme and terminated the employ of the plaintiff, and defendant contended that the sum he had paid plaintiff, £279 odd, covered payment for the services he had rendered.

After a long hearing the Official Referee came to the conclusion that the defendant was justified in determining the plaintiff's employ, and he found that the plaintiff was guilty of negligence in specifying unsuitable material.

The plaintiff appealed to a King's

Bench Divisional Court, and Justices Talbot and Finlay reversed that decision, finding that the negligence found by the Official Referee was not open to the defendant in his pleadings.

The defendant thereupon appealed to the Court of Appeal, who restored the finding of the Official Referee.

Plaintiff now appealed.

Their lordships dismissed the plaintiff's appeal, holding that aerocrete was a material not unsuitable in itself if properly matured, but that it was impossible to tell if it was matured by mere inspection, needing to be kept under observation to see if it would shrink and develop cracks. They further found that the plaintiff knew nothing of this limitation in its use, and took no precaution, and that under these circumstances, the defendant was justified in feeling he had lost confidence in plaintiff, and to put an end to the contract.

ANCIENT LIGHTS DISPUTE

Collins v. *Giles. Chancery Division. Before Mr. Justice Maugham*

This was an action by Mr. A. E. Collins and Mr. F. Collins, of Butts Lawn, Brockenhurst, Hants, against the trustees of the Brockenhurst Nursing Association, claiming damages for the alleged obstruction of ancient lights, caused by a bungalow erected by the defendants.

Plaintiffs' case was that for a period of many years their property, Nos. 1, 2 and 3 Butts Lawn, had enjoyed full and uninterrupted access of light over the gardens of Nos. 4 and 5. These two houses had been demolished, and the defendants had erected the bungalow complained of, in spite of protests from the plaintiffs, with the result that the light coming to plaintiffs' house had been seriously diminished, and rendered it less comfortable for habitation. Plaintiffs also said the value of their property had been depreciated.

Defendants denied that there was an actionable nuisance, and pleaded that as the five houses formerly belonged to one owner there had been such unity of ownership as to destroy the prescriptive right to ancient lights.

Mr. P. J. Waldram, daylight illumination expert, and Mr. W. J. Green, architect and surveyor, of Southampton, were called on behalf of the plaintiffs, and Mr. A. Stewart, architect, of Southampton, and Mr. J. Swarbrick, F.R.I.B.A., of Maddox Street, W., for the defendants.

His lordship came to the conclusion that No. 2 Butts Lawn possessed an easement of light, but that the bungalow only interfered with it to a small extent, and he therefore awarded plaintiffs nominal damages of forty shillings. No legal obstruction had been established in regard to No. 3. With regard to No. 1, he was satisfied there was a considerable diminution of light to the ground-floor window due to the bungalow, and he awarded £60 damages in regard to it. He gave the plaintiffs the costs of the action except in so far as they were increased by the claim made for No. 3.

COMPETITIONS OPEN

August 27.—Sending-in day. Proposed all-Scottish House for the Ideal Home Exhibition. Limited to architects practising in Scotland or of Scottish birth. Assessor: John Watson, A.R.S.A., F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from *The Daily Mail*.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions, etc., were obtainable from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Hayes Farm, Sulley, near Cardiff. Assessors: Ernest Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175, and £100. Conditions, etc., were obtainable from F. J. Alban, General Secretary, Memorial Offices, Westgate Street, Cardiff, before June 29.

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

SATURDAY, AUGUST 8

Sunrise, 5.33 a.m. Sunset, 8.38 p.m.

FRIDAY, AUGUST 14

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, Bloomsbury, W.C.1. Last day for submission of photographs for the Society's Annual Exhibition.

SATURDAY, AUGUST 15

Sunrise, 5.44 a.m. Sunset, 8.24 p.m.

MONDAY, AUGUST 17

Closing date of THE ARCHITECTS' JOURNAL August Holiday Sketches Competition.

SATURDAY, AUGUST 22

Sunrise, 5.54 a.m. Sunset, 8.11 p.m.

SATURDAY, AUGUST 29

Sunrise, 6.5 a.m. Sunset, 7.55 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Tour to Vienna, visiting Munich, Salzburg, Linz, Budapest, Zurich and Lucerne. Return, September 13. Full particulars may be obtained from the Secretary.

TUESDAY, SEPTEMBER 1

INTERNATIONAL ILLUMINATION CONGRESS. London, Glasgow, Edinburgh, Sheffield, Buxton, Birmingham and Cambridge. Until September 19.

FRIDAY, SEPTEMBER 4

INTERNATIONAL ILLUMINATION CONGRESS. At Glasgow. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Organization for the Development of Electric Lighting," by C. A. Atherton; "Progress and Teaching of Illumination in Italy," by C. Clerici; "Lighting Progress in South America," by A. M. Baidaff. Section 3: "The Provision of Adequate Daylight in Building Regulations," by P. J. Waldram; "Daylight Illumination and Town Planning," by C. G. Möller; "Visual Performance at Various Levels of Daylight Illumination," by K. Y. Yang; "Daylight Illumination of Art Galleries with Overhead Lighting," by T. Hirayama. Afternoon Session, 2.30 p.m. Section 1: "Home Lighting," by C. Haslett and N. E. Miller. Section 3: "Photo-Electric Measurements of Daylight Illumination by the Use of a Model Room," by Z. Yamauti and K. Hisano; "Mathematical and Graphical Determination of Direct Daylight Factors," by A. C. Stevenson; "Prediction of Natural Illumination in Interiors and on Walls of Buildings," by H. H. Higbie and A. D. Moore. 10 a.m.

SATURDAY, SEPTEMBER 5

Sunrise, 6.17 a.m. Sunset, 7.40 p.m.

MONDAY, SEPTEMBER 7

SANITARY INSPECTORS' ASSOCIATION, 27 Moreton Street, S.W.1. Annual Conference. Bridlington. Until September 12.

INTERNATIONAL ILLUMINATION CONGRESS. At Edinburgh. Following are some of the papers to be read. Morning Session, 9.30 a.m. Section 1: "The Lighting of Seaside Resorts," by A. P. Allan and J. M. Campbell; "Mason Experiments in Street Lighting," by W. S. Stiles; "Modern Public Lighting by Electricity," by W. J. Jeffery. Afternoon Session, 2 p.m. Section 1: "The British Standard Specification for Street Lighting," by C. C. Paterson. 10 a.m.

THURSDAY, SEPTEMBER 10

INTERNATIONAL ILLUMINATION CONGRESS. At Buxton. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Architectural Lighting," by R. Waldo Maitland and Howard Robertson, F.R.I.B.A. Afternoon Session, 2.30 p.m. Section 2: "Architectural Lighting," by L. Kalff; "Engineering Aspects of Architectural Lighting," by W. J. Jones. 10 a.m.

FRIDAY, SEPTEMBER 11

INTERNATIONAL ILLUMINATION CONGRESS. At Birmingham. Sessions at 10 a.m. and 2.30 p.m. Papers to be read will be mainly devoted to signal glasses and vehicle lighting. 10 a.m.

SATURDAY, SEPTEMBER 12

Sunrise, 6.28 a.m. Sunset, 7.24 p.m.

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

THURSDAY, SEPTEMBER 17

Closing date of THE ARCHITECTS' JOURNAL September Holiday Sketches Competition.

FRIDAY, SEPTEMBER 18

NATIONAL SMOKE ABATEMENT SOCIETY, 23 King Street, Manchester. Annual Conference. Liverpool. Until September 20.

SATURDAY, SEPTEMBER 19

Sunrise, 6.39 a.m. Sunset, 7.8 p.m.

TRADE NOTES

Cast Concrete Products Association

The annual meeting of the Cast Concrete Products Association is now looked upon by members as one of the most important functions of the year, as a programme progressive in interest and variety is always provided. The scientific aspect of the industry predominated at the 1930 meeting, whilst on this occasion an enjoyable and educational day was spent on July 10 as the guests of the Cement Marketing Co., Ltd.

Over sixty members journeyed from all parts of the British Isles to join Mr. Harold Anderson, the chairman of the Cement Marketing Co., Ltd., on the steamer *Viscountess*, in which the journey to the Kent Portland cement works of the Associated Portland Cement Manufacturers, Ltd., was made.

At a luncheon on board, Mr. H. W. Jenks, the chairman of the C.C.P.A., after thanking Mr. Anderson and the Cement Marketing Co. for entertaining them, said that they all realized, of course, that they could not make good products without reliable cement, and this the Cement Marketing Co., Ltd., had been unfailing in its efforts to provide.

Mr. Anderson, in reply, said, as chairman of the Cement Marketing Co., he welcomed the Association and congratulated them on the way they were developing their industry, pointing out that by united efforts they would be able to accomplish far more than they could individually.

On disembarking, the members examined the attractive exhibition of concrete products and cast stone grouped round the pavilion in which the annual meeting was to be held.

The Association's Annual Meeting

The chairman, Mr. H. W. Jenks, at the annual general meeting, referred to the considerable progress which had been made by the Association, and thanked the Council for their unstinted support during his year of office.

In submitting the Council's report, he said the period under review had been one of unequalled trade depression. That had not, however, reacted so severely on the precast concrete products industry, since they were able to meet the demands of the building trades and municipal requirements with the most economical units. Mr. Jenks then drew the members' attention to the following subjects: Standardization of building materials; concrete partition slabs; fire resistance; the various industries (silicosis) scheme, and kerbs.

The meeting then proceeded to elect the new Council, four additional names being nominated. On a ballot being taken, the old Council was re-elected, Mr. D. H. Stent, A.M.INST.C.E., taking the place of Mr. G. W. Butchard, who had asked to be relieved from office. Messrs. Crewdson, Youatt and Howard were elected auditors, and a vote of thanks to the chairman terminated the meeting.

The members then divided into parties and, accompanied by guides, examined all the stages of cement manufacture.

*

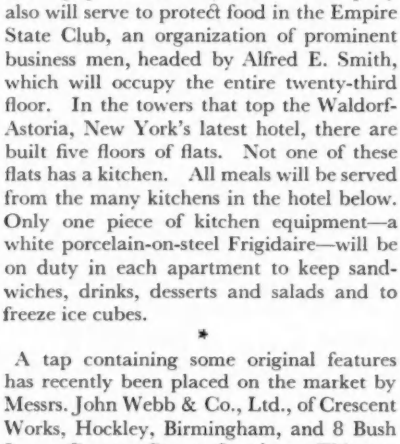
Messrs. Lumbys, Ltd., Greetland Boiler Works, Halifax, have issued a new catalogue of their various specialities. These include the "Solar" sectional boilers, which the firm claim may be placed on wood floors without danger, and which are of types suitable for low-pressure steam heating, central heating and/or hot-water supply. A big range of other types of boilers is included, suitable for every conceivable purpose. Among other specialities are the "Solar Darce" radiators. The firm are contractors to the Admiralty, Air Ministry, War Office, H.M. Office of Works, India Office, Crown Agents for the Colonies, London County Council, Ministry of Health, etc. Among the awards secured by the firm at exhibitions were the Grand Prix, Brussels, 1897; gold and silver medals, Paris Exhibition, 1878–9; and gold medal, Paris, 1900.

*

In connection with the world's tallest structure, the Empire State Building, New York, which will rise to a height of 1,280 ft., and have a dirigible mooring mast, a contract has been signed with Frigidaire to make available for the 25,000 tenants, unit-type coolers which will provide water at the proper temperature at any time of the day or night. Advanced electric refrigeration equipment built by the same company also will serve to protect food in the Empire State Club, an organization of prominent business men, headed by Alfred E. Smith, which will occupy the entire twenty-third floor. In the towers that top the Waldorf-Astoria, New York's latest hotel, there are built five floors of flats. Not one of these flats has a kitchen. All meals will be served from the many kitchens in the hotel below. Only one piece of kitchen equipment—a white porcelain-on-steel Frigidaire—will be on duty in each apartment to keep sandwiches, drinks, desserts and salads and to freeze ice cubes.

*

A tap containing some original features has recently been placed on the market by Messrs. John Webb & Co., Ltd., of Crescent Works, Hockley, Birmingham, and 8 Bush Lane, Cannon Street, London. This tap is patented and registered under the name of "Aquatite" and is guaranteed by the company to be absolutely dripless. Any tap returned to them within seven years from the date of purchase and found to be faulty will be replaced free of charge.



Section of Aquatite (pat.) dripless tap.

The sectional drawing reproduced on this page shows the new principle with double action and encased seating. The tap is suitable for hot or cold water of high or low pressure, each cock being tested to 300 lb. per square inch. Models for all purposes are available and may be finished in brass, nickel, or chromium plating.

The firm's booklet is attractively produced, the illustrations being particularly cleverly printed. Copies are available on request to either of the addresses given above.

NEW WHITGIFT GRAMMAR SCHOOL

Following are the names of the general contractors, specialists and some of the sub-contractors for the new Whitgift Grammar School, illustrated and described on pages 171-174 of this issue. General contractors, E. H. Smith & Co., Ltd., who were also responsible for the excavation, foundations, dampcourses, plumbing, iron staircases, joinery and plaster. Consulting engineer for structural work, foundations, etc., J. F. Farquharson, M.I.STRUCT.E. Clerk of Works, F. J. Pitt. General foreman, F. Baddiley. Sub-contractors: Val de Travers Asphalte Paving Co., Ltd., asphalt; Reinforced Concrete, Ltd., reinforced concrete; Ames and Finnis, bricks and tiles; Metropolitan Stone Co., Ltd., Monk's Park stone; E. Wood, Ltd., structural steel; "T.W.F." Roofing Felt Co., roofing felt; Wotton and Sons, patent glazing; Stoner and Saunders, cast lead; Stevens and Adams, Ltd., oak and maple wood-block flooring; Walters, Ltd., jointless floors; R.I.W. Products, Ltd., waterproofing materials; G. N. Haden and Sons, Ltd., central heating, boilers and ventilation; Southwell Marriage & Co., Ltd., grates and sanitary fittings; Croydon Gas Co., gas fittings; C. Harvey & Co., electric wiring and electric light fixtures; Diespeker & Co., Ltd., precast stairs and shower bath partitions; James Gibbons, Ltd., door furniture; W. James & Co., Ltd., casements and window furniture; Gillett and Johnson, Ltd., turret and clocks; A. L. Gibson & Co., Ltd., gymnasium rolling shutters; Campbell Bros., Ltd., decorative painting to Great Hall; John Daymond and Son, Ltd., modelling and stonecarving; James Walker, Ltd., decorative plaster; F. Jukes, metalwork; Carters of Brockley, wall tiling; Bennet Furnishing Co., school fittings; Lockerbie and Wilkinson, Ltd., cloakroom fittings; Croydon Water Co., water supply; "Permutit" Water Softener Co., water-softening plant.

ANNOUNCEMENT

Mr. William C. Porte, F.R.S.A., architect, has removed to "Mayfair," Arthur Square, Belfast. Telephone No.: Belfast 2482.

THE WEEK'S BUILDING NEWS

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

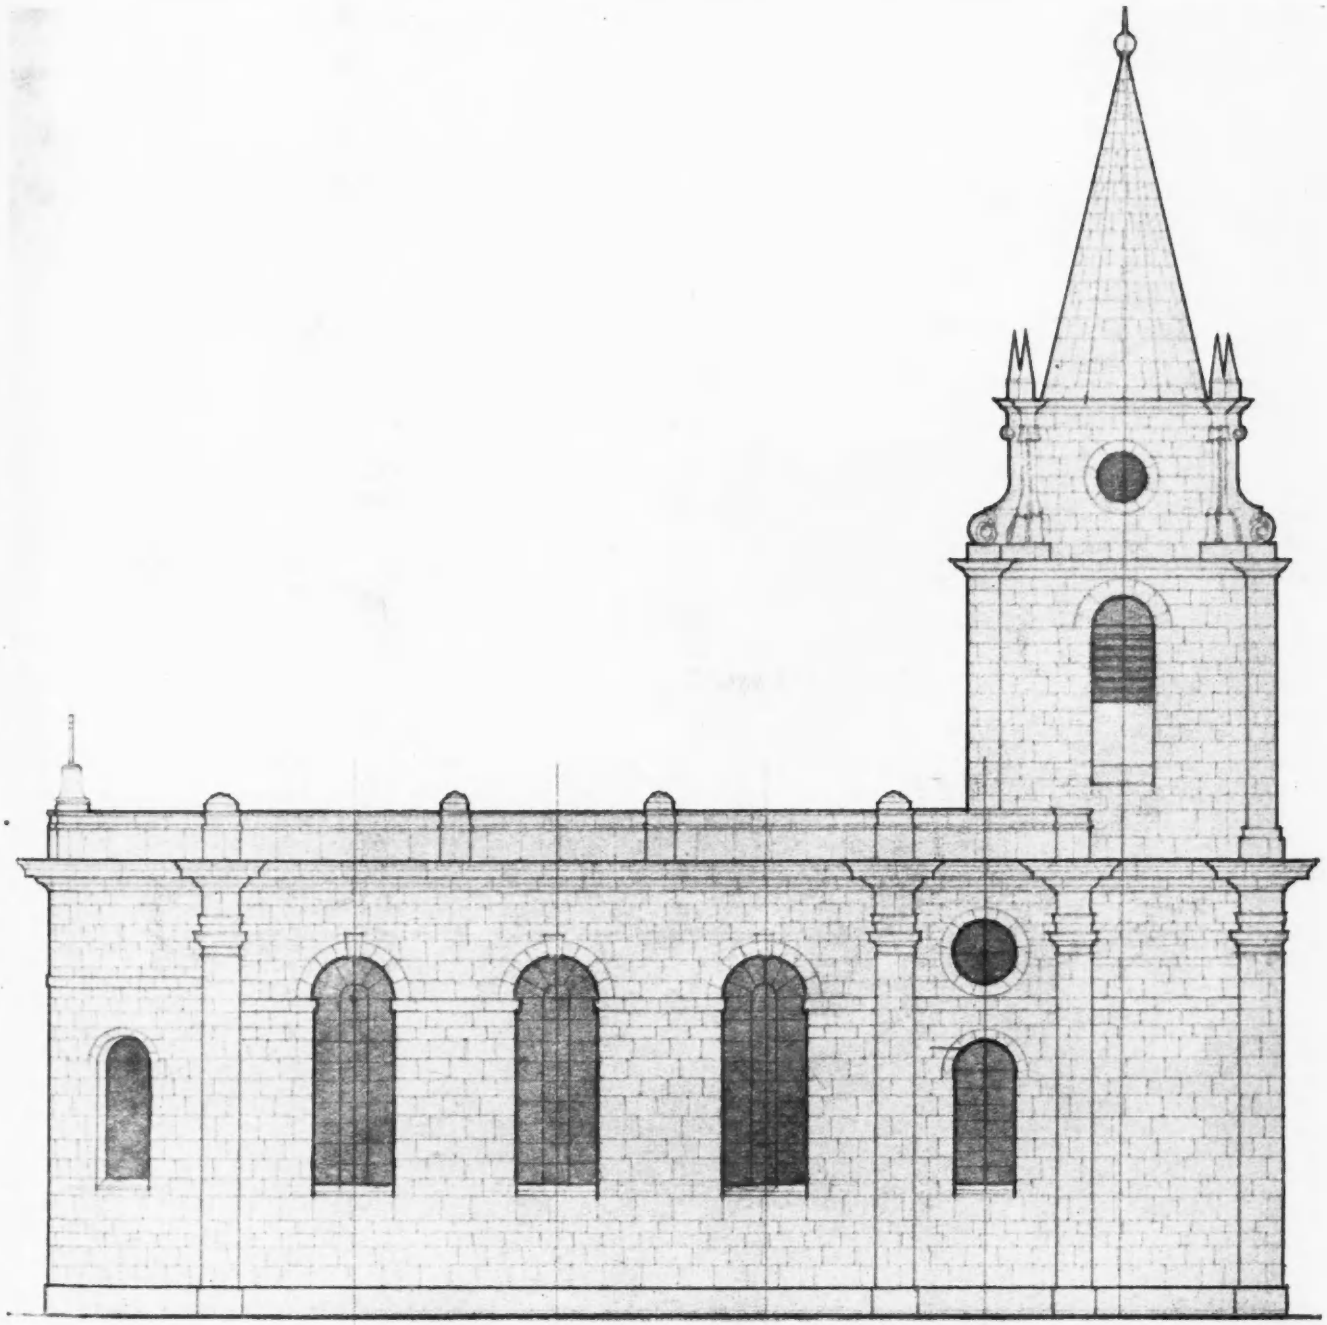
HONILEY PARISH CHURCH, WARWICKSHIRE

MEASURED DRAWINGS BY PHILIP B. HERBERT OF A BUILDING THAT IS ATTRIBUTED TO CHRISTOPHER WREN



THE NORTH ELEVATION TO A SCALE OF 8 FEET=1 INCH

THE church chosen for illustration in this supplement, by means of an elevation, section, plan and details, in measured drawings, is that of Honiley, a village about 5½ miles north-west of Warwick. Originally the private chapel of Honiley Hall, it is in use today as the parish church.

The design is attributed to Christopher Wren, and certainly has some characteristics identifiable with his style.

It is a point worthy of remark that the two columns supporting the organ balcony, indicated in the section and plan, are oval in section, but otherwise follow the usual Corinthian detail.

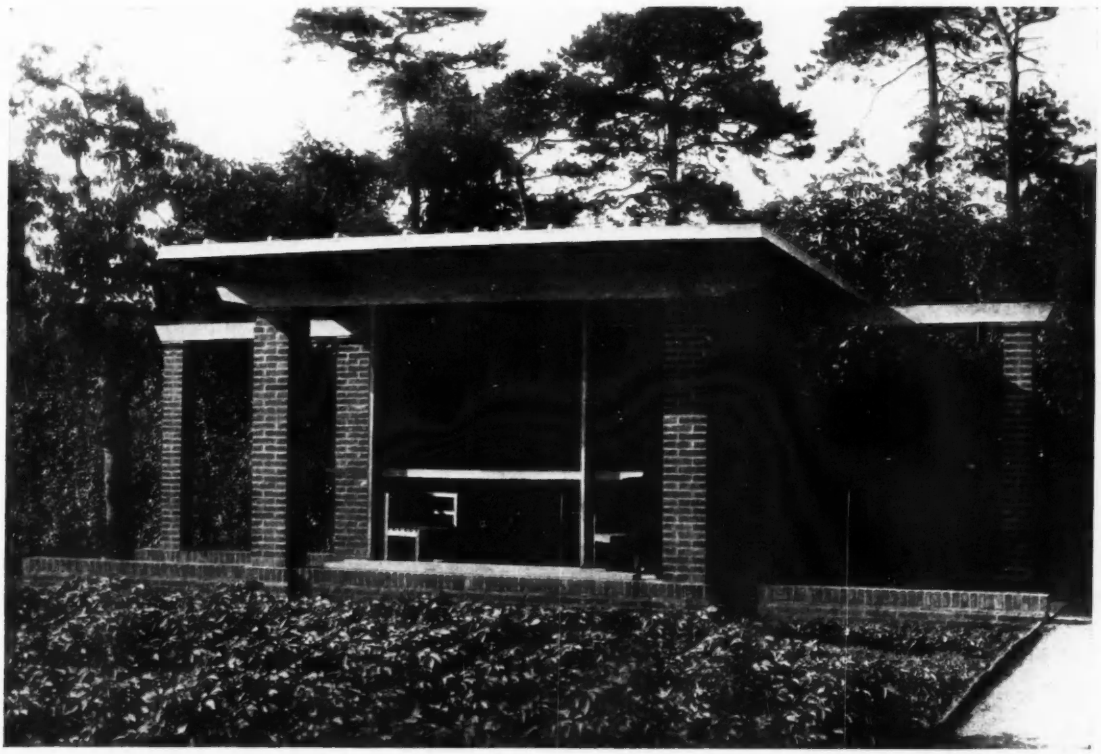
LONGITUDINAL SECTION, TAKEN LOOKING NORTH; AND PLAN (BOTH 8 FEET=1 INCH)

SUMMERHOUSE FOR HOSPITAL GROUNDS

ERECTED AT THE WILLIAM JULIEN COURTAULD HOSPITAL, BRAINTREE, ESSEX



[*Frank Roscoe, architect*

A FRONT VIEW OF THE SUMMERHOUSE FROM THE GROUNDS

THE summerhouse illustrated is situated in the grounds of the William Julien Courtauld Hospital, Braintree, Essex, and is yet another gift to the townspeople who have received so many buildings presented by Mr. Courtauld. Most readers will know of the Town Hall, Braintree, even if they do not know of the many other buildings presented by the donor of the hospital to which this latest addition is made.

The requirements called for a summerhouse for shade as there was no place in the gardens affording protection from direct sunshine. Hence the open character of the structure, with a wide overhang to its flat roof to ensure that shelter from the sun might be provided and the cooling breeze of a summer evening enjoyed.

The plan form was adopted to suit the site requirements. It will be seen that the summerhouse is approached by side paths, flanking the cultivated bed, which is placed axially with the ward block of the hospital. It was thought best to preserve the circulation of these paths.

A fine hedge runs along the back. The flat roof, lead-covered and close copper-nailed on the fascia, in a simple yet ornamental way, allows of the hedge showing behind as much as possible, where a pitched roof on so small a building would have been pretentious and would have cut the line of the hedge very unfortunately.

The whole of the timber work is oak, lime-treated, while the brickwork is in 2-in. hand-made facings. The floor is in sawn slabs of York stone which are cut square.

Two teak angle chairs complete the work.

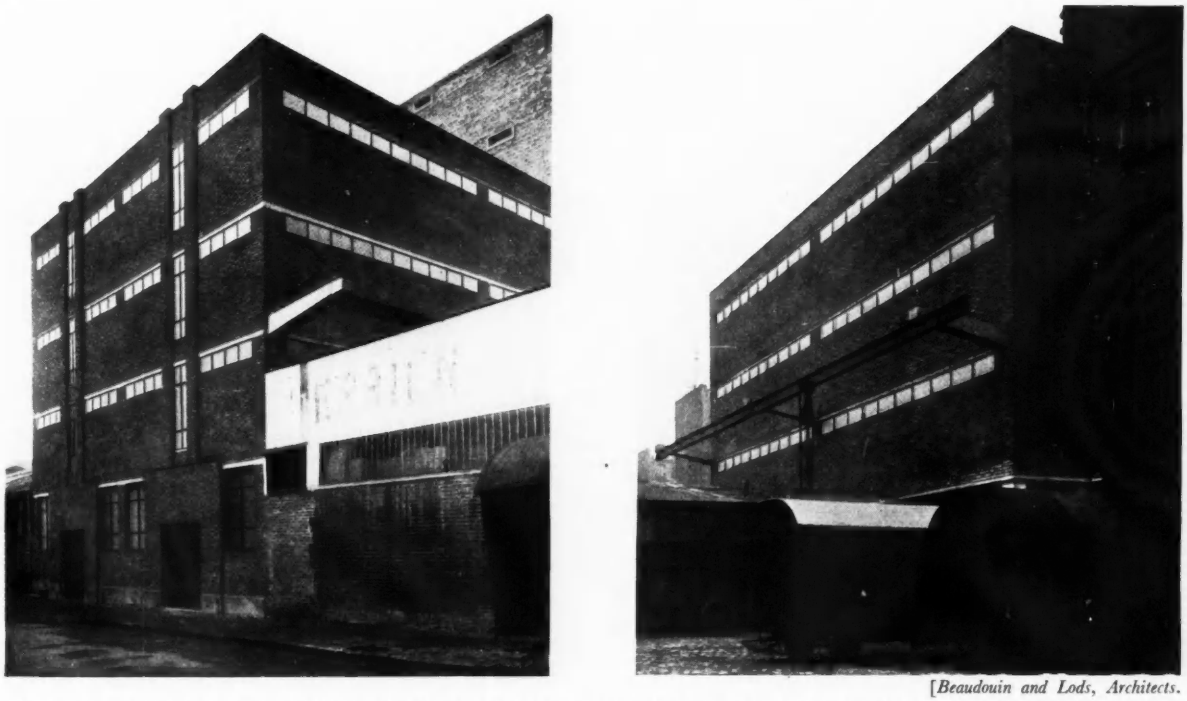
ARCHITECT.

SELECTED PRECEDENTS:
THE HORIZONTAL WINDOW

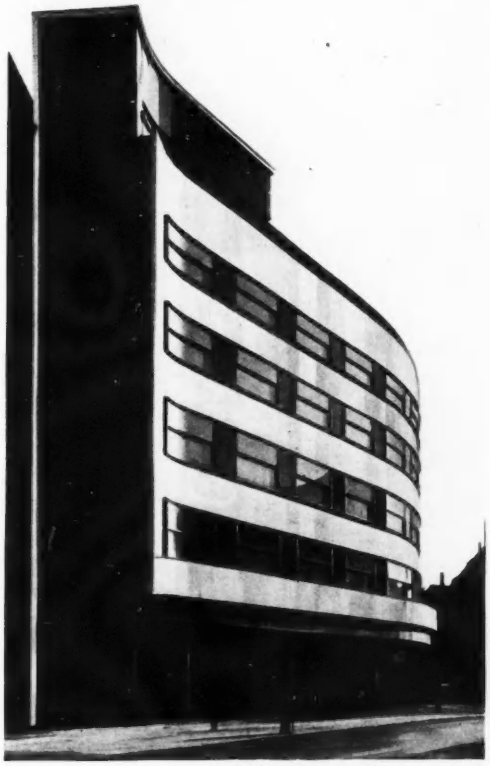


[Beaudouin and Lods, Architects.

1 and **2**. STREET FAÇADE AND COURTYARD FRONT OF A FURNITURE DEPOSITORY, ST. OUEN, NEAR PARIS.

THE longitudinal window, preached by le Corbusier as a sovereign panacea for half our housing troubles, plays a more practical rôle in modern warehouses and office buildings, where it is at once a logical corollary of steel-frame or reinforced-concrete construction, and an economical and rapid type of infilling. Instead of fenestration constituting a series of isolated punctuations of solids by voids, the present tendency in Germany, as figures **3**, **4** *and* **5** *illustrate, is to allow the windows to spread right across the façade in continuous, or semi-continuous, horizontal bands of glass wallage. The divisions between the windows in figure* **3** *are simply flat uniform mullions that separate the standardized units of four immensely long casements extending from side to side of the frontage. In figure* **5** *the three top stories form uninterrupted ribbons of glass running right round the three open sides of the building, without any break at the corners.*

The building shown in figure **1** *is an interesting hybrid example combining vertical and horizontal fenestration on the same elevation. Here a pair of upright windows are used quite logically to indicate two adjacent staircases. In the courtyard front, on the other hand (figure* **2**), *an expanse of blank wallage in plain brickwork is barred by three identical parallel bands of unit glazing, which reappear on the street façade, to light three floors of equal height and area.*



Luckhardt and Anker, Architects.

3. THE TELCHOW BUILDING, POTSDAMER PLATZ, BERLIN.

The Telchow Building (figure **3**) *is a large confectionery shop with a first-floor café, having office suites on top, completely revetted in slabs of white and dark blue vitrolite. The Westfalenhaus, a reinforced-concrete structure, faced with large ceramic tiles, erected on an irregular site, really consists of two separate buildings. The main part (figure* **4**) *comprises shop premises and offices, with a prominent tower at one corner; while its annexe (figure* **5**), *which has different roof and floor levels, contains a two-storied café with an all-weather balcony, and three floors of offices and showrooms for a Co-operative Society above.*

P. MORTON SHAND

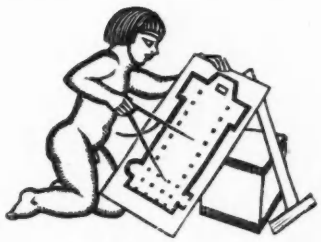
THE ARCHITECTS' JOURNAL



WEDNESDAY, AUGUST 12, 1931

THE LABYRINTH

IF the ignominious failure of the L.C.C. to prepare a workable plan for a bridge at Charing Cross has proved anything, it is the necessity for a plan for Central London.

Charing Cross in its early stages was a bridge. Next, it was a traffic scheme. Then an improvement scheme for the south bank. Lastly, it is seen to be part of the greater plan of London. We advance.

Incontrovertibly we advance, though we but reach conclusions arrived at by thoughtful men half a century ago, applying ourselves to problems which the other capital cities of the world are already solving. New York, Berlin, Rome, and now Paris are working according to plan.

London alone, possessing few of the initial advantages of these cities, a haphazard accretion of centuries' growth, lumbers forward to an unknown future.

Let bridges be the subject and we can name at once Southwark Bridge, Lambeth Bridge and the proposed St. Paul's Bridge, none of which can be provided with approaches that will produce traffic enough to fill them. Southwark Bridge lies, half deserted, a stone's throw from congested thoroughfares, and Lambeth Bridge, built to a limit of wideness, debouches on the north through a bottle-neck, which one can nearly say was designed by the Westminster City Council, on to a hinterland of narrow streets for which no scheme of re-planning exists.

But the bridging of the river is but a part of the machinery of the metropolis. Leading north and south, these bridge roads spread and enmesh themselves into a labyrinthine complexity of streets, mile upon mile—miles that have been slowly added to miles in blind growth—until the brain wearies of streets, and the idea of London becomes only a dirty dreariness.

Yet this dreariness has certain cohesions, nuclei, framework. By a ceaseless effort it contrives to function. It has circulation.

Looked at in the large, it is this circulation, daily enfeebled by congestion, that we have now to provide with further channels in an effort to keep our civilization alive. Left alone, congestion and vested interest will strangle us, and unplanned London will cost us more than we can afford to pay.

Re-planning London will be a long job. The initial stages entail scientific study that might well occupy years, even though ten weeks of really co-ordinated examination would enable us to plan ahead with fair chances of success. The great thing is to start, and to start well, with the determination for action, for we can no longer afford another year's delay.

What does such a re-planning involve? Two things, we think, are primarily involved: hard fact and imaginative manipulation of fact.

For the first we require an organization capable of assembling the facts about London with the utmost speed and accuracy. Many organizations pledged to such a service already exist, but only a paid organization can sustain the effort necessary for such a job, for a great deal of it has little recognizable connection with planning and less with civic ideals. It can only be done by men who like that sort of thing, and is no work for amateurs.

These facts, covering the whole physical and social structure of London, require to be assembled, presented in readable and analysable form, and used as a planning matrix. The man who can use this material, transmute and re-create it, must be an artist, a man of imagination, something of a prophet—the better prophet for having a basis of fact from which to prophesy. He must be an organizer, one who can use others, find a place in the plan for those whom a less generous system would exclude as being not officials but ordinary citizens.

And this man must be architecturally-minded, urbane in the best sense of the word that includes all of a town, the lesser and the greater. If we were asked what man could carry so many virtues, we would indicate Dr. Schumacher, of Hamburg, as the type of such a man—sociologist, architect, artist, man of imagination.

We don't believe this plan of London is work for a committee functioning as a committee, but for a man, helped, if you like, by a committee, but a man, acting, guiding, stimulating and *continuing* one great work.

The plan of London is needed desperately, but it must be gone about as though it were the grandest, noblest thing we ever did. And we should pay handsomely for it.

FIFTEENTH CENTURY ENGLISH HOME

The grounds of Great Dixter, Northiam, East Sussex, were thrown open to the public on Saturday last in furtherance of the scheme in aid of the Queen's Institute of District Nursing. Visitors had the additional privilege of inspecting the house—one of the most beautiful survivals of Fifteenth Century domestic architecture.

The upper view shows the east end of the great hall, dating from *circa* 1450; the lower, the north front, seen from beyond the sunk garden.

The house is now the residence of Mr. Nathaniel Lloyd, a frequent contributor to these pages, whose *History of the English House* is in preparation for late autumn publication by the Architectural Press.

NEWS & TOPICS

THE HISTORY OF REGISTRATION

THE beginning of the movement for the voluntary registration of architects in Great Britain, writes Mr. C. McArthur Butler, Secretary of the R.I.B.A. Registration Committee, in discussing the early history of registration, dates from 1791, 140 years ago, when the Architects' Club was founded by some of the leading architects, including Sir William Chambers, Robert Adam, John Soane, and S. P. Cockerell. This was followed in 1806 by the establishment of the London Architectural Society, probably the first institution having aims and objects similar to those of the present Royal Institute. It seems that this Society became extinct before the formation of the Architectural Society in 1831 In 1834 it became evident to some of its members, architects of established reputation, that although most of the other arts and sciences had their Associations for the promotion and cultivation of their art, architecture, which embraced the whole of the arts and sciences, was without such an establishment in this country, and in 1842 the Architectural Society joined the Institute of British Architects, which had in the meantime been formed in 1834 and had received a Royal Charter in 1837.

★

The principle of the formation of a register of architects by, and under the control of, the R.I.B.A. has been acknowledged and accepted in Great Britain for nearly 100 years. In 1859 the Council of the R.I.B.A. adopted the principle of the examination of architects, whether members of the Institute or not, and the examination was made compulsory for Associateship in 1881, but it was not until 1884 that the first attempt to secure statutory registration was made by the then newly-constituted Society of Architects, a body formed mainly by members of the R.I.B.A., who were dissatisfied with the inactivity of the senior body on the question of statutory registration. Bills for the Statutory Registration of Architects were introduced into Parliament from time to time by the Society of Architects, which also carried on an intensive campaign amongst members of the profession and other interested callings, and in the course of time so consolidated professional opinion in favour of statutory registration that in 1905 the Council of the R.I.B.A. formally adopted the policy.

★

In the meantime the question of statutory registration had been discussed at International Congresses of Architects held in Paris (1900), London (1906), Vienna (1908), and Rome (1911), at each of which resolutions were passed expressing in effect the view that, in the interests of the public of all nations and of the profession of architecture, all practitioners should have statutory qualifications, and that the title "architect" should be restricted to persons provided with certificates of capability, to be placed within reach of all, by means of architectural education and training. After the interruption caused by the Great War, 1914–1918, the R.I.B.A. invited the Society of Architects to negotiate for closer co-operation, and in 1925 the two bodies were amalgamated and the Royal Institute undertook to promote and use its utmost endeavours to carry through a Registration Bill until it became an Act of Parliament. Immediately following the amalgamation, the R.I.B.A. drafted a Registration Bill, and in December, 1926, the text of it was published and submitted to kindred institutions and universities and other interested bodies, and amendments were made to meet their views as far as possible. Thus was settled the Bill out of which the present Act has grown to (almost unrecognisable) maturity.

THOSE ADAM FIREPLACES

Developments are awaited, as they say, in the case of the four Adam fireplaces, feloniously, burglariously and vandalistically abstracted from a house in Bedford Square, owned by the Architectural Association, but for the time being unoccupied. Applying to the problem the question of motive, the detectives in charge of the investigations are said to be of the opinion that the ultimate intended destination is the continent of America, a dry land, athirst for art souvenirs, among other commodities. Hence a watch is being kept at the English ports. But even in these hard times of diminished exports the chances of detection by this method seem formidably slender, the possibilities of their slipping through in cases labelled "Machinery. Do Not Drop" or some such fiction, fair. I doubt whether the A.A. will see their fireplaces again—which is hard luck, as it is only a couple of years since they lost one or two out of their own building.

SOMERSET COTTAGES

One of the most handy and practical booklets I have ever seen, dealing with the care and enlargement of old cottages, has just been issued by the Somerset Rural Community Council. Every visitor to Somerset knows that in the county are a great number of small houses and cottages, with stone-mullioned windows and well-moulded dressings, rather similar to cottages to be found in the Cotswold country. There are also in West Somerset many dwellings with cob walls, wood-framed windows and thatched roofs, and chimneys in front. It is advised that stone-tiled roofs should, if possible, be relaid, with stone tiles, but if this is too expensive, with a soft dun-coloured tile or even an asbestos tile, if of russet colour.

★

It is reported that a quarry has recently been opened which will provide Wiveliscombe slates of good quality. A special word is said in favour of thatch. "Well-laid of good wheat straw, it has, to start with, a life of twenty-five years, with renewals to the heading of the ridge, but in reality a life far longer than that and at little cost for repair." I understand that one of the Surrey Councils is thatching its cottages at the present time. In a few pages this document contains a volume of practical hints.

A VIENNA PERMANENT BUILDING EXHIBITION

The *Werkbundsiedlung* housing estate in Vienna, which is being constructed under the auspices of the Austrian *Werkbund* to the designs of thirty of the most prominent Austrian and foreign architects of the modernist school, will be shown as an exhibition of the modern home during the months of May and June, 1932. French, German, American, Dutch and Russian architects will be represented by houses which, as at Stuttgart, will later form part of one of the City of Vienna's rehousing colonies. The site of the exhibition is a wedge-shaped piece of land between the Veitinger-Gasse and the Jagdschloss-Gasse. Among the foreign architects participating are Richard Neutra, André Lurçat, Gabriel Guevrékian, Hugo Häring and Rietveld. Austria is well represented by Josef Hoffmann, Josef Frank, Clemens Holzmeister, and younger men like Hans Vetter.

ASTRAGAL

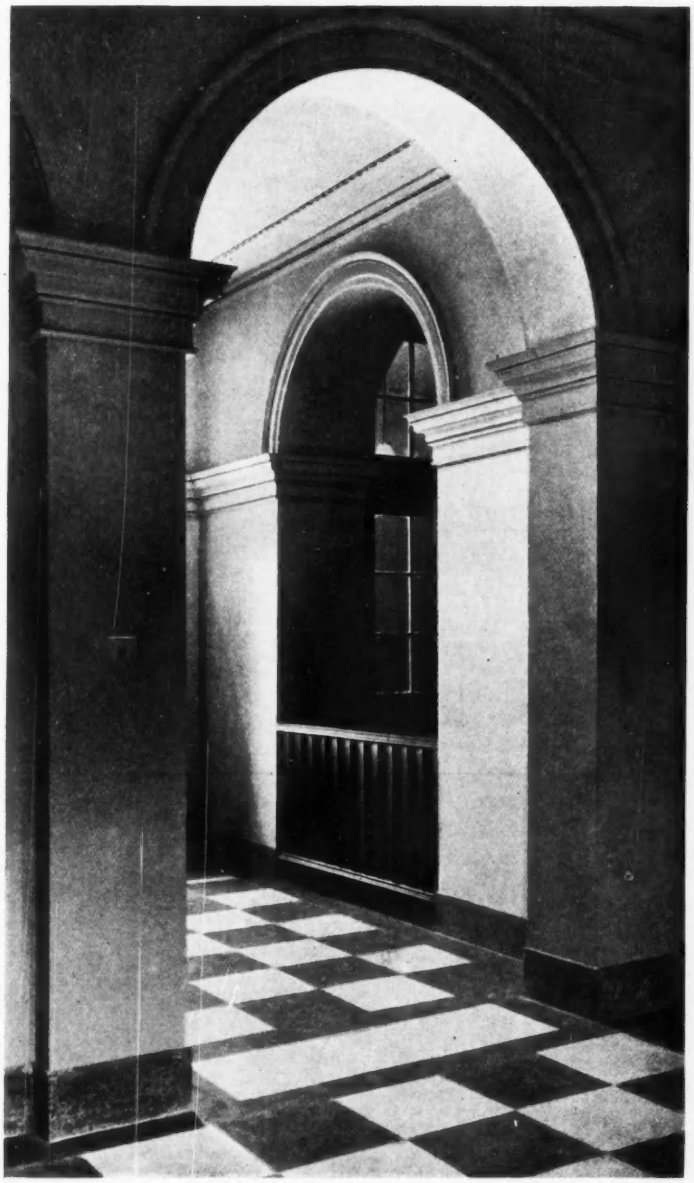
Aladdin Factory, Greenford, Middlesex.] [*By Nicholas and Dixon-Spain.*

THE ALADDIN FACTORY

The main entrance front which will eventually face the projected prolongation of Western Avenue, a new one hundred foot arterial road. Details of the tower, which is constructed in brick and stone, and contains water storage, are reproduced on a special supplement accompanying this issue.

THE ALADDIN FACTORY

DESIGNED BY NICHOLAS AND DIXON-SPAIN



Looking from the staircase hall into the entrance hall in the direction of the inquiry office facing which is the waiting-room for visiting callers.

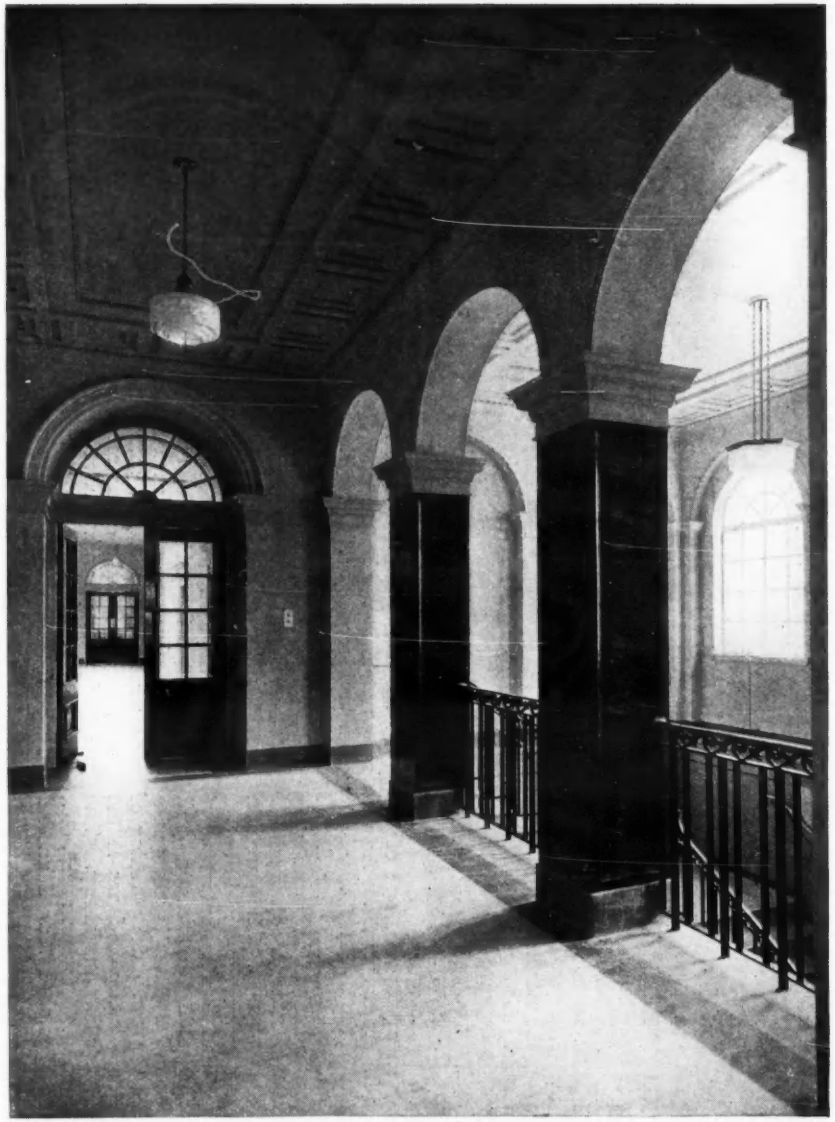
EIGHTEEN months ago Messrs. Aladdin Industries, Ltd., secured a site at Greenford, bounded on the north by the Grand Junction Canal, with a depth of 328 ft. and a frontage of 1,350 ft. to the projected prolongation of Western Avenue, one of the new 100-ft. arterial roads. At the eastern end of the site they have built a group of buildings, the character of which gives a lead to later comers in what may become a distinguished commercial avenue. The western portion of the site is to be laid out as a sports ground for the employees.

The main building consists of a block of administrative offices together with the factory proper. The planning of the building directly conforms to the layout of specialized machinery. The floor space allotted to works area, etc., is upwards of 30,000 sq. ft. Connected with the factory are suites of locker rooms and lavatories for men and women, laboratory and experimental rooms, works manager's office and a dining-room, 58 ft. by 28 ft., with fully-equipped kitchen and service.

The administrative offices, on two floors, have a frontage of 172 ft. by a depth of 52 ft., and house export office, offices for principals, accounts office, conference- and show-room, strong room, store rooms, stationery room, rest room and a dining-room for the clerical staff, with service room. The central tower, 90 ft. high, provides storage for water, which is pumped from an artesian well 450 ft. deep.

While there is perhaps little in this block of buildings which may be termed "novel," the various methods of factory construction were fully explored by the architects, and the one adopted appears to be easily the best suited to the programme. The high proportion of window area results in extremely well-balanced lighting in all parts of the buildings, and, in face of this, it is difficult to maintain an argument in favour of the all-glass walls of some Continental examples even for this northern clime.

The arrangement of the plan follows the sequence of processes of the industries for which the factory was built, and the general welfare has been provided for in the spacious dining-room, rest and first-aid rooms. The temperature of the dining-room and



The first-floor landing, looking towards the corridor leading to the staff dining-room, etc.

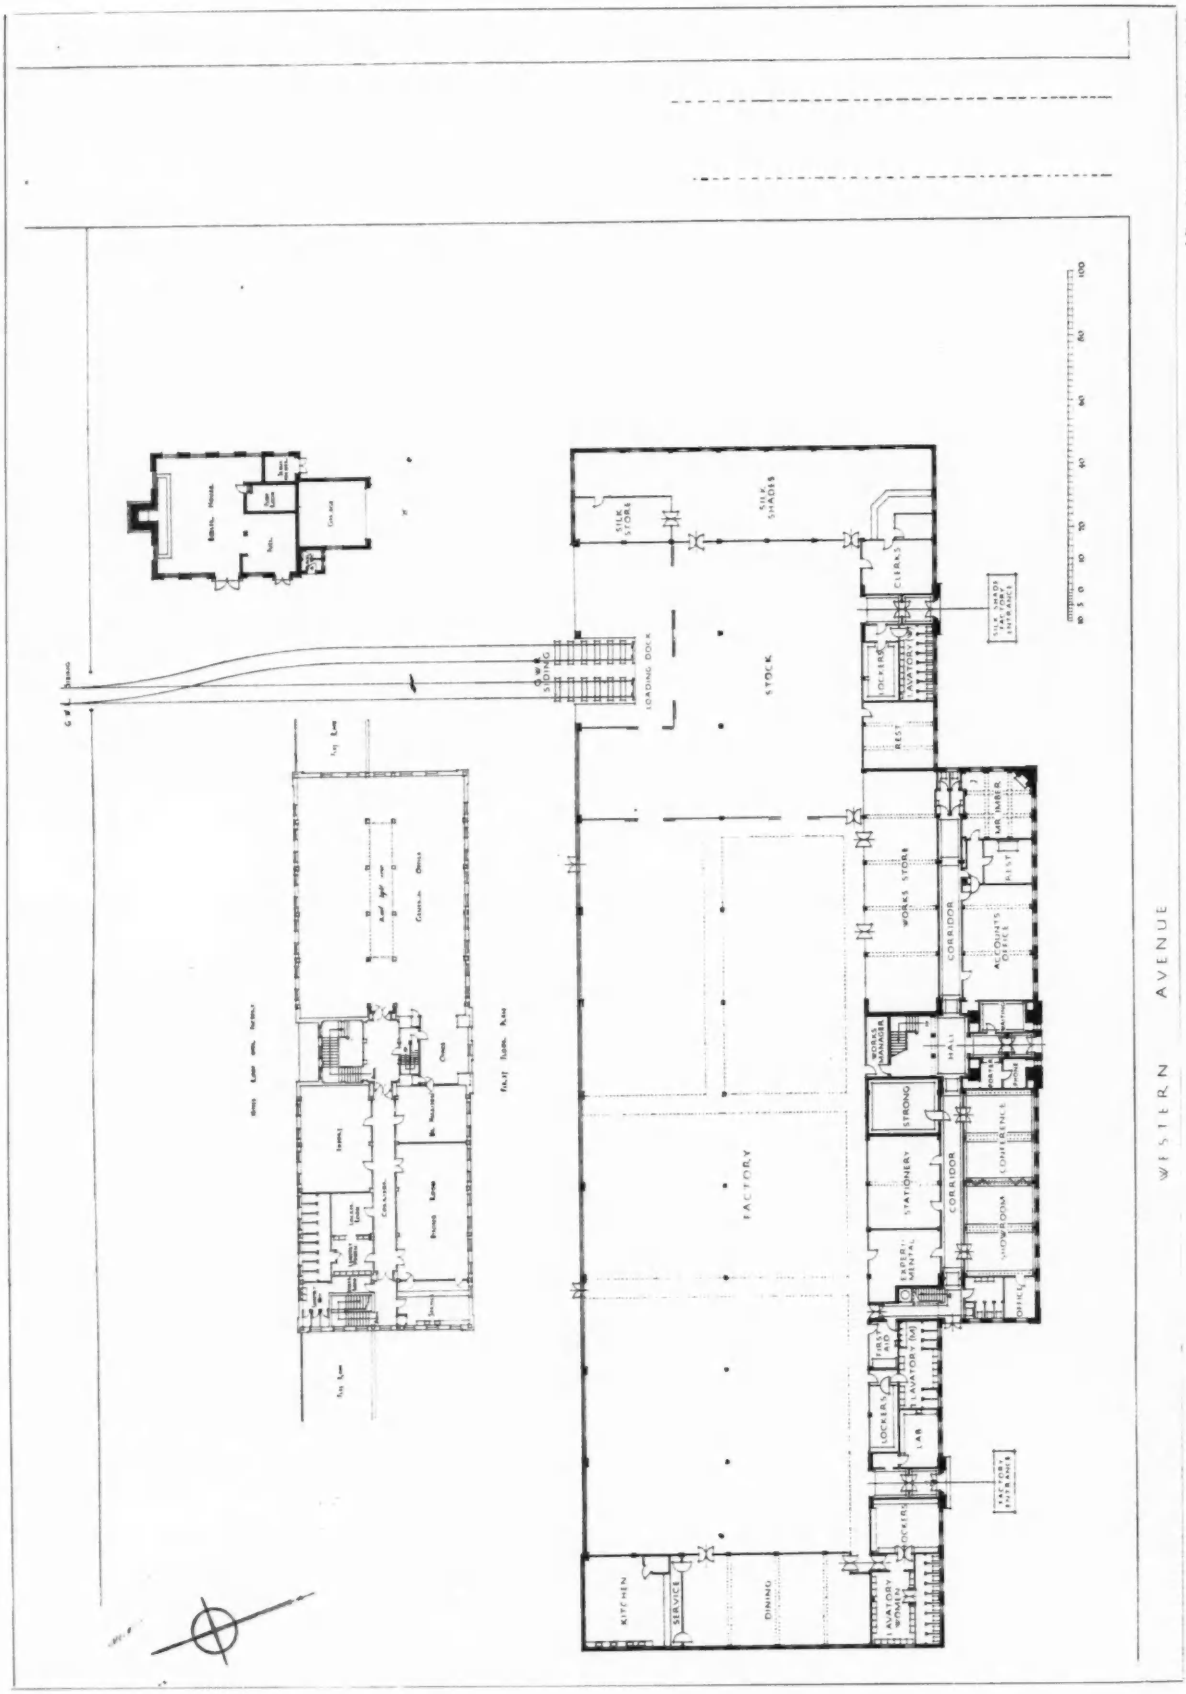
The managing director's room, on the ground floor, which overlooks the main front.

Aladdin Factory, Greenford, Middlesex.]

The light, airy and spacious works dining-room. It is connected with a fully-equipped kitchen through the service doors seen in the far wall.

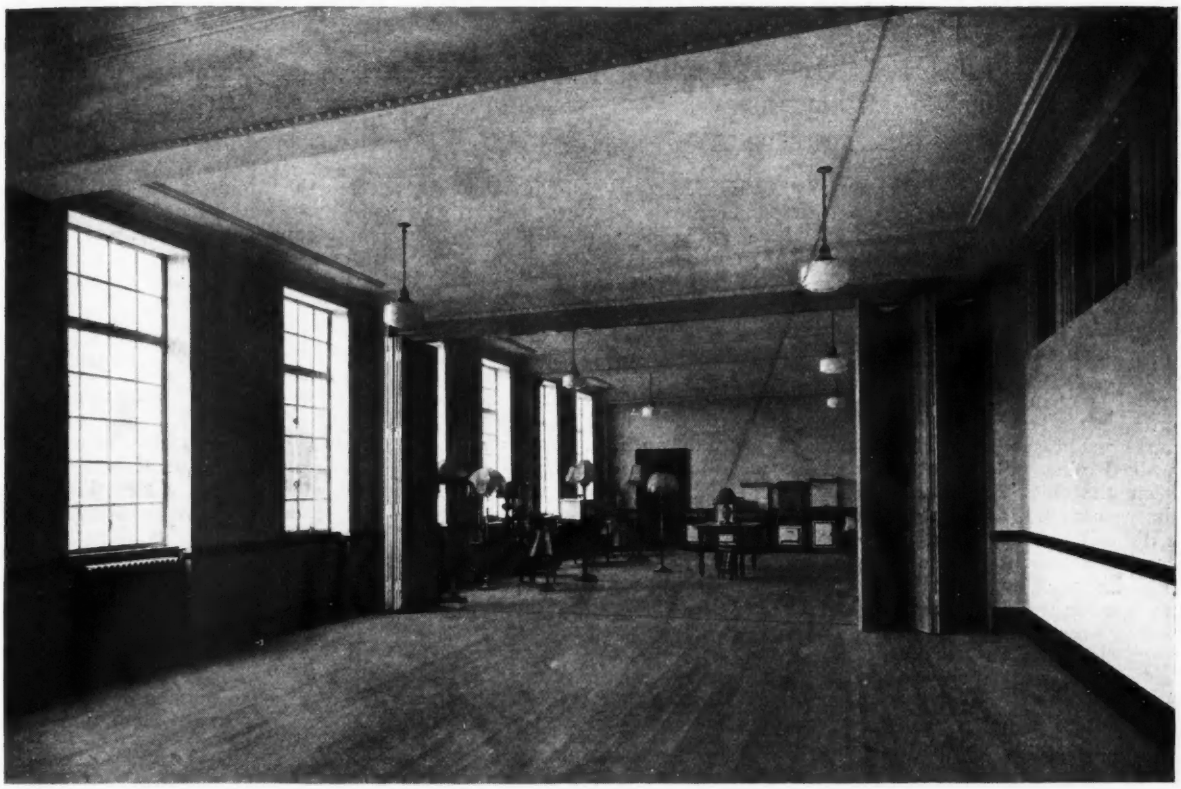
[*By Nicholas and Dixon-Spain.*

The workers' lavatories, like many other features of this model factory, are above the ordinary factory standard and have locker rooms adjoining them.

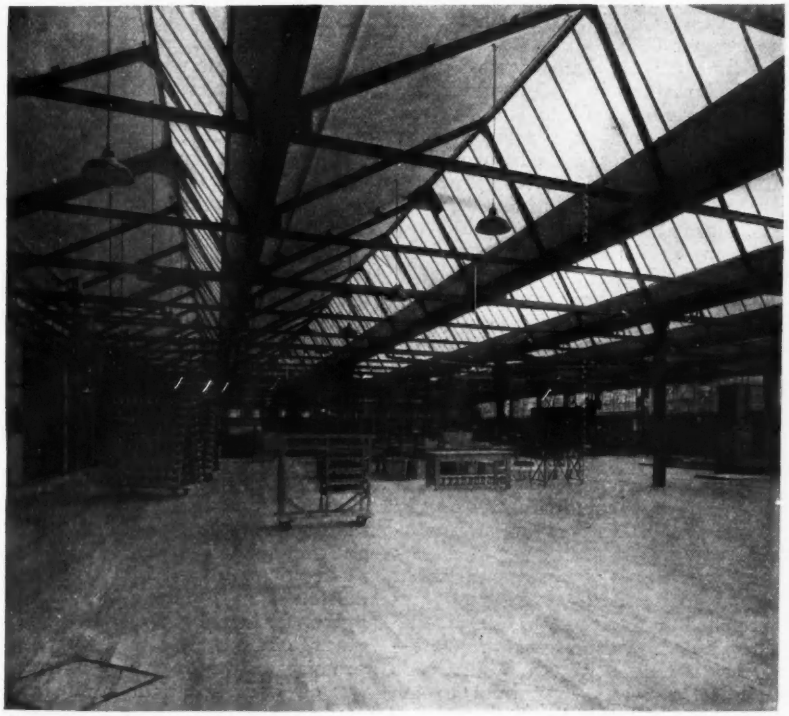


Aladdin Factory, Greenford, Middlesex. [*By Nicholas and Dixon-Spain.*

Plans of the ground and first floors of the factory and ground floor of the boiler house and garage. A portion of the site will be laid out as a sports ground.



Looking from the conference room, at present unfurnished, into the showroom. Note the high proportion of window area and the suspended folding partition between the two rooms.



Aladdin Factory, Greenford, Middlesex.] [*By Nicholas and Dixon-Spain.*

North light roof-construction in the factory. The planning conforms to the layout of machinery specialized for the manufacture of the firm's products.

other apartments has been schemed to be the same as that of the working bays.

The walls are of brickwork and the floors of trussed concrete. The whole of the floors, including the works area, are laid with maple boarding.

The exterior colouring is that of natural materials, well chosen for colour, which time cannot affect adversely. For example, the brickwork is 2-in. multicolour, with Bath stone dressings. The building is, indeed, likely to become only the more mellowed with the onset of time. It may even become black, since the materialization of this group of buildings appears to have given the locality fresh impetus.

The Aladdin factory and that for Messrs. Heinemann at Kingswood (illustrated in THE ARCHITECTS' JOURNAL for August 14, 1929), are outstanding examples of recent commercial work from an architectural standpoint. Their style impresses one with a sense of reasonable co-operation and *esprit de corps* in manufacture, and they stimulate the hope that there may be many more to follow, housing a contented and well-working community and signifying good work, good wages, pride-in-work and an abiding and just collaboration between capital and labour.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xii

AN ARCHITECT'S EARLY GRUEL

BY KARSHISH

(H. B. CRESWELL)

ONCE, on a solitary walking tour, I covered three miles in company with a pedlar. He was a man of fifty, of indifferent physique, who had been a draper's assistant on Ludgate Hill until greying hair signalled his dismissal. His custom lay chiefly at outlying farms; and he tramped in a bowler hat, black morning coat and umbrella, carrying small articles of haberdashery in two baskets slung from a strap across his shoulder. He told me he walked nine miles one day and eighteen the next six days a week all the year round, and when I asked if he did not get greatly fatigued—for he carried a weight of one hundred pounds—his reply astonished me.

"It's not the walking that tires," he said. "It's the *talking*."

This revelation of an actuality of the pedlar's trade, made me for the first time conscious of a salient fact of my own profession, namely, that it is not the job that taxes, but the *people*.

I imagine the architect's heaven to be a place where he conceives, designs, constructs, specifies and directs, free from the obstruction of other persons and from preoccupation with the safeguards which the imminence of that obstruction calls for—a place where he is never misunderstood; where his wishes are never thwarted; where interferences by clients and public authorities, resistance by contractors, and disloyalty and incapacity of assistants and workmen, are unknown. Until, if ever, he wins to heaven, however, a conscientious architect can only get his work done by sustained violence of purpose: however suave, orderly and ingratiating his method of enforcing his will may be, he cannot relinquish for a moment the watchfulness of a boxer in the ring.

I should be much interested to know whether there is any architect of experience who, after honestly scrutinizing his own inwards, will quarrel with this generalization; for it is true of myself and to my observation of others. I refer to the matter here in order to justify my use of the word "gruel"; for when I took up my work as Resident Architect to the Eureka Plough Company at Nollingborough, I found myself beset not merely by the greatest amount of obstruction that normal conditions of architectural practice allow, but by a deliberate and malicious hostility and organized opposition, rooted in that petty enviousness and mean rivalry that no one who is unfamiliar with commercial life and the trivial, jealous self-consequence of a small provincial town, will readily understand.

Most men begin independent practice, tentatively, with small works of a kind with which they are familiar, commissioned by clients who are indulgent well-wishers; and with professional friends near at hand to guide their decisions, compose their doubts and inform their inexperience; and armed also with the authority of the accredited agent—for such, in law, the architect is—to command the obedience and hold the respect of those they are called upon to direct. What, however, was my predicament?

I was pitchforked into vast building proposals—measurable, literally, by the *acre*—of kinds quite new to me; my employer had no understanding of architecture and an engineer's contempt for architects; I was burdened by interferences, and by the requirements of a fatuous organization that tripped me up at every turn and enormously increased the labour of preparing contract particulars and getting the work done; the "Yard Foreman," who had previously been in charge of maintenance and minor alterations, regarded me with implacable hatred as the usurper of his authority and with contempt for my ignorance of those practical matters in which, alone, he was informed; while the Works Manager viewed my advent with intense resentment since he would in future no longer be the chief person consulted in building proposals, and also scorned me for not being an engineer—he himself being unconscious of any other field of attainment.

Both these men openly showed their hostility and made things as difficult for me as they dared; I was thrown entirely on my own resources, without a friend or even an acquaintance—much less anyone who could help me to resolve my many doubts; the Surveyor of the Urban District Council made compliances with the bylaws as difficult for me as he could, and was openly insulting in his manner and by innuendoes implying contempt for my standing and my pretensions, when I went to see him—as he frequently compelled me to do. The intense bitterness of the dispossessed architect—a local practitioner with a surveyor's qualifications—was so painful to me that there were times when the realization of it depressed the heart so that its beat became thick and heavy within me; I found my social standing reduced to that of "a young man at the Steel Works," and myself identified with the swarm of accounting and secretarial clerks who infested the offices and streamed in and out of the front gates, at appointed hours, like ants; and, finally, the authority which the law gives the architect to command the obedience and enforce the respect of contractors was, in great part, stripped from me, so that I had to go forth against the hosts of Philistine (commercial) contractors, like David arrayed with a pea-shooter—a weapon whose terror lies only in its threat.

These, then, were the main ingredients of my gruel; but unless I enlarge on the nature of those ingredients and explain how they came to be components of my bowl, my predicament will be little understood. Such a recital will constitute a narrative of unusual experiences, but the reader must not forget what kind of person it was who suffered them; and must remember, also, that I was not at the time, aware, as I now am, how great my unhappiness was; for I supposed my sufferings were the common lot of architects and that I had to make the best of them.

No one is better aware than I am how much my own defects in character contributed to my distresses and increased my difficulties; at the same time my shortcomings were in kind, if not in degree, those that belong to all men; and since I won through and, however precariously, made a success, the tribulation by which that success was reached has claims on sympathy and is a direction post to those who may find themselves circumstanced as I was. I will, therefore, make the constituents of my gruel—enumerated above—the text of my immediate narrative.

The building operations I found I was required to conduct, when ten days after my interview with Mr. Stevenson and his co-directors I deposited myself and most of my possessions at Nollingborough (Garston harbouring my non-technical books and bits of old furniture at his office or "diggings"), extended from innumerable small additions, alterations, and emendations of defects and oversights—which were carried out by the firm's own building staff—to the extension of the machine shops by an area of 240 ft. by 190 ft.; and included offices for myself, with building yard and shops; a sumptuous engine, transformer and accumulator house; additions to the main offices, extensions of foundry, new pattern stores, core ovens, latrines, lodges for cooling water, a four-foot sewer a hundred yards long to compromise an easement, revision of lay-out of sidings, and much else besides, not to mention two furnace chimneys 120 and 90 ft. high. These works I proceeded to put in hand—not, of

course, all at once, but in the kind of order which may be described as "nearly everything before nearly everything else"; and went to the offices of the company one morning, equipped with a shirt and a box of instruments, to do it.

The terms of my engagement Mr. Stevenson had proposed were a salary of £250 a year, payable monthly, and "a bonus, Mr. Whistlow, of such an amount and paid at such times as the directors may deem appropriate to the results"; and as the salary was twice what I had previously earned and more than I thought I was worth, I had had no hesitation in accepting it, for Mr. Stevenson's shrewd business instincts had led him to speak lightly of the work in view. However, I think that—considering my inexperience, and bearing in mind the humble character of most of the work, and my dependence on the firm's engineers, and the company's (virtual) acceptance of responsibility for the Resident Architect's negligence—my services were adequately paid; for my salary rose to £300 and £350 in the succeeding two years, in which time I had also received £700 in two bonuses, after being first asked, very handsomely, by the chairman at board meetings, whether the amounts proposed met my views.

Living in lodgings, as I did, I was able to spend much more than formerly and yet put by very nearly a thousand pounds before my engagement came to an end on the heels of my thirty-first birthday. I do not regret that—as a result of inflammatory contact with engineers—much of this money was afterwards squandered by riotous indulgence in the newly-invented motor-car.

Within an hour of my arrival at Albion Works my troubles began. In a long interview Mr. Stevenson first told me that I might have some trouble with Piggott, the Yard Foreman (who was to be appointed my foreman of works), as the man's responsibilities had gradually grown with the expansion of the firm till he was too big for his boots, and he also had a very ugly temper; and he then seriously warned me that it would be necessary for me to use great tact in "conferring"—he emphasized the word—with Mr. Beverly Kent, the Works Manager.

"I will take you myself and introduce you to Mr. Beverly Kent," he said, in a hushed manner, giving me his beard as he consoled himself under the chin.

"Is Mr. Kent . . . ?" I began.

"Mr. *Beverly* Kent," he corrected me; and in answer to my completed question told me, No; that I would not take instructions from Mr. Beverly Kent, but only from himself or his co-directors—"but tact, Mr. Whistlow, will be necessary. It will be advisable for you—at any rate at first—to note Mr. Beverly Kent's instructions and report to the Directors through the Secretary with plans and sketches in duplicate for the Board's approval or—er—otherwise. Your instructions will come to you in the form of extracts from the board's minutes through the Secretary. There is a special form of acknowledgment to be made of all such instructions—also in duplicate: we have a system of duplication or quadruplication we employ, and an appropriate distinctive colour for your inter-departmental stationery will have to be arranged—but all these matters will be explained to you by Mr. Foulkes, and I need not delay you with a resume of them."

Delay there was, however, when Mr. Stevenson unmasked a regulation which was to be a thorn in my side and an impediment to my usefulness all the years I acted for him. He told me that my letters would be written and signed by the Secretary.

"But, sir, Mr. Foulkes will not understand what he is signing!"

"—— From drafts or information you will supply. Permit me to hint to you, Mr. Whistlow, that we are not entirely ignorant of our business! Mr. Foulkes is accustomed to indite correspondence dealing with matters of accountancy or engineering with which he is not technically acquainted. Our system, you will find, safeguards errors and secures that the firm's correspondence conforms to a certain standard of courtesy and elegance. The Directors do not allow Tom, Dick and Harry to represent them in correspondence with our customers," he concluded, growing a little pink.

I had already noted that standard of elegance and my alarm was increased.

"Yes, but there is another objection, sir," I broke out.

"I am not inviting your objections, Mr. Whistlow. Incoming letters will be opened and registered, and outgoing written and signed by the Secretary. You will receive carbon duplicates for your files, and you can, if you wish, see the carbons before the letters are press-copied and dispatched. All our letters are press-copied in the Sub-Secretarial Branch, for, as you are of course aware, a carbon copy is not accepted as evidence in a court of law."

"Yes: but how will it be possible for me to make contracts, sir?"

"How possible! I will thank you to kindly explain yourself, Mr. Whistlow."

"Well, sir, am I not your architect?"

"You are appointed to the situation of Resident Architect to the Eureka Plough Company—if that is what you wish to tell me."

"I do not understand, sir, how I shall be able to act as your architect and make contracts if the contractors are to receive instructions from *you*."

"From me!"

"I mean from the Secretary—on behalf of the Company."

"Mr. Whistlow, you surely will not be surprised to hear that we enter into contracts nearly every day of the week. Our standing contracts for our Rockingham Reapbinder *alone*——"

"But——"

"——You interrupt me—*alone* amounted, yesterday, to considerably over *two hundred thousand pounds!*"

"Surely, sir, that is a totally different matter."

"It is *not* a different matter."

"Yes, I assure you: an architect fills the position of Arbitrator. He has to hold the balance between the contractor and the building owner and to draw certificates. The very basis of a building contract is that the architect shall interpret the drawings and specification and determine what can be justly required of the contractor and the building owner. The building owner has no more power to decide what is due under the contract than the contractor has." It was my turn to grow pink, and I did so—not, however, from annoyance, but from fervour.

Mr. Stevenson was now compelled to sit up and take notice. This he did with a considerable display of irritation and disturbance of mind, and it has always seemed to me a remarkable instance of the wide general ignorance of an architect's functions that an experienced man of affairs like Mr. Stevenson, who had actually employed an architect to conduct extensive building operations for him, should be unaware of an architect's fundamental duties. It was clear from the way he fidgeted and pulled at his fingers that he conceded the necessary authority for me to carry on in the post to which he had appointed me, with great reluctance: we wrangled over the matter for a quarter of an hour before, with some show of asperity, he forcibly closed the discussion; and the most that I could secure for myself—and, of course, also for *him*—was that I should write and sign my own letters in the first person, although they were still to be reviewed and posted by the Secretary who would also open and register letters addressed to me. I was to use the Company's headed letter-paper surcharged "Architect's Department"—which, however, I afterwards got altered to "Architect"—so that though my contracts attached me as architect, that attachment was by the most slender of threads. As a consequence, I came to hear of a contractor who spoke of me as "in the Company's pocket," and was to learn that Mr. Stevenson himself boasted "we have our architect on a string." This slight on a faithful servant—for such indeed I was—I have never quite forgiven him.

I hope he remembered the jibe for a year or two after I had cut that string, for I once very neatly rammed it back into his throat—as I shall have to tell.

The result of all this was that I never from first to last—with one conspicuous exception — enjoyed that confidence and respect from contractors which, in common with other architects, has always, since those days, been accorded to me. The contractors who were equipped to give low tenders for the kind of building I was concerned with, were not of the true breed of builders at all; but were usually financial organizers of building, whose commercial instincts were unredeemed by the least consciousness of craft traditions or of the self-respect that is associated with them. Thanks to Mr. Stevenson's discrediting of my standing, the underlings of these people assumed that I was a mere commercial trafficker like themselves; I could only enforce my decisions by weight of insistence and by endless chaffering and argument and bickering; they often became cheeky and personal, so that I only avoided open quarrels by ignoring their impudence, and they would then go off with an insolent parade of being aggrieved. Important men—directors, managers and "our Mr." this, that and the other—would come to see me; crowding into my private office in groups, to try by cajolery, or bluff, or deceitful subterfuge, or a demeanour of ominous threatening gloom, to jump me into certifying larger sums than they were entitled to, or into accepting slates, bricks, scantlings or finishings inferior to what was specified; and would finally leave me with skilfully-conveyed hints that, if I did not change my mind, awkward things would happen.

The muddled wording of many of the letters I received often disguised cunning ambiguities devised to trap me into an admission or consent, which would force me to surrender the company's interests or retire from a position I had taken. I can say with some pride that I was never in this way caught out in any material matter; but the ever-present danger compelled me not merely to read the letters I received, but to test them for hidden meanings; and also led me to the habit of stating in clear words, in my replies, what I had understood their purport to be. Finally, in my simplicity, I accidentally invited a bribe, and was instantly bribed, although—as I shall have to tell—I was unaware of my own guilt, and have to thank Providence that it was I who first discovered it, and not another.

It is not, however, to be supposed that my life was made up of such experiences as these, or that they were usual, or even of frequent occurrence; but they belonged to the world in which I found myself, and the fact that such things happened, and the ever-present possibility of their happening, discoloured my life and, joined with other miseries, taxed the resilience of my youthful spirit severely. I am not ashamed to say that I look back upon myself over the long intervening years, with compassionate feelings.

After Mr. Stevenson had, in the first hour of my employment, loaded me with disabilities which made it almost impossible for me to carry out the duties I was engaged to perform, he seemed to think that he had wasted enough time—for the wasting of time so much engaged him that, though he sat up till one o'clock in the morning to waste his own, he employed a personal secretary, most appropriately named Lolly, to help him waste other people's—and he took me off to introduce me to the Works Manager, Mr. Beverly Kent.

It was first necessary to *find* Beverly Kent. This we speedily did, for Mr. Stevenson's inquiries for him as he walked through the shops were seconded by messengers who left their tools and darted off in quest of the Works Manager; and, since the Managing Director continued his own search through the humming bays of the machine shop—the while he expounded his extension projects—the Works Manager, with hounds still on his trail, was soon also hunting the Managing Director, and collision was thus happily effected in little more than a quarter of an hour.

It was, of course, necessary for Beverly Kent to be continually about the works, and no doubt impossible for him to leave word at his office where he was to be found; but he never, as he might have done, dropped a hint of where he was going when he left one part of the buildings for another, and he had no fixed time when he could be seen in his office, so that the many officials who frequently had need to confer with him were obliged to track him down, and without the help of the messengers a Director could command. I calculated that during my first year I spent six full weeks of my working time searching for Beverly Kent through the works—for the delicacy of our relations during those early months forbade my approaching him except by paying court in person; and I also calculated that the total time wasted by this muddling—which could have been ended merely by the employment of a boy-orderly at eight shillings a week to carry a flag, and telephone up to the office from time to time—cost the company not less than two thousand pounds a year. When I noticed my own clerks spending time in pursuit of Piggott, my Foreman of Works, I soon found a way to make it unnecessary.

Mr. Beverly Kent was a burly man of forty, with a round shaven face, dark hair and the dingy skin and muddy-brown eye that marks a plethoric temperament. His general education was of the kind that may be built up by a sedulous study of *Tit-Bits*, and was a great obstacle to intelligence—clogging his mind as glue might the works of a clock; but he had an unrivalled understanding of machine tools and their output, and was well known as an authority on the subject. I can see him now, as at the moment I first clapped eyes on him.

Mr. Stevenson was speaking to me when, with an unthinking movement—the impulse of a protective instinct which I have experienced many times in my life—I turned completely about and faced full on this man who was advancing down the centre of the bay with his eyes fixed on me. He cast them down, and then looked aside, when he met my gaze; but I knew instantly that he had discerned who the stranger was and that the enmity he had focussed upon my unconscious back had moved me to spin about to defend myself. A few seconds later he came up on the Managing Director's blind side, and said firmly:

"Good morning, Mr. Steffinson Stevenson."

"Oh! Good morning. Er—ahem—just a word"—and Mr. Stevenson took hold of his arm above the elbow and led him slowly up the bay, whispering him—solicitously, as I thought. Then he turned, gave me a chin-salute and signalled me to follow. Mr. Stevenson appeared to be afraid of his Works Manager.

NEXT WEEK—XIII: AN UP-HILL FIGHT

The previous instalments appeared as follows:

May 27. i: I am Articled
June 3. ii: Episodes of Pupilage.
June 10. iii: Episodes of Growth.
June 17. iv: My First Job: The Sewer.
June 24. v: My First Job: The "Pipes."
July 1. vi: I Turn Clerk of Works.
July 8. vii: Bradshaw & Son: Builders.
July 15. viii: Joe Richards: Foreman.
July 22. ix: Trials of a Clerk of Works.
July 29. x: A New Venture.
Aug. 5. xi: The Resident Architect.

Holiday Sketches Prize Competitions

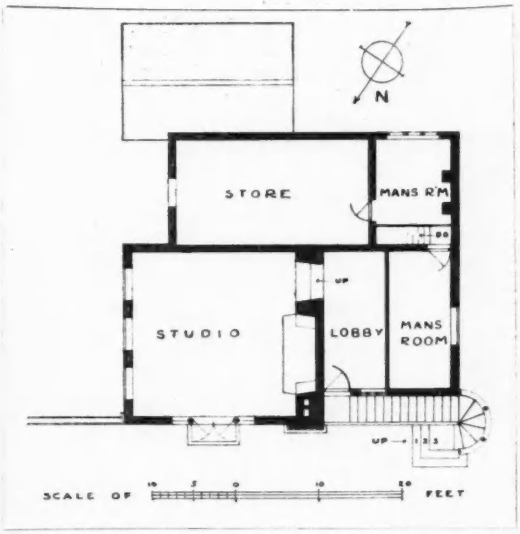
Entries close for the second or August competition—that for sketches made during July of the present year—on Monday next, August 17; for rules, see page 180 of the issue for August 5. Motto labels, the use of which is obligatory, are printed on page xl of the present number.

There will be a third and final competition closing in mid-September.

Awards in the first competition will be found on page 214 of this issue.

STUDIO AT BLACKHILL, HEREFORDSHIRE

DESIGNED BY OLIVER HILL



A general view, taken from the north west; and the plan of Sir Barry Jackson's studio at Blackhill. Situated on a sloping site, the windows, particularly that on the north-west front, afford magnificent views of the surrounding district, which, as will be noted from the illustrations on this page, is thickly timbered.

A view from the north : the balcony window on the right and the three semicircular windows on the left light the studio. Part of the exterior staircase leading up to the entrance lobby is seen on the extreme right of the illustration.

Looking along the main front, which is approximately 40 ft. long. The walls are of textured concrete, coloured afterwards; and the roof is covered with slates. The balustrading of the concrete stairs is executed in wood.

LETTERS FROM READERS

The I.A.A.S.

SIR,—As your correspondent, Mr. William Davidson, is sufficiently acquainted with this Association to know the name of its secretary, he *should* know its address. I cannot understand, therefore, why, assuming he is a genuine seeker after information, he did not address his inquiry in the ordinary way through the post, instead of using your correspondence columns as a means of communication with the writer. (But perhaps his intentions are less innocent than he would have them appear ?)

However, as your correspondent omits to mention his address, and, as I have not the pleasure of his acquaintanceship, I am compelled to seek your indulgence and the hospitality of your columns in order to convey my reply.

With regard to the law case mentioned by your correspondent, I understand the case is *sub judice*; it would, therefore, not be proper for me to make observations on it. Nevertheless, I believe it is not a unique proceeding for a master-builder to rise to eminence as an architect, and, certainly, many most competent architects have learned the principles of their art and craft, in the shops.

But, to get back to Mr. Davidson's first question : Members of this Association, before election, have to sign a declaration witnessed by a Justice of the Peace, commissioner of oaths, or a like responsible person, stating that he (the applicant) is practising as an architect, or as a surveyor, and that he is " in no way connected with or engaged by a builder or firm of builders."

With regard to the second question : the proportion of architect members of the I.A.A.S. who have been articled with or trained by architects is very large, and it would be safe to say that the percentage is at least equal to that of the senior body.

We now come to the third question. I believe there are a large number of architects, not confined to any particular professional body, who do a bit of estate agency work, and it is no reflection on that distinguished society, the Chartered Surveyors' Institution, to opine that the majority of its members are land and estate agents, and that a very large number are auctioneers. Even in that august body, the R.I.B.A., may be found land and estate agents; rating surveyors and valuers, borough engineers, municipal surveyors, technical assistants, and, perhaps, a few sanitary inspectors also. As Mr. Davidson is a seeker after knowledge he may be interested to hear that, in the Architects' (Registration) Bill, the R.I.B.A. sought to include in the personnel of the Admission Committee, auctioneers, house and estate agents, land agents and factors, landed property agents, valuers, and rating surveyors.

Mr. Davidson may be led to ask " How many auctioneers are there on the register of I.A.A.S. members ? " I will anticipate this question by a reply. I have been through the Register and find that there are twelve members only who are known to hold or to have held licences. These are all *surveyor* members who have satisfied my Council in regard to their qualifications in that profession. The majority of these members were admitted in the early days of the Association; even so, the percentage (in a membership of nearly 2,000) is negligible.

Should Mr. Davidson require any further information, and will call at this institution, he will be received with the courtesy and given the assistance invariably accorded to *bona fide* inquirers, and this invitation is extended to you, Sir, and any of your readers.

G. B. J. ATHOE
(SECRETARY, INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS)

SIR,—I have to thank Mr. William Horsman for his reply to my letter. Surely a profession which dates back, at least, to the days of Noah, who built the first travelling menagerie, requires no specially modern support to its dignity. I hope the Royal Institute will note Mr. Horsman's statement that a builder with " sympathetic instinct for design," if he forsakes the trowel for the T square, makes a far better architect than an academically-trained man. I am often asked by anxious parents regarding the best training for pupils, so now I will know to direct them in future to the nearest mason's yard.

I replied to Major Athoe's letter of July 8 as I thought answers to my questions would be of considerable interest to the profession generally. I do not know exactly what Mr. Horsman means when he speaks of " a senior architectural degree," but if he refers to the R.I.B.A. I cannot think that its Council would permit a house agent or estate factor to remain on its register.

I am glad to learn that the I.A.A.S. is watching so carefully the interests of the younger and older architects, but what about the middle-aged ? I am suspicious of all official bodies for obvious reasons, one of which is that a candidate has to sign a declaration not to adopt any intelligent methods of securing commissions.

I now also have to thank Major Athoe for his careful and detailed reply (published above—ED., A.J.) to my letter of July 22. For some time back I have seen letters over his name in various distinguished architectural journals. One special feature of these letters has been that they appeared to be either demanding an explanation or an apology from someone who appears to have made slighting remarks about the I.A.A.S. The latest I noted was an apology from a judge for calling the I.A.A.S. a mushroom. If the gallant major had wished to communicate with me direct, he might have adopted the usual method, which is universally adopted by journalist correspondents, viz., sent the letter on to you, Sir, to be redirected to me.

His explanations are, however, much too valuable to be treated in this secret fashion, and I am sure the profession owes him a debt of gratitude for stating so clearly the constitution of the I.A.A.S. From Major Athoe's letter it would appear that the terms of the constitution are rather loosely worded. Why I should not be considered a *bona fide* inquirer I cannot conceive. I belong to no political party and have no axe to grind.

Let me now deal with the apparent contradictions in Major Athoe's reply. He states : " I believe it is not unique for a builder to rise to eminence as an architect." Note the " I believe." He appears to be only guessing. The strange thing is that later on he states that " Members of this Association, before election, have to sign a declaration witnessed by a Justice of the Peace; . . . or a like responsible person, stating that he . . . is in no way connected with or engaged by a firm of builders." Comment is needless.

Again, " the proportion of architect members of the I.A.A.S. who have been articled with or trained by architects is very large, and it would be safe to say [note "safe to say"] that the percentage is at least equal to that of the senior body." This is not even hearsay evidence. Am I to understand that the I.A.A.S. is a junior section of the R.I.B.A. ?

His answer to the third question I would ask the Council of the R.I.B.A. to look into. If what he says is accurate I can see many resignations from that august body in the near future. Only one item I would emphasize : " and, perhaps, a few sanitary inspectors also." Note the " perhaps." Neither documentary, hearsay nor any other kind of evidence, merely imagination. I have read all the Press notices relating to the Registration Bill, and doubt very much if the R.I.B.A. sought to include auctioneers and house agents in the personnel of the Admission Committee. I can see the Council of the R.I.B.A. demanding an apology from the gallant major in the near future.

Major Athoe's letter reads to me rather like a sneer at the R.I.B.A., and certainly he has made it clear that the I.A.A.S. is composed of auctioneers, house agents, estate agents, land agents, factors, landed property agents, valuers, surveyors, sanitary inspectors AND architects. What power such an Incorporation could possibly possess to protect the interests of architecture as a profession or an architect as an individual it is difficult to conceive.

WILLIAM DAVIDSON

SIR,—I do not wish to enter any private controversy, but cannot help feeling that the statements made by Mr. Horsman in your last issue concerning the association mentioned above are somewhat misleading.

In the first place, no person would grudge a builder, gifted in design and who had had a good architectural training, his place in the profession, provided that he really would be prepared to give up his trowel for the pencil, and not to use them alternately; on the other hand, many of your readers will no doubt agree that we are suffering from much poor work produced by builders, who have, presumably, and without proper justification, imagined that they possessed this sympathetic instinct for design.

Again, the policy of watching the just interests of young and older architects alike is very laudable, but equally important to an association purporting to give professional qualifications should be a policy of protecting the public from incompetent practitioners, such as those who have not even had the fair architectural education mentioned by Mr. Horsman.

J. N. AYLWIN

Cavity Walls

SIR,—In building for a *minimum* duration of a century, we are catering for a period during which abnormal weather conditions will have their say and cavity walls will, at times, be tested very severely.

I have in mind 1903, when exposed houses were battered continuously for periods of forty-eight hours or more by driving rains, and when I had to deal with a recently-built house, in which the cavity walls of sandfaced bricks started from a concrete foundation only 12 ins. below the ground-floor level. The bottoms of the cavities became sheer tanks, and, on the sides most exposed to the weather, damp rose to a height of over 6 ins. above the tops of the skirtings. (Incidentally, in one chimney the rain penetrated to such an extent that it completely logged the brickwork, circumvented the damp-proof course, and ran out through the copper door two floors below.)

Hollow walls, I then concluded, should always start with a quite clear cavity from the foundation concrete, which should be at a level not less than 2 ft. to 2 ft. 6 ins. below the ground-floor line. Fortunately, such weather conditions as those of 1903 are unusual, but they may occur many times in the life of any durable house, and should be the criteria by which we rule the construction of our outer walls.

W. BEESTON

Lowest Tenders

SIR,—Whilst I agree that an onlooker usually sees more of a game than the contestants, it is generally of little use to pass comments unless one knows the game.

"Man of Affairs" (see page 116 of the JOURNAL for July 22) speaks rather as a layman, but I am inclined in general to agree with his views, and I risk the wrath of the majority of your correspondents whose moral code binds them at all costs to advise the acceptance of the lowest tender.

There are still a number of intelligent and capable men in all trades who cannot help but make an excellent job of any piece of work which is placed in their hands, and actually take a pride in their workmanship.

The capable and really reliable builder who encourages the good craftsman stands out more in the country and county towns, and if the price of his work is higher (within a reasonable limit) than others whose eyes are mainly on finance, it should not therefore be debarred from acceptance.

Most people are very tired of hearing that "things are not what they were," but there is a considerable amount of poor workmanship in the building trade, where the scramble to cut prices reacts on the quality of the work. Why, therefore, support the builder who skins his price and trusts to careless workmanship to gain his profit?

I am quite prepared to be met with the plea that all tenders, based on a contract under the control of an architect, are to be to his satisfaction. Theoretically this places the builders selected for tender on the same plane. But in practical fact I consider it a mistaken view, for it must be admitted that some firms do stand out for the superlative quality of their work.

The architect, to use the term of some of your correspondents, should be morally bound to advise the acceptance of the tender from which the client will get the better value for his money, and this is not always the lowest.

W. A. DOWNE

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Bills Receive Royal Assent

BEFORE Parliament rose for the Summer Recess, the Royal Assent was given to the Architects' (Registration) Act, the Housing (Rural Authorities) Act, and the London Squares Preservation Act.

Rural Housing Act Committee

Mr. Greenwood announced that the composition of the Advisory Committee under the New Rural Housing Act would be as follows:—Sir Tudor Walters (Chairman), Sir George Barstow, Sir Valentine Crittall, Sir Theodore Chambers, Sir J. Walker Smith, Sir Seymour Williams and Messrs. E. W. Cemlyn-Jones, R. Coppock, E. G. Gooch, Peter Hughes-Griffiths and Alan Rae Smith.

Rural Housing Act Committee: Scotland

Mr. Adamson said that the names of the persons whom it was proposed to appoint as members of the Committee for Scotland under the same Act were as follows:—Sir William E. Whyte (Chairman), Provost A. M. MacEwen, Miss Bella Jobson, Messrs. Alexander Robb, James C. Cossford, John Train, M.P., and Adam McKinlay, M.P.

Rent Restrictions Acts

Major Graham Pole asked the Minister of Health whether he could state what action the Government proposed to take in regard to the Rent Restrictions Acts.

Mr. Greenwood said it was the intention of the Government to propose to Parliament in due course to extend the existing Acts by means of the Expiring Laws Continuance Act.

Competition Result

The awards in the International Aluminium Competition for suggestions designed to develop the use of aluminium and its alloys have been made as follows:

First prize, 25,000 French francs, Mr. Constantin Szmukler (France), for a contribution on the use of aluminium in leather dressing and tanning.

Second prize, 25,000 French francs, divided equally between Dr. H. Hampel, of Germany, and Mr. de Haes, of Belgium, for two entries relating to the use of aluminium in radiators for central heating systems.

The special prize of 50,000 francs has not been awarded, the judges being of the opinion that no suggestion made was of sufficient importance and exceptional novelty to justify this award.

Approximately 1,000 persons approached the International Aluminium Bureau for information on the competition, and eventually 291 entries were submitted to the judges. For the most part it is stated these entries were highly meritorious and showed careful study of the properties of the light metals.

THE SKETCH CLUB

THIRTY-FIFTH SESSION

JULY HOLIDAY SKETCHES — *COMPETITION: PRIZE AWARDS*

FIRST PRIZE: D. E. Harrington.
Somerset House, London.
(Pen and sepia wash: 18"×6¼")

THIS session represents some fruits of the first of this year's three Holiday Sketches Competitions. In accordance with the rules the awards are announced, and the prize-winning sketches are also reproduced on this page.

After careful consideration of nearly forty drawings, submitted by eleven competitors, there was no hesitation in placing first "Somerset House, London," sent in by "Conté." On opening the sealed declaration the sender was revealed as:

D. E. HARRINGTON,
47 Marmora Road,
Honor Oak, S.E.22,

who therefore takes the prize of ten guineas.

To select a subject for the second prize of five guineas was not quite so easy, but "Wurzle's" watercolour of "The Old Bridge, Sospel, France," was eventually selected. He is:

G. I. C. HIGHET,
Verrieford, Cleardown,
Woking, Surrey.

"Sirod" (G. McKinlay) sent in some attractive pen-and-ink work, which is adjudged commendable.

All competitors are to be thanked for their support and perseverance in the face of the unfavourable June weather conditions—conditions which did not, unfortunately, improve during July. It should be noted that the August competition closes on August 17.

It is proposed to publish a further selection of the July Competition sketches in the near future.

SECOND PRIZE: G. I. C. Highet.
The Old Bridge, Sospel, France.
(Watercolour: 13¼"×8¼")

guineas.

To select a subject for the second prize of

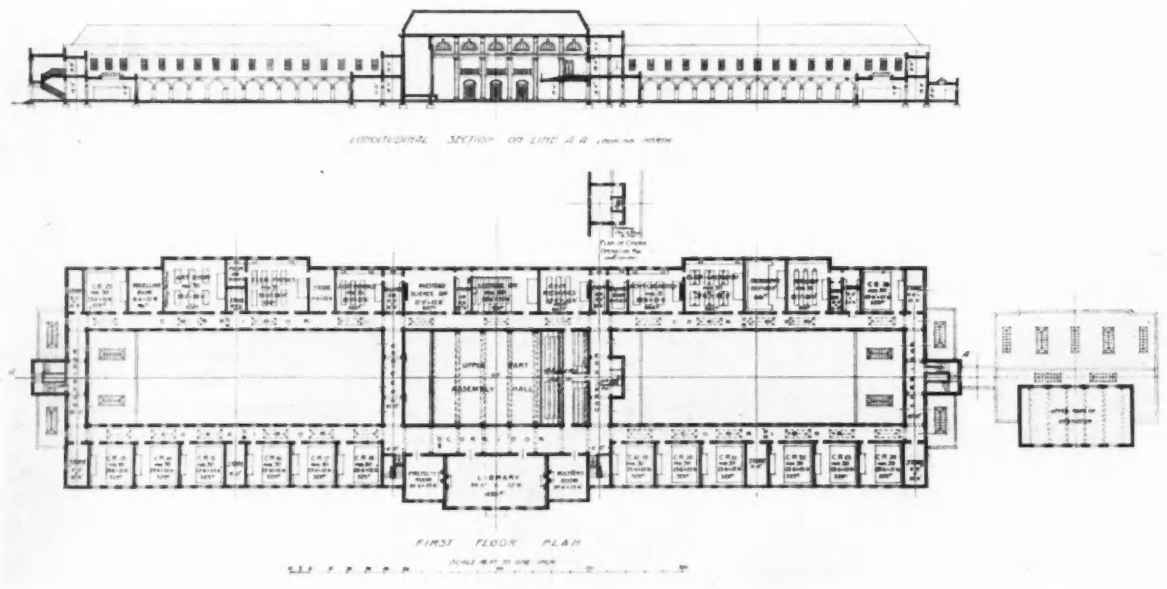
SOUTHAMPTON COMPETITION AWARD

The Designs placed First for the King Edward VI School

The block plan; and elevations; with cross-sections, etc.



[*Tyndall and Peebles, Architects.*

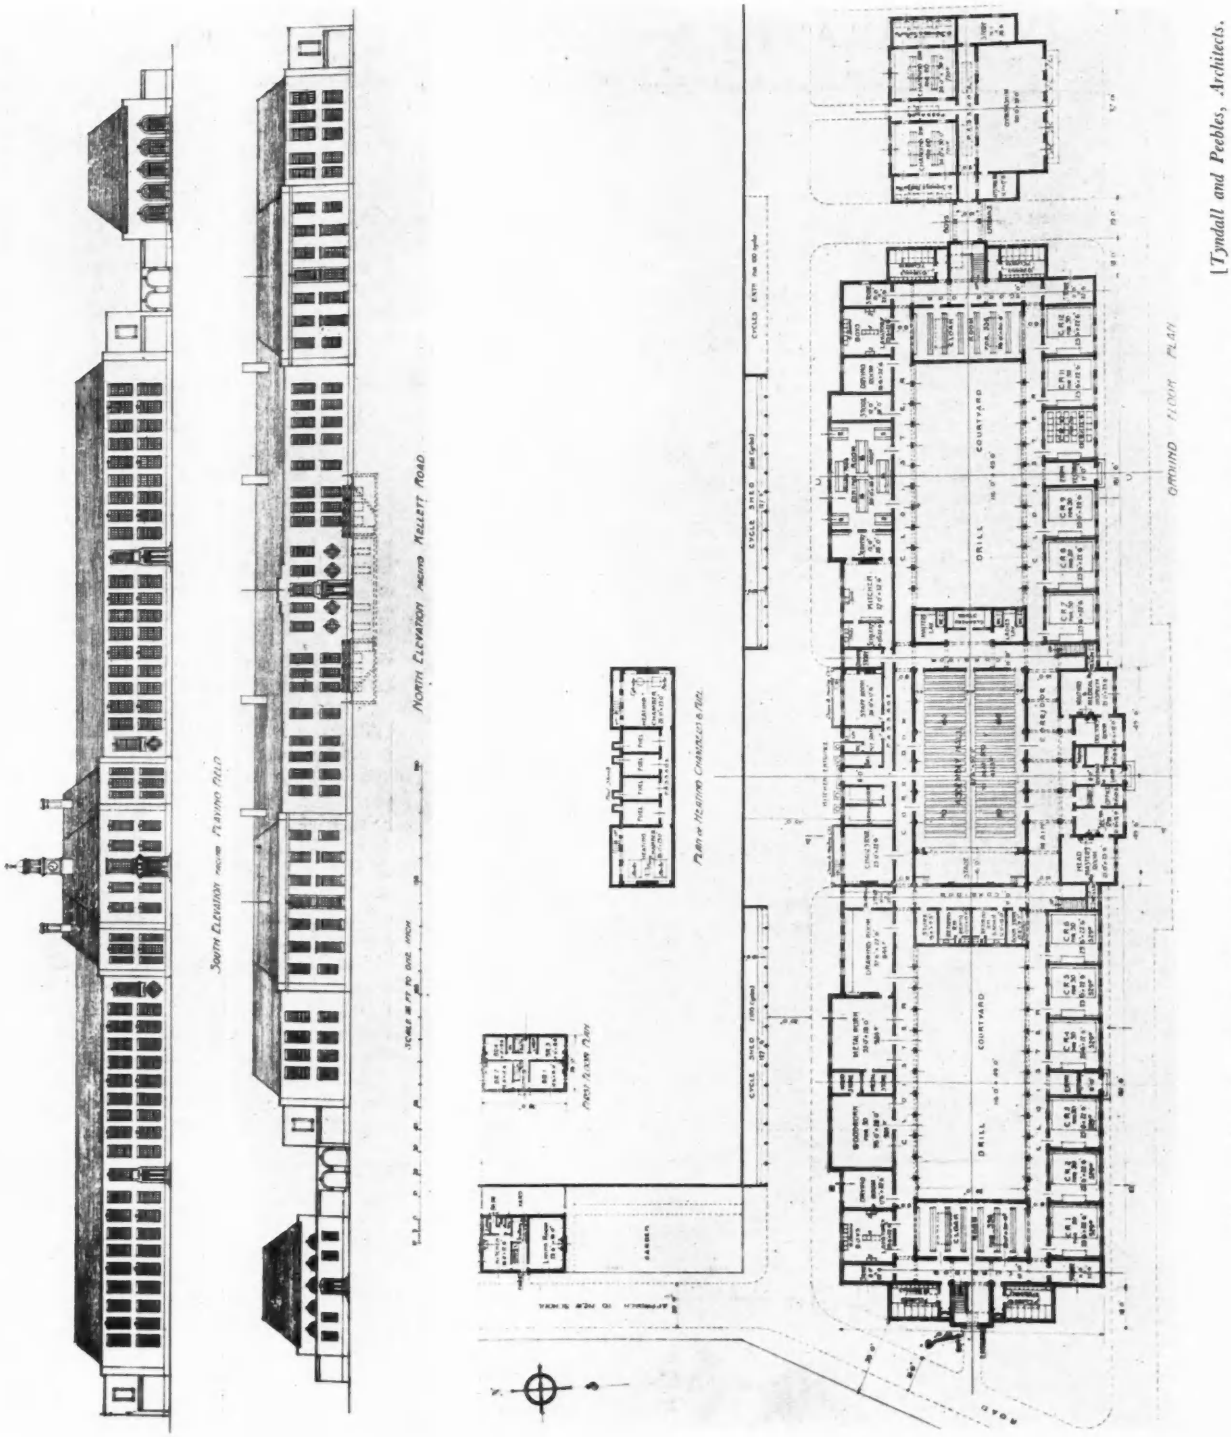
Longitudinal section on centre-line; and plan of the first floor.

MR. SYDNEY TATCHELL, V.-P. R.I.B.A., the assessor, has made the awards as follows: First premium (£150), Tyndall and Peebles, Westminster, S.W.1; second premium (£100), Gray, Evans and Crossley, Liverpool; third premium (£50), Unsworth and Goulder, Strand, W.C.2.

Following are extracts from his report:

In many cases the designers have failed to appreciate the peculiar features of the site and to recognize that so far as the main façade of the building is concerned that facing south will alone be seen from the public road. The intention of the promoters—clearly laid down in the particulars—that the new school should be erected in the N.W. corner of the site, has also been completely ignored by several.

Some competitors have spoilt what otherwise is a satisfactory scheme by insisting on an approach road across the playing field, thereby materially



The south and north elevations; and ground plan, showing also cycle sheds and school-keeper's lodge. [*Tyndall and Peebles, Architects.*

reducing its utility. The placing of the assembly hall at the west end has in many designs proved a handicap; likewise spaces devoted to quadrangles.

The planning of sanitary accommodation has in other cases been somewhat unfortunate; and in the grouping of windows the importance of even lighting of the rooms within has in some designs been sacrificed to elevational effect. Some competitors in their desire to introduce interesting projecting wings have overlooked the rooms which, as a consequence, would be for some hours of the day placed in shadow.

In awarding the first premium I have been impressed by the simple directness of the plan and the resulting attractiveness and dignity of the elevations. The several departments of the school are well placed as regards aspect and in their relation to one another; the corridors are wide and well lighted and ventilated; they are direct and are served by well-placed staircases. The assembly hall is suitably planned in the centre of the main structure and readily accessible by pupils and also by visitors on special occasions. Although the gymnasium encroaches somewhat towards the east, its excellent planning justifies the sacrifice of ground at this end.

LITERATURE

CITY PLANNING TO DATE

ROME was not built in a day, thank goodness! and the modern city planner is not likely even to grasp his whole problem in a day. As Professor Lohmann explains in this very thorough book, the good plan must satisfy an overwhelming number of requirements. "Scattered excellences have not as yet been combined into a single picture." The programme has not only variety but fresh items are added continually with industrial and social changes. Perhaps it is the urgency due to the accumulation of such new difficulties which has caused the professor to deal scantily with the prime matter of site. Our new cities are generally handicapped by unworthy sites. But as the glory and care of a city is inspired by its citizens' affection, aroused by beautiful views of it, there should be some high place whence the city as a whole can be seen, as Jerusalem from Olivet, and London from Hampstead, and Norwich from Mousehold Heath. A mere two-bob glimpse of a New York from a Woolworth's tower is not the same thing as contemplation.

Professor Lohmann brings his readers by an historical résumé of ancient and mediæval examples to American city-planning. Today the first step is the survey of the city as it exists, including the surrounding country. Data of the types and location of industries, residences, public buildings, of the means and volume of transport, and of recreational facilities, are collected. The next step is the main plan to a small scale, in order to show main roads and streets and main zoning subdivisions. The third step is the series of enlarged plans of the subdivisions. The ideal layout of a modern city is like a spider's web, and has radiating lines and concentric arteries to connect them; but the residential blocks so formed should not be cut through by further streets—rather they should be served by culs-de-sac and kept free of through traffic. Thus, the interest of the pedestrian is served, children are safeguarded from motors, and noise is kept at a distance. The acreage of parks and recreation grounds must be worked out in reference to population, and the isolated parks should be linked by broad parkways. Cities of the grid-iron type, which have become over-saturated with population, are most difficult to deal with. Detroit and St. Louis have tried such experiments as the "raised superhighway" for main traffic, with subsidiary roads beneath; two- and three-tier traffic-ways are talked of. Decentralization seems the only cure, and this leads to the regional plan, embracing many square miles of surrounding country. The decentralization of industry may be accomplished by an enormous increase in electric power. Dwellings must be re-centralized within reasonable distance of the factories, parks and recreation grounds will be planned to separate the new city into zones and from its neighbouring cities. "There is a possibility that by the use of an imagination both practical and courageous, some future planner may accomplish such a result." P. M. ST.

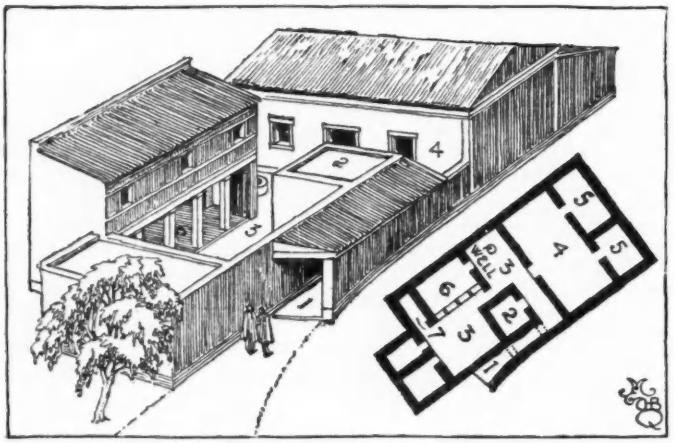
The Principles of City Planning. By K. B. Lohmann. New York: McGraw Hill Publishing Co., Ltd. Price 20s. net.

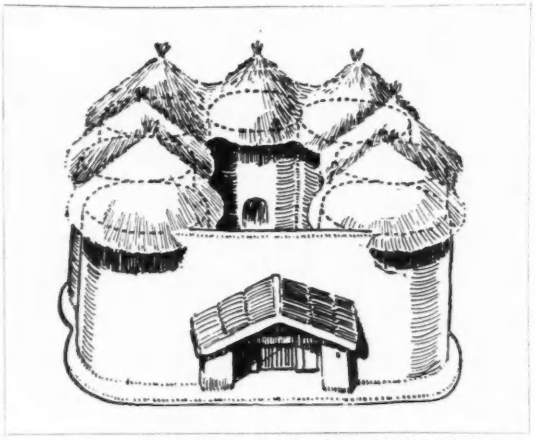
THE DARK AGES

IN their first volume in the present series—*Everyday Life in Homeric Greece* (reviewed in this JOURNAL for May 6, 1931—ED. A.J.)—the authors, Mr. and Mrs. Quennell, contrived to reconstruct a solid background of social history to the romance and poetry of a culture that was to become the basis of our Western civilization. In their second volume, just published, they approach a zone of more concrete fact and more precise history.

Taking as their starting-point the return of Odysseus to Penelope of Ithaca, the authors lead us through the troubled Dark Age of the Dorian invasion, and show us how the original Greek stock settled and preserved its culture in Æolia and Ionia, across the Ægean Sea. We see how the invaders thrived in the peninsula, and how in time they themselves absorbed influences from the older culture; how colonies were formed in outlying territories; and how, in the year 176, the Greeks of the homeland and colonies united to hold a festival together at Olympia. The final phase of the story is concerned with the Persian Wars, which resulted with the utter defeat of the invaders at Salamis. This victory not only consolidated the power of the Greek nation, but also brought it to the threshold of the Classical Age.

After an introductory chapter, which recapitulates the facts of history as we know them from Herodotus, we explore the everyday life and everyday things which formed their background. The book is divided into three divisions. In the first, entitled "The Temple and the House," we are told of the evolution of architecture through the temple, of its sculpture and adornment, with a glance at religious belief and observance; finally, we are shown how it fulfilled its function as a centre of religious and communal life. The next division, "Life Outside the House," describes how the dwelling-house was evolved to meet the requirements of a rapidly developing people. Finally, in





[*From* Everyday Things in Archaic Greece.

(Left) Plan and reconstruction of house at Dystus, Eubœa, Greece. (Right) Reconstruction based on hut urn from the island of Melos.

"Life Inside the House," we are given details of the food, cookery, furniture, pottery, etc., of interest to us today. In conclusion, we are told about the farming, ships, trades and industry, methods of transport and travel and sport of every kind.

The book is illustrated by many delightful drawings from the authors' pens; by them we are given a unique sight into the broad lines and precise details of Greek life during this period. It can be recommended to readers of all ages, for in it there is revealed the germ of that tradition upon which the civilized world has based its development to the present day. W. K.

Everyday Things in Archaic Greece. By Marjorie and C. H. B. Quennell. London: B. T. Batsford, Ltd. Price 7s. 6d. net.

DECENTRALIZATION OF POPULATION AND INDUSTRY

THE need for the studies covered by this little book is outlined in the introduction as follows: "During the last century, the great growth of scientific knowledge, and the rapid development of mechanical inventions, have greatly added to the number and complexity of the activities and services on which the civilized life of the city depends. While the populations of large towns have continued to grow, and the material and mechanical apparatus of life have increased in volume and in complication, the social organization has not kept pace with this development." The want of order or plan in the town reflects, and, in turn, encourages a similar want of social order or structure in the multitude of inhabitants who have flocked together.

The first contribution deals with the essential basis for a good civic life, the health of the citizens, and there is elucidated the relation of health to the distribution of built-up areas and open space, both as bearing on the promotion of sound physical development in the young and on the maintenance of prompt and adequate dilution of town atmosphere with fresh air.

Facility and rapidity of movement are requisite to establish the relation of traffic to health; it is, therefore, only necessary to mention the difficulty in the case of most large cities of conveying the people, particularly the children, from the central areas to playing fields. The problem of the better distribution of population and industry is vital. Chapter V indicates the best method by which increasing population can be provided for. It advocates a localized life of high quality, still maintaining some contact with central organs of commerce and culture, which by their nature can only be developed in the heart of a great population.

Subsequently the relation of expanding town to existing villages is discussed, and the possibility of these being planned to meet the need for satellite communities. The choice or location of satellites within the rural region is an essential part of the problem, and this raises questions of the protection of the beauties of the countryside and of the old villages and towns themselves. Then follows some consideration of the possible improvement which can be effected in existing towns; how the decentralizing of industries to areas which can be more efficiently equipped may provide much needed space in the centre for playgrounds and other purposes.

In the final chapter, the available powers for regional planning, on which action arising out of the consideration of the various problems here dealt with must depend, are brought under review. The results of experience gained in the carrying out of perhaps the greatest regional planning scheme hitherto undertaken, that of the New York City region, suggest that some revision and extension of the town-planning powers available in this country are now due and much needed.

WOOD PRESERVATION

THE recent publication of the first volume of the *Journal of the British Wood Preserving Association* marks the end of the first year of the Association's life. The contents have been limited to verbatim reports of the lectures and discussions on wood preservation in its various aspects, held during the winter in London, except, as stated in the editorial foreword, that it has been considered desirable to include also a copy of the Constitution of the Association and a full report of the meeting held at the Hotel Metropole, London, on December 3, 1929, at which the movement to form the Association was launched. It is hoped by the Association that in the future the scope of the *Journal* will be enlarged to include original articles, reviews of current literature, and an account of the numerous other activities by which the Association is endeavouring to fulfil the purpose for which it has been formed.

A photograph of Sir Harold Boulton, Bart., C.V.O., C.B.E., the first president of the Association, forms the frontispiece to the issue.

All interested in the objects of the Society, who wish to enrol as members, should communicate with Mr. R. C. B. Gardner, Secretary, the British Wood Preserving Association, 166 Piccadilly, London, W.1.

Journal of the British Wood Preserving Association. Vol. i. Price 7s. 6d. (non-members).

The Architectural Review

IN an article entitled "Brighter London Statues," published in the current issue of *The Architectural Review*, the author, Mr. William Gordon, makes three suggestions which would, he claims, if carried out, brighten up the whole aspect of London, enable us to have a modicum of art in our streets, and be of a practical and beneficent nature. First, he suggests painting the figures of the generals and statesmen of the last century in bright and even garish colours; secondly, regarding figures of public benefactors, etc., he would build up a square of cement on the base of each statue and then face it with good stone. Artists would then be commissioned to carve bas-reliefs on each one, the subjects to be carved to be left to the artists' discretion, nor should they be interfered with by art commissions or other busybodies. His third suggestion is of a practical and utilitarian nature. In those places where the statues of statesmen gather too thickly or where bas-reliefs cannot be properly seen and appreciated, the statues would also be covered by a cement square, but this time it would be used for the display of the better advertisements or serve as a background for kiosks for the sale of newspapers, flowers, etc.; others would be cut down or blown up (*sic!*) and, on the places where they stood, would be erected four pillars with a roof or awning and perhaps movable glass walls, where people would be able to enjoy coffee, and have a good view of the traffic and bustle around them.

Other articles in the *Review* include "Theatre Machines in Italy, 1400-1800," by Mr. Edward Carrick; and "Colour in Interior Decoration: Part V—Colour Reaction," by Mr. John M. Holmes. Among the buildings illustrated are the new Whitgift Grammar School, designed by Leathart and Granger, and the new head offices of Lloyds Bank, Cornhill, London, designed by Sir John Burnet and Partners in association with Campbell, Jones, Sons and Smithers.

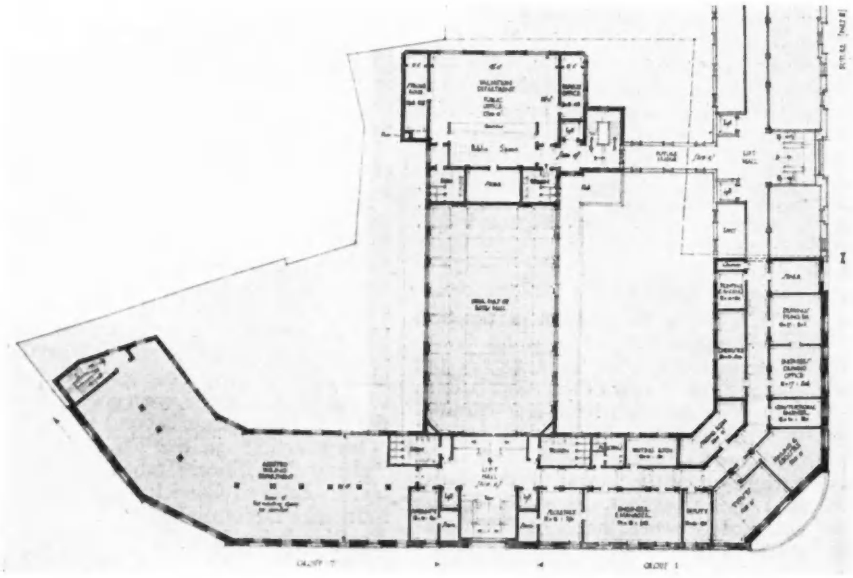
LEICESTER OFFICES COMPETITION

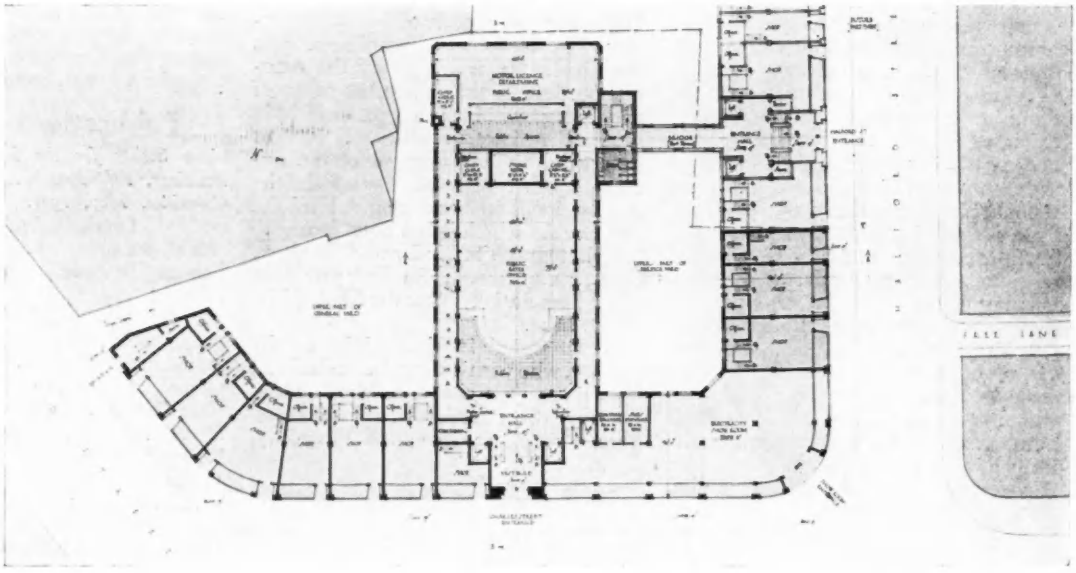
WINNING DESIGN : BY H. SPENCER SILCOCK AND GRAYSON AND BARNISH

Elevation to Charles Street

The elevation to Charles Street. The entrance shown gives access to the Rates Offices. It is flanked on the left-hand side by shops; on the other by the Corporation Electricity Showrooms.



The first-floor plan contains the upper part of the Rates Hall, valuation and assisted wiring departments and other staff offices.



The central feature of the ground-floor plan is the Public Rates Office, the main entrance to which is situated in Charles Street. A subsidiary entrance is provided in Halford Street.

ON this and the facing page are illustrated the winning designs for the proposed Corporation Offices, Leicester, and the proposed extension to Ingham Infirmary, South Shields. The assessor for the first, Mr. E. Berry Webber, A.R.I.B.A., made his awards as follows :

First premium (£300), H. Spencer Silcock, A.R.I.B.A., and Grayson and Barnish, FF.R.I.B.A., of Liverpool. Second premium (£200), G. H. Shepherd and J. G. Sidebottom, of London. Third premium (£100), Stockdale Harrison and Sons, and W. F. Cartwright, F. & A.R.I.B.A., of Leicester.

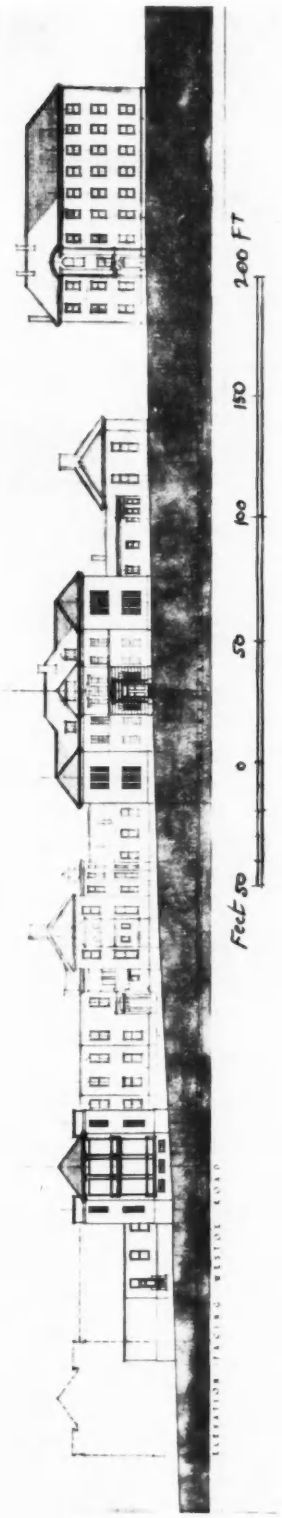
Lt.-Col. George Reavell, F.R.I.B.A., the assessor for the Ingham Infirmary Competition, made the following adjudication :

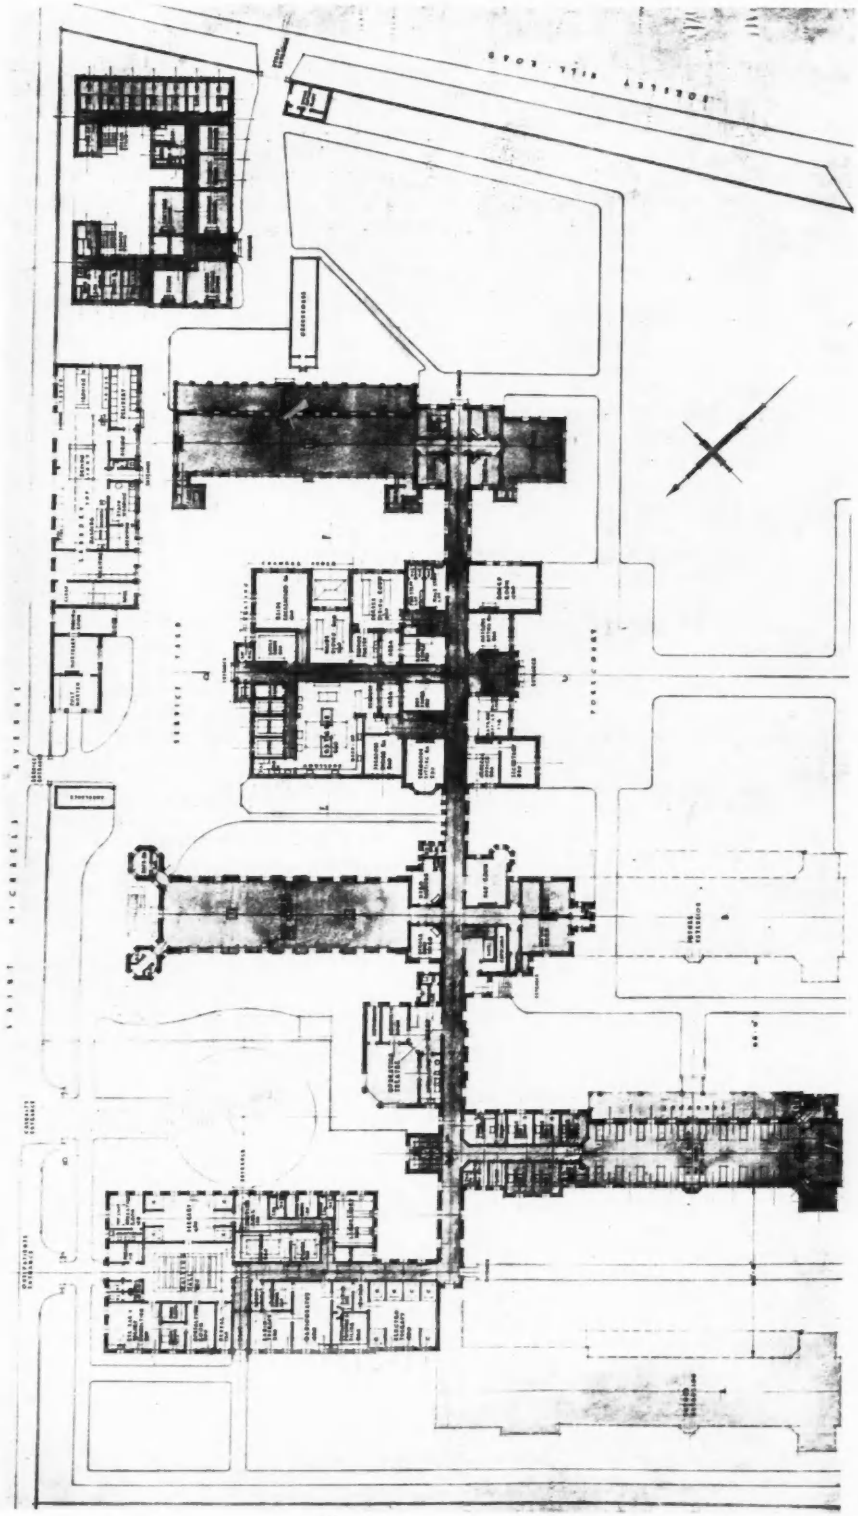
First premium (£250), Cackett, Burns, Dick and Mackellar, FF.R.I.B.A., of Newcastle-on-Tyne. Second premium (£100), W. and T. R. Milburn, FF.R.I.B.A., of Sunderland. Third premium (£50), Dryden and Shaw, F.R.I.B.A., of Newcastle-on-Tyne.

INGHAM INFIRMARY COMPETITION

South Shields, Durham: Winning Design

BY CACKETT, BURNS, DICK AND MACKELLAR





The elevation to Westoe Road, showing the main entrance to the Administration offices; and the ground-floor plan of the proposed extension to Ingham Infirmary, S. Shields.

QUESTIONS THAT ARISE

Gullies to Soakaways

A. J. A. writes: "*I should be glad of your expert's opinion as to whether it is necessary to put gullies at the feet of rain-water pipes where drained into soakaways. With a wire balloon grating at the outlet to gutter, it seems that all that is needed is a bend in the earthenware piping at the ground level and the rain-water piping let into the socket, with a cement joint. This is a cheap method, and as far as I can see has no serious objections. There is no demand for gullies in the bylaws of the district in which I am building.*"

It is advisable to provide gullies at the feet of rain-water piping, to avoid an inaccessible bend, as a seal against odours arising from the earth, and for a barrier against rats gaining access to a house by way of the piping. The method suggested by your correspondent is certainly cheap, and I have seen work executed in this manner with the stoneware socket projecting above ground level, liable to damage, and with an ugly weathered cement joint at the socket.

It is not a satisfactory job. The rain-water pipe with shoe, discharging over a gulley with brick curb, is in favour, but I prefer a trapped gulley with a back inlet. W. A. D.

Professional Etiquette

T. E. writes: "*A builder has introduced a client to me, who wishes me to design a house for which the builder will give an estimate which is to include my fees in the total sum to be paid for the house. Is this a proper thing for me, as an architect, to accept? I have known the builder for some years and he has carried out several contracts for me.*"

There is no objection provided that you make your position perfectly clear in writing to all parties.

The client should be told that your charges will be in accordance with the R.I.B.A. scale, and what this scale is.

The builder should sign the usual form of contract and be informed that although he has been given the job by the client, you, on your part, will execute the proper supervision with regard to workmanship and materials.

In reporting the estimate, which should be sent through you, the amount of your fee should be shown separately and then a grand total made.

If this is all carried out in a business-like manner, there will be no suspicion of collusion or underhand agreement between architect or builder, which could be brought up against you for unprofessional conduct.

As you know the builder for an honest man, his introduction of a client is a compliment and shows that he too finds you a straightforward architect for whom he likes to work.

It is a natural thing for a client to want to know his total liabilities before building, including fees, but you should insist that he pays you by separate cheques and not through the instalments certified to the builder as the work proceeds. A. B.

Mixing Mortar

"Piranesi" writes: "*Could your expert give me some explanation as to how the proportions are arrived at on the job when mortar is specified to be one of lime to three of sand? A test was recently made by first slaking the lime, then putting one box full of this to three similar boxes full of sand. On analysis, this turned out to be one of lime to eight of sand. What method of mixing should be specified to ensure good mortar? Textbooks are very vague on this subject.*"

Fat lime increases in volume enormously during the process of slaking, whilst hydraulic limes do not increase in bulk to any great extent. There is no doubt that fat lime, which should only be used for plastering, would show a loss in chemical composition after slaking. Ignoring the general chemical properties, in which the majority of architects take little interest, it is sufficient to say that certain proportions of slaked lime and sand have, in practice, been found to be satisfactory.

The proportions after test, as given by your correspondent, are high, but this loss can be influenced by improper burning, the freshness of the lime, and the effect of drowning the mixture with water. Quicklime, during exposure to the air, absorbs carbonic acid gas, and is weakened and becomes less adaptable for use. The quality of sand used also has an effect upon the decision of proportions. Actually, apart from the knowledge that is required to form an opinion of the quality of good materials, the proportions of the mix may vary as to plasticity, which is governed by the sand-carrying capacity. The majority of builders interpret the meaning of the specification as regards the proportion of the lime as measurement after slaking, and the specification should give some indication if it is intended that the measurement should be made before slaking.

Assuming that the former is intended, i.e. after slaking, the following proportions can be safely embodied in the specification, assuming that clean, sharp sand will be used. For coarse stuff, one part lime and two parts sand. For mortar for constructional work, one part hydraulic lime and three parts sand. These proportions, as I previously stated, may need variation on the works to ensure a good mix. Some workmen are in the habit of using mortar for brickwork with insufficient sand to afford easier working, and I personally prefer gauged mortar or hydrated lime for structural work.

SOCIETIES AND INSTITUTIONS

R.I.B.A. EXAMINATIONS

THE Final Examination qualifying for candidature as Associate R.I.B.A. was held in London and Edinburgh from July 8 to 16, 1931.

Of the ninety-nine candidates examined, fifty-one passed (twelve in Part 1 only) and forty-eight were relegated.

The successful candidates are as follows:

Adkins, F. W. C.
Allen, W. H. (*Part 1 only*).
Bicknell, P. (*Part 1 only*).
Blythin, C. F. (*Part 1 only*).
Bomer, E. D. N.
Broughton, F. H.
Bubb, E. (*Part 1 only*).
Cardwell, J. J.
Caröe, A. D. R. (*Distinction in Thesis*).
Chard, F. V. S.
Clark, A. R.
Conolly, H.
Cowley, R. H.
Edgar, N.
Fancott, W. E.
Farrow, J. W.
Gardham, H. E.
Hall, A. L. (*Distinction in Thesis*).
Harrison, R. H.
Hobbs, G. B.
Howard, W. F. (*Part 1 only*).
Joseph, M.
Lindsay, R. G.
Long, A. E.
M'Intyre, D. (*Distinction in Thesis*).
Marshall, A. J. R. (*Part 1 only*).

R.I.B.A. EXAMINATION PAPERS

The questions set at the Intermediate, Final and Special Examinations, held in June and July, 1931, have been published, and are on sale at the R.I.B.A., 9 Conduit Street, W.1, price 1s. (exclusive of postage).

ENGLAND'S BEAUTY

"What makes new houses and bungalows ugly?" This question is asked by Miss Margaret Lee, Tutor to Oxford Home Students and Principal of Wychwood School, Oxford, in an address entitled, "England's Beauty," published in pamphlet form in order that it may be read to Women's Institutes in conjunction with exhibitions of lantern slides supplied by the Council for the Preservation of Rural England. Miss Lee supplies the following answer to her question :

"Partly that the builders of today do not, like the old builders, take the materials that lie near at hand, and therefore suit the part of England where they are. On the Berkshire Downs the old cottages are made of great blocks of chalk with overhanging eaves, and look as if they had grown there, they are so natural, and their white walls and brown thatch go so well with the brown fields and white quarries round about them; and in the Cotswolds the old cottages are made of the yellowish stone of those parts, with roofs of Stonesfield slate from the local quarries, and they too look as if they 'belonged' where they are—they are 'just right.' The same may be said of the old rosy-coloured brick and red tiles, of the Chiltern villages. But what are we to say of the glaring scarlet brick bungalows. They do not match anything; they seem to be always shouting 'Look at me!'; they are an insult to the older houses, with their soft colours and beautiful shapes."

TOWN PLANNING EXHIBITION

An exhibition of drawings will be held in the R.I.B.A. Galleries from September 29 to October 3 this year. They will include the whole of the British section of the recent exhibition held in Berlin during the Congress of the International Federation of Housing and Town Planning. In addition to the British section there will be a few examples of work now being done in other countries.

THE R.I.B.A. STATUTORY EXAMINATION

The R.I.B.A. Statutory Examination for the office of district surveyor under the London Building Acts, and the Examination for the office of building surveyor under local authorities, will be held at the R.I.B.A., London, on October 14, 15 and 16, 1931.

The closing date for receiving applications for admission to the Examinations, accompanied by the fee of £3 3s., is September 23.

Full particulars of the Examinations and application forms can be obtained from the Secretary, R.I.B.A.

THE FACULTY OF ARCHITECTS AND SURVEYORS

Sir Charles C. Allom, F.R.S.A., F.F.A.S., has been elected President of the Faculty of Architects and Surveyors for the year 1931-32. Major W. P. Reynolds, O.B.E., F.F.A.S. (London), and Mr. G. Caradoc Roberts, F.F.A.S. (Manchester), have been elected vice-presidents in addition to the following retiring vice-presidents, who were re-elected for a further year : Messrs. H. Langford Moyle, F.F.A.S. (Twickenham), A. E. McEwan-Waghorn, F.S.I., F.F.A.S. (London), and E. J. Michaux, F.F.A.S. (London). Mr. C. Lawrence Paice, F.F.A.S., of Altrincham, fills the vacancy on the Council caused by the death of Mr. Frank Gorst of Blackpool.

INDUSTRIAL DESIGNS COMPETITION

The awards in the Royal Society of Arts eighth annual open competition of industrial design have been made as follows :

Tootal Broadhurst Lee Travelling Studentship (£75), Miss W. M. Christmas (Slade School), who also received the Art Congress Studentship (£50); Simpson and Godlee Travelling Studentship, Miss I. Forbes (Edinburgh College of Art); J. H. Hyde Travelling Scholarship (£100), Miss M. C. Mungall (Edinburgh College of Art); a bronze medal for the best design in the Textile Section, Miss I. McGregor (Edinburgh College of Art). An Owen Jones Medal was also gained by the following students of Schools of Art : G. Robb (Manchester Municipal School of Art) in the Architectural Decoration Section; Miss K. R. Stenhouse (Glasgow School of Art) in the Textile Section; E. L. Clinch (High Wycombe Technical Institute) in the Furniture Section; H. M. Doyle (Liverpool City School of Art). In the Book Production Section; and J. Reddoch (Liverpool City School of Art) in the Advertising Section.

The prize of £10 offered by the Council of the Royal Society of Arts under the John Stock Trust, for a design for a Bronze Wall Tablet to commemorate the loss of R.101, has been awarded to G. Robb (Manchester Municipal School of Art).

The prizes offered by the Court of the Worshipful Company of Goldsmiths for designs for a

From England's Beauty.] [*With acknowledgment to Sir Philip Stott.*

Stanton, Gloucestershire—an unspoilt Cotswold village.

fruit knife, fork and spoon have been won by A. R. Emerson (L.C.C. Central School of Arts and Crafts) and J. Gain (Birmingham Central School of Arts and Crafts); and the prize offered by the Worshipful Company of Cordwainers for a design for a glove or jewel case covered with leather, by Miss J. G. Fleming (Bideford School of Art).

The prize offered by the Peninsular and Oriental Steam Navigation Company for a design for a poster has been awarded to W. D. Suddaby (Royal College of Art). This prize consists of two 20-guinea round trips or cruises (of about thirteen days' duration), plus £10 10s. cash.

The prize of £50 offered by the British Poster Advertising Association for a poster was divided between N. C. Cook (Slade School), C. Bellingham (Liverpool City School of Art), and J. W. Godfrey (Leeds College of Art), the first receiving £20 and the other two competitors a prize of £15 each.

F. B. Hayes (past student of the Bath School of Art): prize of £25 for a design for a poster to advertise the Isle of Man as a holiday resort.

This year there were 1,319 competitors—an increase of 94 on 1930, when 1,225 competitors entered. The number of Schools of Art represented in the competition has also risen from 155 to 170. The total number of designs sent in this year was 4,037, of which 2,365 and 1,000 were for the textile section and advertising sections respectively, these two being the largest sections of the competition.

A selection of the designs is now on exhibition, until August 31, at the Imperial Institute, South Kensington, S.W., 10 a.m. to 5 p.m. (Sundays, 2.30 to 6 p.m.).

KENT EDUCATION EXHIBITION

The second exhibition of Kent County and Craft Education Federation, held at the Thanet School of Art, was opened by the Hon. W. E. James, on Friday, July 31.

Among the exhibitors are the following :

Architectural Section : Messrs. John Little, F.R.I.B.A., W. H. Robinson, S. H. Loweth, F.R.I.B.A., R. Goulburn Lovell, A.R.I.B.A., L. Mason Apps, A.R.I.B.A., and R. Tilsley Green, A.R.I.B.A. Painting Section : Messrs. Augustus John, A. Moody, W. O. Miller, Dr. Miles Tonks and Arthur Schofield.

LAW REPORTS

PRIVATE STREETS WORKS ACT, 1892: RIGHT TO SELL

Payne v. *Cardiff R.D.C. King's Bench Divisional Court. Before the Master of the Rolls and Lord Justice Lawrence*

THIS was an appeal by the Cardiff Rural District Council from a decision of the Cardiff County Court judge, and raised the question as to the right of the Council to put up for sale premises abutting on a street in respect of which improvements had been made by the Council under the Private Streets Works Act, 1892, on the default of the owner of the premises to pay certain instalments of the sum apportioned to the premises in respect of street improvements.

It appeared that Mr. Payne became liable to pay the sum of £48 2s. 6d. in respect of street works carried out by the Council under the Act in Welwyn Road, Rhiwbine, near Cardiff, where he owned leasehold premises known as Southdown. The amount was to be paid in seven annual instalments of £6 17s. 6d. each. There were certain proceedings before the Justices. There were three instalments due with interest, and though Mr. Payne had paid the costs of the proceedings, he had not paid the instalments, the order being that he should pay £3 a month, and that in default of payment the whole became due. Default was made and a distress warrant was returned marked "no effects." Later, the Council issued notices of their intention to sell the premises, but offered to withdraw the notices on payment of £40. Mr. Payne's solicitors tendered payment of £29 odd, but not of the charges incurred in connection with the proposed sale, and on the same day Mr. Payne began proceedings in the County Court for an injunction to restrain the Council from putting up the premises for sale.

The County Court Judge found in favour of Mr. Payne and granted a perpetual injunction as asked and dismissed the Council's counter-claim asking for a declaration that they were entitled to sell the premises.

The Council now appealed.

After hearing legal arguments, the Divisional Court allowed the appeal and reversed the judgment of the County Court Judge, entering judgment in the action for the Council with costs.

The Master of the Rolls, in giving judgment, said the question here was whether the Council had the right to proceed with the sale of these premises. To his mind the right of the Council to proceed to a sale seemed to be established by section 103 (1) of the Law of Property Act, 1925, which now contained section 13 of the Private Streets Works Act, 1892.

Lord Justice Lawrence concurred.

QUESTION OF APPROVAL OF HOUSE

Prentice v. *Keen and Gorham. King's Bench Divisional Court. Before Justices Swift and Charles*

This was an appeal by Mr. Walter J. Prentice, of Upper Elmers End Road, Beckenham, against a decision of Judge Hogg, of the Bromley County Court, in favour of the defendants.

Mr. Dickinson, K.C., for the appellant, said the action in the Court below was for breach of contract in regard to the building of a house, the allegation being that the plaster was bad, with the result that the ceilings fell down. In 1926 appellant purchased the house from the defendants for £890, and one of the clauses was that the house was to be fit for habitation, built in good and workmanlike manner, and of proper and suitable material to the satisfaction of the purchaser. Plaintiff was entitled to have the house inspected by a surveyor, but he relied upon the judgment of a missionary friend, who knew about houses. They went over the house together, and plaintiff then expressed his satisfaction to his friend, and paid his money. In 1929 some of the ceilings came tumbling down, and his client's case was that the plaster was defective in the sense that it had not enough hair in it to make it binding; and further, that it had not been sufficiently pressed through the laths to make a proper "key." The cost of making good the damage was £30. The County Court Judge, having heard the plaintiff's case, held that there was no case for the defendants to answer, there being evidence that the plaintiff was satisfied with the house; and the Judge further said he was satisfied that the plaintiff inspected the house with a friend and expressed approval of it. Counsel submitted that the Judge had misconceived the issue, as the plaintiff never approved of the house to the vendor. He asked for judgment for plaintiff.

After hearing Mr. Cairns and Mr. Caswell for the respondents, the Court dismissed the appeal with costs.

Mr. Justice Charles, in giving judgment, said the question was whether the house was completed to the satisfaction of the plaintiff. Here the plaintiff took a missionary friend with him to inspect the house, and then paid his money. His lordship was satisfied that the County Court Judge came to a right conclusion when he found for the defendants. The judgment must stand.

Mr. Justice Swift : I agree. Appeal dismissed with costs.

ROAD-MAKING CONTRACT

Marsden U.D.C. v. *Sharp and another. King's Bench Divisional Court—Before Mr. Justice Rowlatt*

This matter came before the Court in the form of a special case stated by an arbitrator under section 7 of the Arbitration Act, 1889, and raised a question of the construction of a road-making contract and the amount of damages payable thereunder. The matter concerned the making of a road over Standedge Moor, and the Council alleged that the work had been badly done, and that they were entitled to damages.

Mr. Rayner Goddard, K.C., and Mr. C. J. Frankland appeared for the R.D.C., and Mr. Jenkins, K.C., and Mr. W. Stewart for the contractors.

The facts of the case are set out in the judgment.

His lordship, in the course of a reserved judgment, said that the only question argued before him, though others were indicated in the award, was which of two alternative sums, named by the arbitrator as damages, the Council were entitled to recover under clause 35 of the contract.

The clause was as follows :

" Should it at any time subsequent to the determination of the period of maintenance up to but not exceeding a period of five years from the date of the completion of the works be discovered that the terms of this specification have been violated by the execution of bad, insufficient or inaccurate work, the Council shall be at liberty to make good such work and to recover the cost thereof from the contractor . . ."

In the present case, said his lordship, the work was completed on January 15, 1925, and by December, 1929, certain portions of the road were discovered to have become defective. On January 14, 1930, the Council delivered points of claim in the arbitration, alleging a violation of the specification by the use of concrete not in accordance with the terms set out. The complaint was as to the concrete generally, but he did not think the points of claim could extend the discovery on which the Council's rights depended.

The question was how far the discovery made by December, 1926, carried them. The contention on behalf of the Council, and the question for his lordship, was perhaps not very happily stated in the award. But it was clear that the question was as to what must be regarded, so to speak, as the unit of discovery. The Council's submission was that, there having been discovered a violation of the specification as to concrete, all the bad concrete must be made good, whatever the area of inferiority subsequently laid bare.

The contention of the contractors was that, by discovering some concrete to be bad, the Council did not discover that it all was, and that they must be limited to their actual discovery.

On the construction of the clause of the contract, the work which was to be made good was the work the ill execution of which constituted the violation discovered; in other words, the substance of the discovery was the particular bad work. The Council having discovered that some particular stretches of concrete were bad, made a further discovery when they found that all was bad, and to say that the discovery of some bad patches opened up the question of all the concrete, possibly in places remote and detached from the original site of the discovery, was not he thought, to give a fair or businesslike effect to the clause.

The substance of it was to provide for defects appearing within five years to the extent of that appearance, and therefore his judgment was that the award stood for £1,928, with the consequences named, and that the contractors should have the costs of the hearing before him.

COMPETITIONS OPEN

August 27.—Sending-in day. Proposed all-Scottish House for the Ideal Home Exhibition. Limited to architects practising in Scotland or of Scottish birth. Assessor : John Watson, A.R.S.A., F.R.I.B.A. Premiums : £150, £100 and £50. Conditions, etc., obtainable from *The Daily Mail*.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor : Percy Thomas, O.B.E., F.R.I.B.A. Premiums : £500, £400, £300 and £200. Conditions, etc., were obtainable from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor : Andrew N. Prentice, F.R.I.B.A. Premiums : £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor : Francis Jones, F.R.I.B.A. Premiums : £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor : Sydney Tatchell, F.R.I.B.A. Premiums : £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius from Liverpool Town Hall. Assessor : A. H. Moberly, F.R.I.B.A. Premiums : £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor : Robert Atkinson, F.R.I.B.A. Premiums : 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich.

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors : Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium : £500; also a further amount of £750 will be awarded to other designs according to merit.

THE ARCHITECTS' DIARY

WEDNESDAY, AUGUST 12

ROYAL SOCIETY OF ARTS INDUSTRIAL DESIGNS COMPETITION. At the Imperial Institute, South Kensington, S.W. Exhibition of some of the designs submitted in the above competition, including architectural decoration, textiles, furniture, book production and advertising. Until August 31. 10 a.m. to 5 p.m. (Sundays, 2.30 to 6 p.m.)

10 a.m.

KENT COUNTY ART AND CRAFT FEDERATION'S SECOND EXHIBITION. At the Thanet School of Art. Until August 14.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Liverpool and Manchester and District Branches. Joint visit to the Clarence Dock and Stanley Abattoir, followed by a tour of some of the Liverpool Housing Estates.

FRIDAY, AUGUST 14

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, Bloomsbury, W.C.1. Last day for submission of photographs for the Society's Annual Exhibition.

SATURDAY, AUGUST 15

Sunrise, 5.44 a.m. Sunset, 8.24 p.m.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Visits to Hunsford Brick Machinery Works and Hurstmonceux Castle.

MONDAY, AUGUST 17

Closing date of THE ARCHITECTS' JOURNAL August Holiday Sketches Competition.

SATURDAY, AUGUST 22

Sunrise, 5.54 a.m. Sunset, 8.11 p.m.

SATURDAY, AUGUST 29

Sunrise, 6.5 a.m. Sunset, 7.55 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Tour to Vienna, visiting Munich, Salzburg, Linz, Budapest, Zurich and Lucerne. Return, September 13. Full particulars may be obtained from the Secretary.

TUESDAY, SEPTEMBER 1

INTERNATIONAL ILLUMINATION CONGRESS. London, Glasgow, Edinburgh, Sheffield, Buxton, Birmingham and Cambridge. Until September 19.

FRIDAY, SEPTEMBER 4

INTERNATIONAL ILLUMINATION CONGRESS. At Glasgow. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1 : " Organization for the Development of Electric Lighting," by C. A. Atherton; " Progress and Teaching of Illumination in Italy," by C. Clerici; " Lighting Progress in South America," by A. M. Baidaff. Section 3 : " The Provision of Adequate Daylight in Building Regulations," by P. J. Waldram; " Daylight Illumination and Town Planning," by C. G. Möller; " Visual Performance at Various Levels of Daylight Illumination," by K. Y. Yang; " Daylight Illumination of Art Galleries with Overhead Lighting," by T. Hirayama. Afternoon Session, 2.30 p.m. Section 1 : " Home Lighting," by C. Haslett and N. E. Miller. Section 3 : " Photo-Electric Measurements of Daylight Illumination by the Use of a Model Room," by Z. Yamauti and K. Hisano; " Mathematical and Graphical Determination of Direct Daylight Factors," by A. C. Stevenson; " Prediction of Natural Illumination in Interiors and on Walls of Buildings," by H. H. Higbie and A. D. Moore. **10 a.m.**

SATURDAY, SEPTEMBER 5

Sunrise, 6.17 a.m. Sunset, 7.40 p.m.

MONDAY, SEPTEMBER 7

SANITARY INSPECTORS' ASSOCIATION, 27 Moreton Street, S.W.1. Annual Conference to be held at Bridlington. Until September 12.

INTERNATIONAL ILLUMINATION CONGRESS. At Edinburgh. Following are some of the papers to be read. Morning Session, 9.30 a.m. Section 1 : " The Lighting of Seaside Resorts," by A. P. Allan and J. M. Campbell; " Mason Experiments in Street Lighting," by W. S. Stiles; " Modern Public Lighting by Electricity," by W. J. Jeffery. Afternoon Session, 2 p.m. Section 1 : " The British Standard Specification for Street Lighting," by C. C. Paterson. **10 a.m.**

THURSDAY, SEPTEMBER 10

INTERNATIONAL ILLUMINATION CONGRESS. At Buxton. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1 : " Architectural Lighting," by R. Waldo Maitland and Howard Robertson, F.R.I.B.A. Afternoon Session, 2.30 p.m. Section 2 : " Architectural Lighting," by L. Kalff; " Engineering Aspects of Architectural Lighting," by W. J. Jones. **10 a.m.**

SHIPPING, ENGINEERING AND MACHINERY EXHIBITION. At Olympia. Until September 16.

FRIDAY, SEPTEMBER 11

INTERNATIONAL ILLUMINATION CONGRESS. At Birmingham. Sessions at 10 a.m. and 2.30 p.m. Papers to be read will be mainly devoted to signal glasses and vehicle lighting. **10 a.m.**

ARCHITECTURAL ASSOCIATION. Annual Excursion : to Austria. The programme will include six days in Vienna, followed by a six days' motor coach tour through Austria, returning to London on September 26.

SATURDAY, SEPTEMBER 12

Sunrise, 6.28 a.m. Sunset, 7.24 p.m.

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

TRADE NOTES

There are numerous books and pamphlets on mosaic and terrazzo which deal with historical facts, but so many changes have taken place in the formation, construction and adaptability of such a necessary building product, that in order to mark the fiftieth year of the foundation of Messrs. Diespeker & Co., Ltd., the firm have issued a brief treatise on the various materials with which their name has so long been identified. It is not generally realized that the firm of Diespeker were the originators of terrazzo work and other forms of mosaic decoration in this country. It will, therefore, be readily recognizable that *Mosaic and Terrazzo, 1881-1931*, is not merely a publication describing the buildings in which Diespeker have executed work, but a pictorial résumé of their more important contracts. The book is divided into separate sections, each section being devoted to one material. The order in which they are dealt with is as follows: Venetian glass mosaic, vitreous glass mosaic, Florentine mosaic, ceramic mosaic, alundum mosaic, Roman cube marble mosaic, Smaltino, terrazzo, nonslip terrazzo, precast terrazzo, terrazzo on ships, and bronze metal door frames (Diespeker's patent). Besides the coloured illustrations of terrazzo and Roman mosaic tesseræ, among the buildings illustrated, some in colour, are the following: Westminster Abbey (the late J. F. Bentley, architect); C.W.S. Dairy, Birmingham (W. A. Johnson); Midland Bank, Holborn Circus (Whinney, Son and Austen Hall, F.R.I.B.A.); Bourne and Hollingsworth, Oxford Street (Slater and Moberly, FF.R.I.B.A.); Barclays Bank, Melbury Court (Trehearne and Norman, F.R.I.B.A.); Middlesex Hospital (Alner W. Hall, F.R.I.B.A.); Selfridges, Oxford Street (Graham, Anderson, Probst and White); and the Bournemouth Pavilion (Home and Knight, FF.R.I.B.A.).

*

Crane Radiators is the title of a new catalogue recently issued by Messrs. Crane-Bennett, Ltd., in which the "Pall Mall" radiators and radiator accessories manufactured by the firm are described and illustrated by photographs and plans. Two outstanding features of the catalogue are the two-columned radiator, suitable, it is claimed, for hotel bedrooms or any position where small heating service radiators are required; and the Crane Deflecting Shield. The latter is a metal curtain that fits snugly between each column, from top hub to the bottom of the castings, on the side of the radiator next to the wall. It makes little change in the radiator's appearance and can be removed for cleaning if desired. Instead of permitting the heated air to rise straight up, it deflects it outward into the room, where most required. Thus it protects walls and plaster, largely eliminates blackened areas above a radiator, and guards against damage to draperies. Furthermore, it is claimed that the Crane Shield has the notable effect of reducing the temperature of the air below the ceiling, and at the same time increasing the warmth from the floor line up to about five feet above the floor, between which levels the heat is most required. Therefore, in addition to the same conditions of comfort to the occupants of the room there is also, it is claimed, an appreciable saving in fuel consumption. Every Crane radiator, except the two-column, can be equipped with the Invisible Shield at an additional cost. An adaptation of the shield for fresh air inlet radiators is also described in the catalogue. The radiators are manufactured at the firm's extensive Ipswich works which, together with the British Standard Malleable Fittings factory, cover an area of 500,000 sq. ft.

*

"Zinc is said to be electro-positive to iron, and therefore, under the influence of moisture and atmospheric corrosion, a small difference of electrical potential is created, and even though the coating of zinc, as the result of wear, becomes incomplete, it will be found to exercise a protective action on the exposed iron or steel surface. This 'galvanic' action, coupled with the fact that zinc coatings of a high degree of perfection are commercially obtainable, accounts for the extensive use of galvanized goods in all classes of work. Several different processes of producing zinc coatings have been in use, and, without entering into a detailed description of these, it may be said that by far the most important processes are those known as hot galvanizing. The 'Harco' hot galvanizing process possesses many advantages. The coating is complete and unequalled from the point of view of adherence by any other metallic coating. The zinc is definitely alloyed with the surface of the iron, and it is interesting to know that this coating is composite in character and really consists of several layers merging one into the other, so that there is no really sharp boundary between the iron surface underneath and the pure zinc above. The coating may be very roughly treated without showing any signs of becoming detached.

"An important feature of the hot galvanizing process is that manufactured articles can be galvanized after they are made, which ensures all surfaces being completely coated, with the result that the rust-producing influences are entirely excluded."—From *Galvanizing* v. *Rust*, a booklet explaining the cause and prevention of rust and corrosion in iron and steel, issued by Messrs. G. A. Harvey & Co. (London), Ltd.

*

Much interesting information which should be of service to buyers and users of fabrics for theatre and cinema upholstery is given in a handbook entitled *Theatre and Cinema Furnishing*, recently published by the British Mohair Association. It contains a complete account of the needs and requirements of upholstery fabrics, and is illustrated by many interesting technical photographs and colour reproductions of fabrics. It should be noted that B.M.A. mohair velvets for theatre and cinema upholstery are obtainable in any colour required. It is an important point for architects that their colour schemes, however unusual, can be matched accurately, therefore many attractive examples of fancy effects are also obtainable. The handbook is obtainable from the Secretary, British Mohair Association, 20 King's Arcade, Market Street, Bradford.

*

The Board of Trade state that they have referred to the Standing Committee appointed by them an application for an Order-in-Council to require the marking with an indication of origin of imported iron or steel flush pipes (whether galvanized or not). Representatives of any interests substantially affected by the application who desire to be heard in opposition at the public inquiry which will be held later by the Committee should communicate with the Secretary, Mr. E. W. Reardon, at the Board of Trade, Great George Street, London, S.W.1, as early as possible, and not later than August 29, 1931.

ALADDIN FACTORY

Following are the names of the general contractors and some of the sub-contractors for the offices and factory for the Aladdin Industries, Ltd., Greenford (illustrated on pages 202–207, and supplement to this issue). General contractors, C. Miskin and Sons, Ltd. Sub-contractors: Young, Austen and Young, heating and hot water; Kelvin Construction Co., Ltd., steelwork; Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, patent floors, etc.; Limmer and Trinidad Lake Asphalt Co., Ltd., asphalt; Henry C. Parker & Co., Ltd., facing bricks; Crittall Manufacturing Co., Ltd., windows and roof glazing; C. Isler & Co., Ltd., artesian well; Casselton Bros., stonework; Diespeker & Co., Ltd., terrazzo; Williams, Gamon & Co., Ltd., lantern lights; Hollis Bros. & Co., Ltd., flooring; Caston & Co., Ltd., handrails and balustrading; N. F. Ramsay & Co., Ltd., ironmongery; J. R. Venning & Co., Ltd., sanitary fittings; Cope & Co., Ltd., and Martin Van Straaten & Co., tile paving, etc.; H. & F. Badcock, Ltd., fibrous plaster; Anselm Odling and Sons, Ltd., marble; Morrison, Ingram & Co., Ltd., w.c. divisions; Medway Safety Lift Co., hand-power lift; W. Hitchens & Co., Ltd., laminated flush doors; Dreadnought Door Co., Ltd., fireproof doors; Jno. Booth and Sons, Ltd., partitions; Brilliant Sign Co., Ltd., bronze letters; J. W. Gray and Son, Ltd., lightning conductor; Quenby Fry & Co., Ltd., fencing; J. Briggs & Co., electrical installation and electrical fittings, including automatic telephones and floodlighting; Bratt Colbran & Co., Ltd., fire; Osler and Faraday, Ltd., electric light fittings; Estler Bros., Ltd., calorifier cover; G.W. Rly. Co., buffer stops; General Fire Appliance Co., fire buckets; Incorporated Association for Promoting the General Welfare of the Blind, mats; Henry Boyer, Ltd., forming road and paving; Gas Light and Coke Co., Ltd., gas.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BARKING Corporation has voted £38,850 for the erection of 102 houses on the Upney Farm estate, for rehousing persons from cleared areas.

Plans passed by the BARKING Corporation: Three shops, Axe Street, for Mr. G. A. Smith; mission hall, Gascoigne Road, for trustees of the Barking Baptist Tabernacle; fifty-five houses, Alfred's Way, for Suburban Developments, Ltd.; two houses, St. Mary's Road, for Mr. J. A. Graffy; colour store, Jenkins Lane, for Messrs. Gross, Sherwood and Heald, Ltd.

The City of London Corporation has appointed Mr. Victor Wilkins, F.R.I.B.A., as architect for blocks of flats to be erected in Sumner Street, BLACKFRIARS, at an estimated cost of £36,000.

The L.C.C. has passed plans submitted by Messrs. Hart and Waterhouse for the erection of buildings for the Royal Empire Society, on the site of 18–21 Northumberland Avenue, CHARING CROSS.

Plans passed by the FULHAM B.C.: Four shops and eleven garages, Greyhound Road, for Messrs. Parker, Fish and Palmer; buildings, 298–300 and 303 North End Road, for Mr. A. E. Baxter.

The FULHAM B.C. recommends a scheme prepared by Mr. Walter Cave, for extensions at the town hall, at a cost of £19,776.

The HACKNEY B.C. is to undertake a clearance scheme for the Banister Street area.

The HORNSEY Education Committee is to erect a school clinic in Crouch End Broadway, at a cost of £5,000.

Plans passed by the HORNSEY Corporation: Twelve shops and flats, Crouch End Hill, for Mr. J. White; alterations and additions, Wrestlers Tavern, North Road, for Messrs. A. O. Newman, Ltd.; alterations and additions, 106–8 High Street, for Mr. M. K. Matthews; alterations, Hornsey Central Hospital, Park Road, for Mr. J. M. Lethbridge; ten houses, Twyford Avenue, for the Rookfield Garden Village, Ltd.

Plans passed by the ILFORD Corporation: Nine shops, Redbridge Lane, and two houses, Fairview Gardens, for Mr. T. Anders; five houses, Southdene Gardens, and ten houses, Studley Drive, for Mr. L. W. Robinson; twelve houses, Silver Street, for Mr. W. L. Thompson; four houses, Hatley Avenue, three houses, Birkbeck Road, and two houses, Southdene Gardens, for Mr. J. Aldridge; twenty-six houses, Kelsie Gardens, for Mr. G. F. Siegerts; shop and store, Aldborough Road, for Messrs. Haines and Warwick; alterations, Seven Kings Cinema, Cameron Road, for Messrs. Eley and Nunn; ten houses, Netley Road, for Mr. E. Meredith; new offices, Grove Road, for Messrs. Fullers, Ltd.; twenty houses, Agnes Avenue, and four houses, Ulhall Avenue, for Mr. A. E. Wichello; three houses, Westrow Gardens, for Messrs. J. W. Moore and Son; fifty-five houses, Beech Grove, for Messrs. Fryatt and Godden.

The LAMBETH B.C. is to erect ninety-six flats in Cottingham Street, at a cost of £45,000.

The L.C.C. is structurally to improve the PADDINGTON technical institute, at a cost of £10,000.

The POPLAR B.C. is to prepare a scheme for the erection of a public hall and municipal offices in Bow Road, at a cost of £130,000.

Plans passed at ST. PANCRAS: Buildings, 196–198 Euston Road and 202–214 Euston Road; building, 2–20 Pancras Street; building, 89 Camden Road, abutting upon Rochester Road; shops and flats, Drummond Street; workshop buildings, Gough Street.

The STEPNEY B.C. is to erect seventeen blocks of tenements on a site at Limehouse Fields.

Plans passed by the STOKE NEWINGTON B.C.: Three shops, Somerfield Road, for Messrs. J. Willmott and Sons; premises for Ever Ready Co., Carysfort Road, for Messrs. H. Seymour Couchman and Sons; reconstruction of the "Rose and Crown" public-house, Church Street, for Mr. A. E. Sewell; alterations, Synagogue, Walford Road, for Messrs. Kellands, Ltd.

The Victoria Structural Engineering Co., Ltd., is to construct a greyhound racing-track in Garrett Lane, WANDSWORTH.

The WESTMINSTER City Council has prepared a scheme for continuing Savile Row into Conduit Street, at a cost of £99,000.

The WOOLWICH B.C. is to erect 400 houses on the Middle Park estate, at an estimated cost of £156,000.

SOUTHERN COUNTIES

Plans passed by the BOURNEMOUTH Corporation: Three shops and flats, Christchurch Road, for Messrs. Malmesbury and Parsons; two houses, Belle Vue Road, for Mr. W. R. Wilkins; two houses, Harewood Avenue, for Messrs. Midgley and Hardy, Ltd.; sixteen houses, Bankside Road, for Mr. R. Straker; four houses, Claremount Avenue, for Mr. S. G. Ward; two houses, Howeth Road, for Mr. P. G. Hollister; three shops and flats, Maxwell Road, for Mr. Arion; two houses, Belle Vue Road, for Messrs. A. F. Clarke and Sons; parish hall, Burleigh Road, for churchwardens; three houses, Moordown, for Mr. A. F. V. Holley; seven houses, Luther Road, for Mr. C. Wotherspoon; house and two shops, Barnes Lane, for Mr. H. Smith; alterations, 189–193 Old Christchurch Road, for Messrs. Edwards & Co., Ltd.; alterations and additions, Seabourne Road, for Alcrest Confectionery Co.; additions, St. John's parish hall, Vicarage Road, for Church Council.

Plans passed by the GRAVESEND Corporation: Two houses, Norfolk Road, for Stability Building Co.; three houses, Cross Lane, for Mr. T. Bennett; seventeen houses, Gatwick Road, for Mr. H. L. Smith, on behalf of Messrs. Dagnall Bros.; two shops, Stone Street, for Messrs. Robert Hopkins and Sons.

The HASTINGS Corporation recommends the reconstruction of another section of the White Rock baths, at a cost of £42,800.

Plans passed by the HASTINGS Corporation: Eighteen houses, Marina estate, for New Ideal Homesteads, Ltd.; twelve railwaymen's cottages, West Marina Station, for Mr. F. Ellson; six houses, Hythe Avenue, for Mr. H. H. Ford; additions, Institute N.D. Des Missions, Old London Road, for Mr. J. S. D. Hicks; six houses, St. Helens Road, for Mr. J. S. D. Hicks; two houses, Harold Road, for Mr. J. Hunt.

The HERNE BAY U.D.C. has approved the layout of a new housing site in Claremont Road, provision being made for the erection of eighty houses.

Plans passed by the HERNE BAY U.D.C.: Three shops and flats, The Broadway, for Mr. C. E. Morris; alterations, Hampton Inn, Hampton, for Messrs. H. Anderson; four bungalows, Ivanhoe Road, for Mr. F. Iggulden; bungalow, Beltinge Road, for Mr. R. Messenger.

The OXFORD Corporation has approved the layout of land at Rose Hill for the erection of 124 houses.

The OXFORD Corporation is to erect forty houses on the Quarry Fields estate.

Plans passed by the OXFORD Corporation: Additional story, 9–13 George Street, for Mr. J. C. Leed, on behalf of Mr. De La Mare; additions, Buttery Beef Lane, for Pembroke College trustees; warehouse, Marlborough Road, for Messrs. Salter Bros.; additions, nurses' quarters, Acland Home, Banbury Road, for Committee; shop, corner Iffley Road and Howard Street, for Mr. E. G. Burton; new hospital buildings, Radcliffe Infirmary, Woodstock, for Committee; extensions, Church Hill Road estate, for Mr. A. J. Colbourne.

EASTERN COUNTIES

The CHELMSFORD Corporation Library Committee recommends seeking sanction to borrow £20,800 for the erection of the new library block.

The CHELMSFORD Corporation Housing Committee recommends acquiring eighteen acres of land near Waterhouse Lane, for housing purposes.

MIDLAND COUNTIES

The CHESTERFIELD Corporation is to erect forty-six houses in Newbridge Lane, five in Stand Road, and twenty-two in Walton Crescent.

The DERBY Corporation is to erect a nurses' home at the city hospital, at a cost of about £31,000.

The DERBY Corporation is to erect a garage at the Ford Street depot, at a cost of £17,000.

The DERBY Corporation has voted estimates of £190,000 in connection with the erection of some 600 houses on the Normanton estate.

The SMETHWICK Corporation has approved plans for the erection of a clinic and branch library building at Bearwood, at a cost of £11,500.

Mr. William Lees is to develop a building estate of two-and-a-half acres of land off Mallin Street, SMETHWICK.

Plans passed by the SMETHWICK Corporation: Four shops and flats, Bearwood Road, for Mr. E. Hewitson; surgery and flat, 171 Oldbury Road, for Dr. C. V. Smout; alterations, premises corner of Bearwood Road and Dunsford Road, for Messrs. Jones and Son; three houses, Pitcairn Road, for Mr. J. Reece.

The SUTTON-IN-ASHFIELD U.D.C. is to erect fifty-nine houses on the Twitchwell estate.

NORTHERN COUNTIES

The BIRKENHEAD Education Committee has obtained a site in Whetstone Lane for the erection of a central school.

The GRIMSBY Corporation is to construct another 100 houses on the Nunsthorpe estate, at a cost of £36,400.

The Lancashire Education Committee has obtained a site at LITHERLAND for the erection of an elementary school and the provision of playing fields.

The MANCHESTER Corporation is seeking sanction to borrow £17,000 for the erection of branch washhouses at Collyhurst and Gorton.

The MORECAMBE Corporation has approved plans prepared by the county architect for the erection of the new library in Queen Street, at a cost of £15,000.

Plans passed by the MORECAMBE Corporation: Two bungalows, Heysham Road, for Messrs. Barrow Bros.; two houses, Kensington Avenue, for Mr. G. Jackson; two houses, West End Road, for Mr. J. H. Carleton; two houses, Morecambe Road, for Mr. A. Heathcote; two houses, Balmoral Road, for Mr. G. W. Omerod; eight houses, Moss Grove, and eight houses, George Street, for Messrs. Brook and Kershaw; six houses, Craiglands Avenue, for Mayfield Building Company; two houses, Hall Drive, for Messrs. H. Hillman and Son; alterations and additions, Bare Lane station, for L.M.S.; eighteen bungalows, Osborne Road, for Messrs. William Gardner & Co.; alterations, Wellington Hotel, Marine Road, for Mr. J. Rigby; seven houses, Thornton Road, for Messrs. Harrison and Moore.

The PENRITH U.D.C. is to purchase land at Penny Hill for the erection of fifty houses.

The PENRITH U.D.C. recommends a scheme for the erection of 120 houses (100 non-parlour and twenty non-parlour two-bedrooms) on land adjoining the Castle Hill site, at an estimated cost of £45,000.

The RIPON Corporation is to consider a proposal for the provision of a public swimming bath on the land at the rear of the Spa Baths.

The SALFORD Education Committee is to erect new buildings for the Pendleton High School.

The WALLASEY Corporation is to erect a further 100 houses on the Moreton estate.

The Lancashire Education Committee has obtained a site at WALMER BRIDGE, for the erection of a junior school.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

STEEPLE OF A CHURCH IN DENMARK

ARCHITECTS' WORKING DRAWINGS OF A TIMBER BELFRY SHEATHED IN COPPER

[*Thomas Harning and Fredericksen, Architects*

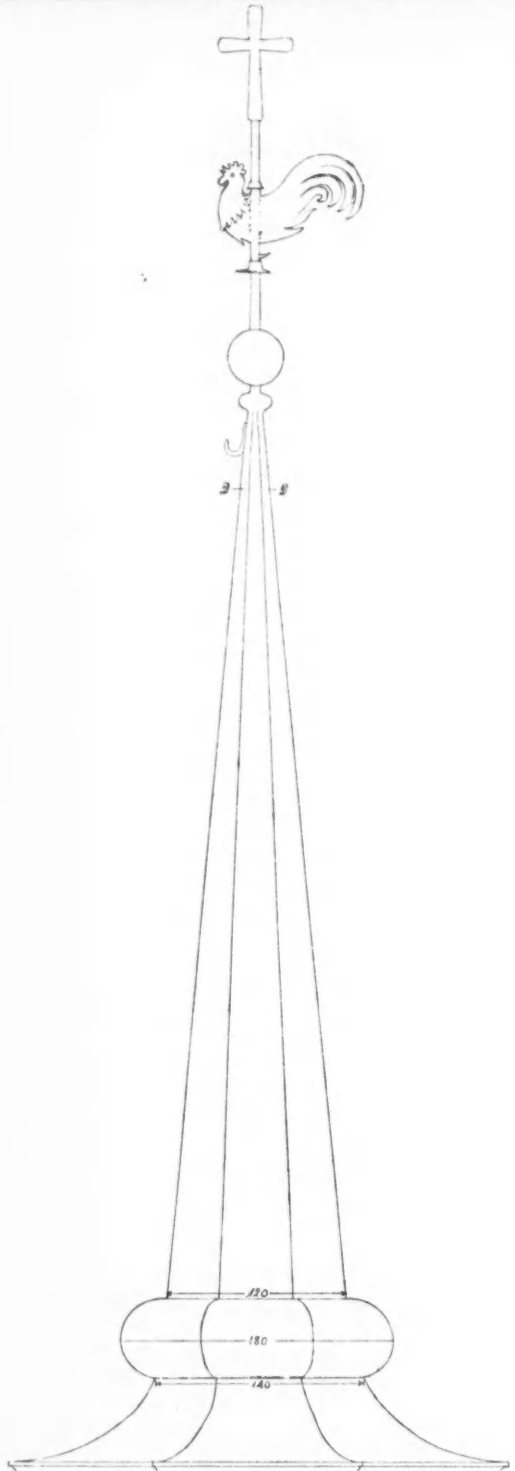
VIEW OF THE LINDEVANG CHURCH FROM THE STREET

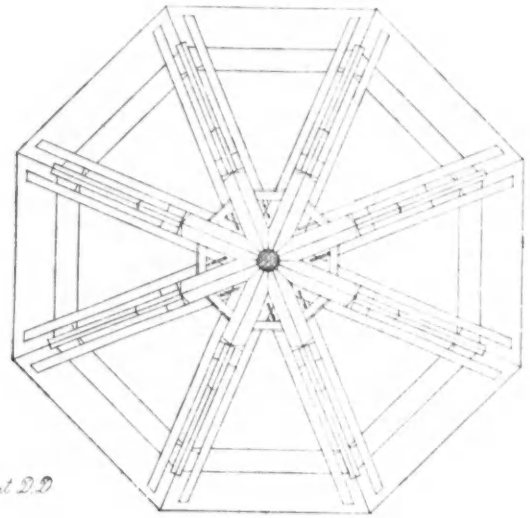
THE church in Denmark, of which a general view appears above, and a nearer one of the steeple on the last page, while within are the architects' scale working drawings of this detail, was opened in September of last year. The main fabric is of red hand-made bricks, with vertical stripes of a yellow variety used for decorative effect; and the plinth is of black bricks. The roof is covered with red pantiles.

The constructional details of the timber-framed campanile are clearly shown on the drawings, and present several features of interest, such as the alternate carrying through solid of the interlacing joists at various levels. The centre post is slightly tapered.

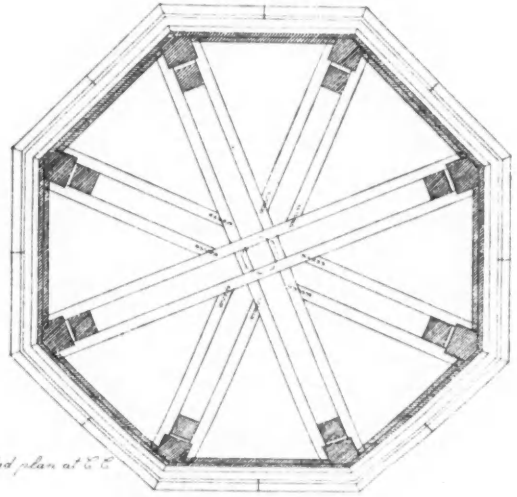
The steeple is sheathed in copper, and the weather-vane, in the design of a cock, is gilt.

A future supplement will be devoted to details of the main entrance.

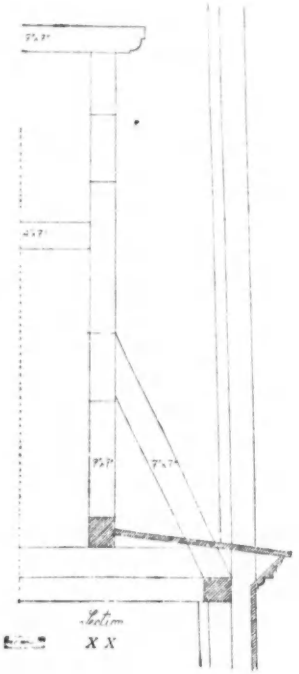




Plan at D.D



Reflected plan at E.E



This plan shows the lower set of joints on the upper curb & the alternate joints were carried through as dots.

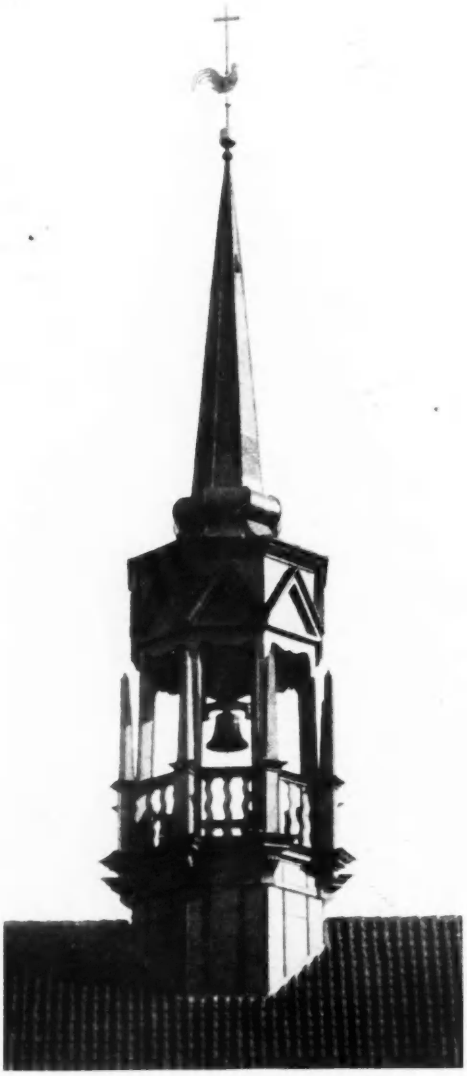
DEN NYE KIRKE I SOLBJERG SOGN



THE COPPER-SHEATHED STEEPLE

A TOWER IN BRICK AND STONE

AT THE ALADDIN FACTORY, GREENFORD, MIDDLESEX

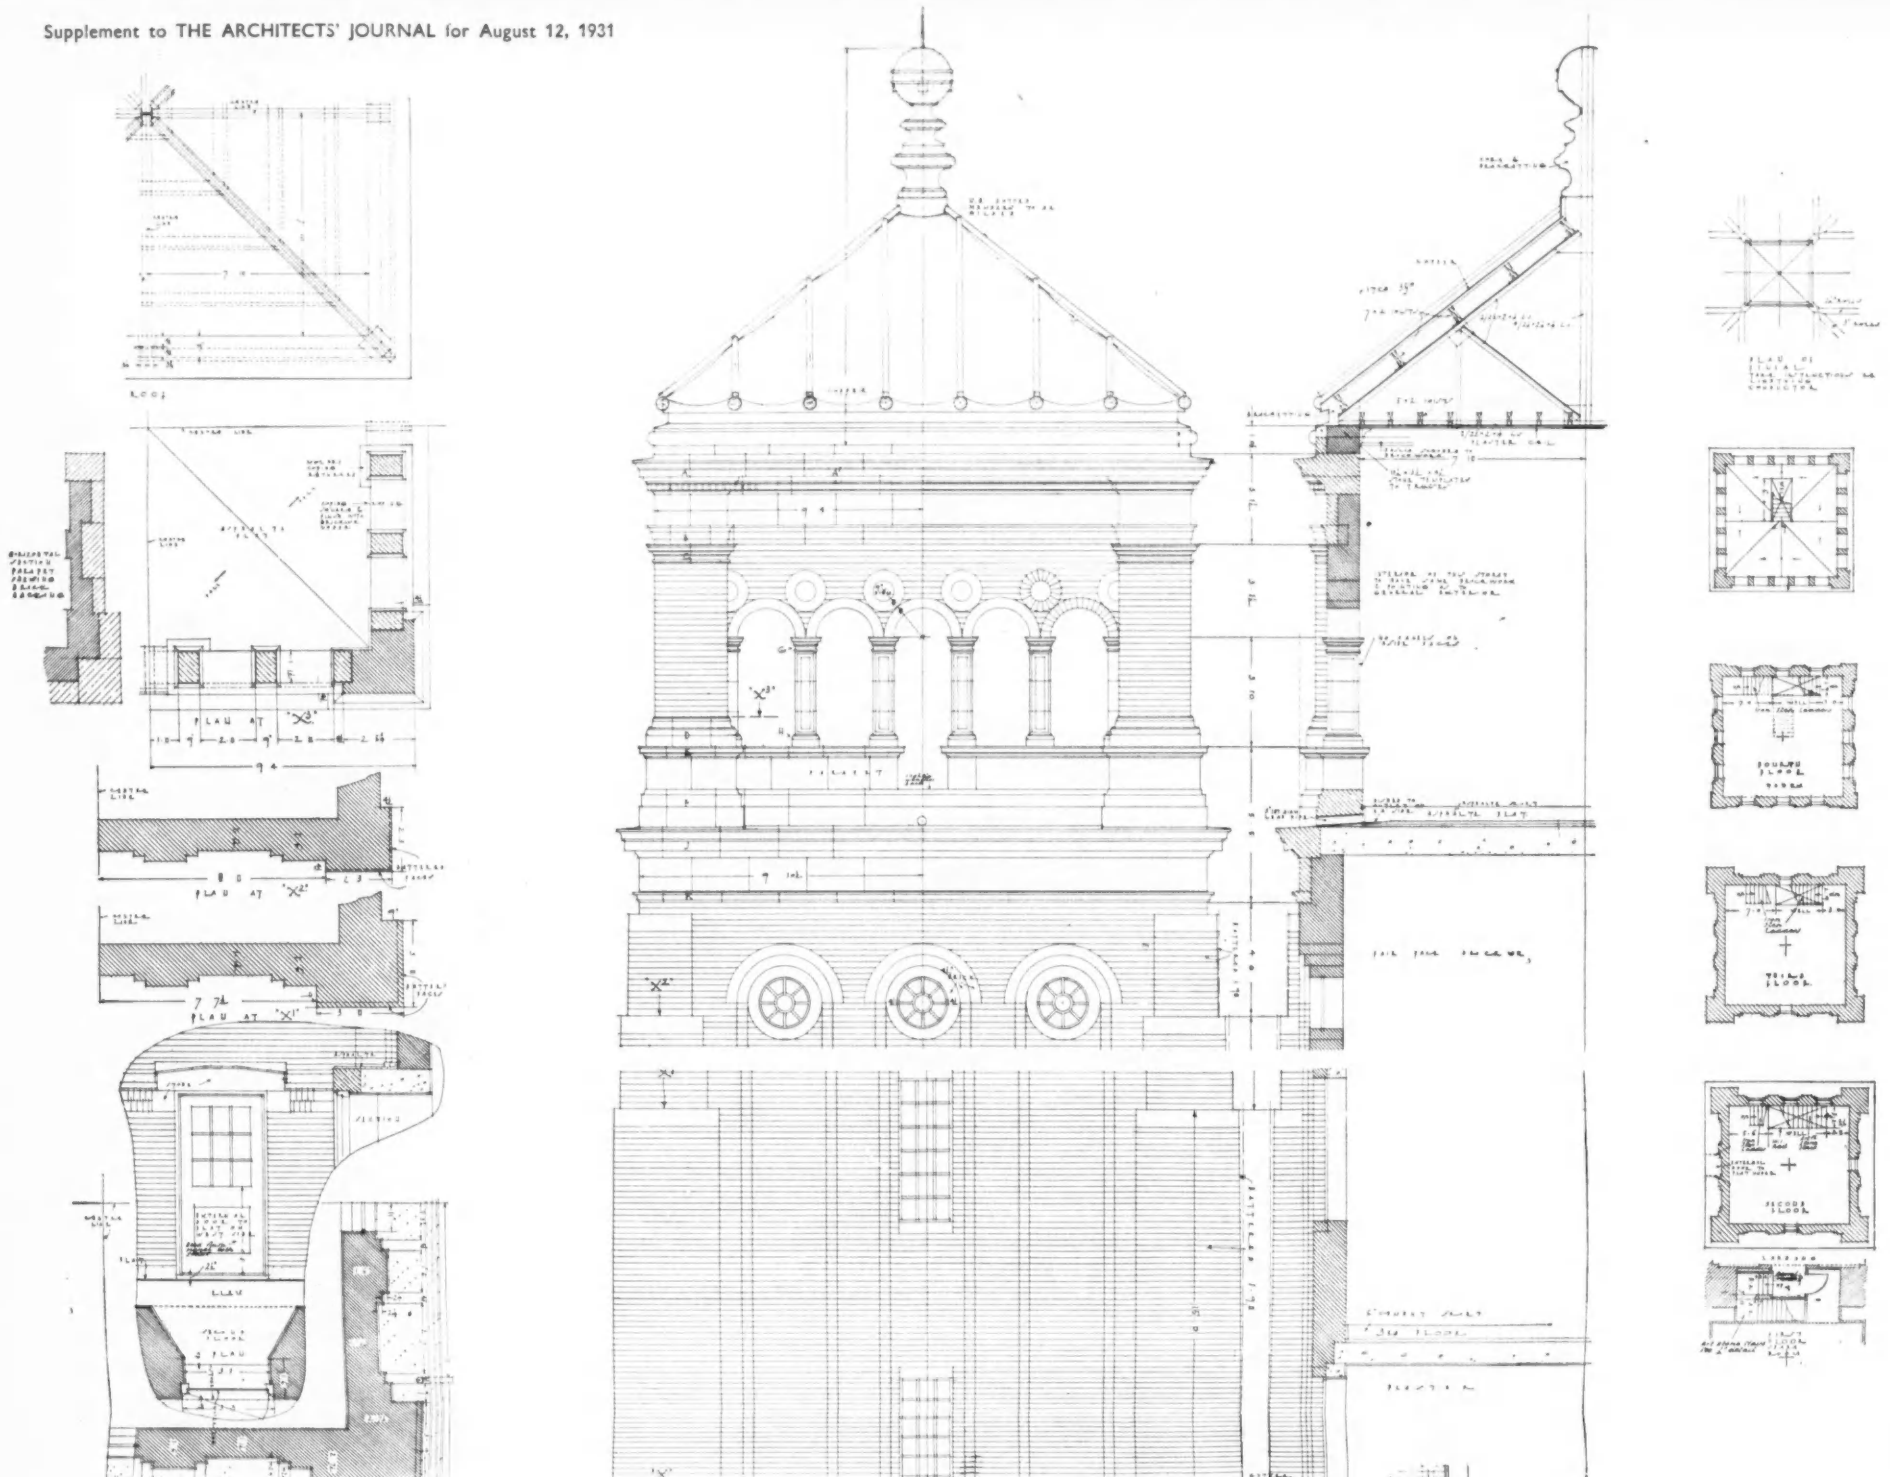
[*Nicholas and Dixon-Spain, Architects*

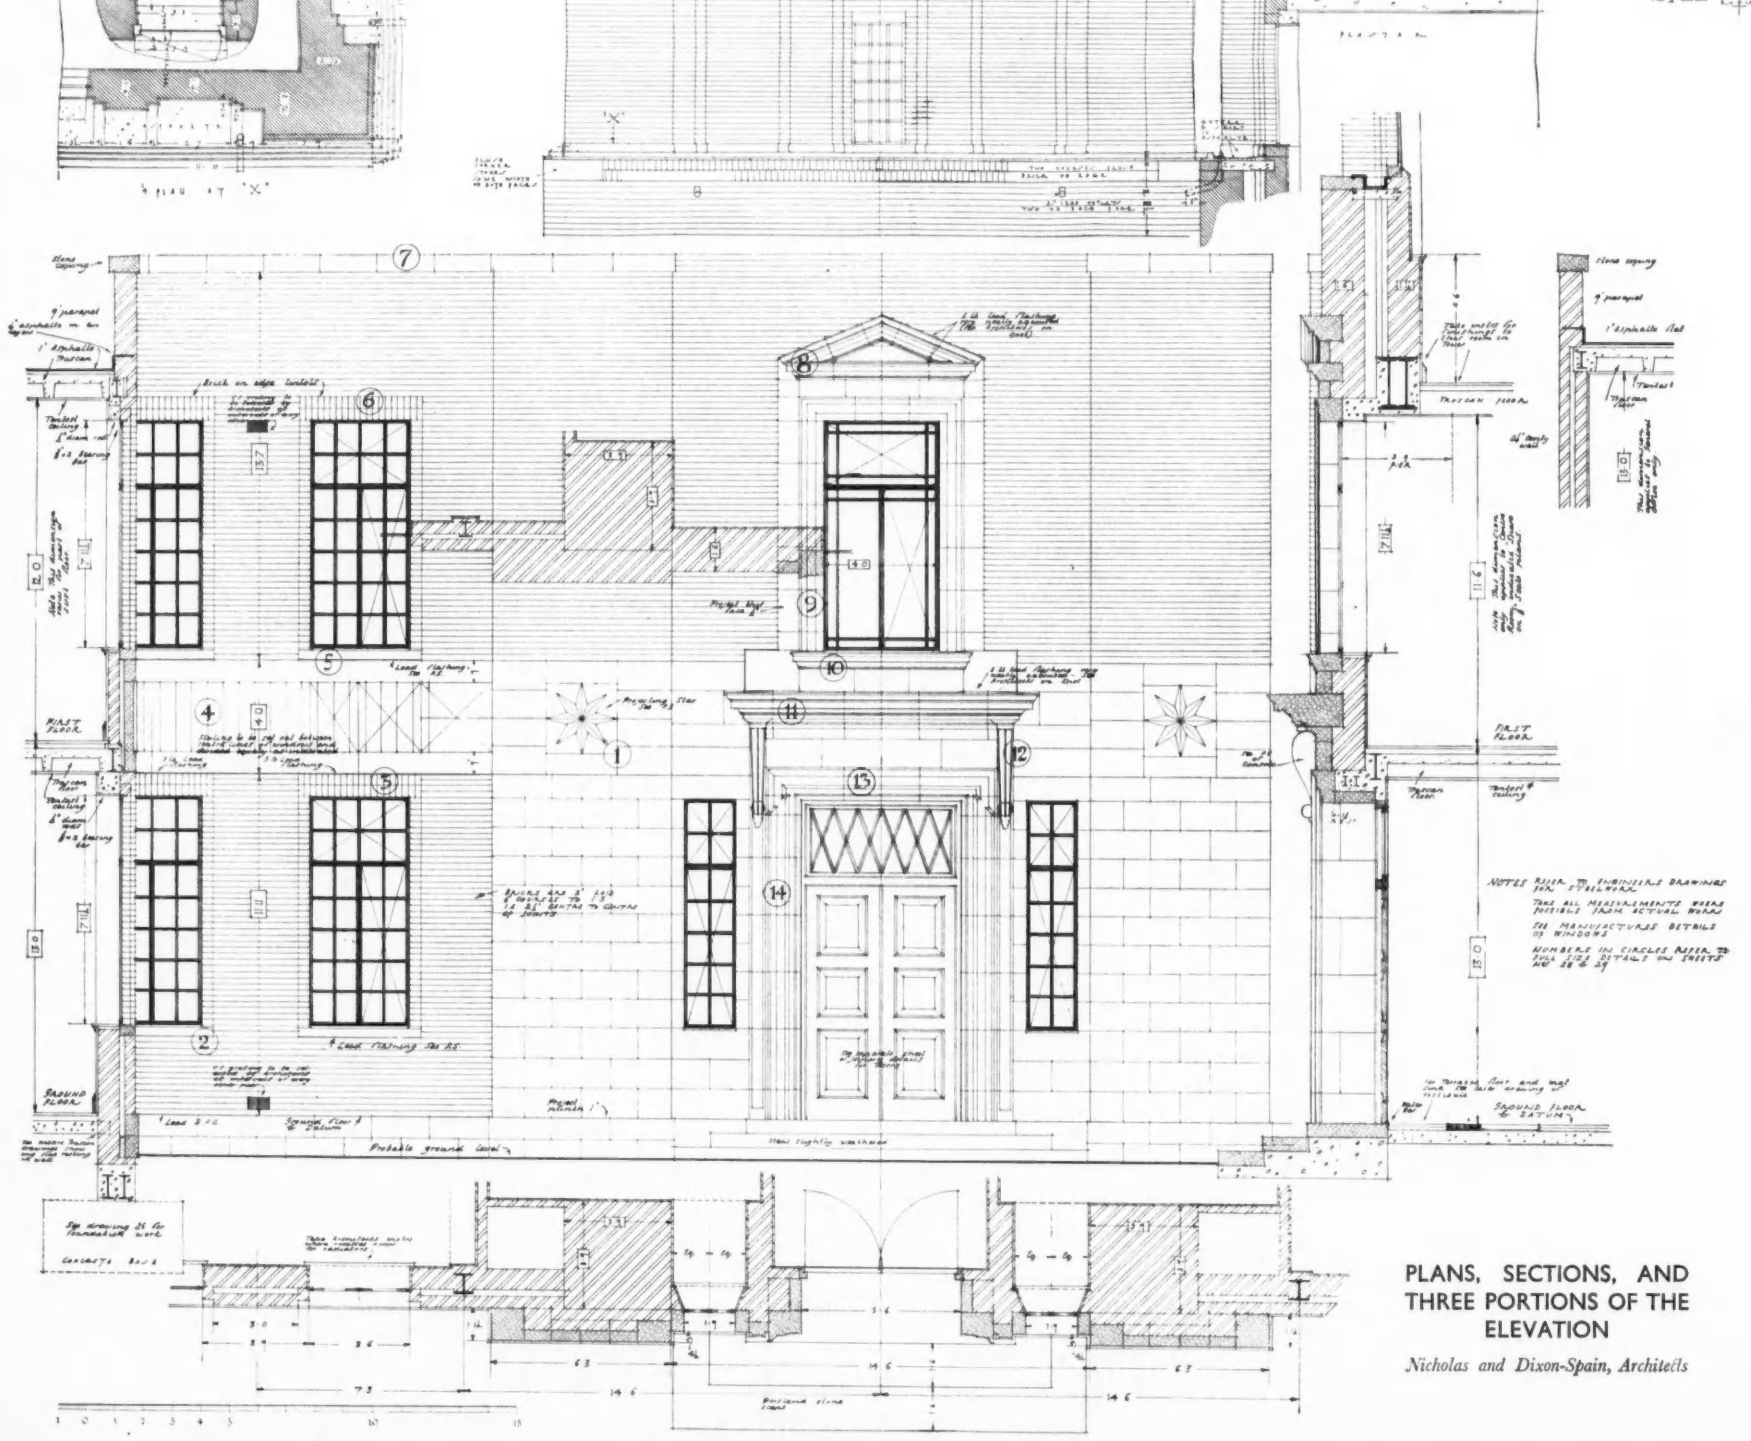
THE WATER TOWER AND MAIN FACTORY ENTRANCE

THE tower, of which a photograph is given above, while the architects' drawings of some of the details are reproduced overleaf, forms the central feature of the new factory for Messrs. Aladdin Industries, Ltd. Ninety feet high, it provides the main entrance to the factory, and storage for water, which is pumped from an artesian well 450 ft. deep.

The building is faced with 2-in. multicoloured bricks with Bath stone dressings, and the floors are of trussed concrete. The site is bounded on the north by the Grand Junction Canal, and the main south frontage will eventually face to Western Avenue, a new arterial road.

Further views of the factory appear on other pages of this issue.





PLANS, SECTIONS, AND THREE PORTIONS OF THE ELEVATION

Nicholas and Dixon-Spain, Architects

SELECTED PRECEDENTS:

THE DEEP STAIR WINDOW

LAST week examples of the horizontal window were illustrated. Its complement is the deep vertical window.

In Continental towns, where all classes have lived mainly in large blocks of flats for the last two or three generations, deep vertical windows for lighting staircases are now becoming conspicuous features of domestic architecture.

As these buildings rarely exceed five stories in height, the provision of lifts is the exception rather than the rule. Thus, the common staircase is the spinal cord of the floor plan and the elevations alike.

Anyone who has lived in French or German flats built before the war will be familiar with the almost impenetrable gloom in which the staircases are plunged during the day-time: an obscurity as unhealthy as it is not infrequently dangerous. After the war, when economic conditions rendered more rational types of construction and plainer façades imperative, the necessity of improving their lighting and ventilation was at last recognized.

The general abandonment of the old plan, based on the enclosed "well," means that staircases have to be lit from either the front or the rear. The vertical window, extending continuously from the attic to the ground floor, offers an ideal solution of this requirement. It also provides a simple and inexpensive manner of giving formal repetitive significance to each block of flats when several are grouped together as units of a single façade, besides being a decorative detail valuable in itself.

Figure **5** *affords the simplest possible example. In this case, as also in figure* **4** *(where the only material difference is that an angular form of window has been preferred to one flush with the wall), the centralizing emphasis of a prominent vertical feature counterbalances the salient horizontal stress of the bands of parallel balconies.*

Figure **2** *shows a rather unusual French disposition. Here the same stabilizing inflection undoubtedly helps to pull an asymmetrical composition, combining various types of fenestration, into a more coherent unity.*

In figure **3**, *the staircase is lit on either side by twin corner windows instead of frontally by a single casement.*

Figure **1** *illustrates the use of a vertical window running down the steeple of a church for lighting the staircase leading to the belfry.*

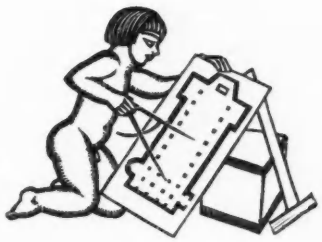
THE ARCHITECTS' JOURNAL



WEDNESDAY, AUGUST 19, 1931

THE UNMENTIONABLE FEE

THE Practice Standing Committee of the R.I.B.A. have issued a warning in terms not often to be found in the pages of their *Journal*.

"The Committee," they say, "receive a large number of letters from members who have difficulties about their fees, and it is safe to say that in nearly nine cases out of ten the difficulties arise entirely from neglect of the architects concerned to act upon the constantly reiterated advice given to them. . . . An infinite amount of trouble would be saved . . . if members would be more businesslike . . . ."

It is extraordinary that architects are so loth to regard their fees as part of the cost of building. Estimates are prepared and discussed freely with clients as the subject-matter of the business in hand, while fees, assessed as a percentage of these costs, capable of being added to the total after an elementary calculation, are reserved and kept in the background, like an awkward child, because for some reason or other it is not felt to be in accordance with the architect's position as a professional man and a gentleman to bring in his fees in the grand total of bricks and mortar, or discuss them with his client as a plain matter of business.

From this senseless taboo, for taboo it is, all manner of difficulties arise, which more often than not leave the architect in a position which his original attitude presumed to be impossible. For a man who cannot bring himself to discuss fees with his client at the beginning of the job is either afraid or is too proud to do so. With the first we need not bother; he doesn't deserve fees. The second, in acting as he does, disparages his value to his client and the value of his profession to society.

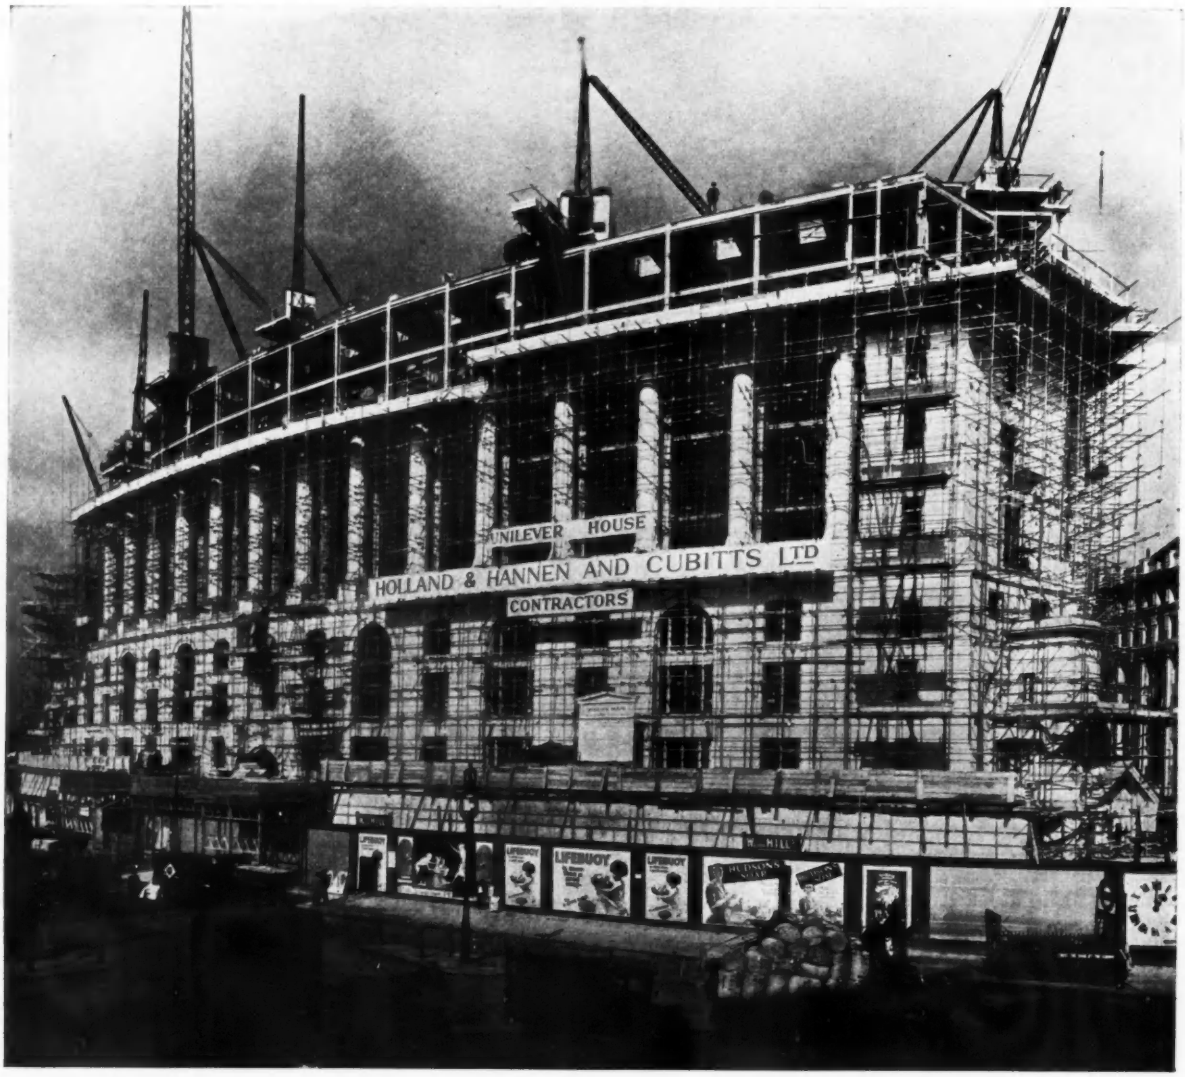
For a fee of six per cent. a competent architect today performs services in excess of that amount in designing and regulating the erection of building. Many business men are surprised at the amount of detailed work and supervision which is at their command for that percentage, especially when, as the job proceeds, its complexity unfolds itself before their eyes. It is safe to say that few clients, business men or otherwise, can regard these charges as excessive when they know what is covered by them.

The whole secret, which experience most abundantly proves, lies first in putting the architect's position clearly to the client, and in following this with an equally clear arrangement for the payment of fees, either in one sum or in instalments as the job proceeds.

It is the only way of preserving for himself the real sense of dignity and equality, to say nothing of the peace of mind which eases the architect's burden of responsibility. Money is power, and the architect's position as agent-adviser constitutes a delegation of power which is completed by the payment of fees, and merely sustained while fees are only presumed to be paid, no matter how well founded the presumption may be.

The whole question was discussed at length by Karshish in *The Honeywood File*, or better still, in that earlier treatise called *The Tribulations of Early Practice*—a most excellent composition of sound advice—but we would go even further than he in urging the architect to be as much a man of business in all matters concerning fees as he hopes to be in those concerning the interests of his client.

Sir John Soane never bothered about unpaid fees, either because he was too absorbed in his work or too proud to put himself in the position of suitor. It is a lesson to know how much of his later years was spent in efforts to collect what was his by the very best rights in the world, and how little he managed to salvage.



THE NEW BRIDGE-HEAD AT BLACKFRIARS

A photographic study of Unilever House, Blackfriars, E.C., showing the rapid progress which is being made with its erection. Occupying the Victoria Embankment site of the old De Keyser's Hotel, it is but a few months since the steel-work began to rise up into a huge skeleton, in preparation for its outer covering of concrete. An important feature of the building will be two equestrian statues, by Mr. Reid Dick, one of which can be seen above the entrance on the right of the perspective drawing seen on the facing page. On the extreme left of the illustration is the statue of Queen Victoria.

Sir John Burnet, R.A., Tait and Lorne are the architects, and Mr. J. Lomax Simpson, consultant architect.

NEWS & TOPICS

PLANNING AND UNEMPLOYMENT SCHEMES

THE committee set up by the Government to see whether Regional Reports might yield plans for future work have had little to report, as might have been expected by those who know to what extent these reports and schemes are advisory only. In the first case, regional schemes are to a great extent restrictive, making proposals for the zoning of land and the provision of open space, neither of which, useful though they be, can be expected to provide work.

*

Road proposals are by far the most important item and roads have been explored pretty thoroughly by all governments. We have it on authority that the Road Fund is nearly exhausted by the demands made upon it, and Colonel Wilfred Ashley, in a recent open letter, gave it as his opinion that we had spent all we should on the road system some time ago, and that most present expenditure is an extravagance. This committee was therefore in the nature of an extravagance itself.

THE LABYRINTH

The urgent plea in last week's leading article, entitled "The Labyrinth," for a considered, comprehensive plan for London, is the logical expression of ideas that have been exercising minds that by their training may be said to be predisposed to think in such terms. But it is well to recall that they are ideas that have been circulating for some time in lay circles, too. *The Week End Review* published, in February last, an article from which the following quotations are worth reprinting :—

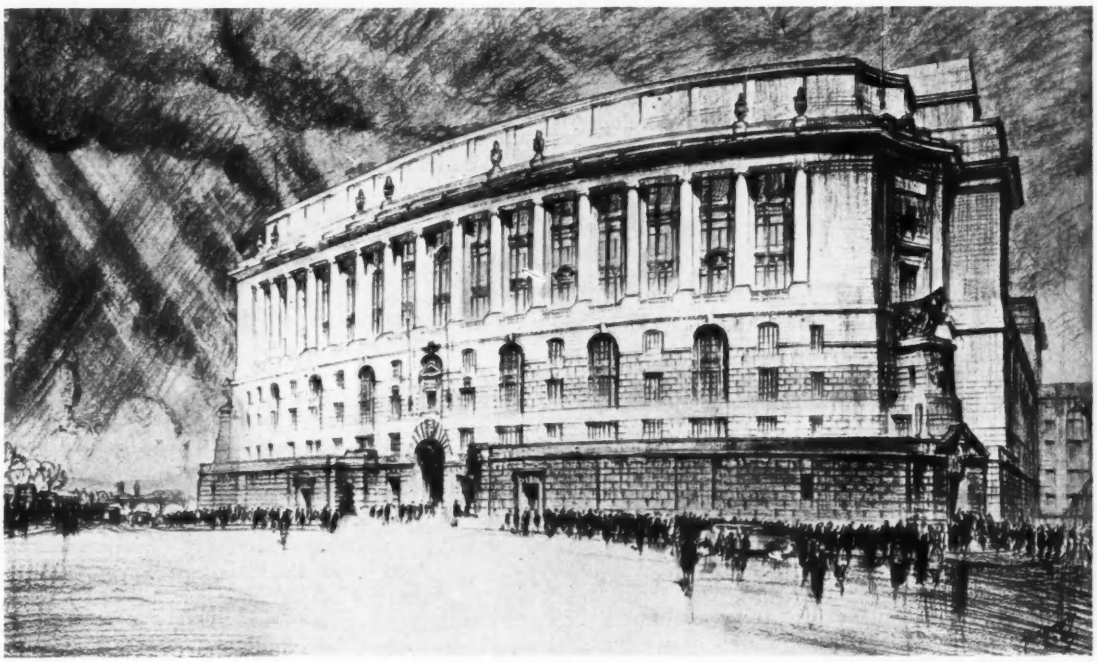
A bold treatment of the national problem of London must take a large place in any constructive planning policy. It is perhaps fortunate that metropolitan conditions are so indisputably chaotic; if they had been patched up within twenty years or so of meeting contemporary needs, as in Paris, it might be more difficult to secure agreement for uncompromising action. The fact that London is an historic City, containing a number of ancient buildings which have to be preserved, must tend to modify a plan seeking to fulfil the demands of the twentieth and twenty-first centuries, but cannot be allowed to nullify it. London at the moment is a city of spectacular waste, due to the sudden growth within the past century of a modern great town on the almost unchanged street-plan of a medieval haphazard settlement. . . .

It is therefore suggested that one of the first steps under a National Planning Policy must be to set up a London Planning Commission to prepare a detailed scheme for the rebuilding of London in accordance with the requirements of a first-rate modern city within a period of, say, thirty years. . . .

It might, to give but one example, recommend taking clearly marked sections and reconstructing them in succession beginning with the wasted South Bank between the Thames, Vauxhall, the Oval, the Elephant, and London Bridge. Here the whole jungle might be cleared with provision for gathering of all railway lines, electrified and running below the surface, into a single spacious South Terminus, the rest of the site being given over to public and business buildings, standing, at ample distances apart, instead of lining cramped, mean corridor-streets.

MASS-PRODUCED HOUSING

The mass production of cheap housing comes very much to the fore with the new Housing Act and the expenditure on 40,000 cottages. One side urges mass production as an essential bound up with very much more scientific



[*Sir John Burnet, R.A., Tait and Lorne, architects ; J. Lomax Simpson, consultant architect.*

Unilever House, E.C. From the perspective drawing by J. D. M. Harvey, exhibited at the Royal Academy this year.

management than has obtained hitherto. Mr. Bossom couples this with a plea that central direction should help to save the countryside. But, says his critic, mass production is inimical to such salvation, for it entails a restriction upon variety and local character expressed in local materials. It does; but is that so important as it at first appears, and is variety in material as important as character in design ?

*

Look at the standardized housing of Germany, and, if you are not too biased against the particular convention, can you say that it is inexpressive or lacks variety within its range ? Take again our own admirable eighteenth century, which left a trail of stucco building over the south of England. Are these, because they are stucco and not local brick, characterless and out of harmony ? Do you want to pull them down because they are un-Kent like or don't smack enough of true Somerset character ? Surely not. Then why not realize that mass production, while it limits the range to a certain extent, cannot prevent intelligent architects from leaving the stamp of character upon building ? The point is that mass-produced houses *must* be architect-designed if they are not to become eyesores. Exactly how far the range is to be restricted depends upon the thoroughness of mass production, which should consist not only of machinery for reproduction of parts, but for the selection of the most fitting and the most beautiful parts, in the same way that metal windows were evolved by collaboration with architects. Labour is the crux of the problem, but mass production would be a waste of time without the architect.

ON COMMITTEES

Manchester fulfils the first order of planning in its recent resolve to amalgamate the offices of the Improvements and Building Committee and the Town Planning Committee in a new Committee to be called the Town Planning and Building Committee. (All those "committees" in one sentence just shows you the kind of age we live in !) This provision saves overlapping, but it is, of course, the coming of the Town and Country Planning Bill which is foreshadowed. Up till now planning has only taken place on undeveloped land, and urban activities have been controlled, but not planned. The inclusion of developed areas throws the balance on to the town to such an extent that town planning becomes the central fact, and the committee in charge of it must be responsible for the planning of the entire city. It will prove to be the most important committee on the council, with the natural exception of that of finance.

THE A.A. MATERIALS BUREAU

The recent letter to *The Times* from the President of the Architectural Association, pointing to the value of the A.A. Materials Bureau in connection with the Government's report on the Education for Salesmanship reminds me again of the extraordinary service which that Bureau performs to the profession. That the profession is not quick to make the best use of the service I am well aware. That is why I feel disposed to discuss it at length.

*

There are several such bureaux in the world. I have seen them in America and I know of them elsewhere. None, I venture to think, can approach this one in London in point of real usefulness, for just as we are professional in that we act without bias, so this bureau, supported by the A.A., and not by payment of exhibition fees or rents, occupies a position of trust, and advises without partisanship in the choice of building materials.

*

Materials by themselves will tell most of their story so long as you can compare and handle, but anyone who has gone along to Bedford Square looking for help, will say at once that the Bureau revolves about Mr. Winser. It is his knowledge of the facts of manufacture, sale, transport, and cost that gives the exhibition its peculiar value to those who know it. There is no other person in London who knows more about materials, old and new, than he, and no one more pleased than I to learn that his work is to be given greater scope in the future.

YORK'S FIVE DERELICT CHURCHES

It must have gone very much against the grain when a commission of clergy advised the demolition of five York churches. They are faced with a situation of unusual difficulty in that the centre of population in York has been displaced and dispersed into outer suburbs, which are as unprovided with new churches as the city is overstocked with old. No particular value attaches to churches as yet undesigned, while the old churches are part of the fabric of antiquity that gives York its special character. Economy presses hard, demands that the waste should be avoided, that clergymen shall be paid decent salaries and that flocks shall not go untended. No one but the Church pays for these old churches and few attend.

*

But they do, by their presence, enrich the spiritual life of the place and have their effect upon the inhabitants. The risk in selling their sites is the encroachment of commercialdom with its negative, unspiritual appeal to the senses. If one could feel that the Church could exercise intelligent control over the new buildings, one might be satisfied that the demands of hard times should be met, but this is a great deal to expect.

"THE MONSTER OF MUSWELL HILL"

Alexandra Palace is well named "The Monster of Muswell Hill." It stands there as a monument to a distressing period of English architecture, in a park that is surrounded by buildings hardly less ugly. The news that the palace was to be saved for London might have been received with doubtful acclamation when it continued in its former state. Continue it must so far as its outer appearance is concerned, but its "innards" are to be taken out by a feat of architectural surgery, and Mr. E. C. Davies is to turn a warren of apartments into a vista of great halls, the largest capable of accommodating 15,000 people, for shows of the magnitude which this age of mass movements demands. Let us hope the acoustics of its concert hall are capable of amelioration.

*

A building of this type is lacking in North London. The South has the Crystal Palace—that pioneer of all exhibition buildings. Other cities, too, feel the need for great halls. Liverpool, for instance, the livest and most civic-minded of all provincial towns, even though it possesses in St. George's Hall the finest civic building in the country, is thinking seriously of investing in another hall large enough to hold the great exhibitions and pageants by means of which it announces its aims, its opportunities and attractions. This, for a city already building two great cathedrals and a tunnel costing five million pounds, shows a remarkable trust in the future.

ASTRAGAL

This perspective sketch, showing the principal entrance and south elevation, has been reproduced in order to show how the tower, not yet built, will harmonize with the rest of the structure.

A MODERN CATHOLIC CHURCH

DESIGNED BY WILFRED C. MANGAN

ALTHOUGH St. Paul's Church, Haywards Heath, Sussex, here illustrated, conforms fully with the conventional requirements of a modern Catholic church, the treatment breaks away in many respects from usually accepted forms. In plan the church is cruciform.

The nave, in three square bays equal in each dimension, is covered by intersecting barrel vaults springing from square brick piers, the transverse vaults being extended over the aisles. At the east end they are further extended laterally to cover the transepts. A shorter bay, also vaulted and flanked by side chapels, connects the nave with the sanctuary.

The latter is spacious and well elevated, and runs the full width of the nave and aisles. Like the nave, it has a barrel-vaulted ceiling, groined and elongated. The sacristies are placed on the south side of the sanctuary under a low flat roof, so that they do not interfere with the lines of the main building.

The outstanding feature of the church is its brickwork, the design calling for a high standard of craftsmanship in this respect. Sussex purple stocks have been used for the deep basecourse, which runs round the whole of the building, and above this the walls are faced with multicoloured, hand-made, sand-faced bricks, set in Flemish bond, with wide joints of cream-coloured mortar, and very freely relieved with cherry-red arches and panels of small pattern brickwork in contrasting shades and textures, whilst under the gables and elsewhere verges and bands of semicircular tiles in a bold pattern add further relief to the surfaces.

The roof is fairly high pitched and covered with Lombardic sand-faced Roman pattern tiles.

Another somewhat unusual feature is the liberal use of light-coloured marbles

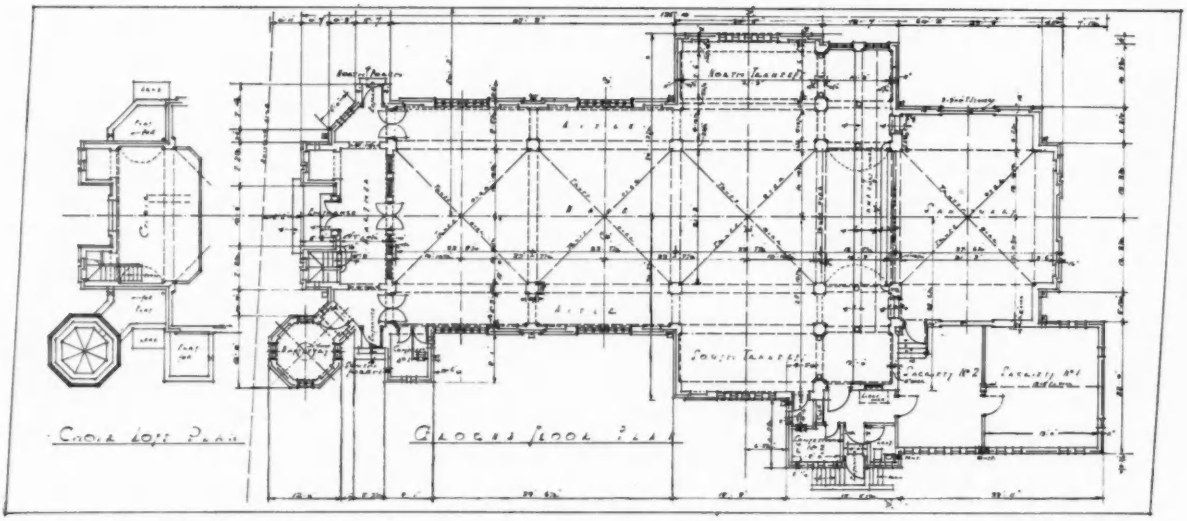
The south elevation. Sussex purple stock bricks have been used for the deep basecourse which runs round the whole of the church, and, above this, the walls are faced with multicoloured, hand-made, sand-faced bricks set in Flemish bond, with wide joints of cream-coloured mortar. The roof is covered with Lombardic sand-faced Roman pattern tiles.

in conjunction with the brickwork. These are introduced first in the surround to the main entrance. Marble is also introduced in a series of narrow seven-light circular-headed windows in the lower part of the aisle walls, and in the sanctuary and side chapels. These are enriched with mouldings and twisted shafts, and are carried out in dark-veined Sicilian marble, the openings being filled with leaded glass in metal frames.

The floors generally are of polished oak blocks, the narthex and baptistry being paved with marble terrazzo tiles, and the sanctuary steps and paving carried out in white and various coloured marbles.

The present high altar is a temporary structure. It is intended to replace this eventually with a suitable marble altar covered by a canopy or ciborium.

The tower shown on the perspective sketch on page 237 has not yet been built.

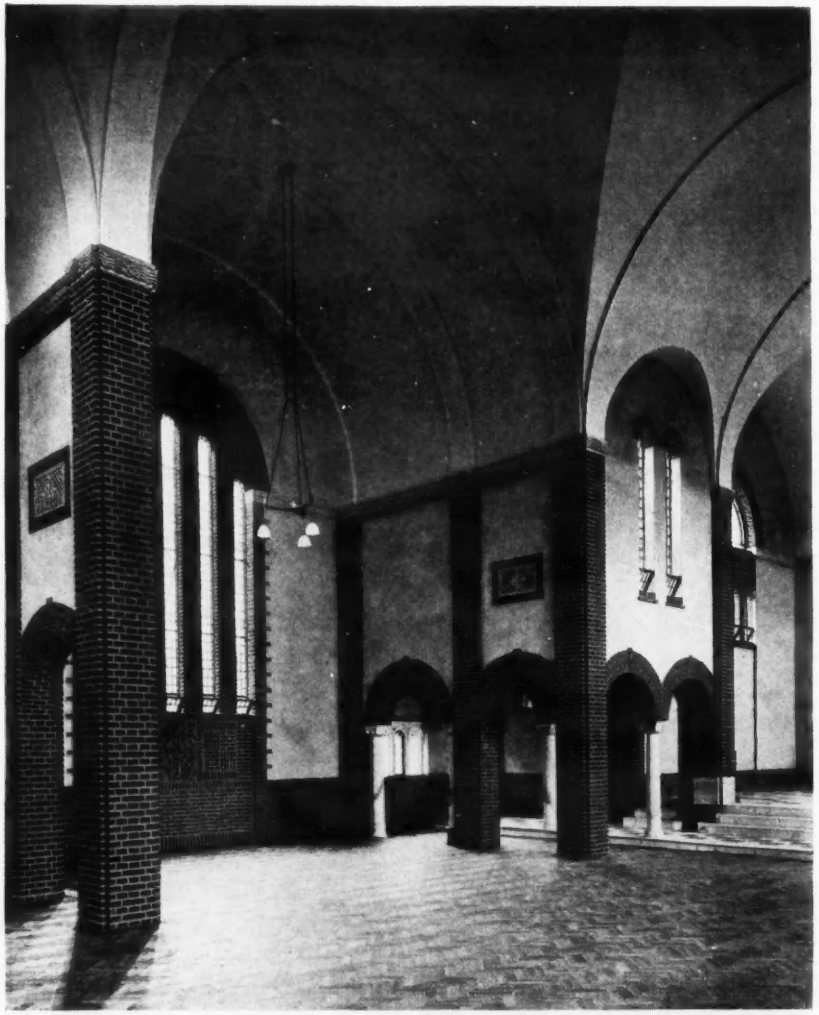


St. Paul's Catholic Church, Haywards Heath, Sussex.] *By Wilfred C. Mangan.*

The ground-floor and choir loft plans. The principal entrance faces west: additional doors at the north and south ends of the narthex provide extra exits, as well as alternative means of entrance for the avoidance of draught in any particular state of the weather. The sacristies are planned in a one-story structure on the south side of the sanctuary; its exterior is seen on the right of the photograph at the top of this page.

St. Paul's Catholic Church, Haywards Heath, Sussex.]

The principal entrance, fronting Hazelgrove Road. The oak entrance doors are deeply recessed under a high brick vault. The door surround is executed in golden pavonazzo marble, moulded and carved, with a bust of St. Paul in Venetian mosaics in the tympanum. The windows in the octagonal projection seen on the right of this view light the baptistry.



[*By Wilfred C. Mangan.*

Looking from the nave towards the north transept. The steps leading up to the high altar are seen on the right. The lower part of the walls, the nave piers and the window arches are built of multicoloured bricks. The upper wall surfaces are finished in a deep cream rough-textured plaster, relieved by panels of elaborately patterned brickwork.

The steps and paving of the sanctuary are carried out in white and various coloured marbles; the floor of the church generally is laid with polished oak blocks.

St. Paul's Catholic Church, Haywards Heath, Sussex.] [*By Wilfred C. Mangan.*

Looking from the second step of the sanctuary towards the choir loft and the doors leading to the narthex. The brick arches which enclose the side chapels are supported on marble shafts.

The frontage to New King's Road, from the south-west. The piers and lintels of the shopfronts are of cast stone; and, in order to preserve an orderly appearance, the names of the shopkeepers on the fascias are executed in uniform bronze letters.

BROXHOLME HOUSE, FULHAM, S.W.

G. TOPHAM FORREST,
Architect to the London County Council.

BROXHOLME HOUSE is situated at the junction of New King's Road and Harwood Road, Fulham, S.W.

The site was formerly occupied by a Council elementary school, and upon its appropriation for housing purposes by the Council, opportunity was taken to set back the frontages on New King's Road and Harwood Road, in order to effect a much-needed road widening.

Broxholme House is a tenement building, is the first of its kind to be built in London by the Council in accordance with the terms of the Housing (Financial Provisions) Act, 1924, and was completed in February last. The accommodation comprises twenty-six three-room, ten four-room and eight five-room dwellings, or a total of forty-four dwellings.

The building is of five stories. The dwellings on the upper floors are approached by external corridor balconies extending from two common staircases, the chief habitable rooms being on the side of the building away from the balconies. The ground floor on the main façade is devoted to eight lock-up shops, and the remainder of that story and the whole of the first and second floors are arranged as flats. The third and fourth floors are combined into a series of two-story dwellings, so that no dwelling has its entrance at a greater height than three flights of stairs above the ground level. In the roof space are drying lofts for domestic washing. The windows of the rooms in the south-western wing look over Eel Brook Common.

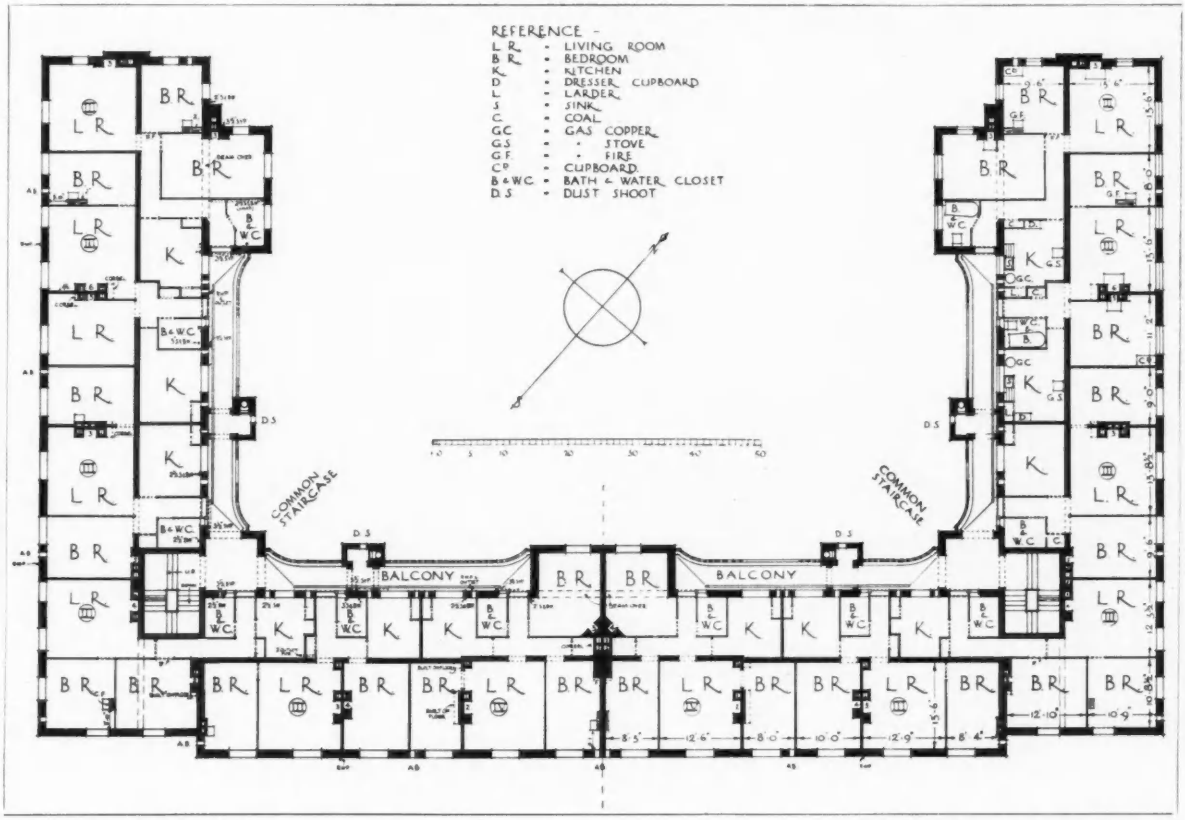
The building is faced with red-brown bricks, relieved by brighter red bricks in the arches and the quoining to the windows. The piers and lintels forming the fascias of the shop fronts are of cast stone. The roofs are covered with hand-made plain tiles.

Each dwelling, in addition to its habitable rooms, includes a kitchen, with a larder, a dresser cupboard, a sink with draining board, and a gas copper, from which hot water is supplied by a hand pump to the bath. In each principal bedroom a fuel fireplace is provided, and in each second bedroom a gas fire has been fitted by the gas company. Artificial lighting is by means of electric light, and some plugs are installed. Hoppers for the disposal of house refuse are provided on each floor, connecting by a shoot to dust chambers at the ground level; from these the refuse is collected by the local authority. The courtyard is paved with concrete, and in it are two large beds for grass and flowers. In addition to the shops and dwellings, twelve perambulator and cycle sheds and a caretaker's store have been provided. The cost was £31,986.

Broxholme House, Fulham, S.W.] [*G. Topham Forrest, Architect to the L.C.C.*

The south-west front overlooking Eel Brook Common. The walls are faced with red-brown bricks, relieved by brighter red bricks in the arches and quoins to the windows. The roof is covered with hand-made plain tiles. This is the first tenement building to be erected in London in accordance with the terms of the Housing (Financial Provisions) Act, 1924.

Looking across the courtyard, which is paved with concrete, towards the entrance to one of the two common staircases. In the foreground are two large beds for grass and flowers. The third and fourth floors are combined into a series of two-story dwellings, so that no flat has its entrance at a greater height than three flights of stairs above the ground level.



Broxholme House, Fulham, S.W.] [*G. Topham Forrest, Architect to the L.C.C.*

A typical upper-floor plan. The dwellings are approached by external corridor balconies extending from two common staircases. The whole of the accommodation comprises twenty-six three-room dwellings, ten four-room dwellings and eight five-room dwellings, containing, in all, one hundred and fifty-eight habitable rooms. On the ground floor are also eight lock-up shops.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xiii

AN UPHILL FIGHT

BY KARSHISH

(H. B. CRESWELL)

I FOLLOWED the Managing Director, Mr. Stevenson, and Mr. Beverly Kent, the Works Manager, up an open circular stair of iron chequer-plates into the works offices—a great iron-and-glass box standing on columns within the shop, and symptomatic of M. le Corbusier, at that time under discipline of slaps now, unfortunately, remitted. Near at hand was a hot, oily, high-speed engine, with a smell recalling stewards hastening with tin pannikins, which ran the shafting distributing power to the hundreds of lathes, drills and planing machines that crowded the place. The belt engaging with the pulley of this engine sang, as it rushed round, an unending rhythmic refrain which, after a few weeks, became fixed in my head by some imp who set its hurried, alarmed outcry to the words—"We're going to go smash; we're going to go smash; we're going to go smash; we're going to go smash . . ." with a prophetic insight which would have made the history of the company a happier one if Mr. Stevenson had shared my experience and taken the hint to heart.

Directly we passed into Mr. Beverly Kent's office—where specimens from his machine-tools served as paper-weights on his dusty table, steam-radiators parched the skin, and fumes from brazing-furnaces in the shop, and the smell of warm oil, revolted lungs and stomach—Mr. Stevenson introduced me as "our Resident Architect."

Beverly Kent was formal and cold in his greeting: his Managing Director was nervous and conciliatory.

"Of course, Mr. Beverly Kent," he said, "Mr. Whistlow will confer with you at all stages and—er—report to the Board with sketches in duplicate: —in fact in triplicate, Mr. Whistlow. One set will go to *you*, Mr. Beverly Kent—through the Secretary: all your communications to Mr. Beverly Kent will go through the Secretary, Mr. Whistlow; in fact—ahem—you are here to *relieve* Mr. Beverly Kent, Mr. Whistlow—er—Mr. Whistlow is engaged by the Directors to *relieve* you, Mr. Beverly Kent."

Sheets of amazingly-drawn plans and elevations, with essentials left out and the joints of the wood-block floors drawn in and the perpends of the brickwork shown, were displayed by the Works Manager; but Mr. Stevenson seemed restive and disinclined to discuss them. He had, in fact, seen them before. They had been made most meritoriously in his redundant leisure by the Assistant Works Manager, who was not an engineer, and whose sole office seemed to be to mark the importance of the Works Manager.

Directly Mr. Stevenson left us together, as he immediately did, Beverly Kent's manner changed. He put the drawings away.

"Well, a brand new, hot-out-of-the-pan F.R.I.B.A. Architect like you doesn't want for me to tell him what to do," he said. "Mr. Stevenson thinks he knows what he wants—which is a fat lot more than I do—and if you're going to get your instructions from the Directors it's no good me telling you what *I* think. The Directors know so much, it's only a prize boy out of a school can teach them anything." He then embarked on the long history of his wrongs, for which he invited my commiseration; but as condolence involved open disloyalty to Mr. Stevenson and Mr. Hart, and the condemnation of persons I had never heard of for reasons I knew nothing of, my show of sympathy was so halting and refractory that at the end of our interview Mr. Beverly Kent had a grievance against me to put into his bag with the rest; and I left him a good deal more sore and unaccommodating than I found him. He was specially indignant at the Directors having been overborne by Mr. Billington, the late architect, who had persuaded them that cement grout—instead of sulphur as the Works Manager contended—was a proper thing for running the bases of stanchions; but as I had no experience in the matter and had never heard of any such use for sulphur, I could only meet Mr. Beverly Kent's scorn for Billington's ignorance and the Directors' weakness in being bluffed by him, with tongue-tied embarrassment.

Like the gardener who larned the frog to be a toad by chopping it up with a hoe, Beverly Kent ended by larning me to be an architect by making mince of Billington who was not an architect but a surveyor. He recounted his many lapses, with indignant contempt, to the refrain "you architects," this, that and the other; and was so rude in manner and insulting by innuendo that I came away from the most humiliating and depressing interview I have ever had with anyone. As no one could have so treated me—or have attempted it—even a year later; it is clear that in some way I must have invited or countenanced this treatment: if I had been more mature I might perhaps have taken this man into my confidence and appealed for fair treatment; but, the circumstances being what they were, my patient endurance of obstruction and vilification was probably the best course. A quarrel would have been disastrous, for it would at once have become public not only in the works but to every shopkeeper and street cleaner in the town, and would have established Beverly Kent's ineradicable enmity, so that I might never have gradually discovered, as I did, that he was a thoroughly good fellow when his failings were indulged.

It was six or eight weeks after my first meeting with him that I first cracked the ice. We were at the front of the building and he, as usual, had worked round to disparagement of my office and of the pretentions of architects. I was determined not to lose patience and, for the first time, ventured a jocularity.

"My job," I said, "is simply—I does my duty and I goes to heaven when I dies."

He stared at me, suspecting I was making fun of him; then, suddenly, he laughed.

"Come along with me and I'll show you something," he said.

He took me a few yards aside to a corner of the steaming lodge where the cooling water that was pumped round the condensers was stored, and there showed me some enormous irises and "bull rushes" he had planted, and gave me his private theories of tropical growths and his schemes for taking prizes at flower-shows with new varieties. He next took a handful of cut crystals of various colours, all flawless as glass, from his pocket. These he said he had picked up on the beach at Llandudno: amethyst, cornelian, agate—I forget the names, but they had been cut for him by a lapidary in the place; and, to point the marvel of the thing, he took from another pocket a rough, yellow stone—a "moonstone" or "cairngorm"—which had *not* been cut. I expressed my incredulity at his simplicity in terms of wonder at the fecundity of Welsh beaches; but it was the fecundity of the Welsh people that called for wonder for, as I came to learn, such crystals were bought by the bushel wholesale in Austria by lapidaries, who parted with them to the public in exchange for a pebble and the fee for cutting and polishing it—as wits unfuddled by *Tit-Bits* might have guessed. Beverly Kent's pockets were

commonly as well stored with irrelevant curiosities as his mind was, and this served to help him waste his own and other people's time when he might otherwise have been at a loss how to do so. I fancy that my advent, which robbed him of occasion to bemuse himself with building projects, widened the ground of his discursiveness instead of directing his attention to his work, as the directors designed.

When Mr. Stevenson left me in the works office he said he would tell Piggott, the Yard Foreman, now made Foreman of Works under my direction, to await me at the time-office by the gate giving access to the works; and here I found my man walking restlessly up and down.

Piggott was a clean, compact, wiry-haired, grey little man of forty or more; a sergeant of volunteers who was not merely every inch a soldier, but a soldier by so many more inches than he was a man, that his military cut and swagger were perceptible a quarter of a mile away and, at close quarters, were aggressive. The ability of this touch-me-if-you-dare soldier-man to give orders, and see them obeyed, was unquestioned; but, unfortunately, he had to take orders from me, and he had learnt, only too thoroughly, that it is more blessed to give than to receive. He was a thoroughly capable general foreman for such work as was required of him : a first-rate organizer, and a thoroughly honest, self-respecting man—if rather a shifty one; but to the end I never had his perfect loyalty. I knew he disparaged my methods and discredited me on all occasions; and his restiveness and recalcitrance dragged upon me like a weight, and made heavy going of work that should have been a pleasure. He dutifully and competently did what he had to do; but, though he dared not overstep the mark, he had an ugly, surly, resentful temper and, in fact, never gave me more than the grudging obedience of a trained lion.

I have said that on the few occasions when I have allowed my feelings to take control, I have always gained my point. My first step in the taming of Piggott was one of these occasions. It happened about a fortnight after I took over at Albion Works, when one morning I met the man and questioned him about some work he had in hand. I saw that he was not exactly following my particular instructions; he had previously demurred to them, and when I now clearly repeated what was to be done, he nodded moodily and walked off. There was something so infuriating in the resentful air with which he turned, and in his squared shoulders and swaggering gait, that I let my anger rule. Why should I allow this fellow to annoy me !

" Come here ! " I called.

He half-turned and looked blankly at me over his shoulder.

" Come here ! "

His gaze fell, and he dragged himself round with an air of boredom, and strolled slowly back over the half-dozen paces that separated us, and stood before me.

" You wish to speak to me ? "

" Yes. You've got to change your ideas—at once."

" Oh ? "

" You've got to learn that I'm appointed to control building operations here, and that you are under my directions."

" Mr. Stevenson told me that."

" Well, I've got something else to tell you. I *mean* to control the building operations, and I intend that you shall *follow* my directions. Can you understand *that* ? "

" Well, is it likely . . . .? "

" Answer my question ! Do you understand what I say ? "

" Of course I do."

" Right ! Then here's something more for you to remember. Your appointment as Foreman of the Works was made with my consent; and I am responsible to the Directors for your work . . . ."

" You've no grounds . . ."

" —Listen to what I say ! Unless you do what I want and *as* I want it done, Mr. Stevenson will either have to fill *your* place, or fill *mine*; have you got that clearly ? "

" I don't see what reason . . ."

"— That's nothing to do with me. I've told you how things are; now go off and get on with your work."

" I should just like to . . ."

"— Go back to your work."

He turned, with a slight loss of colour, and walked doggedly off, and at that moment, although I was trembling with the stress of the scene—for the man might have brought things to a climax by a show of anger or impudence—I felt sorry for Piggott, and distressed at having humiliated him. However, something had to be done; and in those early months one misery or another was my lot at Albion Works, whatever I might do. I could only be thankful I had not used greater violence, for curses were in my voice, which sounded strange and shrill in my ears, and several times almost upon my lips.

Men who will gladly take responsibility and use initiative are rare and to be made the most of; and I soon found that I got the best out of Piggott when I gave him his own way or let him suppose he was getting it, and when I told him fully the exact reasons for work that was required of him. I allowed him to gather particulars of the odds and ends of building that were wanted and, so far as I was able, embodied his proposals in my orders to him; and I used to show him work being laid down in drawings and invite his observations. It was a great nuisance having to nurse his vanity in this way—though I stopped short of feeding it ; but his self-dependence and knowledge of the needs of the place was invaluable, and by flattering his importance I had the full benefit of it. One circumstance well displays his pig-headed character. It would have suited me admirably, and have been to his advantage, if I could have employed him to overlook work done by contractors; but any such idea was quite out of the question—as Mr. Stevenson agreed. Piggott would so completely have upset the apple cart that we might have found bloody noses and black eyes being exchanged almost as freely as how-d'ye-dos.

My first step towards getting things started was to secure—by advertisement—a provincial quantity surveyor's clerk and one draughtsman; and to put in hand a survey of those parts of the works to which additions were immediately needed. My first actual job was a Building Yard with joiner's shop and stores, and an office for myself and staff, next it. These buildings were outside the inner fence that surrounded the works—a point stressed by Mr. Stevenson as though to mark the essential impurity of an architect's presence among engineers; in fact I seemed to be, in his eyes, a Hindoo ryot on the banks of the Ganges, and his Albion Works a sacred cow—gravid with reapbinders — whose hallowed flanks I must not too nearly approach. In this, my first building, which was run up by Piggott from my careful drawings and specification in a very short time, I had to test my teeth on a hard little nut.

The site sloped away sharply, and the yard had to be levelled up by filling six or seven feet deep against a fence wall ninety feet long between returns, which was thus constituted a revetment. I possessed a student's knowledge of the theory of revetments; I had reference books to my hand; my familiarity with graphic statics would have enabled me to turn off an answer to such a problem, if presented in an examination paper, in a very short time, and to gain full marks for it. The accomplishment of the thing was therefore, it may be supposed, a very simple matter. It was, in fact, nothing of the sort; and it is the startling difference between knowing how a thing is done and knowing how to do it, with which I was then for the first time confronted, that has led me to recount the experience.

In examination an architect may justify himself from the pages of

Rivington or Mitchell; but when he gets to work, he is in the position of the German naturalist in Kipling's story, who, bitten by a deadly snake for relying upon the authority of one "Breitmann" that coral snakes were not poisonous, exclaimed: "I am a dead man und Breitmann he haf lied in prind"—he may justify himself from books, but if he gets bit he must take the consequences, and those consequences are often serious.

My problem was not touched by the books—no problems of actual work in my experience ever are. I had to settle for myself the angle of incidence of the spoil used for filling, which was a clay that would stand like a wall in a six-foot trench, melt and crumble away after a week's exposure to the air, disintegrate into mud when dug and thrown out, and crack and split up into blocks under drought. How would such spoil behave when it was rammed against a retaining wall, and was then swelled by damp; and how if it disintegrated and flowed? Would it absorb water and so double its weight; and, if so, could such water be drained away through the wall? Would the mass shrink away from the wall-face in dry weather so that it had no support, and then break away and fall against the wall? How far were these risks actual chances, and how were they to be adequately met without needless extravagance? If I employed ties and anchored the wall to plates or concrete blocks buried in the ground, for how long could the bolts be relied on to withstand corrosion and remain effective?

It will be seen that I was confronted by a problem of civil engineering in miniature. The measure of my failure might be, indeed, only two hundred pounds in cash; but if it had been twenty thousand I could not have taken my responsibility more seriously, and the gentleman whom I have imagined as marking my paper "O.K. 10" would have been entirely unaided by theoretical or book knowledge, in deciding the question for me. However, if he had been at hand he could not have settled the question; for I was responsible, and any decision must be mine. As for Piggott, I got his approval of my proposal after I had completed it; for even in those early years I had realized the danger and folly of urging any craftsman or foreman to undertake work the efficacy of which he has any doubts about. What happened was, that I laid my sketch design before the Board for approval, and Hart, after looking at it half a minute, said:

"Your wall will fall down, Mr. Whistlow."

There were six of them there that day, and they looked at me dully. Peterson exclaimed, "Oh, I say!" as though I were convicted of embezzlement.

"I think not, sir," I said; but Hart had pushed the drawing over to the chairman and was whispering to him.

Mr. Stevenson then said, as he wrote the words in the minute-book, "Ahem. Plan to be amended after reference to Mr. Hart and laid before the Board on the 19th. Ahem."

That, I may say, was all in the day's work; what I call attention to is this: I was a novice, and I was not an engineer; Mr. Hart was an eminent engineer, and the problem was one of engineering; yet, because I had, in my own way, completely mastered to my satisfaction the practical considerations bearing on the problem, and had formed a clear opinion of an adequate and economical solution of it, I found myself confident in my judgment, and indignant with Hart for putting me down, as he had done. The fact that I knew myself helpless to deal with the theoretics and mathematical refinements he was master of, did not weigh with me in the least: I had concentrated on that revetment wall till I knew as much of what it could and could not do, as I did of my own legs. Hart might order me to do differently; but I should be right, all the same.

Hart, however, did not order me to do differently when next day I went to him with my notes and calculations. He had not got the whole of the facts when he condemned the design, and he was unable perfectly to assimilate them during the few minutes I occupied in unfolding them; but he could not controvert them, and he was, perhaps, impressed by my ardour. At any rate, he very handsomely said that he quite agreed the design would do well enough; and excused himself on the ground that he had overlooked the weight of the superimposed wall as a component of the moment of stability.

I mention this small matter because the experience taught me the surprising incompleteness of theoretical knowledge; the nature of the concentration to which problems of construction yield; and the confidence and sense of power which the solution of them gives. It was, in fact, a fortunate circumstance that, at the outset, I should thus have justified myself; for I was immediately to encounter two great disasters, and although they were due rather to misfortune and to the unfavourable conditions in which I worked than to any remissness on my part, I was to endure months in which I felt that the confidence of the directors in their Resident Architect was in danger of being seriously shaken.

NEXT WEEK: XIV—A DISASTER

Aug. 12	xii:	An Architect's Early Gruel.

LETTERS FROM READERS

The I.A.A.S.

SIR,—I have pleasure in accepting Mr. William Davidson's thanks. He has left my question unanswered.

Mr. Noah, apart from being the Patron Saint of Architecture, may also be claimed as such by the Zoological Society, marine engineers, etc. I also note that Mr. Noah was a builder as well as an architect. I endorse Mr. Davidson's hope that the R.I.B.A. will note my remarks concerning a practical architect; it would seem that he prefers the theoretical one who has crammed to pass an examination.

I am only too happy to have been of some service to Mr. Davidson, and am sure that he would appreciate further assistance, so suggest that when he is "often asked by anxious parents regarding the best training for pupils," he directs that the pupil should be sent to a good builder to assist in and obtain a knowledge of construction, and thence the visit to the mason's yard.

His assumption regarding the senior architectural degree is correct, and Mr. Davidson should not think, but as he sought information concerning the I.A.A.S., he should likewise seek in other directions. Mr. Davidson should read the last paragraph of my reply again; he surely does not wish me to give him the meaning of the word "older." I am at a loss to understand what he means by "not to adopt any intelligent methods of securing commissions"; perhaps he would be good enough to explain, as no doubt many of your readers, Sir, need enlightenment.

In reply to Mr. J. N. Aylwin, he was probably not *au fait* with my reference to a builder in my reply to Mr. Davidson, but no doubt Major G. B. J. Athoe's letter helps to explain. [See issue for August 12, page 212.—ED.].

I am entirely in sympathy with and absolutely agree with Mr. Aylwin's remarks regarding poor work produced by builders, and they are not the only

culprits, but my reference was specific rather than general.

Answering the last paragraph of his letter, surely an association or society should offer some measure of protection to its members, and I suggest that the I.A.A.S. has made its contribution in protecting the public in its efforts under the Registration Bill.

WILLIAM HORSMAN

Pedestal Basin

SIR,—On doing up a house I have just taken, I told my builder that I wanted a pedestal basin in the bathroom, because I disliked a lot of pipes, which only serve to accumulate dust, and probably dusters too. My builder agreed, and took me to his builders' merchant to make my selection. We selected a standard pattern. Visiting the house during the progress of the work, I found the pedestal basin duly installed, and all the pipes gaily curling themselves about *outside* the pedestal. I protested that either the pipes should go inside or I should not pay for the pedestal. My builder thereupon took the pedestal away and boxed in the basin as a cupboard. When the bill came in, this was charged for, and, on my pointing out that it was, so to say, his funeral, he replied as follows: "I have personally been through several new properties, and in all cases have the pipes been fitted outside these pedestal basins. On my taking up the question with various builders I am told to connect them inside is not at all practicable."

In spite of the unanimity of the builders, I should value any of your readers' opinions as to whether it is I who am unreasonable or merely the makers of the basins? N. C.

Research Fund

SIR,—The Research Committee of the Institution of Heating and Ventilating Engineers was resuscitated last October for the purpose of organizing a fund to assist the Government Department of Scientific and Industrial Research in its projected research on heating and ventilation at the Building Research Station, Watford.

In 1928 an important link was forged between industry and science in the formation, by the Department of Scientific and Industrial Research, of a Standing Advisory Committee on Heating and Ventilation. It was intended that the work on heating and ventilating problems should not only be directed along lines which should prove of direct value to the industry, but also that the results should be available as soon as they were obtained.

The Department's Standing Advisory Committee consists of the following members:

Messrs. Raymond Unwin, D.TECH., President-Elect R.I.B.A. (chairman); C. G. Douglas, C.M.G., M.C., F.R.S.; A. C. G. Egerton, M.A., F.R.S.; E. Griffiths, D.SC., F.R.S. (National Physical Laboratory); J. A. Macintyre, O.B.E., B.SC., M.INST.C.E.; W. W. Nobbs, M.I.MECH.E.; J. Roger Preston, M.I.MECH.E.; C. W. Price (Home Office); A. Scott, M.B.E., D.SC., A.R.I.B.A. (Office of Works); F. S. Sinnatt, M.B.E., D.SC., F.I.C. (Assistant Director Fuel Research Staff); and Margaret Fishenden, D.SC.

The work which has been carried out so far (by the aid of Government grants) has aimed at the general elucidation of factors which determine the efficiency of heating in a building.

In the course of this investigation, work of great interest has been carried out on heat losses experienced with different methods of heating. At present, however, such work can only be carried on very slowly, because in the present experimental house all the effects of varying weather conditions upon heat requirements must necessarily be studied at the same time. It is not possible with so many variables to speed up such investigations, or to simplify conditions by the control of individual factors.

In view of these experimental difficulties, a proposal has now been made to construct at the Building Research Station a "Controlled Weather House." In this house, the walls, floors and ceilings of an experimental room of practical size are to be exposed to controlled conditions by enclosing such room within a larger structure, the temperature of whose walls can be artificially maintained.

With such installation the study and comparison of different types and dispositions of heating systems would be greatly expedited.

The estimated cost of the "controlled weather house" and its equipment is £1,800 to £2,000, and in order that a case can be made out for the undertaking by the Government of financial responsibility for the erection and maintenance of this new building, it is absolutely essential that the industry proves its interest by contributing towards the cost. Without some such practical form of support it would be quite useless to expect the Government to proceed with this undertaking.

The I.H.V.E. has voted from its general funds a sum of £100 (spread over a period of five years) towards the Building and Equipment Fund. The Research Committee has also received other promises amounting to date to £200 towards this fund, and the promise of Investigating Work in the new house to the value of £1,000, likewise spread over a period of five years.

The Council of the I.H.V.E. appeals to the heating and ventilating and allied industries for such contributions to the Building and Equipment Fund, and promises of Investigating Work, as will justify the Department of Scientific and Industrial Research in embarking on this undertaking.

Contributions and promises should be sent to the Secretary of the Institution of Heating and Ventilating Engineers, 12 Russell Square, London, W.C.1.

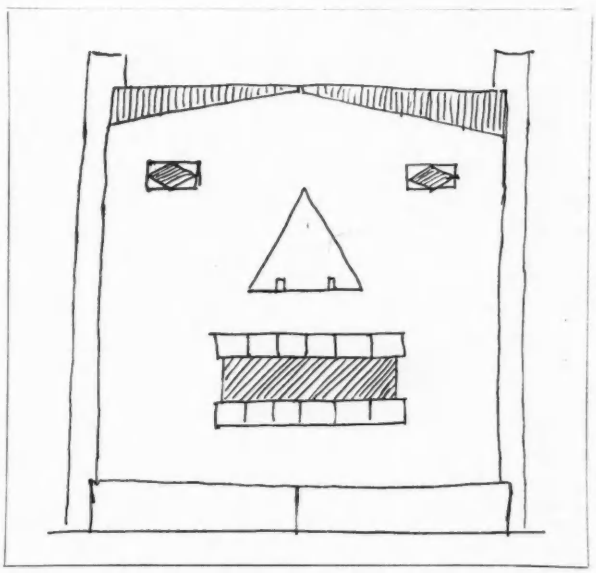
WALTER W. NOBBS
(CHAIRMAN, I.H.V.E. RESEARCH COMMITTEE)

Partiality for Asparagus!

SIR,—Sir Edwin Lutyens, in referring to a recent modernist building, said it seemed to suggest a partiality for asparagus on the part of the client. Your "Selected Precedents" featuring the horizontal window suggest, perhaps, a weakness for washing day or alternatively rows of false teeth.

The possibilities of suggestion have not been fully realized in the examples illustrated, and I enclose a sketch in which the false teeth motif is more fully developed.

M. H. BAILLIE SCOTT



An alternative to the horizontal window? A sketch, by M. H. Baillie Scott, in which the false teeth motif is fully developed.

C

OLD COTTAGES

Their Care and Enlargement

FOLLOWING are some extracts from *Old Cottages*,[1] a booklet containing practical notes on their care and enlargement, recently issued by the Somerset Rural Community Council :

EXTERNAL FEATURES : ROOFS

Tiles : The stone-tiled roof—that most beautiful of coverings next to thatch—is often removed, the tiles sold and the house covered with a flaring red tile—perhaps even an asbestos tile. If it is too costly to relay or renew the stone tiles, at least the roof should be covered with a soft dun-coloured tile of simple pattern. Even an asbestos tile, if of russet colour, might be used at times. There is also the pantile, much more freely used in the Eastern counties than in Somerset—and if it be thought that it is only fit for outhouses and pigsties, let it be remembered that it is now being used on some of the best buildings in the country.

Slates : Many of our older houses and cottages, especially in the neighbourhood of Taunton, are covered with Wiveliscombe slates. Of late years there has been difficulty in obtaining this slate, but a quarry has recently been opened, which is said to be of good quality. The "seconds" quality of the Cornish slate in the neighbourhood of Delabole are very suitable for repairs and can be obtained in any sizes. Some of the beds are tinted with deposits of red, yellow or blue colour, but the best, after all, are the plain grey.

Thatch : It is worth a great effort to repair or renew a thatched roof wherever possible. Few people seem to realize the lasting qualities of a good thatch. Well laid, of good wheat straw, it has, to start with, a life of twenty-five years, with renewals to the heading of the ridge, but in reality a life far longer than that and at little cost for repair.

It ought not to be necessary to point out that there is nothing cheap or vulgar in the use of thatch. In parts of East Anglia it is used for the roofs of churches, some of considerable size and most of them of great artistic and architectural importance. There and elsewhere it is much sought after as a covering for houses by those who can afford it, not only because of the beauty of its appearance, but because it is so comfortable to live under, being warm in winter and cool in summer. Of course it must be kept in good order. If that is done, it must be reckoned as a luxurious and not as a "common" roof covering. It is not wise to use it on main roads, in towns, or near railways, on account of the additional risk from fire. There is now a method for fireproofing, however, which will render it safe for a time under all ordinary circumstances.

Galvanized Iron : When galvanized corrugated iron has to be used, it should be painted a dark grey—never red—with an iron oxide paint, and its life is considerably lengthened by painting it underneath as well as on the top, as condensation takes place rather freely on the underside of the bare iron. As suitable paint can now be obtained from Wallis Dove of Hull for coating new galvanized iron, it should be painted before as well as after fixing, as many parts, especially underneath, cannot be got at when it is once fixed.

PATHS

These are important : much of the beauty of a garden depends on them. They should not be too wide. Main approaches must be kept in safe condition for use, but old paving should be scrupulously retained wherever possible. Slabs of slate, lias, oolite or sandstone are traditional in some districts, while in others a hard gravel path or cobble stones are the rule. Such arrangements should be carefully maintained, as many of them are probably very old. While the tradition of irregular flag pavement should be retained where it exists, care should be taken not to copy what is known as "crazy" pavement. There ought to be nothing suggestive of a sham antique, and no modern pavement ought to be impractical or dangerous. Asphalt, concrete and smooth tiles should be avoided, but ordinary walling bricks set on the flat can be used in some places. Where concrete is unavoidable it should be brushed over while still soft with a coarse brush. Tile edges or verges are out of place as a rule, but where stone edging is traditional the custom should be maintained : old stone tiles set on edge are suitable and economical. Paths should not be excessively rounded on the surface. Narrow paths should be made all round ancient or important buildings, as their proper maintenance is promoted by ease of access.

INTERNAL FEATURES

Decayed Timber : For some reason worm more readily attacks timbers where the beam-ends are built into the walls. Damp here also affects the beam, and these two causes together often cause partial or entire failure in a beam otherwise sound.

Where this decay has proceeded far, the usual method is to cut away the rotten end, and to scarf and bolt a new timber-end on to the old. This is not a satisfactory method, even if well done, for it still leaves the new timber under the same undesirable conditions.

Sometimes the ends of the new timber merely rest on the walls, with the sides, ends and top of the timber left open for ventilation. This method has various disadvantages, especially because such mere resting on the walls provides but a slight tie for them, and the tie afforded by beams to old walls, especially if they are already out of

plumb, is important. The following method is proposed :

Support the beam by means of props, cut off the end of the beam where too decayed to be useful—often it will be found that the part to be cut off does not extend more than a few inches from the wall face—then carefully rake and brush out any smaller rotten parts which extend farther along the beam : and treat generously with Solignum. Open out the original hole in the wall and enlarge it to, say, twice the size, by taking out odd bricks or stones—irregularity is no disadvantage. Clean out all dust and wood fibre and well wet. Then insert in the hole a short length, as necessary, from two to three feet long, of channel iron or steel, whose width is as near as possible the width of the beam. The depth of the channel will be in proportion to the width and is immaterial for this purpose. Two holes, about ¾ in. in diameter, should be drilled as widely apart as possible and about six inches from the inner end of the channel. The beam will rest with its bottom face in this channel, and two ¾-in. bolts will be passed upwards through the channel and the beam and fixed with nuts and large washers on the upper side of the beam. The end of the channel is then thoroughly concreted round with fine cement concrete, finished flush with the face of wall, and similar concrete should also be carefully pressed into such recesses in the beam as have already been cleaned out.

Such repairs are satisfactory and simple to carry out, with the advantage that a thoroughly good tie is maintained, the steel channel acting both as a corbel as regards the wall, and as a continuation of the beam as regards the tie.

ADDITIONS

Pitch of Roofs : It is of general importance to maintain the level of the original eaves lines and the ridge of the roof lines, and to maintain the original angle of the slope of the roof.

Flat angles or pitches are practically never found in this county, and therefore the temptation to use them should be resisted.

In recent years a favourite pitch is that known as the square pitch of 45 degrees, and this is the minimum pitch to be safely used for plain-tiled and stone-tiled roofs, but except in gables of over 20 ft. span it is not quite steep enough for the best effect. If this eaves angle be increased to 50 or 55 degrees, the extra expense is slight and the appearance is considerably enhanced.

Supposing the span of the addition is at right angles with the span of the original roof but less in width, if the eaves line and the ridge are to be maintained at the same relative heights as before, the pitch of the new roof will be steeper than that of the old, and this will look correct; if, however, the new span is greater and the heights are the same, the pitch will be less steep and, in proportion to the difference in span, will look less correct, so that, as an alternative, it is better to maintain the eaves height and raise the new ridge line. New gables should be treated as the old, i.e. if the old roof were hipped the new should be also, unless there is obvious advantage in not doing so. Incidentally, and as a point of little regard in this country, when a roof is hipped, the slope of the narrow ends should always be slightly steeper than that of the longer sides o the roof. Where special close-fitting hip-tiles are used, this alteration of pitch is difficult, but where half-round hip-tiles, or lead-covered hips are used, the alteration of slope presents no difficulty, nor does it make any difference in a thatched roof, where the pitch should never be less than 50 degrees.

Proportion of Windows : As far as possible, the dimensions and proportions should be nearly similar. For instance, if the original distance between mullions be 14 ins., to increase the distance in the new one to 16 or 18 ins. is a serious error, and, indeed, a slight variation in height is far less serious. To increase the size of a mullioned window by increasing the number of mullions is, in reason, a sound method. The increase in width of a sash window is nearly always bad in appearance and worse in practice, as the sashes tend to bind in working if the width is great in proportion to height. An increase in height within small limits, and with careful height alignment with the old, is permissible.

LITERATURE

PLANNING FOR GOOD ACOUSTICS

NOT many textbooks survive to lighten darkness far into the future. Those that do—and I call to mind Anderson's *Greek and Roman Architecture* or Ward's *French Renaissance*—give some addition of the author's own making to the compilation of textbook matter, whereby the imagination is stirred to a response that lightens dull fact.

This book I feel to have been born under the like happy augury. Its subject, in essence a science, only arises where architecture, half science, half art, is concerned; and arises most potently when music fills the spaces of architecture with sound.

The gods therefore must have conspired together to lead to this work authors in whom were combined, with powers of scientific investigation and deduction, a feeling for architectural form, an ear for music, and a sense of humour: unusual qualities that have produced a textbook of more than usual worth.

The study of acoustics is a science bound up with building. It is the study of the behaviour of sound waves in enclosed or partially enclosed spaces. Applied to the study of architecture, it involves the control of sound waves through the arrangement of bounding surfaces, materials and structure. It is therefore a science which, though only recently exalted, has its roots firmly embedded in the fabric of architecture, and it is because this book succeeds in making the diligent architect "acoustically-minded"—if I may use such a term—that its value is unlikely to be diminished with time.

The book opens with a development of the properties of wave motion, leading to an account of the early experiments out of which Sabine's formula was evolved. This evolutionary picture is too clear to be forgotten, and one proceeds to the application of elementary laws with the zest which only understanding can bring.

Throughout the body of the book the authors make use of buildings which they have themselves tested and of which they produce in nearly every case their tabulated findings, so that as one moves, chapter by chapter, to consider different types of buildings—churches, theatres, buildings for debate and so on—growing knowledge is grounded upon historic fact.

Gradually one begins to understand how completely interwoven with the fabric of architecture is this question of sound; each so much the counterpart of the other as to make a concert hall no less an instrument than the orchestra that fills it with sound, to unite for ever the Thomaskirche with the music of Bach.

I cannot overestimate the effect which this careful and intimate analysis of known buildings produces upon the reader to heighten and make vivid his appreciation of the nature and application of acoustics. I can only say that I have never before approached a subject of which I had previously little knowledge with more real enjoyment and positive understanding, and feel that the full effect of the book is bound to be felt in the near future as a clarifying influence upon the study of modern architecture, especially, one may hope, in the R.I.B.A. new premises, where we have the opportunity of setting high standards of architectural acoustics.

If the control of the waves of spoken and of musical sound is the major subject, its enlargement to deal with the control of noise is very important to a traffic-ridden, mechanical age, and the chapters that deal with sound transmission and absorption must widen the scope of the book to include among its readers those who might never hope to build a theatre, or think to study acoustics in the large. It is, indeed, as a textbook, complete; and it is therefore hardly necessary to say that its index and appendices are models of their kind, its illustrations clear and well drawn, its format without fault.

Planning for Good Acoustics. By Hope Bagenal, A.R.I.B.A., and Alex. Wood, M.A., D.SC. London: Methuen & Co., Ltd. Price 22s. 6d.

OBITUARY

COL. A. E. KIRK, 1868–1931

WE regret to record the death, at the age of sixty-three, of Colonel Albert E. Kirk, V.D., O.B.E., F.R.I.B.A., which occurred at Alwoodley, Leeds, on August 9. For many years he had practised in Leeds, as head of the firm of Kirk and Tomlinson.

Colonel Kirk was president of the West Yorkshire Society of Architects in 1912, and again in 1926, the society's jubilee year. He had been an associate of the R.I.B.A. since 1892, and took up his fellowship in 1927.

Among the principal works executed by his firm were the following: Numerous business premises in Leeds, including a large block of offices in the New Headrow, an important factory at Kirkstall, and many large houses in the West Riding, Northants, and Wales.

His military service covered a period of nearly thirty years, and he rose to the command of the 7th Battalion, West Yorkshire Regiment, with which he was on active service in France during the late war. He was once wounded, but returned to the Western front, being afterwards mentioned in dispatches.

The house has been planned in order to take full advantage of view and sunlight. It is heated by an independent boiler, serving radiators which are recessed in the walls and concealed by metal grilles. Water is supplied by an automatic pump.

HOUSE AT

DESIGNED BY WELCH,

The garage from the north-east, with the house in the background. The garden has not yet been laid out, but work on it is now being carried out.

THIS house, at Colyton, Devon, is situated on the top of a hill, from which a fine panoramic view is obtained over the Axe valley stretching from Axminster, down over Axmouth and out to sea. In order that, in its conspicuous position, the building should fall naturally into the landscape, it has been modelled on the local thatched and colour-washed cottages, and traditional materials are used as far as possible.

The view being fortunately north-east to south-west, it did not conflict with the aspect of the rooms. The planning was, therefore, a fairly simple problem, and the house was arranged so as to take

A general view of the main front from the north-west. The walls are of the cavity type, rendered externally as a protection against the driving rain. The casements are of wood; and the roof is thatched with Norfolk reeds, with elm gutters and down pipes. On the left of this photograph is seen the garage, also thatched.

Looking across the sitting-room, towards the entrance hall. The door seen is of the ledged and brace type, with an oak latch.

The walls of the dining-room, like those of the sitting-room, are unplastered. The windows afford magnificent views.

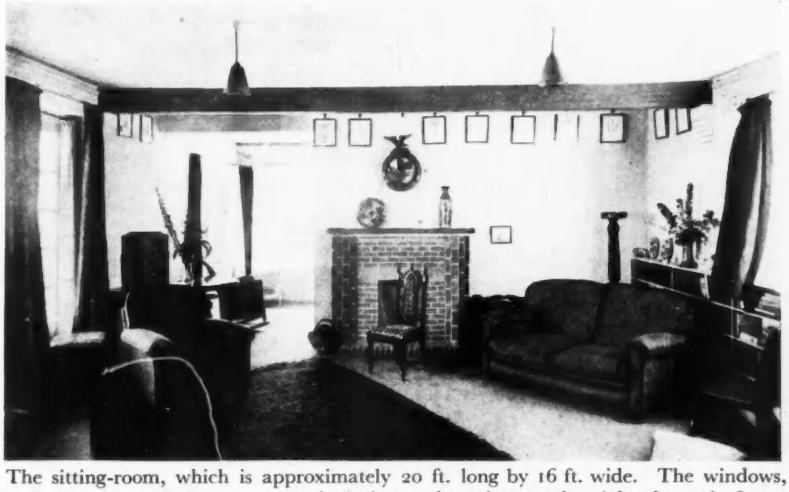
COLYTON, DEVON

CACHEMAILLE-DAY AND LANDER

full advantage of both view and sunlight. The aspect also enabled the main windows to be kept away from the prevailing winds.

Brick cavity walls were used, rendered externally as an additional protection from the driving rain, to which the house is subject; the wood casements are of a special section, with the same end in view. The thatch is of Norfolk reeds with elm gutters and down pipes. Extreme economy had to be observed, with the result that all the finishings are of the simplest nature.

The garden has not yet been laid out, but this is being done in consultation with the architects.



The sitting-room, which is approximately 20 ft. long by 16 ft. wide. The windows, including those of the recess, overlook the garden; that on the right the main front.

The garden front. The circular bay, housing the dining-room with a bedroom over, is supported by reinforced concrete lintels and stanchions, to permit of the greatest possible expanse of window. The door shown gives direct access to the sitting-room, the largest in the house, which embodies the one-story projection on the left of the illustration.

THE SPECIFICATION WRITER

Ventilation by Anemostat

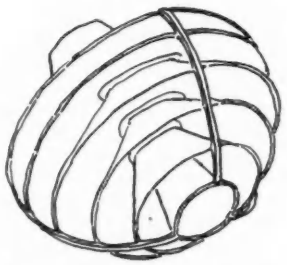
THE architect, in designing public buildings, must satisfy those who like fresh air at all costs as well as those who would rather stifle than feel the lightest breeze blowing about their foreheads. The common method of specifying an intake panel behind each radiator, with extract vents at ceiling level for the removal of foul air on the principle that hot air rises, ignores the disconcerting fact that in this country during several months of the year the air outside the building is hotter than that within. The hot fresh air of summer ought by rights during those months to come in at the top and the cold foul air to go out at the bottom—but does it?

In theatres and cinemas an artificial system is necessary which can be regulated not only according to the external temperature but also to the varying heat caused by the number of people present.

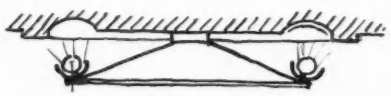
The first essential consideration of such a system is whether the change of air shall take place in an upward or in a downward direction. If the building is to be lit by gas an upward system is essential, since the heat from the burners will prevent the descent and consequent circulation of fresh air entering at a high level. The now obsolete roof ventilator with the ring of gas jets was designed to hasten the change of foul air by rendering the upper strata hotter and more anxious to escape, but the amount of oxygen consumed by this method was out of all proportion to the circulation, and the "gods" who could hold out through a long play under such conditions were truly super-men.

With electricity it is possible to control the ventilation scientifically, and the architect will probably find it best to specify a downward system, since the dust will not be drawn up with the fresh air to the breathing level of the audience. The L.C.C. requires the provision of 1,000 cu. ft. of fresh air per person per hour; therefore in a theatre for an audience of 1,500 people the volume of air required will be 1,500,000 cu. ft. per hour, or 25,000 cu. ft. per minute. This air must be cooled or warmed to the right temperature of about 60 deg. F., and cleaned, before being introduced into the auditorium at definite points. The three essential parts of such a system are therefore (1) the air-conditioning plant, (2) the ducts, (3) the inlet and extract vents.

The conditioning plant will require an intake high up to allow the air to be drawn in as fresh as possible, but in any industrial town the freshest external air will need treatment to remove impurities. The ducts from this fan room require very careful consideration, and are best specified to be incorporated in the structure. Two of the most common materials used for this purpose are galvanized iron or a cement duct on a latticed reinforcement. Care must be taken in calculating the sizes of the ducts that the large main trunks are of sufficient area to give the required cubic feet of air change to all branches at the same time. Not only must all bottle-necks be avoided but also guiding baffles should be inserted at any sudden change of direction to prevent loss of velocity. If carefully considered at the outset, ducts can be concealed in floors and walls, and unsightly ventilating plant in any building is usually due to lack of foresight on the part of the architect.



The Anemostat in perspective.



Sectional sketch of the fitting seen below.

The introduction of the air into a theatre is the most difficult problem. In the auditorium mentioned, 25,000 cu. ft. has to be pumped in per minute without creating a draught, for a draught can be as unpleasant from hot as from cold air. This difficulty is now overcome by a simple invention called the Anemostat, which has been used with success both in Germany and in this country. It consists of a series of cones placed one over the other like the rose of a watering can, fitted at the outlet of the duct. The incoming air is thus spread over a hemispherical range at an angle of about 180 deg. instead of pouring straight into the hall, and this allows the full volume to enter without draught. By means of these spreaders the air in a hall or theatre can be changed fifteen times in the hour without creating unpleasant currents.

The interconal spaces are so arranged as to suck in a portion of the warm air of the room and mix it with the fresh air in the apparatus before it is discharged among the audience, thus the emerging air is at a higher temperature than when it enters the duct from the conditioning plant. This is a very valuable feature, and minimizes yet further the possibility of cold draughts.

In the Traube Restaurant in Berlin, the Anemostat air spreaders are placed in the low ceiling of the balcony directly over the tables, where they cause no inconvenience. Actually they are combined with the lighting to produce artistic fittings on novel lines. They

Combined light fittings and Anemostat ventilators, shown fitted in the ceiling of the Traube wine restaurant, Berlin.

can be used with any system of ventilation, and made in various shapes to suit the architectural design.

The same firm also makes a conditioning plant embodying several unusual features, the most interesting of which is the method of cleaning the air. This is performed by forcing it up through a bed of porcelain rings 20 ins. thick, 1½ ins. in diameter, and 1½ ins. long. These rings are kept continually wet by a pressure water spray, and a test made at the University of Frankfort of air so treated showed that over 98 per cent. of dust and bacteria were eliminated by this means. From this chamber the air passes over drying blocks and is finally delivered into the main duct at a humidity and temperature controlled according to the time of year. The space required for a conditioning apparatus varies with the size of the ventilating plant, but normally a fan room 18 ft. square should be sufficient for the supply of air to an audience of 1,500. LL. E. W.

Copper Back Boilers in Kitchen Grates

THE City of Birmingham Gas Department not long ago carried out some extensive tests relative to back boilers of copper in kitchen grates. For years past copper has been used as a material for back boilers, particularly where the nature of the local water was such that, with iron, comparatively rapid rusting was probable. A few plumbers and domestic engineers doubted the material, but its quality approved itself with use. But serious doubt arose as to whether, where copper was installed, coke could be safely used as fuel; and some engineers advised definitely no coke where a copper back boiler was in use. It was thought likely to lead to external corrosion and eventual perforation of the boiler.

The Copper and Brass Extended Uses Council co-operated in the tests, which were expressly undertaken to establish on a firm basis what service copper could give. Moreover, with the possibility of a partially carbonized coal for general use coming nearer, it was felt that knowledge of the reactions of such fuel should be extended.

The tests fell into two parts. First four boilers were fired with ordinary coke as sold for household use, under the conditions and for the hours of daily use general with kitchen boilers, for a period of 206 days. At the end of the time they were taken out and examined. One boiler was an ordinary commercial saddle-back boiler: make and history unknown: just purchased in an ordinary way as an example of a general trade product. It was of about $\frac{3}{16}$-in. plate. Two of the same size and shape were made of hot-rolled copper plate, ¼-in. substance (used to get a definite standard) and of specially refined copper to carry out ideas the C. and B.E.U. Council had formed upon that point. The fourth was a boiler of the same size and shape, of similar ¼-in. hot-rolled copper, but of ordinary refining.

The test appeared inconclusive. Not one of the boilers showed any sufficiently marked corrosion to justify calling it inferior. The two boilers made of specially refined copper showed a trifle less of corrosive action than the ordinary ¼-in. plate copper boiler. Some evidence also suggested, to a very slight extent, that the somewhat smoother finish of cold-rolled copper might make a better boiler than was the case with ordinary hot-rolled copper. It was accordingly decided to reshape and repeat the test.

The one trade boiler made of commercial copper and the two boilers of specially refined copper, of ¼-in. plate, were tested again. The ordinary refined ¼-in. plate boiler was discarded. Two new boilers, each of cold-rolled, specially refined, ¼-in. copper were added, and one also was added with its external surface specially treated by a trade process claimed to prevent corrosion, and known to possess some value with materials other than copper.

The three boilers first tried were now fired with a coke made especially and unduly high in sulphur so as to make the test far severer. One of the new cold-rolled specially refined copper boilers was fired with similar coke and also the surface-treated boiler. The other new boiler was fired with ordinary coal to give a comparison. All six were fired with such frequent running-off of hot water, and letting down of fires, as to give external condensation every chance of causing corrosion. Conditions far severer than those of the ordinary kitchen were thus set up. The test was continued for 195 whole days (approximately twelve hours each) and thirty-nine half-days.

The boilers were dismantled in October, 1930. Careful examination was made of the external condition of each, both before and after cleaning, external deposit was examined both visually and chemically, and all other necessary observations made. The conclusions to be drawn from the complete double test were:

a: No boiler was seriously corroded; the worst was very sound; nothing even suggested leaks. The entire suitability and serviceableness of copper for back boilers is confirmed.

b: The surface-treated boiler showed in patches a marked deterioration of surface. There was not enough evidence to show whether (or not) the copper itself was injured. But it is a fair conclusion that surface treatments are neither necessary nor desirable with copper.

c: The one boiler tested with coal showed more of a very slight surface corrosion than any of the boilers used with coke, although three of the latter had been in use 206 days longer, and although the coke used for the 195 days (plus half-days) of the second test had been made more severe, in its potential corrosive activity, than ordinary coke could be. The idea that coke might be a corrosive fuel with copper is entirely disproved.

d: The boilers made of cold-rolled copper showed no superiority in condition over those made of hot-rolled. While therefore reasonable smoothness in surface of the copper for boilers is desirable, a sufficient smoothness can be obtained by hot-rolling.

e: The two boilers made of a specially refined copper, although they had been through the double test, were sufficiently superior, in surface condition at the end of the test, to the others to justify the conclusion that this copper is preferable.

f: In case of any surface corrosion, the extra thickness of boilers made from ¼-in. plate provides a factor of safety. It is, however, not an essential, but can be recommended.

g: Some points in the manufacture of the boilers are clearly of importance. The brazing should be well done and finished smoothly; rough places in brazing may give a lead to corrosion. Internal protrusions of brazing should also be avoided. Indeed it should be of advantage to boiler-makers to study autogeneous welding with copper, to see if it is not a superior process. The design should avoid external projections due to overlapping of copper: there is evidence of a possible wastage due to corrosion wherever any such external projection is permitted. The bending of the "wrapper-plate" of the boiler should be accomplished with a minimum of strain, tension, roughening or thinning of metal at bends; there is evidence that smooth and even-thickness bends leave the copper at its full strength to resist corrosion potentialities.

It may be added that, in the discussion which has taken place among those who have examined the tests, mention has been made of the character of the setting as possibly delaying or aiding corrosion. It appears very desirable that there should not be crevices between setting and copper in which the products of combustion can settle. Also it is a suggestion that a layer of neutral fire-clay, between brickwork and copper, would be very well worth while; or a "stone-ash" wash, between setting and boiler, is another device worth trying.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may, in the course of time, indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Efflorescence and Staining on Masonry

AN architect wished to know the advantages in coating all Portland stone in contact with brick backing materials with a bituminous composition, also whether the bedding of Portland stone in Portland cement mortar and pointing with a hydraulic lime mortar would reduce the incidence of efflorescence and staining on the stone.

The absorption of salts from backing materials such as brick or concrete may be prevented by coating all masonry in contact with such backings with bitumen or other such preparation. The use of a cement or lime wash for this purpose does not provide a certain bar to the passage of water and, therefore, is comparatively unsafe; bituminous coatings do not, however, eliminate the staining and efflorescence due to alkali salts in the jointing materials.

The staining of masonry, particularly light coloured limestones, is usually caused by the formation of a brown water-soluble compound due to the action of alkali compounds in the jointing material on organic matter present in the stone. This water-soluble compound is brought to the surface as the stone dries and a brown stain results. When masonry is pointed with a dense cement mortar, little movement of water can occur through the pointing, and comparatively little drying takes place from the mortar joints. If the wall becomes wet, as it almost invariably does in building, the drying will take place through the stonework and any soluble salts present will tend to concentrate in or on the surface of the stone; with dense mortar the stone is therefore more liable to be subject to efflorescence and staining. By using a less dense mortar for pointing, such as a lime mortar, evaporation may be induced to take place from the joints, and the salts crystallize in the pointing; thus the likelihood of efflorescence and staining on the stone will be lessened.

In addition, Portland cement, eminently hydraulic lime, moderately hydraulic lime and white cement, contain alkali salts in decreasing amounts, and the use of a mortar made from materials having a lower content of soluble salts will again lessen the risk of efflorescence and staining of the masonry.

Cracking of Ceiling

Architects reported the cracking of suspended ceilings, consisting of cement rendering on expanded metal lathing, wired to steel angles and finished with acoustic plaster. It was suggested that the cracking was due to shrinkage of the acoustic plaster. Since it appeared improbable that a material such as acoustic plaster, having essentially a weak porous structure, would exert any marked effect on a dense cement rendering, the ceiling was inspected and some samples of the plastering materials were examined. The cracking was first noticed two or three weeks after the application of the acoustic plaster, which had been applied three or four weeks after completion of the rendering. Heating by means of embedded pipes near the centre of the ceiling had been commenced soon afterwards. The cracking was observed to be regularly distributed.

The shrinkage of a 1 : 2 cement-sand mortar, which had been used in this case, is of the order of 0·05 per cent., and it can be shown that in order to restrain this movement a stress greater than the tensile strength of the mortar is required. This means, of course, that unless the rendering is reinforced cracks are bound to occur; and, even when reinforced, planes of weakness will exist at any discontinuities in the reinforcing material and a tendency to the localization of shrinkage cracks will result. Tests indicate that, although the shrinkage movement of the acoustic plaster is slightly greater than that to be expected with a 1 : 2 cement-sand mortar, the average tensile strength of the plaster at seven days is only about 85 lbs. per sq. in. In comparison, the unreinforced rendering may be assumed to have a tensile strength of 600-800 lbs. per sq. in. at twenty-eight days. Actually, the thickness of acoustic plaster on the ceiling is one-half that of the rendering, and the maximum stress induced in the latter has been calculated to be less than 10 per cent. of the maximum tensile strength of the rendering. Taking these factors into account, it is considered extremely improbable that the shrinkage of the acoustic plaster has been responsible for the cracking.

The incidence of the cracks appears, undoubtedly, to be due to the existence of planes of weakness at the joints of the expanded metal which were very slightly lapped working joints when applying the rendering, and, as regards the ceiling as a whole, reduced sections in which vent openings occur.

To summarize, it is concluded that the cracking is primarily due to the shrinkage of the cement rendering, and its localization on planes of weakness in the rendering.

So far as remedial measures are concerned, it is recommended that any making good should be deferred for some time, in order to allow the greater part of the shrinkage to occur. With further work it is suggested that particular attention should be paid to the following points in order to avoid the formation of planes of weakness; (*a*) Provision of a good lap of at least 2 ins. of the expanded metal reinforcing sheets; (*b*) Use of as lean a mix as possible in the cement rendering in order to minimize shrinkage movements; (*c*) Delay the application of the finishing plaster until shrinkage of the rendering has had time to take place. (It might be possible, when panel heating pipes are embedded in the rendering, to heat up for a period before applying the finishing coat); (*d*) Avoid the coincidence of planes of weakness, e.g., the junction of reinforcing sheets corresponding with the section in which vent openings or similar features occur.

Prevention of Corrosion of Steelwork

An architect requested the advice of the Station in the following circumstances. He had been instructed to complete a building where operations had begun some three years previously but, through unforeseen circumstances, had been stopped. The steelwork of the building had been exposed during this period, and was now corroded. There was some doubt as to the advisability of retaining the steelwork, and, if retained, as to the best method of treating the surfaces to prevent further corrosion.

The question of the structural stability of the steelwork is a matter which does not fall within the scope of the work of this Station, and if any apprehensions are felt as to the weakening of the members by corrosion, it is suggested that the services of a consultant engineer be sought.

Should it be decided to retain the steelwork, it will be necessary to remove all rust either by sand-blasting or scraping and brushing, before any remedial measures are attempted. To protect the steelwork from further corrosion, painting with two coats of bituminous paint is probably as satisfactory a method as any; it is suggested, however, that additional protection may be obtained by applying a chromate primer before the bituminous paint.

Particular attention would have to be paid to the work around bolts and at angles, and where the steel enters the ground or concrete. In certain cases, it might be worth while pouring a bed of molten bitumen at the bases of columns.

COMPETITIONS OPEN

August 27.—Sending-in day. Proposed all-Scottish House for the Ideal Home Exhibition. Limited to architects practising in Scotland or of Scottish birth. Assessor: John Watson, A.R.S.A., F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from *The Daily Mail*.

September 5.—Proposed extension of the Town Hall, Hackney, for the Hackney Borough Council. Architects are invited to submit their names and brief particulars of their experiences. The competition will be limited to six architects to be selected from the applicants. Assessor: Professor S. D. Adshead, F.R.I.B.A. Premiums: £250, £150 and £100. The authors of the three unpremiated designs will receive a payment of £50 each. Applications should be submitted to R. H. R. Tee, LL.D., Town Clerk, Town Hall, Hackney, E.8, by September 5 next.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions, etc., were obtainable from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 1.—Sending-in day. (Last day for conditions was June 3.) Pictorial Map of the Area of the West Yorkshire Society of Architects. Premium, 10 guineas. Particulars were obtainable from the Secretary, 62 Woodhouse Lane, Leeds.

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich.

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

SOCIETIES AND INSTITUTIONS

NEXT R.I.B.A. CONFERENCE

A special meeting of the Council of the Manchester Society of Architects has been held to consider the preliminary arrangements for the R.I.B.A. Conference of 1932, which is to be held in Manchester next June.

Following a visit of Mr. Ian MacAlister, secretary of the R.I.B.A., to Manchester, when he outlined the general scope of the Conference and described the arrangements made in previous years, the Council met and allotted various sections of the necessary work to numerous members. Mr. Francis Jones, F.R.I.B.A., has accepted the duties of general secretary to the Conference.

Numerous tentative proposals were put forward, which are more than sufficient to indicate that an interesting programme, including both the historical past of the Society's area and the characteristic present of this important industrial district, will be available to the visitors to the Conference.

The Manchester Society is looking forward to entertaining a large number of architects from all quarters of the kingdom.

VISIT

The second of the series of the Manchester Society of Architects' summer evening visits was made on Wednesday, August 5, when the members visited Sunlight House, Quay Street, Manchester.

This building is a large block of offices, with shops below, designed by Mr. Joseph Sunlight, of Manchester. It is one of the highest blocks of offices in the city, and has a simple but dignified façade of Portland stone.

The visitors were shown round the building by Mr. Sunlight, and the Society was indebted to him for a most interesting evening.

ANNOUNCEMENTS

Mr. Thomas Edward Jones, A.R.I.B.A., of Arvonia Buildings, High Street, Bangor, has removed his office to Midland Bank Chambers, Bangor.

Mr. Thomas F. Ford, A.R.I.B.A., has removed his office from 35 Finsbury Square, E.C.2, to 12 City Road, E.C.1.

THE ARCHITECTS' DIARY

WEDNESDAY, AUGUST 19

ROYAL SOCIETY OF ARTS INDUSTRIAL DESIGNS COMPETITION. At the Imperial Institute, South Kensington, S.W. Exhibition of some of the designs submitted in the above competition, including architectural decoration, textiles, furniture, book production and advertising. Until August 31. 10 a.m. to 5 p.m. (Sundays, 2.30 to 6 p.m.) **10 a.m.**

SIR JOHN SOANE'S MUSEUM, 23 Lincoln's Inn Fields, W.C.2. Exhibition of Professor C. R. Cockerell's water-colour drawing, "A Tribute to Sir Christopher Wren." Until August 28.

SATURDAY, AUGUST 22

Sunrise, 5.54 a.m. Sunset, 8.11 p.m.

MONDAY, AUGUST 24

LONDON SOCIETY. Visit to the Chelsea Physic Garden (Swan Walk entrance, between Royal Hospital Road and the Embankment, S.W.3). **3 p.m.**

SATURDAY, AUGUST 29

Sunrise, 6.5 a.m. Sunset, 7.55 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Tour to Vienna, visiting Munich, Salzburg, Linz, Budapest, Zurich and Lucerne. Return, September 13. Full particulars may be obtained from the Secretary.

TUESDAY, SEPTEMBER 1

INTERNATIONAL ILLUMINATION CONGRESS. London, Glasgow, Edinburgh, Sheffield, Buxton, Birmingham and Cambridge. Until September 19.

FRIDAY, SEPTEMBER 4

INTERNATIONAL ILLUMINATION CONGRESS. At Glasgow. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Organization for the Development of Electric Lighting," by C. A. Atherton; "Progress and Teaching of Illumination in Italy," by C. Clerici; "Lighting Progress in South America," by A. M. Baidaff. Section 3: "The Provision of Adequate Daylight in Building Regulations," by P. J. Waldram; "Daylight Illumination and Town Planning," by C. G. Möller; "Visual Performance at Various Levels of Daylight Illumination," by K. Y. Yang; "Daylight Illumination of Art Galleries with Overhead Lighting," by T. Hirayama. Afternoon Session, 2.30 p.m. Section 1: "Home Lighting," by C. Haslett and N. E. Miller. Section 3: "Photo-Electric Measurements of Daylight Illumination by the Use of a Model Room," by Z. Yamauti and K. Hisano; "Mathematical and Graphical Determination of Direct Daylight Factors," by A. C. Stevenson; "Prediction of Natural Illumination in Interiors and on Walls of Buildings," by H. H. Higbie and A. D. Moore. **10 a.m.**

SATURDAY, SEPTEMBER 5

Sunrise, 6.17 a.m. Sunset, 7.40 p.m.

MONDAY, SEPTEMBER 7

SANITARY INSPECTORS' ASSOCIATION, 27 Moreton Street, S.W.1. Annual Conference to be held at Bridlington. Until September 12.

INTERNATIONAL ILLUMINATION CONGRESS. At Edinburgh. Following are some of the papers to be read. Morning Session, 9.30 a.m. Section 1: "The Lighting of Seaside Resorts," by A. P. Allan and J. M. Campbell; "Mason Experiments in Street Lighting," by W. S. Stiles; "Modern Public Lighting by Electricity," by W. J. Jeffery. Afternoon Session, 2 p.m. Section 1: "The British Standard Specification for Street Lighting," by C. C. Paterson. **10 a.m.**

THURSDAY, SEPTEMBER 10

INTERNATIONAL ILLUMINATION CONGRESS. At Buxton. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Architectural Lighting," by R. Waldo Maitland and Howard Robertson, F.R.I.B.A. Afternoon Session, 2.30 p.m. Section 2: "Architectural Lighting," by L. Kalff; "Engineering Aspects of Architectural Lighting," by W. J. Jones. **10 a.m.**

SHIPPING, ENGINEERING AND MACHINERY EXHIBITION. At Olympia. Until September 16.

FRIDAY, SEPTEMBER 11

INTERNATIONAL ILLUMINATION CONGRESS. At Birmingham. Sessions at 10 a.m. and 2.30 p.m. Papers to be read will be mainly devoted to signal glasses and vehicle lighting. **10 a.m.**

ARCHITECTURAL ASSOCIATION. Annual Excursion: to Austria. The programme will include six days in Vienna, followed by a six days' motor coach tour through Austria, returning to London on September 26.

SATURDAY, SEPTEMBER 12

Sunrise, 6.28 a.m. Sunset, 7.24 p.m.

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

WEDNESDAY, SEPTEMBER 16

INSTITUTION OF STRUCTURAL ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Manchester and District Branch. Visit to the Wardle (Watergrove) Reservoir.

THURSDAY, SEPTEMBER 17

Closing date of THE ARCHITECTS' JOURNAL September Holiday Sketches Competition.

LAW REPORT

BUILDER'S APPEAL : COUNTY COURT JUDGMENT SET ASIDE

Riley v. *Colquhoun. King's Bench Divisional Court. Before Justices Swift and Charles*

IN this case Mr. Samuel Colquhoun, a builder, of Warren Road, Blundellsands, appealed against a judgment of Judge Morris sitting at the Liverpool County Court, awarding the plaintiff in the action, Mr. William Riley, of Burdett Road, Waterloo, Liverpool, £25 damages in regard to the roof of a house he had purchased from the appellant.

It appeared that Mr. Riley purchased his house from the appellant for £600 in 1927 and was in occupation in the October. Mr. Riley had not been long in the house when he made a complaint as to the roof leaking and the appellant executed certain repairs. When gales came Mr. Riley again complained of the roof, and a local property owners' association took the matter up and the appellant replaced 120 slates on the roof "as an act of grace." Mr. Riley's case was that this did not cure his complaint, and that as the roof was still leaky he instituted county court proceedings for damages, with the result that Judge Morris, whilst holding that the house was fit for occupation, said the slates used were of poor quality, and he awarded Mr. Riley £25 damages.

Mr. Lynskey, K.C., for the appellant, said his client appealed from this judgment. Counsel's contention was that the roof was on the house when Mr. Riley agreed to purchase. It was true that there was a clause that the vendor would complete the house in a good and workmanlike manner, fit for occupation, but counsel submitted that this applied only to work to be done and not to work already done. Here Judge Morris had found that the house was fit for occupation and in counsel's opinion that clearly exempted his client from any further liability. Under these circumstances he argued that the appeal should be allowed.

Sir Thomas Hughes, K.C., for the respondent, supported the judgment of Judge Morris, and said, in his opinion, the appellant was liable for the roof and that his client was entitled to the damages awarded.

The Court allowed the appeal, set aside the judgment of the county court judge and entered judgment for the appellant, with costs.

Mr. Justice Swift, in the course of his judgment, said he was not going to determine the point in the contract as to whether a certain clause applied to work done or to be done, as that point had been left open by the Court of Appeal in the case of *Lawrence* v. *Castle*, and, so far as his lordship was concerned, it was still open.

In the present appeal the county court judge had found as a fact that this house was fit for human habitation, and if that was the case, then it was clear that the appellant had done all he had contracted to do, either expressly or completely. Having provided a house fit for human occupation, the appellant could not be held liable for defects which developed subsequently. Therefore the county court judge came to a wrong conclusion and the appeal must be allowed.

Mr. Justice Charles agreed.

TRADE NOTES

Messrs. Haywards, Ltd., of Union Street, Borough, London, S.E.1, have issued two catalogues describing and illustrating their iron staircases and "copperlite" glazing. In *Iron Staircases* it is strongly urged that every building of any considerable height should be served with an external iron staircase, permanently fixed in such a way that it is always ready for use and equally available from all floors. Such a staircase, it is claimed, cannot be overloaded by a panic rush, and, if properly constructed, at no stage is its stability in danger in the early phases of a fire. A weighty argument in favour of these external staircases is the fact that Great Britain suffers a fire loss of £12,000,000 per annum (a figure that is steadily rising), so that the danger of a fire is a menace to every building, private, public and industrial. Some of the buildings which are provided with these staircases include the National Radiator Building, London (Gordon Jeeves, F.R.I.B.A., and R. M. Hood, architects); Kodak Building, Kingsway, London (W. E. Riley and E. B. Glanfield, F.R.I.B.A., architects); St. Mary's Hospital, Paddington, London (Sir William Emerson, F.R.I.B.A., architect); Royal Westminster Hospital, London (Adams, Holden and Pearson, FF.R.I.B.A., architects), Yorkhill Hospital, Glasgow (John Burnet, Son and Dick, architects); and New Park Hospital, Davyhulme, Manchester (Elcock and Sutcliffe, FF.R.I.B.A., architects). In the second catalogue, entitled *Copperlite Glazing*, partly illustrated in colour, it is explained that "copperlite" glazing is built up of small panes of glass mounted in copper bars having a definite initially-formed rebate, that is to say, the bars are of I section, and hold the glass in a positive grip, independently of the copper deposition, which further secures and seals the glass. Bars of I section are employed as being stronger and more satisfactory than bars without rebates, which depend wholly upon the work done in the copper depositing bath for their security. Hayward's special method of construction, it is claimed, provides a large contact area and definite hold between the glass and the framework, and further stiffening by the deposition of copper, which serves the double purpose of giving maximum strength and of sealing the minute crevices between the glass panes and the rebated copper bars, ensuring a product of the highest strength and quality. It is also stated that the result of the tests carried out by the British Fire Prevention Committee on Hayward's "copperlite" glazing, after being subjected to 1,750 deg. (red heat) for 1½ hours, followed by the application of water at a pressure of 50 lbs. per sq. in. from a fire engine, was that it was found to be intact.

*

Messrs. W. H. Gaze and Sons, Ltd., have recently secured the following contracts: Extension to St. Joseph's Church, Malden, for A. Gilbert Scott, F.R.I.B.A.; extension to Victoria Hospital, Chelsea, for R. Kitching Ellison, A.R.I.B.A.; new Library and Fire Station, Surbiton, for Joseph Hill, F.R.I.B.A.

*

In the Blue Coat School, Birmingham, designed by J. L. Ball and H. W. Simister, and illustrated in the ARCHITECTS' JOURNAL for July 29 last, about 5,250 yards super of "Expamet" expanded steel, supplied by the Expanded Metal Co., Ltd., of Caxton Street, Westminster, S.W.1, were used to reinforce the concrete flooring.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

St. Paul's Church, Hayward's Heath, Sussex (pages 237–240). General contractors, James Longley & Co., Ltd. Sub-contractors : British Reinforced Concrete Eng. Co., reinforced concrete; W. T. Lamb and Sons, bricks; Thomas Blackburn and Sons, Ltd., structural steel; Ames and Finnis, special roofings; Ruberoid Co., Ltd., roofing felt; Barrowclough and Sanders, glass; James Longley & Co., Ltd., wood-block flooring; Seward & Co., Ltd., central heating; W. H. Hogger, electric wiring; General Electric Co., Ltd., electric light fixtures; Musgraves (Liverpool), Ltd., sanitary fittings; James Gibbons, Ltd., casements and door and window furniture; Marchetti, Ltd., decorative plaster and marble.

Broxholme House, Fulham, S.W. (pages 241–243). General contractors, Hole & Co., Ltd. Sub-contractors : Henry Greenham, Ltd., and W. T. Lamb and Sons, facing bricks; Dorman, Long & Co., Ltd., structural steel; A. C. W. Hobman & Co., Ltd., artificial stone; McDowell Steven, stoves and ranges; General Asphalte Co., Ltd., asphalt; Roberts Adlard & Co., roof tiling; Nettlefold and Sons, Ltd., and Lockerbie and Wilkinson, Ltd., ironmongery; Fletcher Russell & Co., Ltd., gas coppers; W. H. Gascoigne & Co., plumbing and hot water; Hawkins, Carlton & Co., plastering; Archibald Kenwick & Co., baths; A. H. Herbert & Co., Ltd., wall and floor tiles; Nash and Hull, Ltd., bronze lettering and numerals.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Mr. A. Frampton is to erect eleven shops and flats and a billiards hall in Bromley Way, on the DOWNHAM estate.

SOUTHERN COUNTIES

Plans passed by EASTBOURNE Corporation: Two houses, Dillingburgh Road, for Mr. A. J. Fellows; shop, Victoria Drive, for Mr. W. R. Hamblyn; two houses, Kingston Road, for Messrs. P. D. Stonham and Son; three houses, Osborne Road, for Mr. A. Ford; three houses, Moy Avenue, for Mr. F. C. Benz; ten houses, Kingston Road, for Messrs. P. and G. Attfield.

Plans passed by the GRAVESEND Corporation: Four houses, Central Avenue, for Mr. T. Bennett; eight houses, Hillside Avenue, for Mr. C. A. Reid; bungalow, Malvina Avenue, for Mr. C. D. French.

Messrs. Browning and Hayes are to develop the West Street estate at Cowley, OXFORD.

The OXFORD Corporation is to build fifty houses on Corporation estates for rehousing displaced tenants.

The Kent Education Committee is to erect a central school in Hayes Lane, WEST WICKHAM.

Plans passed by the WEYMOUTH Corporation: Four houses, Cleveland Avenue, for Mr. W. Knell; school room, Convent of the Sacred Heart for Messrs. Jesty and Baker; three houses, Northovers Estate, for Mr. F. Greenaway; estate layout for Mr. F. Weeden at Radipole, for Messrs. Theo Conway.

The WEYMOUTH Corporation has approved plans for the erection of showrooms for the electricity dept. at the corner of Westham Road and Royal Terrace.

SOUTH-WESTERN COUNTIES

The BRISTOL Education Committee has selected a site on the Bedminster estate for the erection of an elementary school.

The BRISTOL Corporation has prepared a clearance scheme for the St. Paul area.

The BRISTOL Education Committee has obtained a site in Melvin Square, Knowle, for the erection of an elementary school.

The Hampshire Education Committee is to extend the CHILWORTH and BADDESLEY elementary school, at a cost of £7,000.

The DORCHESTER Corporation is to prepare a scheme for the erection of further houses on the Victoria Park site.

The DORSET C.C. is preparing a scheme for the provision of isolation hospital accommodation for the county.

Plans passed at PAIGNTON: Three shops, Old Torquay Road, for Mr. A. Savile; four houses, Hilton Crescent, for Mr. H. Proctor; dining hall, café, assembly room and pavilion, Holiday Camp, King's Ash Hill, for Mr. Leins; nineteen houses, Clifton Road, for Mr. A. E. Jonas; bungalow, Old Dartmouth Road, for Mr. Burman; house, Marldon Road, for Messrs. Scriven and West; ten houses, Clifton Gardens, for Messrs. R. H. Peeke and Son; house, Dartmouth Road, for Mr. F. C. Stockman; bungalow, Maidenway Road, for Mr. G. Wyatt.

Plans passed at PLYMOUTH: Shop, Mutley Plain, for Mr. B. Hawken; additions, Holy Cross School, Beaumont Road, for the Rev. Father Lee; four houses, North Down Road, for Mr. W. Andrews; eleven houses, Ganges Road, for Messrs. Waycott Bros.; two houses, Weston Park Road, for Mr. A. Manning; eighteen houses, Swilly House Estate, for Mr. C. G. Edgcumbe; six bungalows, Hill Top Crest, for Messrs. A. E. Searle and Son; shop premises, 100, 101 and 102, Fore Street, for Messrs. Marks and Spencer; twenty-four houses, South Down Road, for Messrs. Selborne and Labell; layout of streets, Crest Hill Estate, for Mr. F. Westcott; two houses, Compton Lodge Estate, for Mr. M. Olver; three shops, Egg Buckland Road, for Mr. J. W. Spencer.

The Hampshire Education Committee is to enlarge the SOUTH HAYLING elementary school, at a cost of £10,000.

The Hampshire Education Committee has voted £10,500 for the erection of a junior school at TITCHFIELD.

The TORQUAY Corporation has approved amended plans by Messrs. Bridgman and Bridgman for adapting the Y.W.C.A. premises for municipal and library purposes, at a cost of £29,895.

Plans passed by the TORQUAY Corporation: Four houses, Barton Hill Road, for Mr. F. White; two houses, Newton Road, for Mr. H. Pearce; two bungalows, Isaacs Hill, for Mrs. Ellicott; two houses, Barnfield Road, for Mr. L. Gough; additions, Prince of Wales Inn, Union Street, for Plymouth Breweries, Ltd.; twelve houses, Florida Way, for Torquay Building Co.; additions, 3–6 Hilly Gardens, for Mr. W. Steer.

EASTERN COUNTIES

The COLCHESTER Corporation has approved plans by Messrs. Baker and Burton, architects, for the provision of a clinic at the education offices.

The COLCHESTER Corporation is to erect sixty-four houses, by direct labour, at Old Heath, at a cost of £20,500.

Plans passed by the COLCHESTER Corporation: Church hall, Collingwood Road, for Messrs. John Harrison & Co.; two houses, St. John's Road, for Mr. E. Mower; two houses, Shrub End Road, for Mr. G. Hearsum; screen erecting shop, Hythe Bridge Ironworks, for Messrs. F. W. Blackett & Co., Ltd.; shop, Mill Street, for Mr. A. E. Wagstaff.

MIDLAND COUNTIES

The Warwickshire Education Committee is to proceed with the extension of the central school at ARLEY.

The Notts C.C. is to erect a welfare centre in Bull Pit Lane, BALDERTON.

The Worcestershire county architect is preparing plans for the erection of a junior school for 350 pupils at CAKEMORE.

The CHESTERFIELD Brewery Co. is to erect an hotel at the junction of Pickles Lane and Carter Lane, Warsop, Notts.

The COVENTRY Corporation is seeking sanction for a loan of £49,000 for the erection of branch baths at Foleshill.

The COVENTRY Corporation is to erect 200 houses at Stoke Aldermoor, at a cost o £61,000.

The Worcestershire Education Committee has prepared plans for the erection of a senior school for 800 pupils at HALESOWEN.

The Warwickshire Education Committee has approved plans for the erection of a junior school for 270 pupils in Malthouse Lane, KENILWORTH.

The KIDDERMINSTER Corporation is to erect baths in Castle Road.

The Worcestershire Education Committee is to erect a junior school at LEIGH HURST.

The MATLOCK U.D.C. is to erect thirty-six houses on the Starkholmes Road estate, from plans prepared by Mr. John Simpson.

The MERIDEN R.D.C. is to erect a fire station in Sumner Road, Coleshill.

The governors of the Women's Hospital, Peel Street, NOTTINGHAM, are to prepare a scheme for extensions.

The NUNEATON Corporation is to erect municipal buildings at the corner of Coton Road and Mill Walk from plans prepared by Messrs. Peacock and Bewlay.

The Notts Education Committee is to erect an elementary school for 500 pupils at OLLERTON.

The Warwickshire Education Committee is to erect a senior school for 480 pupils at Sharmans Cross, SOLIHULL, at a cost of £20,000.

The Warwickshire C.C. has passed plans for the erection of a petty sessional court at SOLIHULL.

The STRATFORD-ON-AVON R.D.C. has purchased two acres of land adjoining the housing estate, for the erection of further houses.

The STOKE-ON-TRENT Education Committee has acquired a site on the Abbey Hulton estate, for the erection of an elementary school.

The Worcestershire Education Committee has prepared plans for the erection of a senior school for 400 pupils at STOURPORT.

The Worcestershire Education Committee is to obtain a site at UPTON-ON-SEVERN for the erection of a senior school for 320 pupils.

The Warwickshire C.C. is to erect a nurses' home at the mental hospital, WARWICK, at a cost of £43,000.

The Notts Education Committee has purchased a site in Loughborough Road, WEST BRIDGFORD, for the erection of a secondary school.

NORTHERN COUNTIES

The Lancashire Education Committee has obtained a site at BLACKROD, for the erection of a senior school.

The BOLTON Corporation has approved the lay out of land at Lonsdale Road, for the erection of 112 houses.

Plans passed at BOLTON: House, Borrocks Fold, for Mr. T. P. Longworth; eight houses, Southgrove Avenue, for Messrs. A. H. Price and Grove; house, Boot Lane, for Mr. J. H. Sharples; house, Brook Hey Avenue, for Mr. W. Turner; extension to office, Orlando Street, for Messrs. Bellamy and Dagnall; extension to premises, Back Haydock Street, for Mr. J. Pennington; extensions, 327 Bury Road, for James Haslam Estate Company.

The DURHAM County Education Committee has purchased a site at St. Nicholas for the erection of an elementary school for the Easington colliery district.

The Lancashire Education Committee has obtained sanction for a loan of £4,000, for the erection and equipment of a gymnasium at FARNWORTH Grammar School.

The Rev. Francis Avery is to erect a Roman Catholic school for 200 pupils in Dryden Road, Low Fell, GATESHEAD.

The Frankby Hall Estate Co. is developing a building estate at GREASBY, Cheshire.

The HULL Education Committee recommends a site on the Queen's Dock estate for the erection of the new technical college.

The Rev. T. McGrath is to erect a Roman Catholic school for 400 pupils at Deane, HULL.

The HULL Education Committee is to obtain a site on the Johnson Fold estate, for the erection of an elementary school.

The LANCHESTER R.D.C. is to erect sixteen bungalows at Knitsley and six houses at Winning.

The LIVERPOOL Corporation is to erect a further 500 houses on the Dovecot estate.

Mr. C. J. Boyle is to erect a cinema in Green Lane, LIVERPOOL.

The Lancashire C.C. has obtained sanction to borrow £5,116 for the erection of a county police station at ORRELL.

The Cheshire C.C. has approved a scheme for the erection of a block for 100 patients at the PARKSIDE mental hospital, at a cost of £16,000.

The Rotherham Co-operative Society, Ltd., is to develop a building estate in Wickersley Road, ROTHERHAM.

The SHEFFIELD Corporation has obtained sanction to borrow £22,318 for the erection of fifty-eight houses on the Shiregreen estate, and £156,092 for the erection of 448 houses on the Wybourn estate.

The WARRINGTON Education Committee is seeking sanction to borrow £47,887 for the erection of the Fairclough council school.

Plans passed by the WARRINGTON Corporation: Sixteen houses, Winwick Road, and two houses, Manchester Road, for Mr. R. Smith; extensions, Sankey Street, for the Warrington Co-op. Society, Limited; six houses, Oakland Street, for Mr. G. Cooper; eight shops, Thelwall Lane, for Messrs. J. P. Booth and Son.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

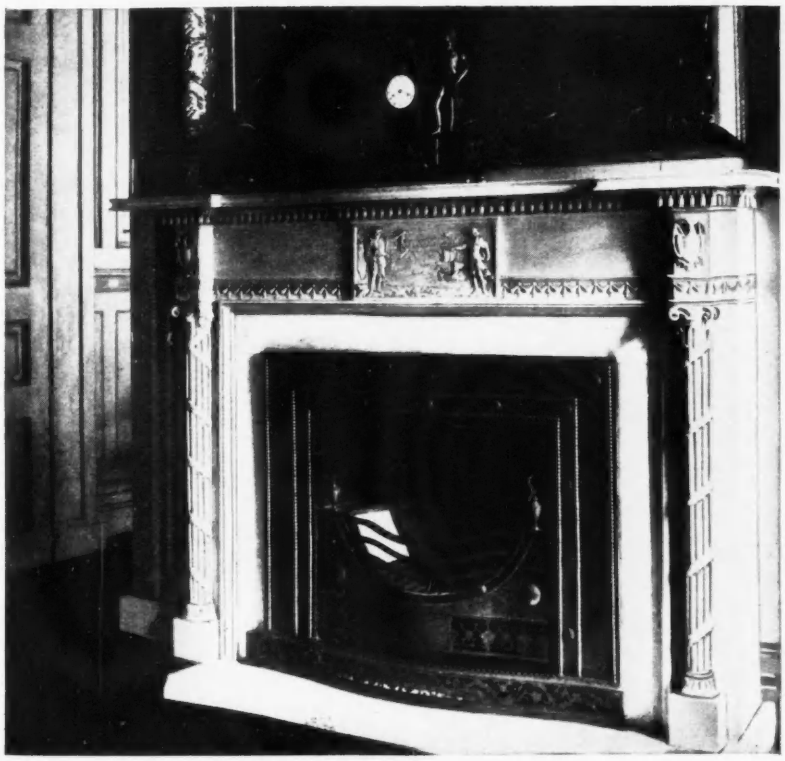
FROM THE NEW WORLD: I

MEASURED DRAWINGS OF AMERICAN COLONIAL DETAILS



MANTEL IN THE GOVERNOR'S SUITE, OLD CITY HALL, NEW YORK

AMERICAN architecture of the Colonial epoch shows the influence of contemporary European styles—British in the Virginias and New England, Dutch in New York and its southerly vicinity, French in New Orleans. But, as the set of supplements of which this is the first will reveal, the expression of these tendencies was conditioned by climate, by the resources and materials available to the pioneers, and by their taste.

The measured drawings within are devoted to a mantel and certain dados. The above photograph of the former also gives, on the left, a glimpse of some of the wainscoting included in one of the drawings.

The merit of the mantel lies equally between its pleasing and well-proportioned design and its craftsmanship.

Though the purist may cavil at the suggestion of silken tassels in the bed-mould and of woven fabric on the architrave and capitals of the shafts, these playful incidentals may be forgiven, inasmuch as they have been kept strictly subordinate to the design as a whole.

In the dados in the Old City Hall the same refinement of mouldings is noticeable as in the fireplaces in these rooms; but while the latter features command direct attention, the dados take their place naturally and unobtrusively as part of the wall design and not as features of interest in themselves.

MANTEL IN GOVERNOR'S SUITE. OLD CITY HALL. NEW YORK CITY.

CECIL SHARP HOUSE, N.W.

A DETAIL FROM THE ENGLISH FOLK DANCE HEADQUARTERS

[*H. M. Fletcher and Godfrey Pinkerton, Architects.*

ONE OF THE GARDEN DOORWAYS AND PROCESSIONAL STAIRWAYS

THE two doorways, one of which is illustrated, above photographically, and by scale working drawings within, lead from the large hall in the London Headquarters of the English Folk Dance Society to the garden, which was originally planned as a theatre for open-air festivals and entertainments.

It was intended that performers should enter the garden processionally, down the steps from these doors and up the steps from the large central classroom in the basement, the two sets of dancers meeting on the circular landings before proceeding together to the arena.

The bricks are roughened wire-cuts of a varied pinkish-brown colour. The pointing is slightly toned and flush with the brickwork. The bond is English up to the set-off at the top of the plinth: above that it is Dutch. The bricks are so hard that for the sake of economy the arch-bricks are specially made, not cut. The flat arches are laid with a camber of $\frac{3}{4}$ in. to 5 ft. 6 ins., and proportionately less for smaller spans. The railings are wrought iron, with ornamental panels of cast iron.

Cecil Sharp House was illustrated and described in the issue of June 4, 1930.

SELECTED PRECEDENTS:
FROM THE GERMAN COALFIELDS

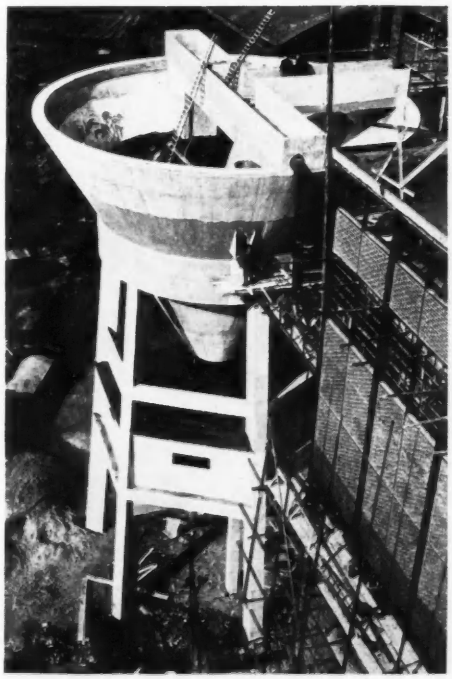
[The late Adolf Fischer, Architect.

1. STORAGE BUNKER, FRANKFORT-ON-MAIN COKERIES.

2. COOLING TOWER, MINISTER STEIN PIT, DORTMUND.

THE incidental structures characteristic of German pit-heads and gasworks are usually far better co-ordinated and designed than those familiar at home. To ensure the utmost economy and efficiency in operation, screening, washing and coking plant, and coal and coke bunkers, are constructed as separate units, linked together by overhead travelling conveyors. Gravity plays an important part in the various manipulations of coal from the working face in the mine to the loading of railway trucks or gas retorts. The verticality of these structures is therefore simply the logical expression of their functions.

All the five structures illustrated evince vertical emphasis of one kind or another. In figures **2** and **3**, both of which were designed with a marked oblique batter and are hexagonal in form, this is embodied naturally in the type of construction adopted. In the former, at once the most architectural and symmetrical of the examples shown, the upward thrust is stressed by the salient arrises at the angles of the brick-faced cooling tower; while in the latter the rectangular section of the free-standing legs of the slanting



3. REINFORCED CONCRETE COAL-WASHING SIPHON IN THE RUHR.

trestle frame produces an identical effect. In figure **4**, the vertical emphasis inherent in the shape of a tall and narrow building is heightened by a triple longitudinal window of great depth, and the splayed-out concrete flanges in prolongation of its mullions which fret the summit into a semi-castellated silhouette. In figure **5**, a twin structure to the last (though differing from it in form and function), which looks rather like a mediæval keep, the same vertical accentuation, if in minor key, is obtained by repeating the band of louvred openings running round the arcaded base underneath the roof parapet; and further enhanced by the buttress-like projection, containing another longitudinal window that stretches to the top of it, flanking one corner.

In figure **1** this dominant emphasis appears less conspicuous because the roof is of the coved "wagon-top" type. It is, however, plainly discernible in the four "organ-pipe" corrugations surmounting the middle opening, the pattern of the longitudinal ventilating slits close to the top, and the chimney-like protuberance of the coal-chute. P. MORTON SHAND

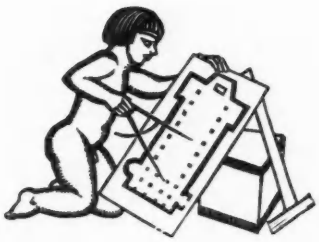
THE ARCHITECTS' JOURNAL



WEDNESDAY, AUGUST 26, 1931

LUCK AND TEMPERAMENT

WHAT attributes go to make the successful architect? As in the old Battle of the Styles, partisans range themselves, for the most part, pretty evenly into two sets: those who believe that man is "captain of his soul," that success comes from within and not from without; and those who believe that success is fortuitous and outside man's control. Like the combatants in the Battle of the Styles, too, it will be found that adherents are divided, not so much by a difference of opinion as by a difference of temperament, so that reconciliation by means of argument must remain an impossibility.

Let us take the case of two young architects, Smythe and Jones, who set up office side by side. Into the office of Smythe there comes a rich aunt, upon philanthropy bent, who commissions her nephew to design a Home for Indigent Females of Gentle Birth. He does so, incidentally delighting his aunt and beautifying his native town. The immediate result is a trickle of commissions, which trickle develops into a flow, a stream, a deluge; and in thirty years Smythe has more work than he can cope with. Jones has no rich aunt, nevertheless he succeeds, in the course of a year or two, in landing a client who wants a country house; a testy, unscrupulous tradesman, who on some trivial grounds brings an action for negligence against his architect. The client loses his case, but Jones loses his reputation, and his exiguous capital, in costs, and applies to Smythe for a post. He gets taken on as one of Smythe's increasing staff of draughtsmen.

In another town two young architects, Browne and Robinson, have adjacent offices. On a certain day they are both invited to join a panel of local architects to design houses for a large local authority's housing scheme. Browne's houses are an immense success. They add to the amenity of the district, the tenants are delighted with the internal arrangements, the contract has been handled with tact, and the price is moderate. Browne's next job is the local Cottage Hospital, and by degrees he becomes the leading architect of the district. Robinson's houses, on the other hand, are failures. Although they are by no means ugly, the planning is full of those pinpricks of inconvenience which are—not surprisingly—so irksome to the housewife; moreover, there is constant friction with the contractor, and, at the outset none too cheap, the houses become intolerably expensive owing to the addition of countless extras. Thus Robinson fails to make good, and in a few months applies to Browne for a post; and *he* gets taken on as one of Browne's increasing staff of draughtsmen.

What are the qualities, the presence of which made Smythe and Browne successful and the absence of which made Jones and Robinson unsuccessful? Assuming that Smythe had no say in the selection of his parents, the possession of a rich aunt bent on philanthropy was a piece of luck quite outside his control. Not so the handling of the opportunity which chance gave to him. Here he displayed his good taste, his skill, his technical knowledge, his tact and his patience; but he had an easy client to deal with, and money was plentiful. Jones was unfavoured by chance. His client was shrewd, parsimonious, unscrupulous, and possessed execrable taste, against which Jones's good taste, skill, technical knowledge, tact and patience availed him nothing. Had chance given him a rich aunt, then doubtless, all would have been well. Had Smythe—with his equal inexperience—been given Jones's first client there is little doubt but that he, too, would have come a cropper.

Browne and Robinson, however, started fair. Chance favoured neither of them, but Browne succeeded because of his greater skill, his greater capacity for grasping essentials, his better taste, his more pleasant manners, his keener insight—in fact, on account of those qualities which make for success generally; and Robinson failed because of his lack of them.

In architecture, indeed, as in most walks of life, half-a-dozen men owe their success to a piece of quite fortuitous good luck, whereas six men owe their success entirely to their own endeavours. The fortuitous circumstance, however, by itself can do nothing for a man unequipped to take advantage of it. Good luck may aid, bad luck may thwart; but luck can do little for the architect who is unwilling or unable to help himself.

THE STROLLING AUDIENCE

A correspondent's letter, printed in this issue, advances a plea for a new promenade theatre. Even in England, much more abroad, there has always been a certain feeling in favour of listening to music and plays in conditions freer and easier than those afforded by the formal seating in theatres and concert halls. The recrudescence of pageants and the folk-dance movement, all up and down the country, the open-air plays in Hyde Park, are present evidences without doors, and within are promenade concerts, cabaret shows and the like. The idea is, in fact, of honourable antiquity. In the National Gallery is the painting belonging to the Bibiena school (early eighteenth century) reproduced above, showing the interior of a theatre, with a stage of noble proportions, and elaborately architectural scenery, set for "Othello." The point about it is that the audience, seen in what we should term the pit, is actually shown standing and strolling; there is no seating in view. The time is perhaps ripe, as our correspondent suggests, for history to repeat itself, here in London.

NEWS & TOPICS

THE HEAVY-WEIGHT BUILDINGS IN THE CITY

I HAVE never seen a building that, having satisfied the conditions of plan and structure, was devoid of some striving after effect. By satisfying the conditions of plan and structure I don't depress these conditions, but make *them*, and not effect, the ruling motives, even as they rule in the design of what are called purely engineering structures. That is why I think Sir Owen Williams, in his recent letter to *The Times*, spoke only a part of the truth in condemning the heavy-weight buildings in the City; and why I think it the greater pity that he was denied the opportunity of designing the Dorchester Hotel on the conditions which the building owners and the state of society today presented, for it would have been a double revelation.

*

I am not seeking to crab Sir Owen Williams in any way, because he is right, if ever a man was right, to see in these enormous classical palaces and in the mass of modern building in London a colossal waste of time, material and money, as being erections devoid of the spiritual quality that might alone serve to commend their extravagance. I hold firmly to the necessity for a spiritual quality in any building that hopes to hold even one man one minute out of his normal course, and what I take Sir Owen Williams to stress in his letter is the foolishness of hoping that surface effect can ever be more than on the surface.

*

Architecture in England is all wrong so long as it pretends to derive its source from old models instead of from plan and structure, and it is never so all wrong as in that home of architectural stupidity, the City of London. And architects know it, though they have not the strength of mind to say so in the hearing of their clients. English architecture, if it is to have any future at all, must be a deal more honest than it is today.

THE FETTERS OF A BUREAUCRATIC SYSTEM

The truth is that we are fettered by tradition, and our chances of recovering sanity are the poorer in that we have allowed an increasing proportion of building to drift into the hands of a bureaucratic system. With the economics of the system I am not for the moment concerned, except to note that it is now found possible to cry extravagance at the appointment of an architect to a public building—as in the case of Mr. Berry Webber being asked by the Kent County Council to design certain work for them, whereas they may already employ a permanent staff of twenty-seven architects to build schools and other work. The point at issue is the quality of work produced under the official system and the chances of rapid development in ideas. I think these chances are poor.

THE COST OF BUILDING

The cost of building today is about 85 per cent. above that in 1914, and one frequently hears vague complaints that the present prices ought to be lowered. A recent article in *The Times*, after analysing the causes of the increase, holds out no immediate prospect of a return to pre-war prices. Before the war, although wages had been rising, the increasing use of machinery offset the wages, until in 1913 a point was reached where the machine could do no more. In 1914 a parlour house could be built for £180, about £90 of which represented the cost of labour; today such a house costs £330. The article goes on to show that since 1914 the combined wages of a bricklayer and a labourer have jumped from 1s. 2d. per hour to 2s. 7½d. per hour, an increase of 120 per cent. Materials have not risen in the same proportion, since the total increase in cost of the house is only 85 per cent., and there is little hope of any drop in this item as long as the wages for getting, haulage and manufacture remain at their present level.

*

Shorter hours have added to the builder's overhead charges, which are still further inflated by the various insurances for social service: it obviously costs more to employ fifty-four men for forty-six hours a week than forty-six men for fifty-four hours a week. Wages in the building trades are not likely to be considerably reduced at the present time, and the level of prices may therefore be regarded as stable for some years. Thus the decision to hold up building work in the expectation of a rapid decline in costs in the near future will probably not prove to be a wise one.

BRICK *v.* STONE AT CHIPPING CAMPDEN

There has been an amusing duel in progress in Chipping Campden during the last six months between the local council, who want to build some cottages in the cheapest available material, and the Campden Society and other local intelligentsia, who want them built in stone, even though they should cost more thereby. I have not seen the houses in question, neither do I know the nature of their position except that it is in Station Road, where other red-brick houses stand to shame the earlier apathy of the Campden Society; but I think the argument of the Council is unassailable, for they say, in effect, if they give way in the first instance, who is going to pay the extra for stone in future cottages? Which obliges the Campden Society to plead that Chipping Campden is a show place and that the extra cost is worth it.

*

But how melancholy are these efforts to keep dead tradition alive in face of the steady pressure of a changed economic system! It is a sad fact that the face of rural England must reflect the changes of economic structure, but we are better employed in trying to work the new system properly than in exercising our time and money reviving that which has no life of its own. Under the circumstances that at present govern the design of cottages, I devoutly hope that these may be eventually built of stone.

BARBERS' SHOPS

The ancient gate of the Inner Temple has been closed for several days because a lump of stone fell on the head of a girl. The notice on the Temple gate, in language which is itself a most precious relic, states that the gate is closed "because of a dangerous structure *beyond*."

*

Actually, it was part of the adjoining Rainbow Tavern that fell, and the tavern is a mere Victorian affair, and no worthy part of the ancient fabric of the Temple. It used to be a barber's shop—a pleasant place to sit back in, for it has a beautiful ceiling, for the appreciation of which only a leisurely shave could allow time fit and proper.

Barbers' shops are coming into their own again today when one considers the *illuminated worm* of Austin Reed's master barber shop in Regent Street, and its contribution to the enjoyment of shaving.

★

But I have wandered far *beyond* the Temple Gateway into the more interesting topic of barbers' shops. An interesting topic, but not altogether architectural. There is a barber's shop in the Royal Opera Arcade that preserves its Regency tradition absolutely intact; and there is another in Chelsea with a ceiling made up of a mixed assortment of plaster casts. Both architectural subjects in a sort of way, though I don't think I had better pursue the subject further.

CLOTHING THE STEEL CAGE

The architectural treatment of steel cage construction is a matter upon which many disagree. If, after the modern

The Kaufhaus Breuninger at Stuttgart, under construction.

English fashion, one is to conceal the whole frame behind a shell of brickwork, besides flouting the disciples of Ruskin in a way which must give them great pain, one adds an unnecessary load to the frame itself. If one reveals the construction in all its nakedness, one will produce, inevitably, a façade upon which the upright and horizontal lines are almost equally emphasized—a kind of chessboard which the greatest genius cannot imbue with architectural distinction. Perhaps the solution offered by the Kaufhaus Breuninger at Stuttgart, of which the supplement with the issue for July 15 has brought me, from a correspondent, the accompanying progress photograph, is the best one : that is to say, to conceal the horizontal girders, and show the upright ones. That certainly accords with the requirements of the plan. A large shop of this kind obviously requires as much light as possible. What little external clothing the designers have conceded to notions of decency has done no more than to plunge the shopman's feet in shadow. It will be noticed that the blocks of travertine employed on the façade are jointed vertically ; this has the advantage of showing clearly that this material merely acts as a surface panelling and plays no part in the construction.

MITIGATION OF FIRE RISKS

I have before now commended to my readers' notice the fire-preventive measures advocated by Dr. F. J. Waldo, the City Coroner. In the S.P.A.B. annual report just published reference is again made to them. It may be remembered, says the report, that at the last annual meeting of the Society the late Mr. Spanton spoke urging the Society to point out to the owners of fine old country houses some of the dangers and risks to which they are subject by fire. As a consequence the Society sent a letter to the Press in the early autumn, reminding the public of these dangers. As a result of this letter, Dr. F. J. Waldo, His Majesty's Senior Coroner for London, wrote to the Society giving it the results of his experience in the City of London.

★

Among the extracts from Dr. Waldo's letter published in the Society's report are the following : " . . . I entirely agree with you as to the danger of obsolete flues and old-fashioned electric lighting wiring, which are in not a few instances responsible for the mischief. I have often suggested the use of big tanks of water on the roofs of country houses, worked automatically by sprinklers in places where water is scanty or absent. . . . For several years past I have suggested to the Corporation of London the compulsory use in all new City buildings of the model Rules and Regulations for electric wiring of the Institution of Electrical Engineers. I was pleased to see that you approve of the unique City of London Fire Inquests Act, 1888, which gives power to the City Coroner to hold inquests—with juries—on any fatal or non-fatal fire officially reported to him under the Act as having occurred in the City; with power also, to commit for arson or incendiarism on the verdict of a jury. I find that the Act works as a strong deterrent against arson and neglect—short of wilful fire-raising. . . ."

A FLIGHT OF TOY BALLOONS AT LLOYDS

The scene, you are asked to believe, is the Room at Lloyds. Upon the eyes breaks the spectacle of a number of brightly-coloured toy balloons making a wavering ascent to the ceiling; upon the ears, something like a cheer. Yet is this cheer not altogether a tribute to frivolity, and the experiment has a serious aim. It is to discover, if not the origin, at least the prevailing direction of certain draughts which have proved persistent and of sufficient force to blow papers about the desks in the boxes in that august department. Underwriters are congenitally disposed to shiver at the onset of tempestuous weather : they have too much at stake to endure it without certain misgivings. That the present investigations may lead to a permanent cure may be devoutly hoped.

REBUILDING THE PEOPLE'S PALACE

It is good to know that the Charity Commissioners are to hold a public inquiry into the question of the rebuilding of the People's Palace, Mile End Road, which was partially destroyed by fire. There has not seemed to be any proper justification in keeping the place closed for so long to the people for whom it was originally built; and the inquiry is long overdue.

ASTRAGAL

DEPTFORD OLD TOWN LIBRARY

DESIGNED BY A. W. S. AND K. M. B. CROSS

The main entrance front to Clyde Street, which is adorned with cherubs' heads carved in Portland stone; and a nearer view of the doorway. This is treated as a separate feature, and has a copper-covered cupola and bronze finial.

THE main walls to the front elevation of this building are faced with multicoloured bricks, obtained from various sources, and the roof to the front block is covered with Lombardic tiles. Portland stone is used for the construction of the main cornice, window dressings and sills, and a Portland stone plinth carries the base of the front wall.

The foundation stone is laid under the central window, and two circular medallions in Portland stone are carved in the form of cherubs' heads to symbolize a prominent department of the library: that devoted to children.

The principal entrance to the building is treated as a separate feature in the design, and additional emphasis is obtained by a copper-covered cupola and bronze finial. The panelled entrance doors are of teak, with bronze door furniture.

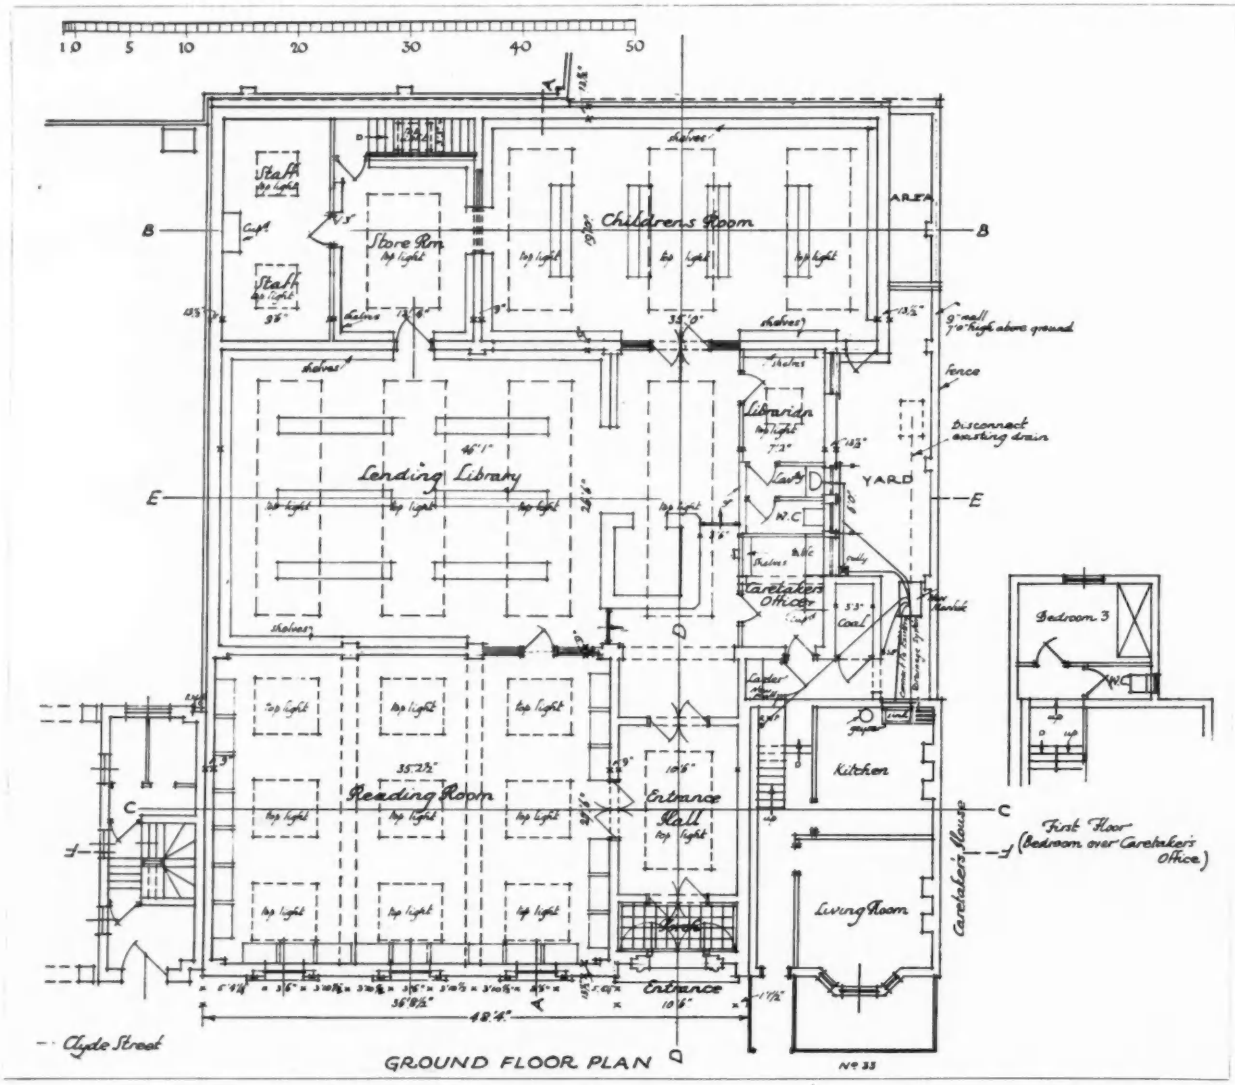
Internally, the entrance hall is reached through a small marble-paved lobby, and from the hall access is obtained to the reading-room and to the lending library.

In the reading-room natural illumination from ceiling lights is employed, supplemented by windows overlooking Clyde Street. Reading desks for newspapers are fitted around three walls, and tables and chairs occupy the central floor space, while a magazine rack is fitted in one corner of the room. All the fittings and the internal doors are in plain waxed oak.

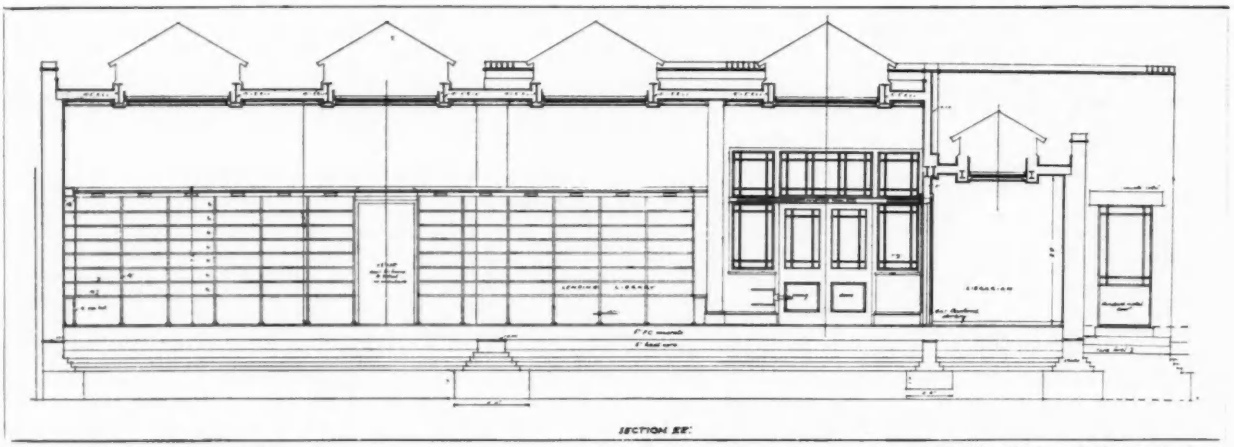
The lending library is reached through a small wicket control gate, which adjoins the issuing counter, and the walls are lined with oak book stacks, six independent stacks being arranged in the central floor space. Here, also, top lighting is employed and an even distribution of light is obtained over the room. The floors to all public rooms are of patent wood blocks, specially treated.

Adjoining the lending library are the librarian's room and the caretaker's office.

The approach to the top-lighted children's room is also controlled by the same wicket gate which serves



The ground plan reveals at a glance a layout conspicuous for its convenience and comfort. The arrangement of the public rooms is such as to ensure ease of working and supervision; and they are all top-lit. In a small basement under the children's and store rooms is further storage space, with a lavatory. Some of the caretaker's living-rooms are in the existing adjoining house on the right.



Deptford Old Town Library, S.E.] [*By A. W. S. and K. M. B. Cross.*

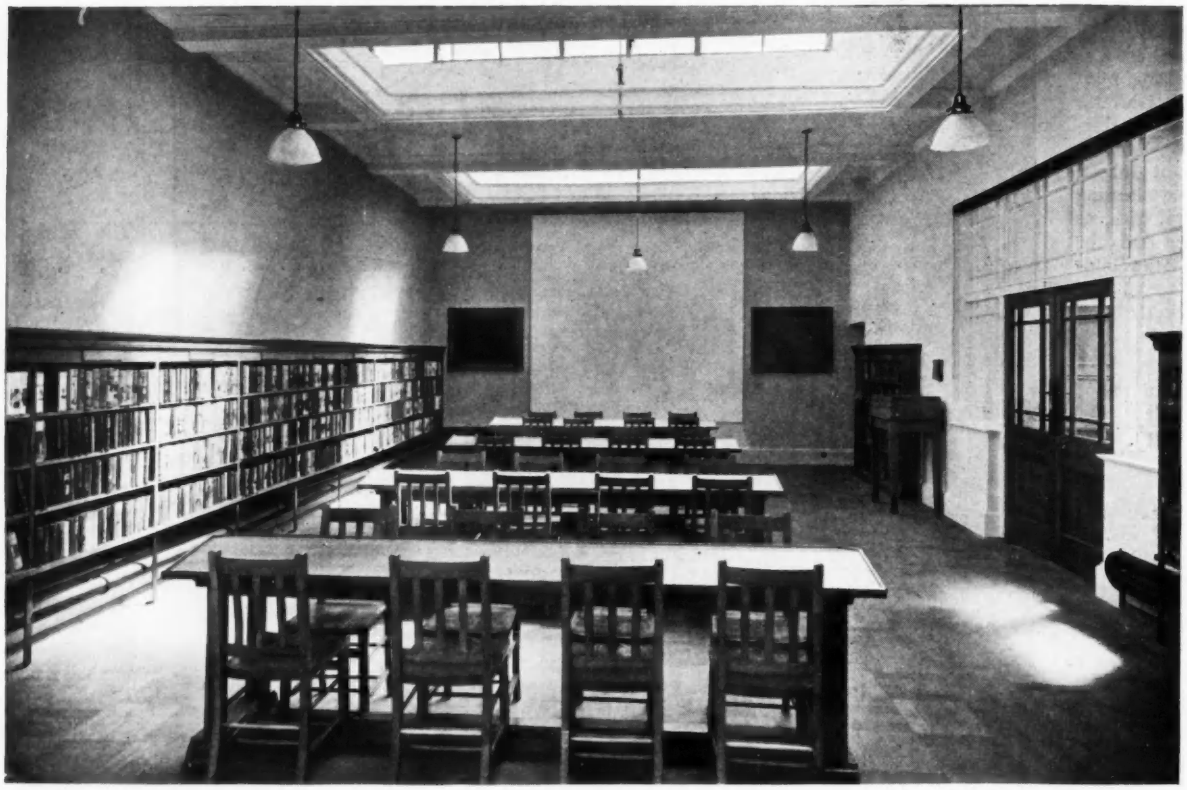
A longitudinal section through the lending library, on the line E-E of above plan. The walls of this room are lined with book stacks, and six more independent stacks stand in the floor space. A photograph of the lending library and detail drawings of some of the library fittings and furniture, there and elsewhere, designed throughout in oak, appear in a supplement accompanying this issue.

A view in the entrance hall, which is approached from the street through a small marble-paved lobby. Straight ahead is the lending library, with, at its far end, the door to the children's room. The newspaper room is on the left. The building being mainly of one story, top lighting is generally employed.

[*Deptford Old Town Library, S.E.*]

[*By A. W. S. and K. M. B. Cross.*]

The newspaper room is equipped, like the other public rooms, with library fittings specially designed in oak, with a plain waxed finish, by the architects. Three of the walls carry sloping reading desks, and double sloping tables are arranged on the floor. Entrance from the hall is on the right; to the lending library itself, on the left.



Deptford Old Town Library, S.E.] [*By A. W. S. and K. M. B. Cross.*

The children's room, entrance to which is through the lending library, indicated on the right, under control of a wicket. The walls are fitted with dwarf shelves, and a lantern picture screen has been provided on the farther wall.

the lending library, and here miniature wall shelving is fitted along four walls and reading tables again occupy the central space.

Store and staff rooms are also provided, and there is additional storage accommodation in the basement. The existing house adjoining the new building has been repaired and redecorated, and, after the addition of a new bedroom and offices, now forms the caretaker's residence.

QUESTIONS THAT ARISE

Canadian Timbers

B. G. writes : "*Observing the interesting data recently given in your Journal with regard to Empire timbers, I should be glad of information as to whether Canadian soft woods can maintain their commercial position in this country, so that an architect can specify this timber without asking his client to pay an excess cost over other wood of a similar nature and quality.*"

Besides the exports to the Empire, Canada supplies the United States with over one thousand million cubic feet annually. The Canadian Forestry Department have reported that easily accessible timber is being rapidly depleted, and that increased transport costs from further inland forests may eventually raise the prices.

Although there is enough timber in Canada to meet all demands for many years, any increase in cost will naturally go against the commercial use of Canadian wood in England unless the price of European supplies rises proportionately, either through stringency of supply or by means of a preferential Empire Tariff. J. B.

Correct Template

B. and S. write : "*A difficulty has arisen over the liability for making a correct template for some special hip tiles required for a square bay-window roof. The roof is a very steep one, and several attempts have been made to obtain the correct angle tiles. The general contractor for the building gave the angle to the tilemakers in the first instance ; when the tiles arrived on the site, however, they were found to be the wrong shape and pitch. The tile makers then sent their works joiner to prepare a template, but when the tiles arrived on the site they were again found wrong. Lastly, the tiler, who is a sub-contractor to the general contractor, was instructed to meet the tile maker's joiner on the site and make a proper wooden template. The tiles are now correct, except for some of the wings which have curled up. We should like to know who is responsible for the making of a correct template (wooden) ?*"

There appear to be three people concerned—the general contractor, the tile maker, and the tiler. The latter can presumably be dismissed, as an employee of the contractor. I should say that responsibility for obtaining hip tiles suitable to their position rested with the general contractor, and if the pitch of the lay were exceptional to the point of needing specially-made hip tiles, he should have drawn the tile maker's attention to that point when ordering, and requested them to prepare and offer up templates. If, after this precaution, tiles did not fit, responsibility would rest with the tilemakers. In the circumstances related, it rather appears that the actual fault was with the tilemakers, at any rate, after their own employee had failed to make a serviceable fitting after visiting the site.

It is inferred from the statement of circumstances that the endeavour has been made to procure an exact angular intersecting hip tile. This is always difficult, and results are usually unsatisfactory, owing to irregularities produced by firing. The old men knew what they were about when they adopted the cone and "granny bonnet" forms, which are adaptable without exact fit, and permit considerable variation in shape without disclosing a "botch." E. G.

A NEW MULTIPLE SHOP AT COVENTRY

DESIGNED BY PERCY BARTLETT

THIS building has recently been completed for Messrs. Boots, the chemists. The horizontality of the elevational treatment has actually been determined by the chief requirements of the proprietors' business, which calls for display cases 8 ft. high around the walls. Apart from the loss of space that would have been entailed by the use of vertical windows, these would have admitted strong daylight, which has a most unpleasant effect when contrasted with the artificial light intended to be used for the illumination of the wall cases. The obvious place for the windows, both for light and ventilation purposes, was therefore at the top; and the horizontal treatment naturally followed.

A retail shop should, from the trader's view-point, be as attractive during the dark evenings of winter as in the daylight, and this consideration, too, has had a considerable effect on the design. Seen from without, the horizontal lines are thrown up at night by the self-illuminated windows, by the fascia of white alabaster glass, which may be floodlighted, and by the horizontal lines of red neon lights, in units of three, which occur on the front. A line of similar green light, fitted into a groove in the bronze cornice over the shopfronts, also maintains the general lines. The light tower is frankly a night advertisement, intended to draw attention to the position and nature of the shop, without having recourse to the usual signs.

The external materials are brindled bricks, with wide stone-colour joints. The shopfronts, of black and white alabaster glass, can be as readily cleaned as the windows. The plinths and columns to the entrance are in Bon Accord (black) granite. The shopfront sashes, blind rails and doors are of bronze metal, as is the sheathing to the reinforced concrete cornice overhead.

The interior shopfittings are carried out on the ground and first floors in Tasmanian oak, with Zebrano enrichments, the floors being of ceramic mosaic, laid in a design of lines and bands. The second-floor showroom fittings are painted blue-green, with rubber composition flooring of geometric design.

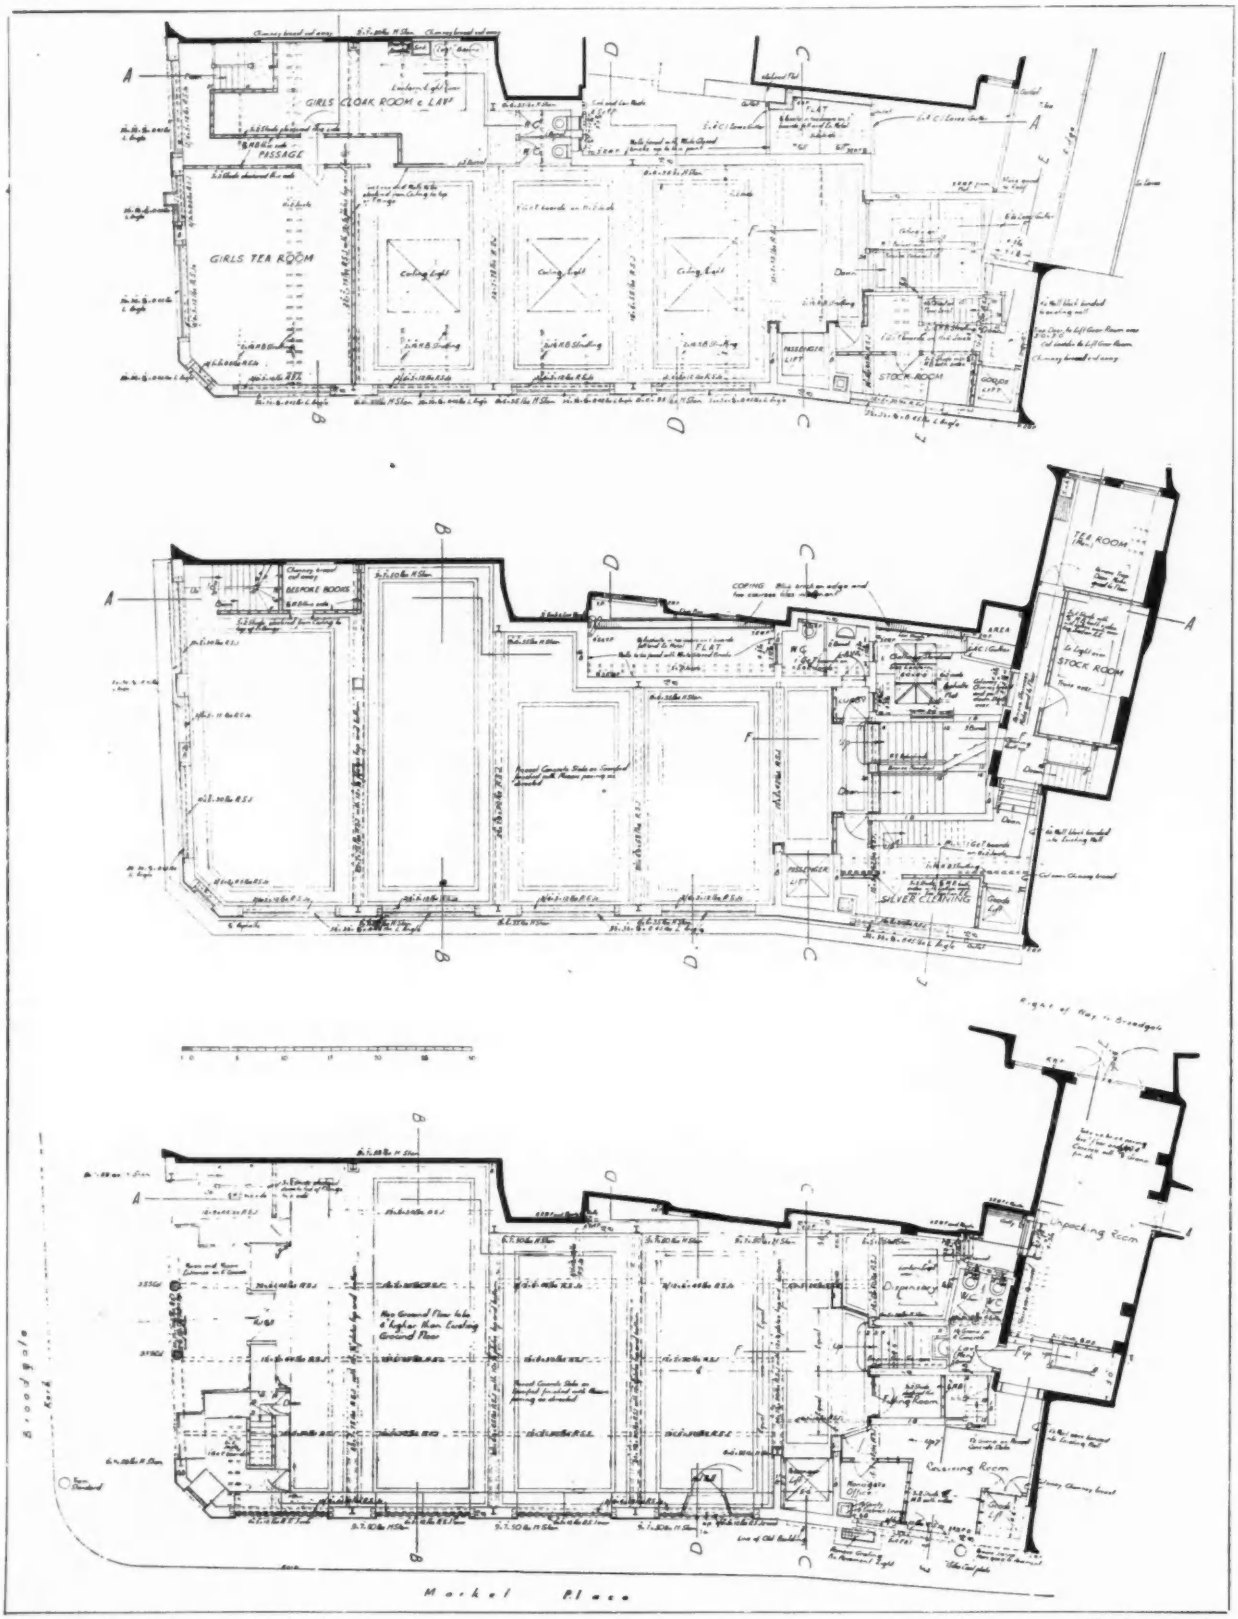
The decorations of the showrooms are carried out in sprayed lacquer paint, in which silver and green predominate on the ground floor, pink and gold on the first floor, and on the second floor ivory and silver.

The stairs have black alabaster glass dadoes, with stainless steel ribbon balustrading.

As will be seen from the plans reproduced on the following page, the ground and first floors provide spacious showrooms, with a small dispensary. More shop space and commodious staff rooms are planned on the second floor, while there are additional unpacking, goods-receiving and stock rooms in the basement.

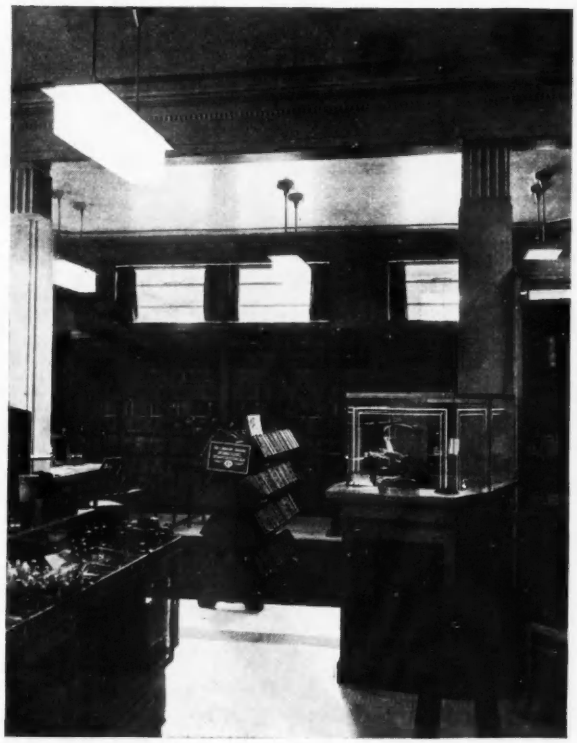
The heating is of the ceiling panel type, and this, with the omission of obstructive stanchions or columns inside the showrooms, allows, without expense, of any rearrangement of the shopfittings which may at any later time be desired.

Two views of the exterior, which has a frontage to Broadgate and a return to Market Place. The horizontality of the design was the logical outcome of considerations of lighting as affected by the desired disposition of shop cases around the internal walls.



Boots Shop, Coventry.] [*By Percy Bartlett.*

Plans of the ground, first and second floors. The main entrance is from Broadgate, and a subsidiary one, with lift adjoining, from Market Place. At this inner end of the shop is the dispensary, close by the main staircase, leading up to showrooms on the first and on the second floors, where there are also commodious rooms for the staff. In the basement further stock space is provided.



Boots Shop, Coventry.]
A view in the showroom, showing some of the wall book cases on the ground floor, eight feet in height.

[*By Percy Bartlett.*
The first-floor landing of the black glass and stainless steel staircase. The door leads to lobby and lavatory.

LETTERS FROM READERS

Art and Industry

SIR,—Your readers will doubtless have remarked the formation of a Board of Trade Committee under the chairmanship of Lord Gorell, to deal with the relationship between art and industry, and in particular the possibility of stimulating industrial design by means of permanent or temporary exhibitions. There has been some criticism in the Press, both as to the terms of reference and the constitution of the Committee, and though personally I should like to have seen the business element with a stronger representation, nevertheless, I feel we should be very ungrateful if we looked such an unexpected gift horse too carefully in the mouth.

The case for the designer has been advocated so frequently in your columns and in those of your architectural contemporaries, that it is only natural that architecture should be represented on the Committee by Mr. Clough Williams-Ellis, President of the D.I.A. Nevertheless, I think the architectural profession as a whole might well give serious thought to the subject, and if possible, obtain the opportunity of putting its views before the Committee. No one has more frequent experience of the effect of good and bad design in everyday life than the architect, and none is engaged in so constant a struggle for common sense, let alone beauty, in the design of our surroundings. Well-designed simple furniture and fittings are still hard to get, and often too expensive, paradoxical though it sounds. Nor will they become readily available to the architect, until they are in popular demand.

It is common knowledge that architects were at the back of the many simple excellently-planned things we saw at Stockholm. We have the talent to do the same thing here, and on an infinitely larger scale. What prevents us planning an International Exhibition in London for three or five years hence, the aim of which will be Design in Civilization? Would it not prove a better stimulus to trade than tariff conferences, or nationalist propaganda? Would it not give the younger generation courage and hope after our present long depression? The architects, whose prosperity is linked with that of the industrial community, are the key men of the new civilization, the dawn of which is undoubtedly breaking. Here, so it seems to me, is an opportunity for the profession to show the way. For any great exhibition the house will be the central unit.

I am aware that a large exhibition means years of preparation and great initial expense. I am aware that our manufacturers are not for the most part ready for it. But temporary and preparatory exhibitions are not out of the question, and with the greater aim in view would commend themselves more readily to the trading community. What is needed is a plan, an objective to work for. NOEL CARRINGTON

A Promenade Theatre

SIR,—A night or two since, being work-bound in London, and weary of it, I had the idea of exchanging, for an hour of relaxation, "frozen music" for the molten variety. I went to "the Proms."

This year, more forcibly than ever, the crowded state of the stalls floor at Queen's Hall recalled that the designation "Promenade" for these popular concerts is one of courtesy only. The condition down there was that proverbial of sardines in the tin. I should have liked to be free to stroll about between times, but decided to take a seat upstairs, where I could at least smoke a cigar without the risk of the ash being knocked into my eye by the elbows of propinquitous sardines.

And, as I puffed at it, I reflected that London has need of a concert hall large enough for promenading to be practicable. It is true that the experiment was tried at the Albert Hall a few years ago; but that is too vast.

The season of Promenade Concerts

only lasts for a couple of months in the year, but why should not the said house be built to be capable of alternative use as a variety theatre, also for a promenading audience ?

AMBULATOR

"Modernist" Architecture

SIR,—Mr. Baillie Scott's analogy between false teeth and "modernist" architecture is entirely superficial. He should know that the endeavour of architects described (for the want of a better word, I suppose) as "modernists" is to avoid falsities of any kind. To my mind, and to the mind of any one who has thought seriously on the evolution of architecture, nothing can be a worse falsity than the reproduction of historical forms which have lost the purpose and significance which gave them sincerity.

JAMES BURFORD

Cavity Walls

SIR,—Your correspondent, W. Beeston, mentioned in your issue for August 12 a very abnormal case of weather penetration to cavity walling. By quoting the severe percolation by way of the chimneys, the case points to either faulty construction or the erection of the house in an extremely exposed position where further precautions against the weather were necessary.

After all, nobody would build hollow walling in a weather beaten part of the country of a similar character to Dartmoor.

Hollow walling has proved to be a sound form of construction, although where inadequate attention has been given to the proper method of construction failures, which are then to be expected, have arisen.

A certain amount of moisture no doubt penetrates the cavity, but unless a very soft brick is used, it should not form a tank for the accumulation of water.

I assume that your correspondent suggests building the two 4½ in. thicknesses direct upon the concrete foundation without any thicknessing at the base, and with that object, suggests taking the walling down further to avoid rising water in the cavity.

Built in the proper manner, there should be no gathering of water in the cavity, and I suggest that the most practical method of construction is to build the base of the wall solid.

This can be accomplished in the cheapest manner by building the two 4½ in. thicknesses of brickwork directly upon the concrete foundation and filling the cavity with fine concrete to a height of 6 ins. below the damp proof course. This method I observed was mentioned in an answer to a query in the JOURNAL some weeks ago.

If there is a fear of accumulation of moisture in the base of the cavity, it is a simple method to leave a number of open joints in the brickwork, below the damp course, as an exit for this.

A considerable amount of correspondence has arisen in the past as to the value of this type of construction; for domestic work I have found the hollow wall a satisfactory method, and cannot understand the reason why a number of clients, laymen to construction, suggest that they prefer solid walling, because practical men with a certain prejudice against its use have informed them of imaginary disadvantages.

G. E. D.

The Pedestal Basin

SIR,—We have read with interest your reader's comments on the pedestal lavatory basin which he had recently installed.

This is quite a common complaint, and we give below our own views, based on our experience.

It is interesting to note, however, that only last week we inspected the drawings for a provisional patent which has been taken out for a special design pedestal, which would appear to solve the problem definitely, and at the same time give the plumber the minimum trouble. This arrangement is not yet on the market, but it will be available before long.

(A) We consider that with ordinary pedestals as now produced, whilst it is difficult for the plumber to thread the supply pipes through, it is not impossible.

(B) Having gone to the trouble of threading them through, we would always feel uneasy as to what would happen if there was a slight leak on any coupling union or in any part of the pipe, as it would be such a difficult matter to remove the pedestal for inspection.

(C) We have seen quite attractive jobs completed where the plumber has carefully "run" his supply pipes up to the taps: he has branched them into the main pipe, running probably close to the floor on the skirting board, and he has put the two branches in close together right behind the pedestal. He has been careful to bend the pipes so that they are nicely concealed behind the shape of the basin, and they are then invisible.

(D) We agree it may not be possible to do this with every type of pedestal: these are by no means standardized, but most of them give sufficient room between the back of the base and the skirting to allow the pipes to be passed.

J. H. LEYLAND
(ROWE BROS. & CO., LTD.)

SIR,—The service pipes referred to in your correspondent's letter may have existed above the floor, and the branches to the basin would then be visible.

On the other hand, the pedestal may have been constructed with a solid base. Speaking generally, however, the majority of British manufacturers construct their pedestals with an opening in the base and a slot in the back, which gives plenty of freedom and space for the carrying of the service pipes and also the waste pipe inside the pedestal. As a matter of fact, a large number of pedestal basins are constructed with this object in view, and this company is constantly supplying pedestal lavatory basins which are so installed.

To carry the services in this manner, inside the pedestal, of course involves a certain amount of scheming and extra work by the plumber, and we can quite understand that in contract work, where the prices are, perhaps, rather cut for plumbing, the plumber takes the line of least resistance and carries out the job in the easier way.

J. R. VENNING
(GOVERNING DIRECTOR,
JOHN R. VENNING & CO., LTD.)

SIR,—We were most interested in your correspondent's letter, and sympathize with his disappointments in connection with the supply and waste connections to his pedestal lavatory basin.

The problem he speaks of is one, perhaps, more for the plumber than for the manufacturer. The waste pipe from the basin can quite simply be brought down through the pedestal, given an up-to-date design. It is, however, generally the practice to pass this waste pipe direct through the back wall, in which case the trap is concealed in the pedestal and the pipe is also almost hidden by it.

The supply pipes to the taps are a rather more difficult problem. It may not always be practicable, or perhaps we should rather say convenient, to bring these pipes through the pedestal, although it may be made to take them, as the modern fireclay pedestals are. The pipes must be brought through the floor directly under the pedestal, so that the plumber should have very early notice of the type of basin to be installed and full details of the pedestal itself.

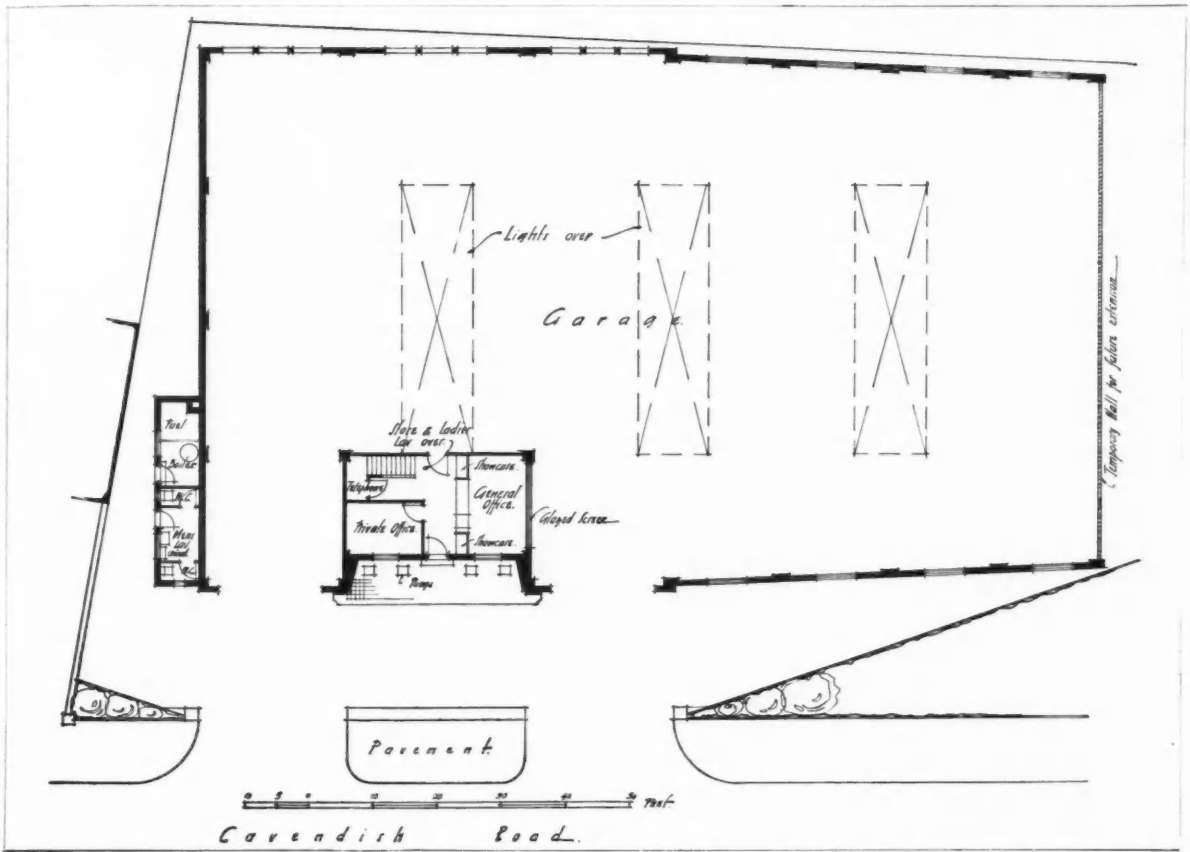
The pipes so placed, however, are rather inaccessible, which may be considered an objection. It is quite possible, even if the pipes do not pass through the pedestal, to place them right behind it so that they are out of sight, and no plumber who took a pride in his work would permit them to "curl." They can be run up the wall within a few inches of each other perfectly straight, and right behind the pedestal a sharp bend can be made close under the basin to the taps on either side, and all can be placed so as to be practically out of sight.

ADAMSEZ, LTD.

GARAGE IN CAVENDISH ROAD, BRONDESBURY, N.

DESIGNED BY G. ALAN FORTESCUE

The walls are built of bricks, finished with white Portland cement, with the exception of the recess, which is executed in hand-made, multi-coloured bricks. The building is roofed with Marseilles tiles with the eaves projecting 18 inches; and the windows are of steel, built into wood frames. The canopy is of wood, covered with lead, and has a recessed light in the soffit.



The garage provides accommodation for sixty cars, and has an entrance on either side of the office quarters. The whole of the exterior woodwork is painted emerald green, and the pumps have been rendered in the same colour to match. The first floor comprises ladies' cloakrooms and storerooms. A temporary wall has been erected at one end of the garage, for future extension.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xiv

A DISASTER

BY KARSHISH

(H. B. CRESWELL)

ENOUGH has been said of the conditions of my employment and of the people I had to deal with at Albion Works; and I will cut the cackle and get to the hosses.

I was now set up with an office comprising rooms for myself, my general clerks and my draughtsmen; adjoining a building yard which comprised a joiner's shop of four benches, fitted with power-driven circular saw, routing, planing and mortising machines, and also comprising various subsidiary shops and stores for dealing with the jobbing and minor works carried out by my foreman of works, Dan Piggott. I was equipped further with a quantities, secretarial, and boy clerks, and as many as five draughtsmen, with whom to keep Piggott going, deal with the considerable inter-departmental correspondence and the innumerable reports and proposals which I laid before the Board of the Company's Directors every fortnight, and to conduct, as architect, the preparation of contracts, and their direction and supervision. I soon organized a routine which left me free to bestow most of my time that was not taken up in conferring with Mr. Stevenson and heads of departments on these last important duties; and employed the admirable system of the Office of Works with great advantage to this end, though the tenacity of purpose demanded was considerable. "Piggott's Hatch" affords a good example of this.

My office was built up against the joiner's shop, at the end of which I had screened off a private bin for Piggott. Afterwards, I put a hatch opening from this bin into my general clerks' office, so that papers could be passed through and communications held without its becoming necessary for Piggott to invade my office or for my clerks to dodge round into his yard. As I found that Piggott talked to my clerks through the hatch and was beginning to give them orders, I screwed up the hatch and put a slot, for passing papers, in the bottom of the panel. This, however, prevented my clerks from knowing when Piggott was "at home" when I wanted him—for he was much about the works; so my next step was to glaze the upper part of the panel. When it was glazed Piggott was, of course, able to overlook my outer office, and me—when I was in it; and he could also observe who my callers were, put two and one-and-half together, make fourteen of it and, with the total, enrich the cloud of poisoned gossip that enveloped the place like a bad smell. I also so loathed the sight of the man that the view of his profile through the glass, aloof yet observant, like a rook on a fence, was more than I could stand. I, therefore, had the glass stippled so that, though his shadow revealed his presence, he could not see us; and I finally finished cooking his goose by fixing a second glazed frame over the first so that he could not overhear, either.

The first building for which I was responsible as architect, at a time when prices were scarcely one-third of what they are now, cost £27,400. This work was the extension of the machine shop of which I have already spoken. It was carried out under three contracts—I. Digging and Foundations; II. Supply of Steelwork; III. Superstructure—which included erection of the steel work. The object of this was to save time, since the first contract could be put in hand before the others were let and while the second was being completed.

It will be observed that the two chief contracts were the first and the third—for the second concerned only the preparation of material; and both these contracts involved me in disasters which, for a year or more, so embittered my life that, when I passed the works in the train as I frequently had occasion to do, I well remember that I turned away my head or shut my eyes to escape the sickness of mind which the sight of them provoked. Although these disasters would not have happened if I had been then equipped as I am now; they were, nevertheless, not due to actual neglect or to any blameworthy oversights on my part, but arose partly from the conditions under which I worked, and partly from a most unlucky conjunction of circumstances which, in one case, landed the Eureka Plough Company in a Court of Arbitration, and in the other put them in difficulties which would certainly have involved them in litigation if I had not intervened and saved the situation, and which did, in fact, involve them, indirectly, in great losses. The story I have to tell is chiefly of interest as an example of the catastrophes which lie in wait for the most devoted architect.

The Albion Works fronted the railway with a formidable parade, in alleged architecture, of great detached buildings filled with forests of steel stanchions carrying traveller-girders from back to front, and "weaver roofing" from side to side. The work involved joining up the machine shop with the blocks on either side of it, and extending the "bays"—as the alleys between rows of stanchions were called—far to the rear. The grazing land at the rear lay at such a slope as made it necessary to excavate for levels to a mean depth of about five feet over an area of about 9,000 square yards. This, with the digging and concreting to foundations, was the work included in Contract I.

The following circumstance must be observed. Piggott, under my directions, re-erected the unclimbable iron fence which enclosed the works, to a position beyond the site of the new building; and the contract stipulated, first, that the contractor should instal and maintain, for his carting, a temporary road from a gate in this fence to the public road; second, that he should also include for such tracks inside the fence as he would from time to time have need of. The tender form, further, included a declaration that the person tendering had examined the site, so that this matter of the provision of tracks will appear to have been clearly set forth; at any rate I do not to this day know how it could have been made more clear.

Six or seven firms, of whom I necessarily knew nothing, were invited to tender, and a certain contractor who had previously done work on the place under the displaced architect, Billington, was successful. Mr. Andrew Gorringe was well equipped to offer a low price; for he specialized in carting, road-making and kindred works, and had, as I was to learn, particular ways of making such work pay. He was a rough-looking, touzled, moth-eaten, grey-bearded man of sixty; and when he came to sign the contract and told me—by way of preparing his ground—that he had never tried harder to get a contract, he seemed to me, though repulsive, a hearty, worthy fellow; but, later, he impressed me as looking more like the sort of thing one finds in a bad nut. He was, however, as I learned, a very religious man—a conspicuous member of a special distillation from Nonconformity, which lived publicly in the odour of its own sanctity, rejoiced in its salvation, and let its light shine before men; and when Mr. Andrew Gorringe gave five hundred buns to a school treat, the event was announced by a special paragraph in the local paper so that men should know his good works. This, then, was the man; and, though I found little good in him myself, it is right that I should do justice to the esteem in which he was held by others. I will not say he was a dishonest man: he was no

doubt honest according to his principles, but his principles were not my principles.

Directly the contract was signed he began pressing me to allow him various concessions; but I perceived—as I now well know—that even a small concession may undermine a contract by weakening a radical principle of it; and that an architect may find himself unable to uphold a stipulation of the contract in a material matter, because he has not interpreted it rigorously in a trivial one. I did not make this mistake, although I conceded all that the vital need for maintaining the company's output allowed; but when I found that Gorringe made every inch of ground he won, foothold for a new advance, I got tired of his wheedling and his strainings to warp the interpretation of the contract to his advantage. With the experience I now have, I should yield nothing to such a man, but grip him as one overpowers a monkey, and push his nose down into his job; for his only ambition was to give as little and gain as much as he could, and as long as he thought he could better himself by any other methods than by tackling the work energetically and finishing it, he would use them.

Another mistake I made was in repulsing him with a too stiff display of authority. Once or twice I even addressed him peremptorily in letters as "Sir," instead of as "Dear Sir." This, of course, was the result of the great effort I had made to assert myself: it was a mark of weakness, for if I had had confidence I should have been cool, and not emphatic. Self-control is so much the source of power—being, in fact, the result of power—that it is essential to power. As a result, I awoke Gorringe's hostility; we grew to dislike one another, and our relations became strained. For this, however, there was soon another good reason, for, after he had been at work a few weeks, it was apparent he was behind his contract time—which was five months: in two months he was only about quarter through and his rate of progress, in spite of incessant urgings, was slower than ever; and it speedily became clear that he would never overtake the time he had lost and that he was likely to be two-and-a-half or three months late. It was of enormous importance that the new shop should be available at an early date, to enable the company to take advantage of the increasing demands for their manufactures; and, as things went on from bad to worse, the concern of the directors grew into consternation.

I now learnt a fact that astonished me; and, as I have never since had cause to be reminded of it, that astonishment may be shared by others.

The usual penalty by way of agreed and liquidated damages for each week or part of a week during which the completion of the contract should be in arrears was rather a heavy one—as befitted the circumstances; though it bore no sort of relation to the loss that would result to the company from that delay. The contractor contended that the continual rain prevented him from getting on faster, and that the time he had lost was no more than the bad-weather allowance he was entitled to under the terms of the contract. The ground was clay; the struggles of his horses—with even two tracers—to drag the carts up from the site, were dreadful to watch; and conditions at the tip—where they were sometimes mired and one was lost—were, I was told, even worse. *My* contention was that the contractor had engaged to do the work in the autumn and winter; that the amount of rain was not abnormal for that season; and that the difficulties in hauling could be overcome by maintaining adequate tracks. The truth of the matter was that a larger number of horses or better tracks would have cost more than delaying the work till dry weather came; and that the contractor was merely making a show of working, until those improved conditions arose.

Now comes the point I have referred to. The directors decided that some decisive action must be taken, and I was asked, at a board meeting, what I proposed. I replied that the contractor could not possibly complete his contract; was not making any serious attempt to do so; had not responded to letters formally calling upon him to perform his undertaking; and that the company was empowered, under the terms of the contract, to enter on the works and employ someone else to complete. In this I found I was entirely wrong. Hart shook his head; and a telegram was sent to the company's solicitor, who came down next day, and, in an interview with the chairman, Hart and myself, gave an unhesitating opinion that to take the step I had recommended would be *ultra vires*, and that the company had no power to break the contract. In reply to my objection that it appeared Gorringe was making no attempt to complete, I was told that he might conceivably, by some possible means, still contrive to do so.

"Do you mean that we shall have to wait until after the expiration of the contract date before we can do anything?"

"Yes, quite," he said. "And you cannot do anything then. The contractor is liable, under the penalty clause, in damages for delay; but you cannot break his contract."

"Do you mean that we could not put someone else in to complete even if the contractor delayed completion indefinitely?" I persisted.

"That is so, yes: unless he stopped work altogether and ignored the formal order to proceed," said the solicitor, looking, as I thought, a little bothered and even ashamed of the law he was expounding. "Under this contract you have no remedy for delay except in penalties as fixed and limited by the contract. Yes."

"So that we should be in a better position if there was no penalty clause at all?"

"Well—yes. That is so—if you could find any contractor to execute such a contract, that is. Certainly, yes."

I thereafter learnt that owing to the necessity for time allowance for bad weather, strikes, alterations, etc., it is not possible—strictly speaking—*to make time the essence of a building contract*. All that can be readily done to that end is to divide the work up into sections, or parts; to fix a date for completion of each part separately—such dates to be put forward by prescribed formalities which are, in effect, endorsements on his contract, whenever circumstances arise that entitle the contractor to an extension of time; and to balance the penalty for delay by a bonus for anticipating the dates so fixed. As a matter of practice, however, this procedure is so unmanageable, and depends for successful working so greatly upon such *bona-fide* good intentions on the part of the contractor as would make it unnecessary, that very few architects have experience of it.

The directors of the Eureka Plough Company, however, found themselves so completely at the mercy of their contractor that they, in part, made use of this procedure, and offered him a bonus to relinquish some of his contract and complete the rest six weeks later than he had contracted to finish the whole. These arrangements were made at a board meeting which welcomed Mr. Gorringe with the effect of a session of the Zoological Society honouring a very rare and highly-valued gorilla; and it was then settled that the agreement should be recorded in a letter to be drafted by the chairman, to the contractor's approval. Accordingly, next day, after long chaffering, in which Mr. Stevenson was solicitous and accommodating and Mr. Gorringe surly and suspicious, a draft acceptable to Mr. Gorringe was at last completed and dictated to a shorthand clerk, since no one but its author could decipher the blotted sheet. Before this was accomplished I had the small triumph of catching Mr. Andrew Gorringe out and, for that occasion at least, saving the company's bacon.

The part of the work Gorringe relinquished left two other parts, each

of which was given its separate date for completion and its applicable rates of bonus and penalty; and the need of the company for speed was so desperate that the weekly bonuses were made four times the amount of the weekly penalties. I took no part in the wording of the letter, but merely sat by to confirm, or negative, points of fact. When, however, all was settled, I pointed out to Mr. Stevenson that his letter left it open for the contractor entirely to neglect one part while he concentrated on earning a big bonus on the other. This would have stultified the whole purpose of the company's liberality, and would have been treacherously false to the spirit of the agreement.

"Oh—er—ahem—but Mr. Gorringe would not do *that!*" Mr. Stevenson said, looking at his contractor. That good fellow quickly squinted down his nose, embarrassed, not by my poor opinion of him, but by Mr. Stevenson's good one. He paused a moment, pulling his fingers, before he grumbled:

"Don't see why I shouldn't."

This, as I had suspected, was what he had had in view while the draft was being settled; and it was probably in bitterness at my interference that he shortly after, in reference to previous history, snarled at me across the table with blazing eyes—"Not after that dirty trick he played me."

He no doubt said this to discredit me with Mr. Stevenson, for I certainly had played him no trick, dirty or otherwise, and he had never before challenged me; but I was so deeply concerned to get things straightened out that I had no impulse to protest. I merely looked straight at the man—and without any expression either of surprise or annoyance in my face, as I was made aware by the circumstance that, while I looked, I knew Mr. Stevenson to be closely studying me, which led me to take stock of what there was for him to see. He steadily gazed into my face for at least four seconds—partly perhaps in expectation of my reply—before he remembered himself with a start:—

"Er—ahem—well—er—then, if you agree, Mr. Gorringe, I would suggest—" he began, and he returned to the point under discussion.

I can remember the glow of exultation of that moment. I knew, in spite of the horrible mess we were in, that I had Mr. Stevenson's perfect confidence—not indeed as an architect, but as a man. It was a first triumph after months of discouragement, and I warmed to him from that day. Looking back, I realize that my demeanour must have carried conviction to one of Mr. Stevenson's experience in affairs; for if I had been in the least degree conscious of guilt I should certainly have protested against the aspersion, demanded an explanation, or sought to justify myself.

Unfortunately, I missed another catch Gorringe offered in this little game of his, that was not cricket; and, in the end, our side lost the match in consequence. It was a difficult catch—a late snick into the slips at the moment stumps were to be drawn.

The typed letter had been brought in, and was read out by Mr. Stevenson, and then read to himself by Gorringe who, because it was exactly what he might do himself, suspected that his opponent was garbling what he read. He then raised a new objection.

"But the letter has no such significance as you suppose, Mr. Gorringe," Mr. Stevenson protested. Gorringe was, however, not satisfied.

"Ahem—well, that is easily made clear," said Mr. Stevenson. He proposed a form of a dozen words which Gorringe accepted, and wrote at the foot of the letter—"N.B. It is not intended that"—so and so; I forget what the point was, but I saw that the words cast an ambiguity upon another part of the letter. I could not, at the moment, however, perceive where the confusion lay with sufficient clearness to state my objection; and I hesitated to start the wrangle all over again and knock down what had been so carefully built up. Mr. Stevenson wrote in copying ink; signed; carefully blotted the sticky ink; sent the letter to be press-copied and put in an envelope; and handed it, with a great display of cordiality, to Andrew, who went off to praise the Almighty for his manifold mercies and make the sacrifice of buns already mentioned.

Months later, when the evidential papers were filed, our solicitor said to me—pointing to the place where Mr. Stevenson had so nicely blotted the sheet that the flimsy could not take the words—

"It looks as if something had been written here!"

I had by that time forgotten the circumstances and could not warn him, and we went to the Reference depending on a point which opposing Counsel—with the original letter before him—was able to demolish by the humiliating evidence of our chairman's own hand. Thus it often happens in life. The trivial circumstance of the blotting of the sheet and of its press-copying out of routine by an irresponsible clerk, was material in dishing the company to the tune of two thousand pounds.

I am not going to give the history of this arbitration; but the circumstances that led to it are well worth recounting, for they are unique in my professional experience and display, in a remarkable way, the pitfalls that beset the architect, and the devices by which a dishonest purpose can profit by law to the confusion of justice.

NEXT WEEK: THE LAW'S MAJESTY

The previous instalments appeared as follows:

May 27.	i:	I am Articled.
June 3.	ii:	Episodes of Pupilage.
June 10.	iii:	Episodes of Growth.
June 17.	iv:	My First Job: The Sewer.
June 24.	v:	My First Job: The "Pipes."
July 1.	vi:	I Turn Clerk of Works.
July 8.	vii:	Bradshaw & Son: Builders.
July 15.	viii:	Joe Richards: Foreman.
July 22.	ix:	Trials of a Clerk of Works.
July 29.	x:	A New Venture.
Aug. 5.	xi:	The Resident Architect.
Aug. 12.	xii:	An Architect's Early Gruel.
Aug. 19.	xiii:	An Uphill Fight.

LITERATURE

TWO WREN SOCIETY VOLUMES

IF any justification for the existence of the Wren Society be needed, it will be found abundantly in its last two volumes, the seventh and eighth of the series. These have been issued within a short time of each other and can conveniently be reviewed together, especially as they both deal with Wren's work at the royal palaces.

The value of any organization such as the Wren Society is threefold: it assists scholars directly by the publication of material not easily available, it provides a "clearing house" for any information on the subject that may come to light, and it makes possible the tracing of material that is known to have existed, but which has been lost. It is this last function that has proved so valuable in these two books, as its activities have resulted in the finding, at All Souls College, Oxford, of a fifth volume of Wren's drawings, which had been completely lost sight of. This contains thirty-two large drawings, some measuring 6 ft. long, which are of very high quality and, as the editor says, are "by far the largest and most complete drawings of the Wren period that have survived." The most important of them relate to Whitehall Palace and form a valuable supplement to volume vii. They show Wren's various projects for this great scheme, prepared for Charles II, James II and William and Mary; another series relates to Hampton Court and is supplementary to volume vi. There is also an important set dealing with Greenwich Hospital, which may usefully be considered in conjunction with volume vi. The remainder are of schemes for Windsor, Kensington and St. James's.

From these two volumes we know that Wren prepared at least four schemes for Whitehall. His first idea

is shown, in part, by three drawings which were probably made for Charles II in 1669. It is known that the King intended carrying out his father's idea of building a great palace and of incorporating Jones's Banqueting House in it. John Webb was instructed to prepare drawings in 1661 and Evelyn tells us of a conversation that he had with Charles in 1664, during which the King borrowed his pencil and sketched his idea for a royal palace. The three drawings reproduced in volume vii were prepared by Wren in 1669, soon after his appointment as surveyor. Unfortunately, the plan has been lost and the layout is not clear, although the elevation shows that Wren intended building a pedimented central feature next to the Banqueting House, which was to be duplicated, the two forming the wings of the main building. Charles, however, had other uses for his money and the scheme did not mature.

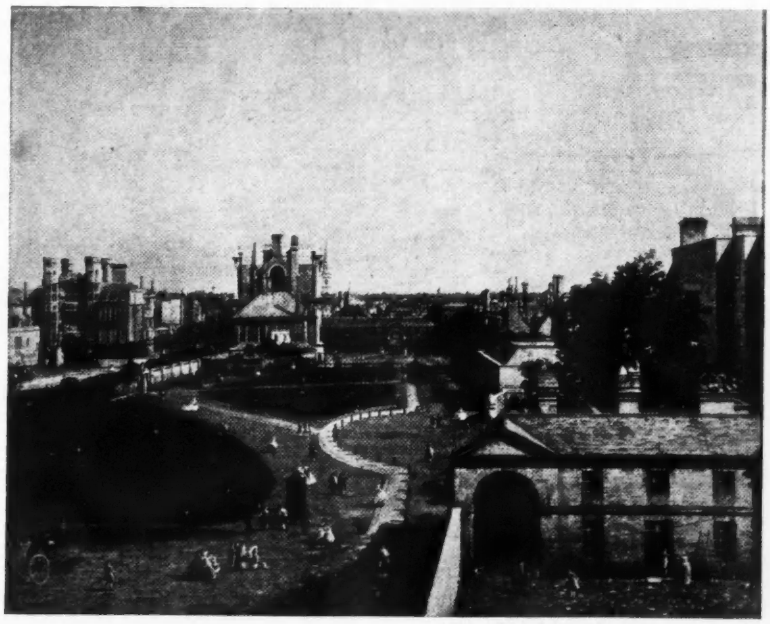
For James II (1685), Wren built a range of buildings adjoining the Banqueting House, at right angles to it, and extending towards the river. The only pictorial record that remains is an unfinished bird's-eye view, possibly drawn for Kipps, which does not, unfortunately, show any details. This building does not seem to have been part of a comprehensive scheme for rebuilding Whitehall, but was hastily erected to meet the needs of the moment, one need being a new Roman Catholic chapel. Although this caused much comment by its purpose and its gorgeousness, no drawings of it remain, excepting the masonry setting out of the elaborate reredos, with carving by Grinling Gibbons and Quelin. After James II's flight it was removed, and later on presented by Queen Anne to Westminster Abbey, where it remained until removed by Wyatt in 1820. Fragments of it now adorn the village church of Burnham in Somerset.

One of the most amusing discoveries that the editors have made is given in volume vii. It consists of a piece of office notepaper on which Wren has sketched alternative elevations for the drawing-room that Queen Mary built on the river in the 1690's. They are done freehand, in ink, and the main dimensions are figured on; at the side are sketches of rustications and balustrades. The building actually erected follows one of the sketches very closely, as is shown in the bird's-eye view referred to above. Wren's drawings for a formal garden on the river front of this little building are also reproduced.

A disastrous fire occurred in 1698, and destroyed the whole of Whitehall except the Banqueting House, which was itself saved with the greatest difficulty. King William then instructed Wren to design a palace to rival the magnificence of the Louvre, and the drawings that he prepared are among those rediscovered at All Souls'. There are two distinct schemes, equally ambitious, and each was built round Jones's Banqueting House. In one case Wren reverted to his original idea of 1669 and duplicated the Banqueting House on the other side of a central feature. The second scheme involved making the Banqueting House into a "centre" by planting a portico of great Corinthian columns on the middle of its river front; it was linked up to the flanking buildings by domed vestibules, circular on plan, around which the same "order" was repeated, with an unhappy effect of loss of scale.

The second scheme referred to above has, as a centre, a portico of four Corinthian columns *in antis*, surmounted by an attic bearing trophies and an equestrian statue — no doubt of William III; on one side of this is the Banqueting House with a replica on the other. This group is joined to the centre and to the wings of the courtyard by four low "links" covered with horrid little domes *à la* Marot. Each of these schemes has advantages and each has defects, but had either of them come to fruition, many of the bad points would have been improved. Wren's preliminary schemes were seldom as good as the executed work.

In volume vii the first Royal palace to be considered is Charles II's building at Winchester, which he started in 1683 from Wren's designs, and which proceeded with remarkable speed until the king's death. It was a large palace, intended as a summer or sporting residence, to be used instead of Newmarket. On the king's death, building was stopped and it was never finished, although Anne intended completing it as a residence for her husband, the Prince of Denmark. Nothing now remains except some fragments that were re-used in the barracks that occupy the site. The illustrations reproduced consist of original plans from All Souls', reproductions of engravings of the buildings either as intended or as they remained in the eighteenth century, and some architect's drawings from the British Museum, all of which show a building of brick and stone. The main block has two internal courts and wings which project to form a courtyard. The editor has endeavoured to make clear the uses of the various rooms in the plan, but this proved to be a hopeless task, even with the help of Wren's own list of rooms provided and the descriptions left by contemporaries, such as Celia Finnes and John Evelyn. In addition to the drawings, the editors have printed a manuscript book of contracts relating to this palace which belonged to Wren; this was recently presented to the R.I.B.A. Library by Mr. S. J. Wearing.



[*From* The Wren Society, volume vii.

Detail from a picture by Canaletto. Whitehall, 1746, showing the position after the great fire of 1698, with the Holbein Gateway, widened in 1723 (pulled down in 1759). The front of Sir Christopher Wren's New Building for James II, 1685–87, faced this way (300 ft. from the Gateway to the Stone Gallery). The Privy Garden occupied the foreground.

A previous volume (v) has dealt at length with the important subject of Greenwich Hospital, but the fifth All Souls' volume had not then been discovered, which is regrettable, as it contains important drawings which illustrate further the evolution of Wren's ideas. He started from John Webb's plan, which he reproduces almost exactly, and from this made various attempts to solve the problem, while keeping open the axis of the Queen's House, upon which Queen Mary was determined. Some very fine plans resulted and the drawings illustrating them are among the best Wren drawings that have come down to us.

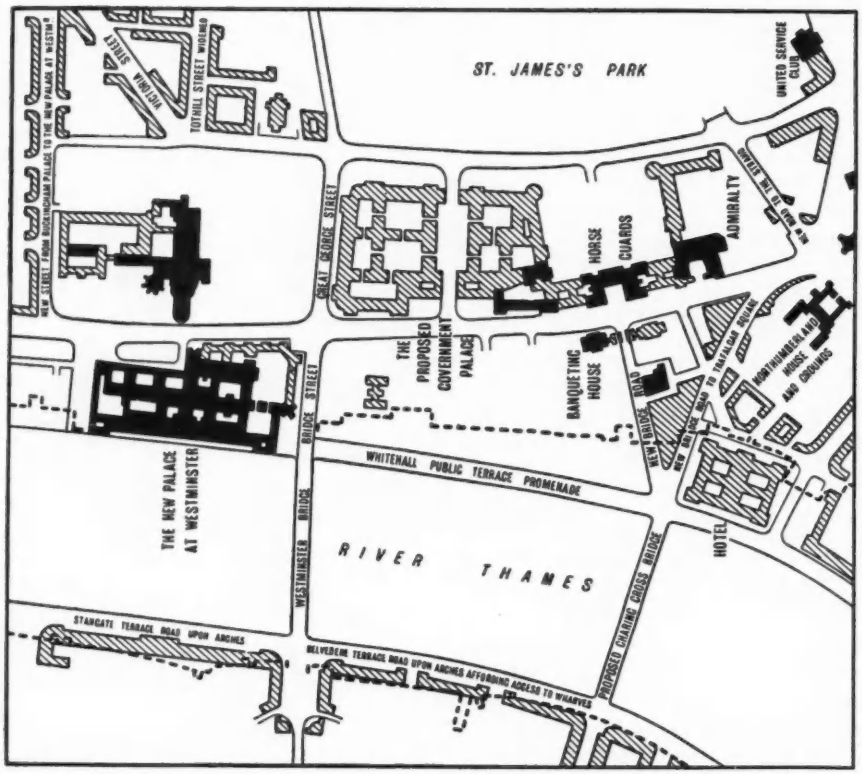
The work that Wren did at the other royal palaces—Windsor, Kensington, St. James's and Hampton Court—occupies much space in volume vii. From the All Souls' collection are a first sketch-plan of Hampton Court, several proposed alterations and a number of drawings of decorative schemes for the rooms. At Kensington Wren did a good deal of work for Queen Mary, who died there. This included the Orangery, which he designed jointly with Vanbrugh, and which may have been intended to form part of a larger scheme. The documents printed from the minute books and the accounts show fairly conclusively that George I's additions were not, as was often supposed, by Kent, who only painted the ceiling of the King's Gallery. In volume vii are given studies for a building at Windsor, which, it is pointed out, is strongly reminiscent of the library of Queen's College, Oxford, and elaborate garden schemes, which would have involved the demolition of much of the mediæval work. These discoveries have enabled the editors to recognize a plan in the British Museum which has hitherto been unidentified. The work at St. James's Palace was in the nature of minor alterations and was not important.

The editors have, as usual, done their work in an exemplary manner and have gathered together all relative material on the subject under consideration. In volume vii there are no fewer than 255 pages of text which, besides the contract book of Winchester Palace, consists of extracts from building accounts from the Record Office and excerpts from the minute books of the Board of Works, which often prove valuable in assessing the relative share of the architects of the Board in any particular work. Extracts from diaries and memoirs and contemporary prints are reprinted, and everything else that helps the reader to get a mental picture with the least waste of time in hunting among the works of the period, which, after all, he may not find easily available.

The longer the society exists, the more obvious is the value of its work. Had it larger funds, it could do its work quicker than at present, and it is to be hoped that everyone interested in architectural scholarship will subscribe the guinea a year that entitles them to the society's volumes, which, incidentally, are extremely good value for the money.

GRAHAME B. TUBBS

The Wren Society : Volumes vii and viii. Oxford : University Press.



[*From* The Wren Society, Volume viii.

Site plan of Sir Charles Barry's design for the concentration of Government Offices in Whitehall in 1859. It shows in advance much that has been very imperfectly realized since. It will be noticed that the doubling of the Banqueting House, proposed by Sir Christopher Wren, is shown, but at the northern instead of the southern end, the new centre being an open portico across a new bridge road. Dotted lines show the old river banks on both sides as then existing.

CHINA ARCHITECTS' AND BUILDERS' COMPENDIUM

IN the preface to the *China Architects' and Builders' Compendium for 1931*, which has now reached its seventh year of publication, we are told that the exceptional activity in building in China which characterized 1929-30 has been continued into this year, despite the increased cost of building materials resultant from the new tariff regulations and the augmented wages being paid because of the currency depreciation. The building trades and realty operations have been practically the only lines which have not shared the current trade depression.

Buildings in the Settlements tend to continue their aspiring trend, and with land appreciating so rapidly in value it is expected that the number of stories will increase so far as considerations of safety permit. Although the difficulties surrounding the opening of roads outside the Settlements persist, building of detached houses is rapidly developing on such tracts of ground as are available.

China, like other countries throughout the world, is still building new theatres and cinemas. The editors of the *Compendium*, Messrs. J. T. W. Brooke and R. W. Davis, point out that there is apparently an inexhaustible audience amongst the Chinese. The new cinemas are being constructed upon the best modern principles with regard to projection and audition, as well as comfort.

The book, like its predecessors, is divided into four sections; the first contains general information, a list of land, property and building; the second, technical information, cost and price lists; the third, a directory of architects; and the last a catalogue of builders' materials, etc. At the end is a comprehensive index. W. K.

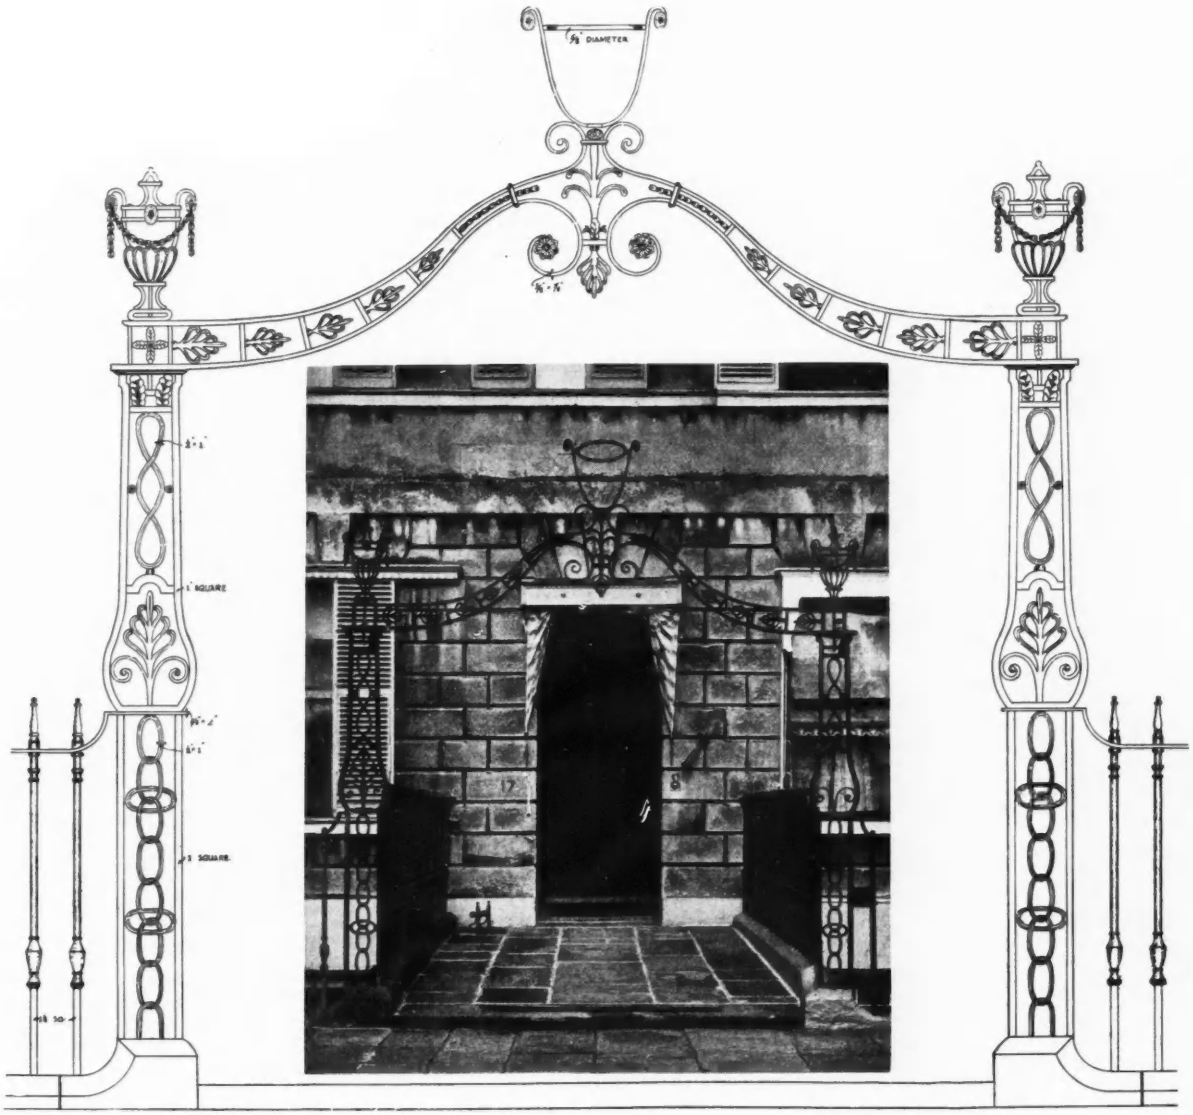
XVIII CENTVRY LAMP STANDARD LANSDOWN CRESCENT. BATH. ENGLAND.



SCALE

The lamp standard here illustrated by a photograph and scale drawing, fronts No. 17 Lansdown Crescent, Bath, and is probably coeval with the building of the Crescent, which was designed by John Palmer, who superseded Baldwin, the city architect, in 1794.

The two fuchsia sprays and the rosette immediately below the lamp holder are of bronze, and the other ornaments are of cast iron, and not of lead, as was originally thought. The supports to the lamp ring are of iron, finely swaged.

A note on the drawing suggested that the ornaments were cast from the same patterns as the plaster ornaments within the houses, but this opinion has been questioned in favour of patterns made for the purpose.

The lamp itself was composed of a glass bowl, which hung by a lip from the ring, and was covered by a metal dome. The bowl being filled with oil, the light was given by floating wicks. The standards throughout the Crescent are in a bad state of repair, with many of their ornaments missing. To preserve an example of this fine ironwork, the owner is having this lamp standard repaired by a local smith, whose business is in direct descent from one Edward Tuck, whose smithy is known to have been founded prior to 1740.

HEREWITH are exhibited more of the drawings submitted in the first of the Holiday Sketches Competition. The second Competition — that for August — has now closed, and once more the task of adjudication is in hand. The award will be announced in THE JOURNAL for September 9, when winning subjects will also be reproduced. There is yet a third, and last, chance for intending competitors; September 15 is the sending-in day for the final competition. Motto labels, the use of which is obligatory, are reproduced on page 291.

NORWICH: FROM A STRANGER'S STANDPOINT

BY ROBERT ATKINSON

We print below extracts from an address entitled "Norwich: From a Stranger's Standpoint," read by Mr. Robert Atkinson, F.R.I.B.A., at the annual meeting of the Norwich Publicity Association. The author descends upon Norwich as a stranger with no previous knowledge of its history, and, aided by an ordnance map and his own expert knowledge, he tells of his deductions and discoveries. Much of the extracts are devoted to the city's ecclesiastical buildings.

NORWICH is redolent of the Middle Ages. Every lane is peopled with shadows. How one can see the crowds run towards the markets; how they chaffer in the streets; every travelling bear is an event.

Every dark passage has its church bridging it in some way, either by its porch, or its chancel, or its tower; and each archway has its niche for the patron saint whose lamp was maintained alight day and night.

East Anglia is quite a kingdom in itself and is so different from the rest of England, so detached, so very Flemish, and its churches are only rivalled by those of Somerset. No other district ever produced a "School," with its Crome and Cotman; and with Gainsborough and Constable so closely associated with it. As for the churches, Suffolk has five outstanding examples at Blythburgh, Lavenham, Long Melford, Southwold and Bury, but in Norwich alone there are five gems of the purest water in St. Peter Mancroft, St. Gregory's, St. Giles', St. Stephen's and St. Andrew's—with thirty others in reserve. The cartwheel plan of the Norfolk roads, fourteen or fifteen at least centring upon Norwich, denotes an old and populous concentration. No other city so dominates its county, proving that Norwich, although not always the cathedral city, must at all times have been the largest town. Its Saxon and Norman importance may be gauged by its 1,300 burgesses, which, on the basis of 100 families to a parish, admits of thirteen churches. But its greatest period of prosperity began about 1400 and lasted till 1600 or 1650. The Flemish weavers, arriving about the middle of the fourteenth century, laid the foundations of its wonderful wealth during the fifteenth and sixteenth centuries. Even to-day's impression is overpoweringly mediæval, more so than either York, Chester or Bristol.

The Mediæval Buildings

The immense mass of mediæval buildings embedded everywhere in the street blocks of Norwich is surprising. Many were refronted at later dates, but this really is only skin deep. The merchants' houses alone—Strangers' Hall, Suckling House, Curat's House and the Bridewell, with probably others still to be disinterred, are worth a pilgrimage. Back's Elizabethan Wine Room, by the way, shows embattled panelling of probably one hundred years earlier. There are many fifteenth-century houses, Elizabethan specimens galore, and but few eighteenth-century types, though such as there are—St.

Cow Hill and St. Giles' Church, Norwich.

Catherine's Close, with its round porch, the old Assembly Rooms now the Girls' High School, the two chapels, the Old Meeting House and the Octagon, are all beautiful and anywhere else than in Norwich would be notable.

The Centre of the Old Saxon City

There is a site marked "church" in Upper King Street, and another (now Catholic Apostolic) in the flesh in Queen Street, just labelled "church" on the ordnance map. This latter is part of the bunch of churches near Tombland, once the centre of the old Saxon city.

Hereabouts the churches are placed higgledy-piggledy and the houses are squeezed closer together, marking probably the centre of the Saxon town and producing delightful views across Tombland, the original market place, from which, as in other large towns, several markets for various purposes sprang.

In Saxon times the walls were not yet built and the houses, of flint and thatch or with sun-dried clay walls, were strung loosely along the one-and-a-quarter miles of rising ground looking over the meadows and river. Into this barged, as it were, the Normans, seeking a safe home for their lords, spiritual and temporal. They built the castle on its ready-made knob and probably made Ber Street as a safe way in to avoid the Saxon streets on a dark night. But as the best situations were already fully occupied, they were forced to place their cathedral in the meadows, almost below flood level but on the highest ground still available within the town. Thus the first great era of Norwich began, the church and castle were built, many monasteries settled themselves and many more churches were founded. Practically the whole low-lying area on the bend of the river was covered by clerical and monastic buildings and gardens, and this area was fortified with walls and gates probably before the town itself was walled, as the citizens had not yet acquired valuables worth protecting.

The ordnance map tells all about the churches. The little ones, with rounded tower and narrow plans, are Norman, the wide square ones, with many buttresses, are perpendicular or fifteenth century; others show irregular additions and are of various dates. No little one is off the old street, except perhaps St. Mary-at-Coslany and St. Saviour. The square ones are all over the city, clustering thickest where the population is, and thinner on the outskirts, showing a gradual expansion right up to the Reformation. When the walls were built, they made a long curve from river to river on both sides; on the south just enclosing the extreme ends of the Saxon town but bulging out to secure the highest ridges of ground at St. John de Sepulchre so as not to be overlooked, and to St. Giles's Gates and so down to the river, thus enclosing incidentally a good open space for market gardens and grazing ground for cattle in case of defence. North of the river, the bulge of walls does not coincide with the south, showing how the buildings here, which had overrun the ground before the walls were built, had to be included. Of these walls much remains, but of the many gates nothing substantial is left us.

St. Michael-at-Coslany Church, Norwich.

Venturing into an Ancient Church

To enter for the first time an ancient church is a great adventure. To the knowing its secrets are revealed and one is stunned by the revelation of what remains in Norwich. I am always hunting out the secrets of these churches and gloating over them, and I am letting you into my discoveries. Sometimes one goes into a church to find that some restorer of a hundred years ago has left nothing of value. Norwich, fortunately, escaped the "restoration" fever, so every interior brings something new and interesting. Not least amongst its treasures are fifty or sixty doors of the fourteenth and fifteenth centuries, and I hardly think you would find half a dozen in any other county. What is more, the ironwork, hinges and locks are often complete. The outer doorway to the Strangers' Hall, with its carved lion and unicorn and pierced fanlight, is a thing any other city would make a particular feature of. Were it at South Kensington it would be almost the lion of its section. Last year (1930) at South Kensington there was arranged a collection of mediæval church fittings from the whole kingdom. I do believe Norwich possesses as many, if not more, of these fittings than there were in the whole of that collection.

Notes on some of the Churches

St. Michael-at-Plea possesses a beautiful porch, with its original traceried fifteenth-century doors second only to those at St. Michael-at-Coslany, and a lovely Jacobean font-cover, of which there are many similar in Norwich.

St. Gregory's Church is really wonderful—as good as anything in Norwich. In many ways it is as good as St. Peter Mancroft. It has a superb tower, and a pair of porches that I do not think you could match elsewhere; above all, a great rarity is the sanctuary knocker of the fourteenth century on the vestry door—there are probably six others existing. I could have put it in my pocket at the time of my visit, but I understand it has now been securely fastened. The church has also a ringers' gallery, a Jacobean font-cover of unusual pattern, a lectern of 1486, old sedilia and part of a screen. The fine clock, as is not unusual in Norwich churches, is not working.

St. Margaret's Church made my visit to Norwich a red-letter day indeed, for there I found something very remarkable—a wonderful chest of the late-fourteenth century, similar to one illustrated from Litcham Church in M. R. James's recent book on *Suffolk and Norfolk* (p. 21). Upon it were several hymn-books, hats and coats. There is only one other chest anything like it that I can remember, and that is at Faversham, in Kent. It was included

in the South Kensington exhibition, but the Norwich one is better because it has its original quatrefoil lid. Here also is a fine Jacobean chair and the original Jacobean altar table, now a receptacle for hymn-books.

St. Giles's Church

Wandering up Pottergate and Cow Hill, I came quite suddenly and unexpectedly upon the wonderful tower of St. Giles's Church, the simplest and grandest tower in Norwich. From the bottom of Cow Hill, looking up between the two rows of old houses, is a view to delight any painter's heart. This recalls another asset of Norwich—a lovely atmosphere. The perspective of its streets in every direction is paintable and beautiful, and especially lends itself to etchings.

St. Michael-at-Coslany exhibits the finest flint work in England. It also possesses the best west door in Norwich, in fact, one of the finest in the country, and a fine seventeenth-century altar table and a brass matrix from which the brass is missing; but why, by the way, are the authorities allowed to nail income-tax notices on church doors ?

Fine Monuments in Overwhelming Numbers

In all the churches there are fine monuments in overwhelming numbers, of which a proper survey is necessary. There can be no general idea of what wealth of effort and money has been lavished on the beautiful things in Norwich. To exploit them properly would open up an enormous field of publicity. Every reference to York mentions what a wonderful mediæval city it is, how remarkable its churches and its walls. The same remark applies to Chester. Yet Norwich is larger than either of these cities, with twice or three times the number of churches, and the fittings are certainly unique.

Publicity on Proper Lines

Publicity on proper lines could be got by exploiting the lesser monuments more fully; by publishing very small handy folders or guides to each particular building and not so much a general guide to the city. Postcards, as such, are dead : their popularity has waned enormously. Small folders, with a plan of the church, or whatever the monument is, with two or three of the best photographs, and a few details sufficient to occupy the ordinary visitor a few minutes, are all that is needed. The whole collection might be put together to form a larger volume. Some of the churches now derelict could be used during the summer to house interesting collections of furniture from the churches; another year, vestments and documents might be shown, and a continuous public interest could thus be maintained. Most of the old churches and old inns are well kept up and well restored. I realize the difficulty of preserving or even of restoring everything, because the return on the money spent must be economic, and Norwich possesses a square mile of beautiful buildings.

LAW REPORTS

ALLEGED NUISANCE FROM KENNELS

De Lengerke v. *Berg and others. Chancery Division. Before Mr. Justice Bennett*

THIS was an action by Mr. Geo. Ed. de Lengerke, against Mr. W. H. Berg and others, for an injunction restraining them from keeping or conducting greyhound kennels at Motspur Park, New Malden, Surrey, in such a manner as to cause a nuisance to the plaintiff and the other occupiers of his house known as the Old Farm House, which adjoined.

Mr. Archer, K.C., for plaintiff, said the question at issue was a very simple one, viz., whether the defendants, who were carrying on the business of kennel proprietors, were conducting that business in such a manner as to cause a nuisance from the noise of the dogs kept by them, thus preventing the reasonable occupation of the plaintiff's house. Plaintiff purchased his property in 1929, and at that time the adjoining stables, which did not form part of the plaintiff's property, were unoccupied. In 1931 plaintiff went on a trip to America and servants were in charge of the house. In the April, dogs were placed in the stable by the defendants, who used them as kennels. At first there was no trouble, but in the May, when the plaintiff and his family had returned, their sleep was seriously interfered with by the noise of the dogs, numbering from thirty to fifty.

Plaintiff gave evidence and said the noise of the barking and whining was practically continuous.

Plaintiff's wife and other witnesses supported his case.

For the defence, Mr. R. J. K. Netcott, one of the defendants, gave evidence, and said he had for years been a licensed trainer. They had never had more than forty dogs on the premises. Since the complaints had been made he had often visited the premises at different hours of the night and he had heard no barking, whining or howling. The dogs might have been noisy on the night of the earthquake, but he had not noticed any noise from them since. He had heard the defendant's terrier barking at night.

A number of witnesses were called who gave evidence that they never heard the greyhounds barking or whining or howling at night, and a veterinary surgeon said a properly trained greyhound did not make any noise at all.

His lordship, in giving judgment, said there was a great conflict of evidence, but on the whole he saw no reason for disbelieving the evidence given by the plaintiff and his witnesses. Much of the evidence given on behalf of the defendants did not cover the whole of the period in question, and it was quite possible that so far as it went it was accurate evidence. Under the circumstances the plaintiff had established his case and he was entitled to the injunction he sought, and defendants must pay the costs of the action.

LIABILITY FOR A COLLAPSED WALL

Chessum and others v. *Links. King's Bench Division. Before Mr. Justice Charles*

This was an action by the trustees of the late Mr. J. W. Chessum against Mr. J. G. Links, of Pond Street, Hampstead, to recover damages in respect of a wall.

Mr. Cyril Binney, for the plaintiff, said the action arose over a boundary wall of the garden which separated the properties of the late Mr. Chessum and the defendant at Pond Street. It was a substantial wall, some 9 ft. high. The land on the defendant's side was higher up the brickwork than a pathway which was on the plaintiffs' side of the wall. There were a number of poplar trees on the defendant's side of the wall, and the plaintiffs' case was that the roots of the trees had grown through the wall and had caused it to collapse. Under these circumstances they claimed damages and also sought an order that the defendant should remove some of the trees which were in close proximity to the wall.

On behalf of the plaintiffs, Mr. A. H. Corbell, a surveyor, of Windsor House, Victoria Street, S.W., was called. He admitted that the wall was old, though in his view it was not weak. In his opinion it was possible that the trees swayed in the wind, and their movement would affect the roots and injure the stability of the wall. Witness also mentioned that there was ivy on the wall on the defendant's side.

Mr. L. H. Gluckstein, for the defence, said his case was that the wall collapsed in a gale which raged in December, 1929, owing to the fact that it was decrepit and out of repair. Under these circumstances the defendant disclaimed responsibility for what was an Act of God.

Mr. S. G. Ramsey, an architect, now of Berkhamsted, said at one time he owned the defendant's property, and in 1928 he informed the late Mr. Chessum that though the wall was not a good one, if it were attended to it would probably enjoy a long life. Later he

noticed that it began to bulge, and though he suggested strengthening it, nothing was done.

His lordship, in giving judgment, said he came to the conclusion that the plaintiffs had failed to establish that the trees, either by their roots or through swaying in the wind, had caused the collapse of the wall. In his opinion the wall was old and bulging, and soggy with moisture. It had been badly maintained, and he formed the conclusion that the high wind of the gale blew it over. Under these circumstances he gave judgment for the defendant with costs.

COMPETITIONS OPEN

August 27.—Sending-in day. Proposed all-Scottish House for the Ideal Home Exhibition. Limited to architects practising in Scotland or of Scottish birth. Assessor: John Watson, A.R.S.A., F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from *The Daily Mail*.

September 5.—Proposed extension of the Town Hall, Hackney, for the Hackney Borough Council. Architects are invited to submit their names and brief particulars of their experiences. The competition will be limited to six architects to be selected from the applicants. Assessor: Professor S. D. Adshead, F.R.I.B.A. Premiums: £250, £150 and £100. The authors of the three unpremiated designs will receive a payment of £50 each. Applications should be submitted to R. H. R. Tee, LL.D., Town Clerk, Town Hall, Hackney, E.8, by September 5 next.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions, etc., were obtainable from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 1.—Sending-in day. (Last day for conditions was June 3.) Pictorial Map of the Area of the West Yorkshire Society of Architects. Premium, 10 guineas. Particulars were obtainable from the Secretary, 62 Woodhouse Lane, Leeds.

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

March 1. 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich.

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

SOCIETIES AND INSTITUTIONS

DORMAN LONG TRAVELLING SCHOLARSHIP COMPETITION

The result of the Dorman Long travelling scholarship competition (value £300), awarded with the object of encouraging and developing steelwork construction in Great Britain, has been announced as follows.

First: E. W. Bentley, of 81 Cholmondeley Road, Pendleton, Manchester (winner of scholarship and gold medal).

Second: D. A. Godfrey, of 15 Western Circle, Burnage, Manchester (silver medal).

Third: G. B. Martin, of 13 Beech Road, Chorlton - cum - Hardy, Manchester (bronze medal).

DORSET SOCIETY OF ARCHITECTS' OUTING

The third annual excursion of the Wilts and Dorset Society of Architects took place recently. About twenty-five members and friends met in the morning at Sandford Orcas Manor, by the courtesy of Sir Hubert Medlycott who, with Lady Medlycott, conducted the party over the church and Manor House, and gave a most interesting talk on the history of the house and its owners. The next place visited was Trent, followed by Church Farm and the Manor House, which provided special historical interest as being the hiding place of Charles II after the Battle of Worcester.

Luncheon was partaken of at the Woolmington Hotel, Sherborne. The President (Mr. C. W. Pike, F.R.I.B.A., of Dorchester) presided.

The journey was then continued through delightful scenery to Bradford Abbas, where a brief halt was made to see the church, and then by way of Yetminster, Ryme, and Evershot to Mapperton.

THE ARCHITECTS' DIARY

SATURDAY, AUGUST 29
Sunrise, 6.5 a.m. Sunset, 7.55 p.m.
ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1 Tour to Vienna, visiting Munich, Salzburg, Linz, Budapest, Zurich and Lucerne. Return, September 13. Full particulars may be obtained from the Secretary.

TUESDAY, SEPTEMBER 1
INTERNATIONAL ILLUMINATION CONGRESS. Official Luncheon to be held at the Savoy Hotel, London. 12.15 for 12.45 p.m. **12.45 p.m.**

FRIDAY, SEPTEMBER 4
INTERNATIONAL ILLUMINATION CONGRESS. At Glasgow. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Organization for the Development of Electric Lighting," by C. A. Atherton; "Progress and Teaching of Illumination in Italy," by C. Clerici; "Lighting Progress in South America," by A. M. Baidaff. Section 3: "The Provision of Adequate Daylight in Building Regulations," by P. J. Waldram; "Daylight Illumination and Town Planning," by C. G. Möller; "Visual Performance at Various Levels of Daylight Illumination," by K. Y. Yang; "Daylight Illumination of Art Galleries with Overhead Lighting," by T. Hirayama. Afternoon Session, 2.30 p.m. Section 1: "Home Lighting," by C. Haslett and N. E. Miller. Section 3: "Photo-Electric Measurements of Daylight Illumination by the Use of a Model Room," by Z. Yamauti and K. Hisano; "Mathematical and Graphical Determination of Direct Daylight Factors," by A. C. Stevenson; "Prediction of Natural Illumination in Interiors and on Walls of Buildings," by H. H. Higbie and A. D. Moore. **10 a.m.**

SATURDAY, SEPTEMBER 5
Sunrise, 6.17 a.m. Sunset, 7.40 p.m.

MONDAY, SEPTEMBER 7
SANITARY INSPECTORS' ASSOCIATION. Annual Conference to be held at Bridlington. Until September 12.
INTERNATIONAL ILLUMINATION CONGRESS. At Edinburgh. Following are some of the papers to be read. Morning Session, 9.30 a.m. Section 1: "The Lighting of Seaside Resorts," by A. P. Allan and J. M. Campbell; "Mason Experiments in Street Lighting," by W. S. Stiles; "Modern Public Lighting by Electricity," by W. J. Jeffery. Afternoon Session, 2 p.m. Section 1: "The British Standard Specification for Street Lighting," by C. C. Paterson. **10 a.m.**

THURSDAY, SEPTEMBER 10
INTERNATIONAL ILLUMINATION CONGRESS. At Buxton. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Architectural Lighting," by R. Waldo Maitland and Howard Robertson, F.R.I.B.A. Afternoon Session, 2.30 p.m. Section 2: "Architectural Lighting," by L. Kalff; "Engineering Aspects of Architectural Lighting," by W. J. Jones. **10 a.m.**
SHIPPING, ENGINEERING AND MACHINERY EXHIBITION. At Olympia. Until September 16.

FRIDAY, SEPTEMBER 11
INTERNATIONAL ILLUMINATION CONGRESS. At Birmingham. Sessions at 10 a.m. and 2.30 p.m. Papers to be read will be mainly devoted to signal glasses and vehicle lighting. **10 a.m.**
ARCHITECTURAL ASSOCIATION. Annual Excursion: to Austria. The programme will include six days in Vienna, followed by a six days' motor coach tour through Austria, returning to London on September 26.

SATURDAY, SEPTEMBER 12
Sunrise, 6.28 a.m. Sunset, 7.24 p.m.
ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

TUESDAY, SEPTEMBER 15
Closing date of THE ARCHITECTS' JOURNAL September Holiday Sketches Competition.

WEDNESDAY, SEPTEMBER 16
INSTITUTION OF STRUCTURAL ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.
INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Manchester and District Branch. Visit to the Wardle (Watergrove) Reservoir.

FRIDAY, SEPTEMBER 18
NATIONAL SMOKE ABATEMENT SOCIETY. Annual Conference. Liverpool. Until September 20.

SATURDAY, SEPTEMBER 19
Sunrise, 6.39 a.m. Sunset, 7.8 p.m.

MONDAY, SEPTEMBER 21
INTERNATIONAL ILLUMINATION CONGRESS. Reception of the delegates at the Royal Institution, London. 3 to 4.30 p.m. **3 p.m.**

TUESDAY, SEPTEMBER 22
INTERNATIONAL ILLUMINATION CONGRESS. Conference of the Institution of Electrical Engineers, at the Kingsway Hall, W.C. 10.30 a.m. Conversaziones at the Royal Institution and the Albert Hall. 8 p.m. **10.30 a.m.**

TRADE NOTES

The Leyland and Birmingham Rubber Co., Ltd., have recently issued a new catalogue of Leyland rubber tiling and flooring. It consists of sixteen pages, thirteen of which form plates showing the many colours and designs in which the tiling and flooring may be obtained. It should be noted that two types of rubber floors are manufactured by the firm, one under the name of Flooring, and the other Tiling. The flooring is manufactured in long lengths, supplied with or without separate borders and in two thicknesses, whereas the tiling is supplied in tiles or panels and laid on the site, to form the design. In the tiling, five thicknesses are available. The illustrations show a big variety of tiling and flooring, in self-colours and marbles in two, three, four, five and six colours. Even then the designs are not meant to be taken as standard, but merely as suggestions. While adopting the patterns illustrated, any colours may be used, or, again, any design may be completed, the colours or marble shades being specified from the list of colours given in the catalogue. Thus designs to suit any specific area can be prepared.

*

A new six-ply waterproof building paper composed of bitumen and sisal fibres encased within sheets of tough waterproof kraft paper, has been marketed under the name of Sisalkraft. It is claimed to be endowed with remarkable strength and stoutness, and to be tough, air-tight, strong, waterproof and permanent. Sisalkraft has been devised for a multiplicity of uses, such as sheathing roofs and waterproofing walls, for lining sheds and poultry houses, for covering openings in buildings, for laying under floor boards to prevent creaking, warping or the penetration of draughts or damp, for use as a tarpaulin for protecting temporarily exposed lime, cement or other damageable materials, for covering "green" work during rainy weather, for curing concrete, for covering carpets and furniture during redecorations, and for 101 varied services throughout the year. It is manufactured in rolls in six widths, ranging from 36 ins. to 84 ins., and is obtainable from Messrs. J. H. Sankey and Son, Ltd., 7/8 Norfolk Street, Strand, London, W.C.2, who are the sole selling agents in England and Wales. This firm will be pleased to forward samples, prices, merchants' terms and full particulars upon application.

*

A new booklet has recently been issued by the British Challenge Glazing Co., of Marshgate Lane, London, E.15, containing the price-lists of the firm's standard lantern skylights and domes. It is divided into three sections, comprising hipped standard lantern skylights, gable standard lantern skylights (including general information on lantern skylights) and standard domes, respectively. Each section, in addition to the price-lists, contains diagrammatic drawings and full fixing instructions. The firm state that their experience covering the period during which exposed steel had been used for roof skylight work, proved the damage caused by neglect irreparable. They claim that the only suitable metal that does not require periodic attention for this type of work is bronze, whether on sea coast or inland, but in most cases the cost is prohibitive. Nevertheless, they state that bronze should always be used on the sea coast, and they will be pleased to furnish prices when desired. Regarding standard domes, they point out that up to the present the use of glazed domes has been restricted by the cost. Each dome, being specially made, had to bear the full cost of detailing, setting out, templets and glass-bending moulds, etc. As their works include, among others, roof glazing and glass-bending departments, they claim to have exceptional facilities for the manufacture of domes, and by standardizing certain sizes, eliminate many of the costs mentioned above.

*

The Standing Committee appointed by the Board of Trade will hold an inquiry at 11.30 a.m. on Monday, October 12, and at 10.30 a.m. on Tuesday, October 13 (if necessary), as to whether imported iron or steel flush pipes (whether galvanized or not), should be required to bear an indication of origin. The inquiry will be held at the Board of Trade Offices, Great George Street, London, S.W.1. Communications should be addressed to the Secretary, Mr. E. W. Reardon, at that address.

The tower of Eastbourne College, floodlighted by G.E.C. projectors and Osram lamps, during the E.C.A. Conference, held at Eastbourne last June. This College was illuminated in order to call attention to this particular form of lighting, which will figure largely during September next, when the International Congress of Engineers will be holding their first conference in this country for several years. Eastbourne College was fully illustrated and described in THE ARCHITECTS' JOURNAL for June 18, 1930.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue.

Deptford Old Town Library (pages 269-272; and supplement). General contractors, L. & W. Whitehead, Ltd. Sub-contractors: Birmingham Guild, Ltd., bronze tablet; Libraco, Ltd., library fittings; Carter and Aynsley, Ltd., door furniture; Morris Singer Co., wrought-iron railings; Z. D. Berry and Son, heating; Acme Flooring and Paving Co., Ltd., flooring; Crittall Manufacturing Co., Ltd., metal windows; Duncan Watson, Ltd., electric lighting; Holophane, Ltd., electric light fittings; Ragusa Asphalte Paving Co., Ltd., asphalt; Gilbert Seale and Son, Ltd., sculptured heads; Moreland Hayne & Co., Ltd., steelwork; F. J. Barnes, Ltd., Portland stone; Finch & Co., Ltd., sanitary fittings.

Boots shop premises, 9-10 Broadgate, Coventry (pages 273-275). General contractor, E. Harris and Son. RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

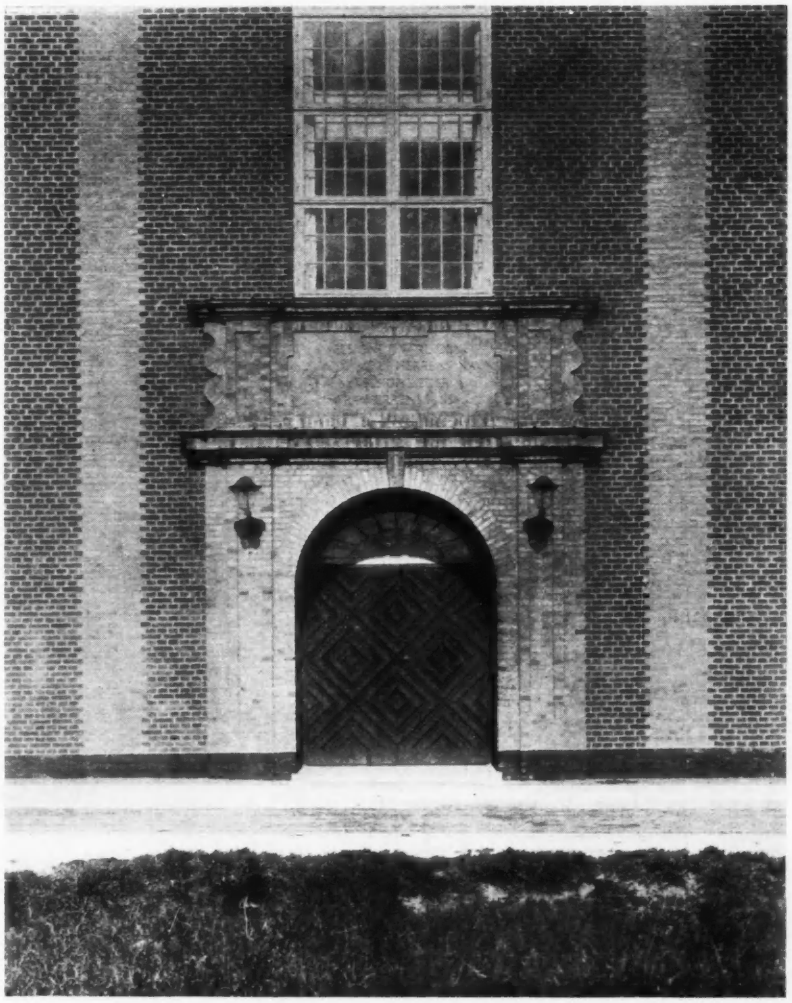
THE LINDEVANG CHURCH

THE ARCHITECTS' WORKING DRAWING OF THE ENTRANCE



[*Thomas Harning and Anton Fredericksen, Architects.*

THE MAIN DOORWAY, WITH INSCRIPTION OVER

THE Lindevang church, Denmark, from which the steeple was chosen for illustration in a supplement with the issue of August 12 last, terminates in plain ends, and the main entrance, pictured above and within by means of scale drawings, is the central feature in one of them.

The present photograph indicates very clearly the effect of the black brick plinth and the red brick walls, relieved with their yellow brick vertical stripes. The tablet over the doorway is in limestone, and bears the following inscription :

> Blessed be he that cometh in the name of the Lord.
> We have blessed you out of the house of the Lord.
> (Psalm 118, v. 26.)

The general view of the church is reprinted on the last page of this supplement for purposes of reference.

MODERN READING ROOM FITTINGS

THE ARCHITECTS' DETAIL DRAWINGS FOR DEPTFORD OLD TOWN LIBRARY

[*A. W. S. and K. M. B. Cross, Architects.*

THE LENDING LIBRARY, SHOWING BOOKSTACKS AND ATTENDANT'S DESK

THE large-scale drawings reproduced overleaf include details of the bookstacks in the Lending Library, shown in the above photograph. Views of the Newspaper Room and of the Children's Room, in which occur the newspaper slopes, tables and other fittings, also drawn, will be found in the pages of this issue devoted to an illustrated descriptive article upon Deptford Old Town Library.

These designs are modern in the best sense of the word—not here to be confused with "modernistic"—inasmuch as they represent fittings conceived in the light of experience for specialized needs of the present day. They are carried out in plain waxed oak, the same material being used for all internal doors of the public rooms in the building.

The Lending Library, besides being lined with bookstacks, has six independent stacks in the central floor space.

In the Newspaper Room, sloping reading desks are fitted around three of the walls, and a magazine rack in one corner. Here and in the Children's Room the tables, with their slightly inclined tops, and chairs, occupy the central open spaces of the rooms.

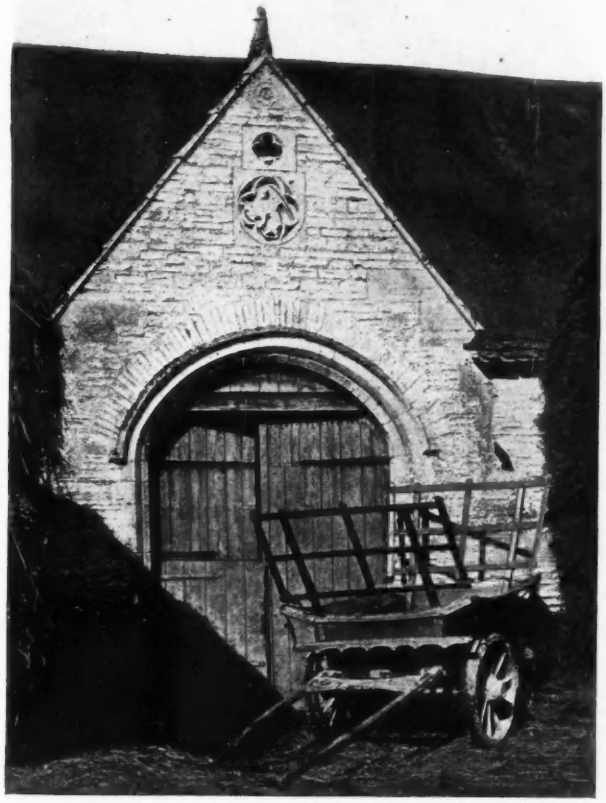
SELECTED PRECEDENTS:

A SERMON ON BARN DOORS



1. *PILTON SOMERSET.*

"IF buildings, when they die and crumble here on earth, rise again in happy immortality, then in their heaven, filled with the goodly buildings of this world, surely barns will hold an honoured place. There they will enshrine celestial treasure, as here they harboured golden grain."

A pretty thought, or, at least, a quaint conceit (borrowed from my very old friend, Mr. Geoffrey Giddings), but, to my mind, going nearer to the depth and root of the matter than all this learned talk of "crucks" and tie-beams, wall-plates and purlins, which swells the space between the covers of our knowledgeable textbooks.

Here are four doors, from ancient barns, wide and tall to let the loaded wains go in, discharge their precious cargo, and come out empty on the other side. Now that is meeting conditions fairly. Every stone is there for a set purpose—the arch-stones above the door, the drip mould to throw the water off, the buttresses to take the thrust, the quoins, the steep pitched roof, the coping-stones protected by their moulded joints—even the emblems of the saints had a practical significance. Now there's "Functionalism" for you—Functionalism in its time and season.

But what is sincere today may be an affectation by tomorrow. Superficial forms are passing things. But in the depths, at the roots, there is something firm remaining—something older than these barns, older even than their stones, and that is the love of truth which takes these barns to heaven.

Today we store our corn in other ways. Rats and mice do not molest it, nor does mould corrupt it. So glory be to our clean white ferro-concrete silos. If we build aright who shall say that that love of truth shall not waft them, too, to heaven?

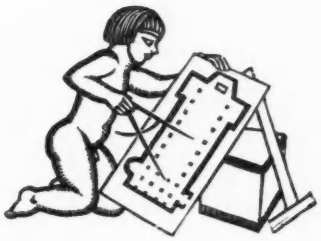
THE ARCHITECTS' JOURNAL



WEDNESDAY, SEPTEMBER 2, 1931

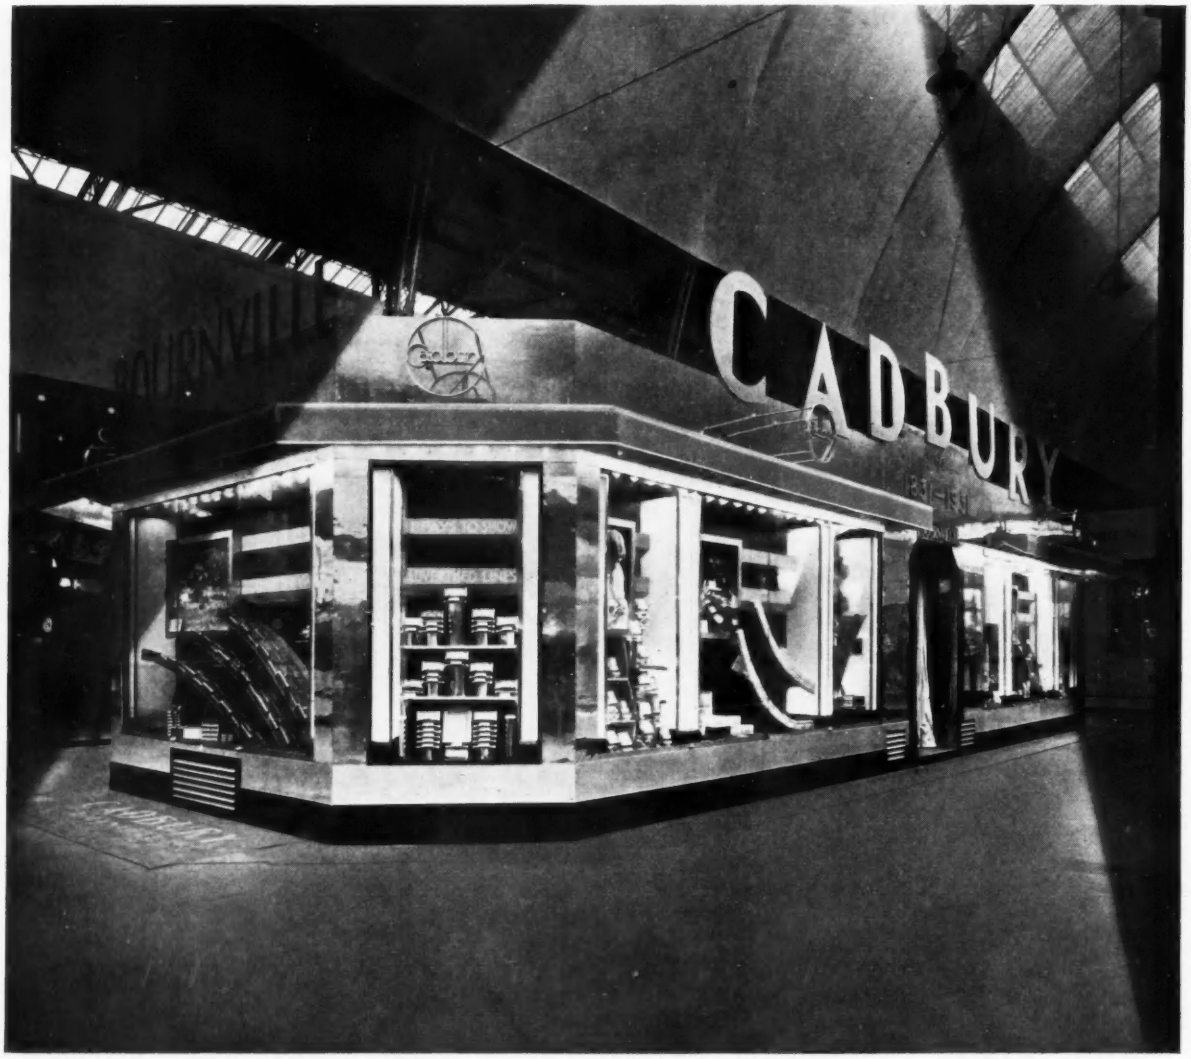
THE CASE OF SOUTHWARK

AT a time when the need for national economy is on everybody's lips, it is but natural that every department of human life, and architecture not least, should be affected by the new-found zeal for curtailing public expenditure. To what extent must the building industries be made to suffer in what is admittedly a good cause? The question appears to be raised in an acute form by the decision of the Southwark Borough Council to postpone all building operations on the proposed new Town Hall and Public Library, which were to cost approximately £155,000. The plans for this building have already been approved, but no definite action has yet been taken to give effect to the scheme. If the zeal for economy takes a similar form in other boroughs, one might well ask where it is going to stop.

In the present age the municipalities of England have, in a large number of instances, shown themselves to possess a new pride in their function and status, and this pride has taken the form of a determination to build for themselves town halls and municipal offices worthy of their civic dignity. It will be acknowledged in times to come that these new town halls will represent one of the finest architectural achievements of the present century. Moreover, if we look at the problem from the purely practical and utilitarian point of view, it must be admitted that the efficiency of municipal administration is still in many instances gravely hampered by badly-arranged offices, providing quite inadequate accommodation. Just as we cannot hope to revive our industries without extensive schemes for re-conditioning our factories, for the same reason the functions of the municipalities cannot be properly performed unless their officials also are housed in buildings exemplifying twentieth-century standards of planning. Therefore, it may be contended that if, in these times of stress, the building industry is to have left to it any function at all, the erection of new and much-needed municipal offices should be the very last activity to be curtailed.

In this connection one may point to the example of Germany and Austria, in which countries large schemes of building for purposes of public utility were embarked upon even at the periods when the national finances stood at their lowest ebb. This action has often been criticized as an unjustifiable extravagance, but it is questionable whether such strictures are just. As an example of far-sighted state and municipal building, one may mention the new Labour Exchange at Kiel, in which city there are at the present moment 27,000 unemployed. Yet the municipality has chosen this time to erect what is probably the most efficient and scientifically-planned labour exchange building in the world. It may scarcely be questioned that this building will pay for itself many times in the increased efficiency in which a necessary social function is discharged.

Again, we have to take into consideration the effect which a general policy of postponing building operations and other public expenditure will have upon the numbers of the unemployed. It will be no national economy if, after reducing the unemployment benefit by 10 per cent., we increase the numbers of the unemployed by 15 per cent. The basic industries of the country must be carried on; and while "luxury" building should certainly be discouraged, a well-planned block of municipal offices should certainly not be considered as coming within this category. We should appeal, therefore, to the Southwark Borough Council to reconsider its decision. Money spent on a good building which is designed to serve the public interest is not wasted.



AN ALUMINIUM-FACED EXHIBITION STAND

Cadbury's stand at the Chocolate and Confectionery Exhibition at Olympia, which has just closed, was designed by Mr. Joseph Emberton.

The stand contains an elaborately-fitted showroom, reached through two principal entrances, placed centrally on the longer sides. Inside and out the stand is lined with aluminium-faced plymax.

A great deal of light was required to throw into prominence the exhibits arranged in showcases round the four sides of the stand. Owing to the great amount of heat generated by the lights placed inside the showcases, it was necessary to arrange for part of the light to be thrown into the showcases from outside. The inverted lighting troughs were, consequently, not a part of the original design.

NEWS & TOPICS

THE SHAKESPEARE THEATRE ONCE AGAIN

NOTHING but good can come of the numerous press controversies over various aspects of architecture, especially when a new building becomes the subject of comment. I read with interest, therefore, the letters recently published in *The Birmingham Post*, in which a number of correspondents have expressed their views for and against the new Shakespeare theatre. Again, it is objected that this building too stridently defies the established tone and character of its architectural environs, and again the defenders of the new design utter their protest against the sentimentalists, who would still make us clothe a modern structure in the sham Romantic dress of half-timber. Yet this is not really the point at issue. Any visitor to Stratford-on-Avon must be aware that the dominant architectural character of the little town is not really mediæval, or even Elizabethan, for many of the streets are lined with charming eighteenth-century façades, and it is with these latter that le Corbusier style appears to clash. However, the problem will not be settled this year or the next, and the main thing is that it should be publicly discussed as often as possible—and without the disputants losing their tempers!

A "TEMPLE OF LABOUR"

It is a far cry from Stratford-on-Avon to Moscow. But there also the "functional" buildings make their appearance, yet probably without raising any protest (or at least any *printed* protest on the part of the "traditionalists"). The latest architectural venture of the stern rulers of Russia is the Temple of Labour, which is to replace the famous Cathedral of the Redeemer. The Cathedral, which was started in 1837 and took forty-six years to build, has an enormous golden dome, which crowns the Moscow skyline in much the same way as the dome of St. Paul's dominates London. Its construction was undertaken by the Czar's Government, in order to commemorate Napoleon's retreat from Russia. Famous painters and sculptors gave of their finest work to embellish this building, which could hold a congregation of 10,000 worshippers. The Cathedral is to be demolished, and the Soviet Government, anxious that an appropriate building should rise in its place, bearing "the character of the modern epoch, the incarnation of the will of the workers to construct the Communist State," is offering 100,000 roubles for a "Temple of Labour" which will combine beauty with utility. The ambitious scope of the project may be judged from the fact that the huge auditorium, to be the central feature of the Temple, must hold an audience of 25,000 with an orchestra of 500, and a Press Gallery to hold 500 Soviet and foreign journalists. Even the secondary auditorium is to hold 6,000 people. In England we serve the cause of "labour" in a less sensational way, and it is scarcely conceivable that at any future date our own socialists or other builders of Utopia would want to create such an architectural symbol of their aspirations. And is not the idea of an auditorium to hold 25,000 people just a little crude, out of date and decidedly *in*utilitarian? Have the authorities of the Soviet forgotten the wireless? Why collect 25,000 people under one roof to hear a speech or lecture, when by a mechanical device the same message can, if necessary, be communicated to 25,000,000? Yet, architecturally, the problem presented is of great interest. Either a "human" scale can be preserved, or else the form of the edifice will be deliberately contrived to belittle the human element so that the members of the audience appear insignificant. Already in St. Peter's in Rome the proper scale has been exceeded; in the Temple of Labour, three times as big, this particular problem of making a gigantic structure appear conscious of the scale of human beings will be even more difficult of solution.

STROLLING AUDIENCES

Commenting on Ambulator's letter in the last issue of THE ARCHITECTS' JOURNAL, and on the painting by Bibiena, which was illustrated as a frontispiece in the same issue, the *Evening Standard* expresses some doubt as to whether there is really a need for a theatre where the audience could promenade during performances. It is noted that the new Saville Theatre has a large salon under the auditorium, in which the audience may stroll and talk in the interval. I should say myself that such promenading space close to the auditorium was indispensable in a really first-class theatre. If a theatre audience was allowed to stroll about during the performance, the outside foyer, or salon, would, of course, become a sitting-out place, and might, in this event, contain such charming seats as those in the vestibule of the Skandia Cinema, Stockholm, of which an illustration appears on this page. To sit down before the play and during the intervals, and stroll about during the course of the performance, would be a novel and not unattractive way of spending an evening.

ASTRAGAL

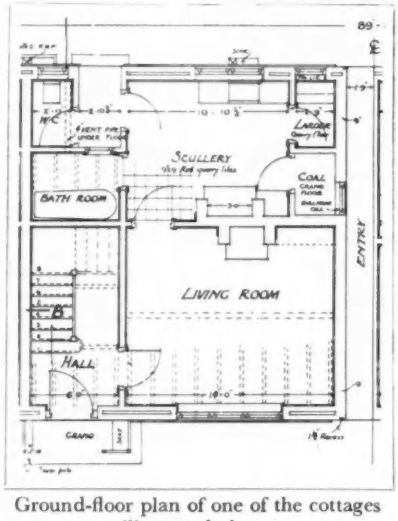
RECENT WORK AT [redacted] MELCHET COURT

FROM DESIGNS BY

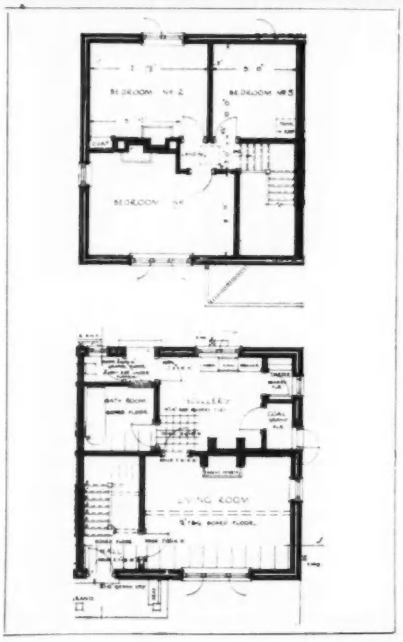
BUCKLAND AND HAYWOOD

A block of four cottages outside the entrance gate on the main Romsey-Salisbury Road.

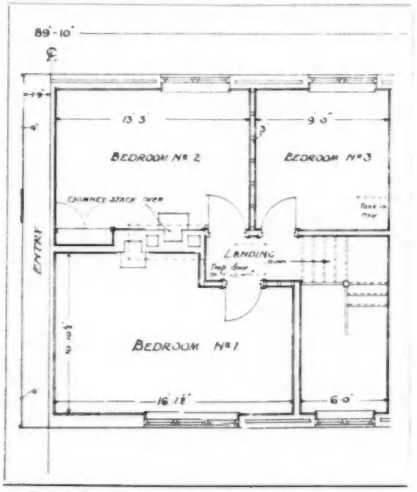


Ground-floor plan of one of the cottages illustrated above.

ON the following three pages is illustrated some of the more recent work erected on the estate at Melchet Court, near Romsey, Hants, for the late Lord Melchett.



Plans of one of the cottages illustrated below.

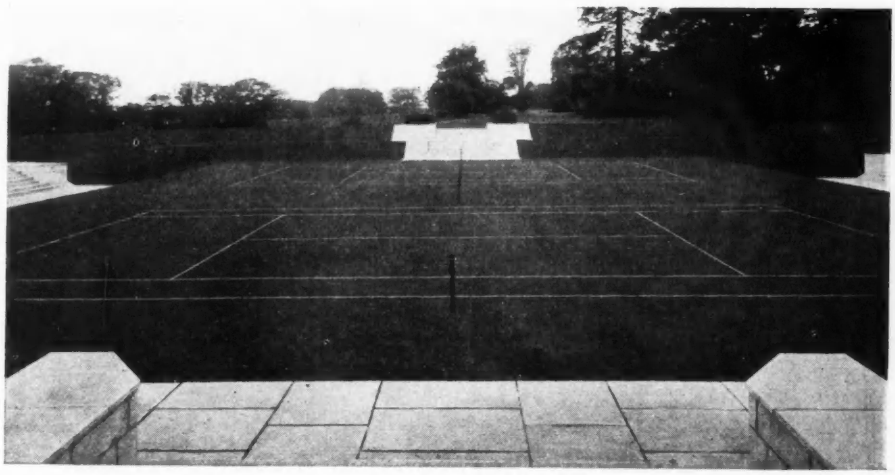


First-floor plan of one of the cottages illustrated above.

The cottages have been built to house the numerous people employed there, and the designs have been varied in order to harmonize more closely with the particular surroundings.

A pair of cottages near the Landford Wood entrance to Melchet Court. Note the design of the chimney-stacks and brick verges.

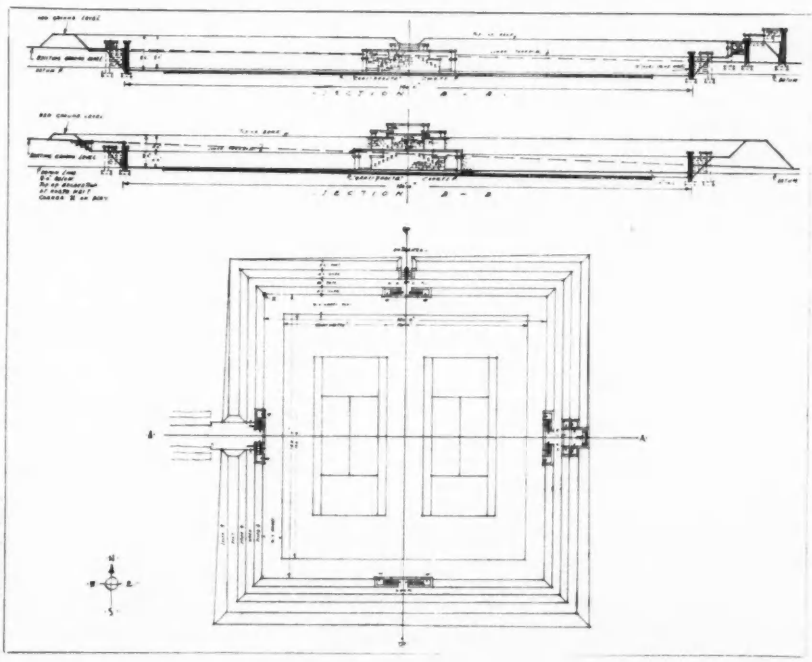
The tennis courts have a surround of stepped grass banks, 8 ft. high, which form a background for the players and afford good visibility. A near view of the entrance steps appears below.



The block of four cottages (page 300) is built with multi-coloured bricks with tile dressings to window openings. The treillaged porches give character to the whole unit.

A gabled treatment has been employed in the design of the pair of cottages in Landford Wood (page 300), the details of the chimney-stacks and brick verges being especially interesting.

The pair of cottages near the main house (page 302) have a character reminiscent of the Georgian period. The bricks are multi-coloured, laid diaper pattern, and the roof is covered with sand-faced pantiles. The linking together of the front entrance doorways and staircase windows over, carried out

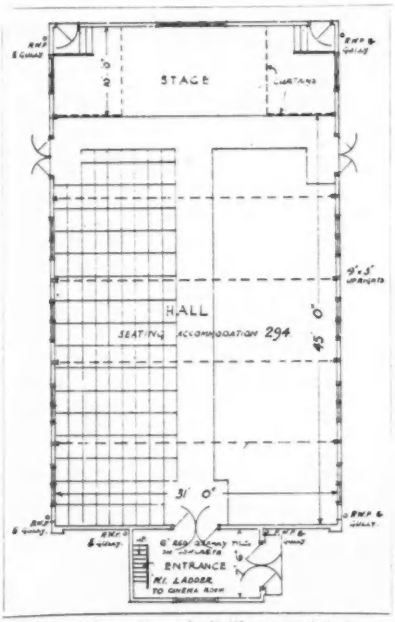


Plan and sections of the tennis courts. The overall length and width of the courts is 120 ft. respectively.

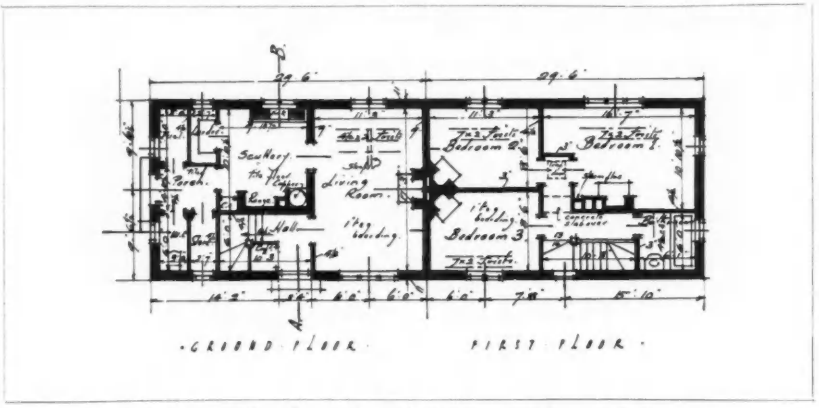
The main entrance steps leading down to the walk, which runs round the four sides of the tennis courts.

Tennis Courts, Melchet Court.] *[By Buckland and Haywood.*

A pair of cottages adjoining the main building, Melchet Court ; in multi-coloured bricks, white cement dressings and pantile roof.



Plan of the village hall illustrated below.

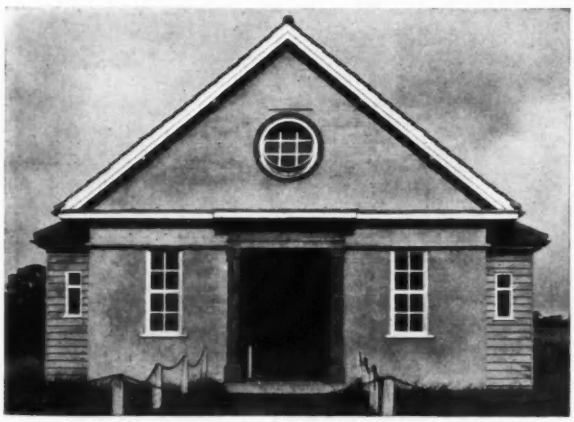


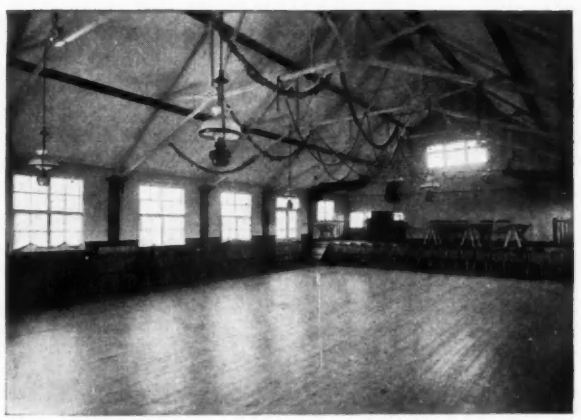
Ground- and first-floor plans of the cottages illustrated above.

in white cement, are interesting features in a well-balanced composition.

It was largely owing to the generosity of the late Lord Melchett that the building of Whiteparish Village Hall was achieved. The structure is simple in outline and expressive of its use; the entrance elevation is given a monumental character with its well-proportioned doorway and pediment.

Photographs and the architects' detail drawings of the Landford entrance gates and lodges, and a wrought-iron glazed door for a sculpture setting, appears on one of the special supplements accompanying this issue.





Cottages at Melchet Court and Whiteparish Village Hall.] [*By Buckland and Haywood.*

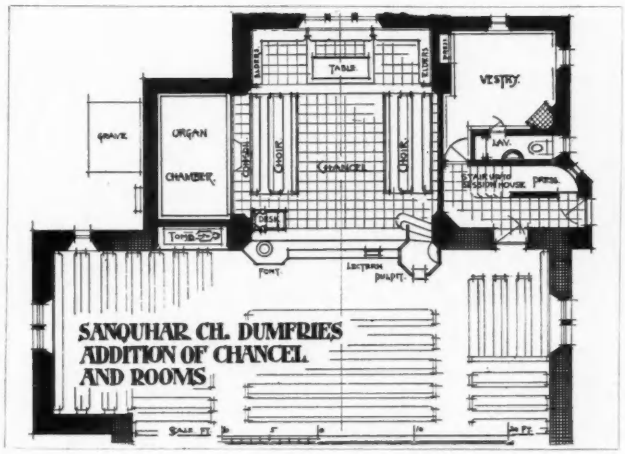
Whiteparish Village Hall, Wilts. The main front is in stucco, the remainder in weatherboarding. The roof is covered with pantiles.

ADDITIONS TO A DUMFRIES CHURCH

FROM DESIGNS BY JEFFREY WADDELL AND YOUNG

A general view of the new chancel. On the extreme left of the photograph is seen the font, and, further along, the lectern and the pulpit.

SCATTERED throughout the length and breadth of Scotland are a number of cathedrals, abbeys and parish churches which are as fine as anyone could wish to see. Sir Walter Scott made Melrose Abbey world-famous, and the Crypt or Lower Church of Glasgow Cathedral is admitted to be the finest in the world; but to the average individual who is not a Scot, these things are unknown, and Scotland has a reputation for having no ecclesiastical architecture worthy of the name. This arose, doubtless, from the fact that in post-Reformation times the churches that were built were shockingly plain and barn-like. But about the middle of last century Scotland shared in the fruits of the Gothic revival. All over the country churches were built; generally too broad, and with galleries round three sides, frequently with the pulpit in the middle of one of the long sides against the wall, and the seating grouped around it. Usually the walls were well built of good ashlar stone, with simple buttresses and traceried windows. Often all the art that was in the building had been put into the tower and spire, and invariably the exterior was more attractive than the interior. The Church of S. Bride, Sanquhar, belonged to this category. It is an ancient foundation, going back to Celtic times, and there was a fine thirteenth-century church on this site, fragments of which remain; but the problem was to modernize the interior and make it worthy of its fine exterior. This has been done, as the illustrations show, by gutting out the interior, opening up the roof, re-seating the area, building a transept, a recess for the fine mediæval effigy, and adding a large chancel, with organ chamber and vestries, as shown in the accompanying plan and views.



The ground-floor plan; and a view of the new transept. The interior of the church has been modernized by adding a new chancel, transept, organ chambers and vestries, and has also been re-seated throughout.

The font, octagonal in shape and executed in oak, is situated below the chancel arch. Another view of it is seen in the photograph on page 303.

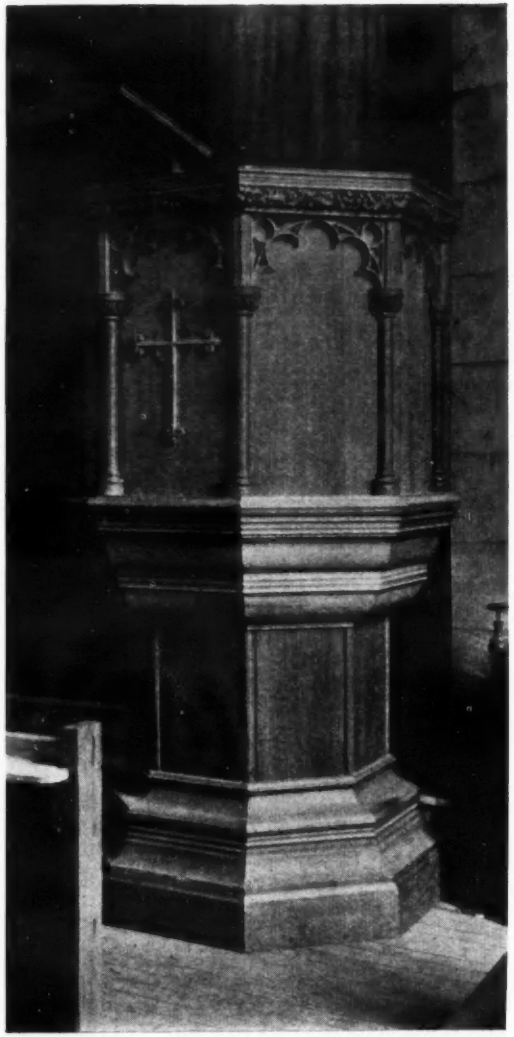
[*By JEFFREY WADDELL AND YOUNG*]

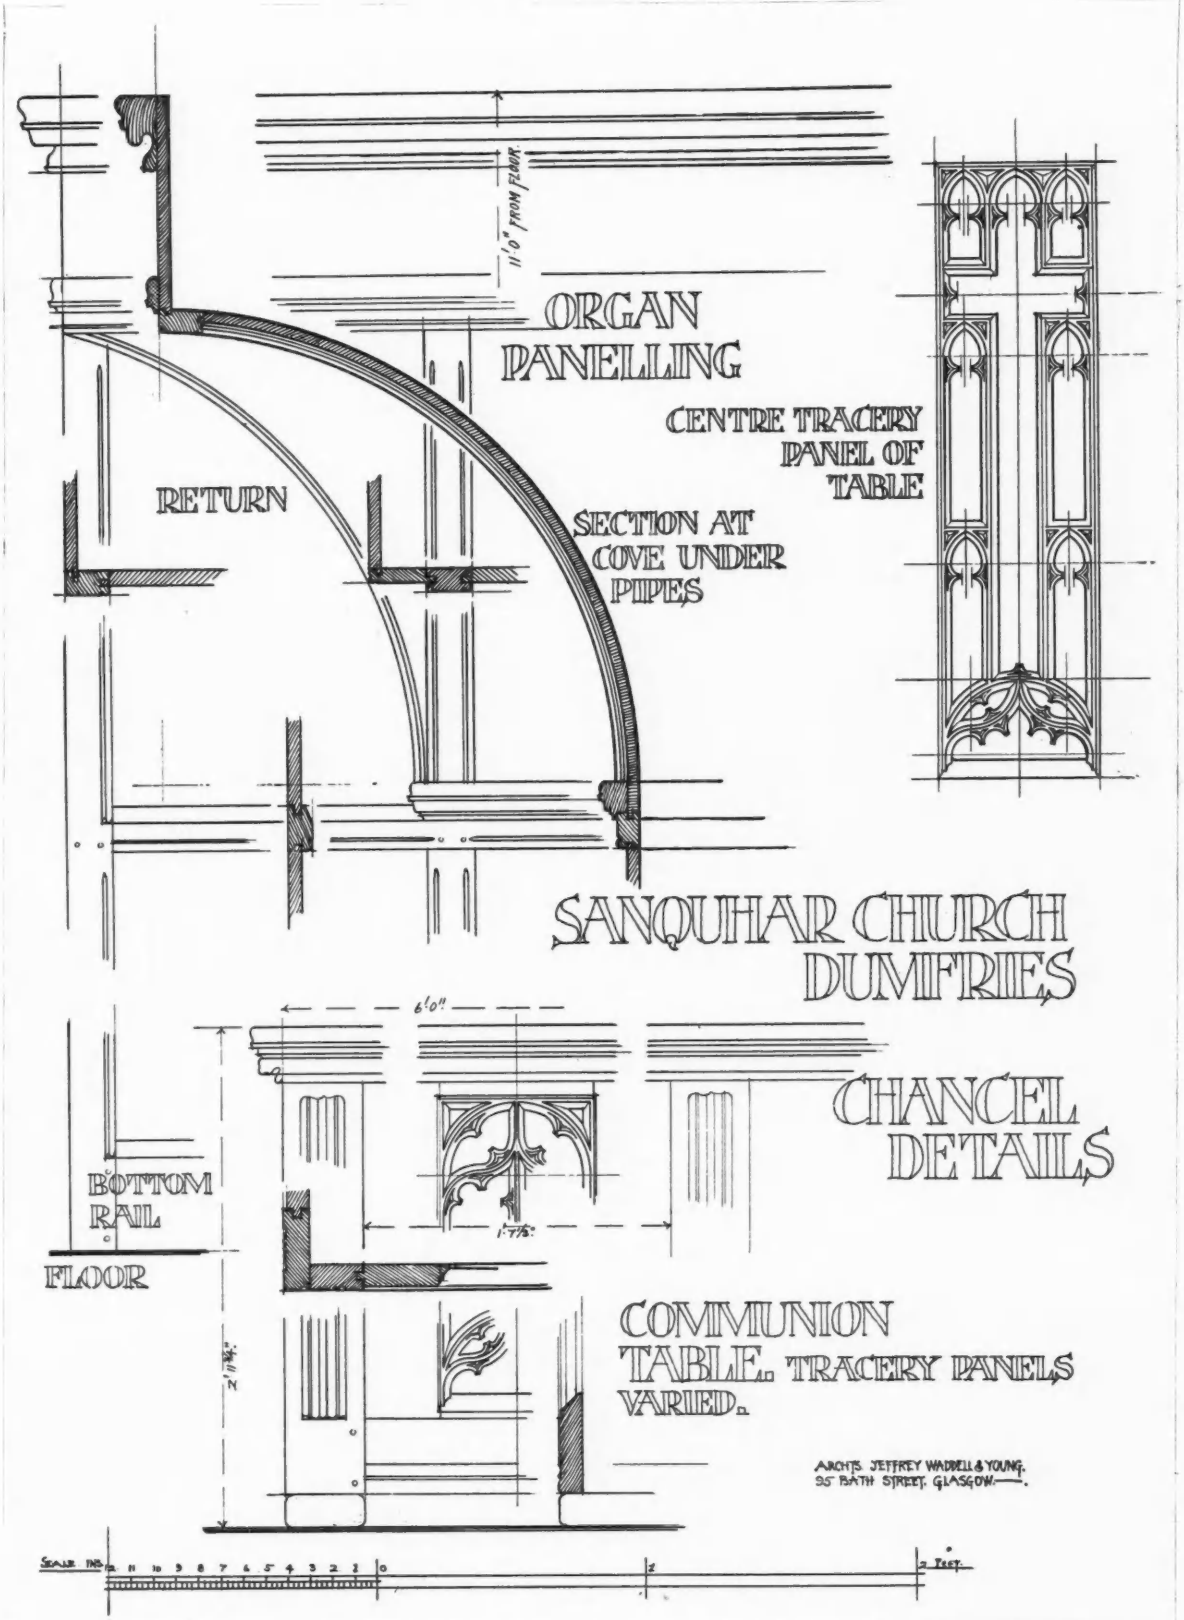
The communion table is of oak, and the steps are of marble. The architects' detail drawings of the tracery panels are reproduced on page 305.

A night view of the chancel. The organ is in the recess beneath the pipes on the left. Behind it is the organ chamber.

[*ADDITIONS TO A DUMFRIES CHURCH*]

The pulpit, like the font, is executed in oak. An inscription has been inserted in the panel immediately beneath the reading desk.





Additions to a Dumfries Church.] [*By Jeffrey Waddell and Young*

The architects' detail drawings of the chancel fittings, which are carried out mainly in oak.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xv

THE LAW'S MAJESTY

BY KARSHISH

(H. B. CRESWELL)

BEFORE I embark on an account of my second disaster I must fulfil my promise and give a short account of circumstances which led to my first, and which involved the Eureka Plough Company in arbitration and the loss of more than two thousand pounds. These circumstances, as I have said, remain unique in my experience and constitute a remarkable instance of the pitfalls that beset the architect, and of the devices by which dishonest purposes may profit by law to the confusion of justice.

There was access to the company's land at the back of the works both on the west, from Albert Road, and on the east from Sussex Street. The contract laid down that the contractor was to "form and maintain a suitable temporary road from the fence enclosing the site to the public road," for the purpose of carting away the twenty thousand cubic yards—more or less—of spoil from the "excavating for levels" which was comprised in Contract I of the Machine Shop Extensions; and, as firms tendering were at liberty to use whichever of the approaches suited them best and Sussex Street was the nearer to the site, the quantities—which formed part of the contract—gave the yard-run measure of the temporary road to Sussex Street as a "provision," so that any firm adopting the Albert Road access would know that a *pro rata* allowance for the increased length of road would be made to them. Mr. Andrew Gorringe, the successful contractor, elected to use Sussex Street.

Sussex Street was a little blind road that ran from the boundary of the company's property to the highway. It was only two hundred yards long, but it became a nightmare to me. It was a fashionable little street, with artisans' villas lined up on either side of it like strips of pink postage stamps, each with its bay window and a photograph of a well-dressed person—like an effigy from Madame Tussaud's—looking out into the street between a pair of lace curtains. Social appearances were strictly upheld in Sussex Street. At the risk of appearing discursive (and also a cad), I will add that in Sussex Street, as in higher walks of life, the best fruit was arranged at the top of the basket; for the company owned three of the houses, and it was my duty to see the backs of them as well as the fronts. In one a fitter, his wife and eight children lived entirely in the small back kitchen, in company—as make-weight—with a majestic St. Bernard dog; in another the coal-hole accommodated a perambulator and two bicycles which had been adopted as hen-roosts by the fowls from next door; and in the third the explanation given me for the paper being torn down in strips from the wall of a bedroom I had decorated three months before, was: "Yes. That would be my lodger lighting his gas from the passidge, of a night."

Gorringe had not long been digging before the residents of Sussex Street complained of the state of the road—and with good reason, for it fell from grace almost as completely as their own back yards. Clay, dropped from Gorringe's carts, formed a dense mud which prevented the road from draining and softened it so much that it speedily began to crush down under the heavily-loaded wheels and stamping hoofs. These complaints were passed on to me, and I called upon Gorringe to mend his ways; for he had contracted to "hold the company blameless from all damage to persons or property," etc. It then came out that Sussex Street had not been "taken over" by the local authority—the Nollingborough Urban District Council; for the road was a new one—shoddily made by speculators who had laid out the street—and the time had not yet come when need for repairing it would lead the Council to step in, impose a charge per foot of frontage on the owners of the property bounding it, properly re-make it, and maintain it out of the rates in common with other public roads. In some way or other, I also gathered up the surveyor of the District Council upon my shoulders in addition to the owners and tenants of Sussex Street, and Gorringe who was the heaviest burden of all.

The wrangling was interminable. The tenants complained to the company, whose servant Gorringe was; and to their landlords, who were the owners of the houses. The owners complained to the company, and also to Gorringe. Complaints were made by members of the public to the Council, who called on the owners to "keep in repair." The owners said: "It's not our fault; why don't you make Gorringe repair?" The Council complained to the company, and the company said: "Do it yourself: it's your business, not ours." The Council replied that Sussex Street was still technically a private road and it was impossible for it to be re-made and taken over until the carting was finished. Gorringe said he was using all precautions, and only three-quarters filling his carts—which was not true, for his whole course of more than a mile to the tip was marked by his droppings. Finally he fitted side-boards to the carts, and put on a wretched old man with a shovel to make a show of scraping aside the clay and mud. Before long, however, Gorringe was obliged to mend the road with broken rubbish to enable him to haul over it at all; yet, among all the preposterous considerations he urged, there was no suggestion of an extra, although the contract laid down that no claim for extra would rank unless it was made at the time the work was done. Thus with wrangling, complaints, protests and muddle and general disgust—the whole burden of which weighed on me—the contract was completed and new quarrels staged.

The first of these arose when I named the day from which the bonuses earned by the contractor were to be computed—for it need scarcely be said that, under the indulgent revision of the contract, Mr. Gorringe had no difficulty in earning big ones. It devolved upon me, as arbiter between contractor and building owner, to certify those dates: I did not press unduly upon the contractor, but, after hearing all he had to say, did him something more than justice for I knew the directors had no wish to avoid their full obligations. Gorringe, as usual, opened his mouth to full stretch as though, instead of a fact to be determined, a bargain was to be struck by haggling and the halving of differences; but, in the absence of any grounds for doing so, I refused to alter my decision.

The next struggle was also a personal one; and it employed us a whole day upon business that should have been settled in a couple of hours.

It was laid down in the contract that the contractor was to satisfy himself of the accuracy of the quantities for excavating for levels; and that if he raised no objections before he began the work, it was to be understood he accepted those quantities as accurate. He raised no such objection; but when the contract was revised and the new arrangements made for early completion, he persuaded Mr. Stevenson to agree that the excavating should be re-measured at completion; and as he was relinquishing part of what was included in his contract, his demand had more plausibility than most of his contentions. He had, no doubt, all along held a demand for re-measurement up his sleeve; for he must have

observed that the slope into which he dug showed on section a concave line and not a straight or a convex one, so that, after the ground had been dug away and there was no means of proving what the contours had been, the perpendiculars of an assumed uniform slope from back to front, would yield a much greater number of cubic yards of excavating than had, in fact, been dug. Gorringe, however, insisted that the transverse contour had been in great part *convex*, and as I had not made a contour-plan of the ground, and he refused to accept the notes in my surveying book on the ground that the company had agreed to *re-measurement*, I was obliged to compromise with the averaged contour represented by a uniform slope. By this means he probably got paid for nearly two thousand cubic yards more excavating and carting than he had performed.

When we began the actual levelling there was a wrangle nearly every time the staff was planted; and at one time Gorringe and my clerk appeared to be fighting for possession of it, for Gorringe would not allow the staff to be planted as the ground at the top of the cutting happened to come, but contested for inches—once actually trying to get the staff set up on what was clearly a mole-hill.

The vexation of all this nonsense was beyond endurance; but Gorringe must have gathered several hundreds of cubic yards by his shameless indulgence in it. The clerk who represented him at the level was an independent surveyor employed for the purpose, who read fairly and seemed abashed at what was going on, or things might have been even worse than they were. I came near refusing to measure and to insisting that the whole business should be handed over to an independent estimator; but if the contractor did not agree to this proposal it could only be enforced by an arbitrator; and, if he did agree, the person measuring would have to depend upon evidence of the former conditions, and a new and more formidable wrangle would have to be staged.

The last misery before the appearance of solicitors on the scenes, and the strain of the preliminaries of a reference to arbitration, was the receipt by me of the contractor's Statement of Account.

Gorringe had ended our differences over the dates of completion with the shrug of a man who makes the best of a bad business; but it was now to appear that he had done this to mislead me into thinking he had given way on the point so that I might be less inclined to oppose him in other matters, for his Statement included bonuses calculated from the dates he had named, but which I had disallowed. This extra claim amounted to £370.

There were three or four foolscap sheets of items extra on measurements taken in the quantities, or for work stated not to be fully covered by the descriptions in the bills; and the minute honesty of Mr. Gorringe was shown by his allowing one small omission item, of the value of four pounds three shillings and four pence. These details were all insignificant matters that would involve enormous labour in unravelling. The total value of the whole was something under £450.

Next came a charge for forming and maintaining temporary roads *inside* the fence enclosing the site. The specification required, as has been said, a temporary road from this fence to the public road, and a provisional item to cover it was included in the quantities. The contract further required the contractor to provide any tracks that might from time to time be necessary, inside the fence, and this also was covered by a general item in the quantities. Although there had been, from first to last, no confusion, nor any suggestion of a claim, for measuring the tracks inside the fence, the contractor now set it up, and based it—as we were later to find—on a quibble by which the word "site" in the specification was interpreted to mean either the area to be occupied by the building, or the ground enclosed by the fence surrounding the whole scene of operations, as best suited the contractor's ends. The amount of this claim was £560.

There was next a charge for forming and maintaining a temporary road *over the whole length of Sussex Street*. This, as we learnt when we came to arbitration, was based on the argument that Sussex Street, not having been "taken over" by the urban authority, was not a "public road," but a private road; and as the contract included a provisional measure for a temporary road "from the fence enclosing the site to the public road," Mr. Gorringe contended that he was entitled to include the length of Sussex Street, up to the public highway, in the measure of temporary road, and to be paid for it at the rate he had affixed to the provisional measure, since he had had to maintain and to repair Sussex Street. I may mention that our leader, an eminent K.C., afterwards scoffed at this contention. "It's all nonsense," he said; "Sussex Street was in public use and was, for all applicable purposes, a public road." The amount of this claim was £162.

Lastly, an allowance was claimed for "extra carting over temporary roads." This claim was so intricate and ingenious that it can only be made clear by illustration.

The excavating was in two parts: "A" and "B." The total contract measure of "A" and "B," together, was 20,000 cubic yards. "A" was relinquished by the contractor, who, after privately measuring, declared the amount to be 8,700 yards, which made the contract measure of "B" stand at 11,300 yards. The *actual* measure of "B" had, however, been agreed at 14,000 yards, so that the *contract* measure of "B" was 2,700 short, and therefore, *in respect of "B,"* the contractor had maintained temporary roads in excess of the contract provisions.

It is obvious that, as Gorringe had contracted to cart 20,000 yards, and had only been required to cart 14,000, an omission, and not an extra, was indicated; but my good friend argued that the new arrangement under which he relinquished "A" did not affect any matters not specifically included in that agreement; and he declared that, in coming to terms, he had allowed for a saving on road maintenance, and had relied on the quantities being correct. He, therefore, made up his little bill somewhat as follows:—

	£	s.	d.
178 yds. run temporary road as per provision in contract	133	10	0
747 yds. run temporary road inside fence	560	0	0
216 yds. run temporary road Sussex Street	162	0	0
Total	855	10	0
Following on this, he argued: As 11,300 yds. is to £855 10s., so is 14,000 yds. to the answer, which he gave quite correctly as	1,059	18	3
An extra of	204	8	3

Most people will think that this £204 8s. 3d. was better merited by the ingenious labours in claiming it than by the work represented in the claim.

The company refused to entertain any of these charges, and were indisposed to parley with Mr. Andrew Gorringe. Our Counsel, who had told us in consultation that the other side had not a leg to stand on in the major claims, was not, as so often happens, able to justify that opinion; for he was detained in court in the provinces, and the lesser man, also a K.C., who took charge of our destinies on the day before the hearing, had not the opportunity—nor, I thought, the ability—to master the intricacies and niceties of the case. The arbitrator was a very big, heavy surveyor—thick in limb, thick in body and thick in head; and he was unable to cope with the nimble wits of Gorringe's Counsel in the absence of a like agile equipment in ours. How the arbitrator arrived at his award I do not know, for he was not, as a judge is, obliged to tell us, and wisely preferred not to do so; but Gorringe must have won on nearly all the items, for the company had to

pay him more than £1,500 and his costs, in addition to the costs of the reference, and, of course, their own as well.

This ends the history of my first contract and my first disaster; but before I had finished instructing solicitors, collecting evidence and securing proofs, I was up to my neck in another contract and involved with another builder. How far this disaster was my fault the reader must judge. My own view is that I deserved more praise for getting the company out of pickle, than blame for putting them in it.

The contractors, who under Contract III erected the superstructure of the Machine Shop Extensions—including steelwork supplied under Contract II—upon foundations laid by Gorringe under Contract I, were not, in a true sense, builders, but were the kind of specialized financial adventurers, better called "contractors." P. and F. T. Wagworm, Limited, of Loughborough, was a private firm of twin brothers and a retired solicitor's clerk who had been allotted one share so that the brothers might limit their liability by constituting themselves a company—on the principle popular in America where a man, when his "bid" turns out all right, may make over his gains to his wife; and, if it does not, go smash and start afresh. The two Wagworms were, as twins, imperfect: although they aggravated their disconcerting facial and bodily resemblance by dressing alike in frock coats, lie-down collars, black bow ties and bowler hats—so that they looked as though they were a pair of undertakers slipping round the corner for a drink—they were not in the least of a size, so that the effect they gave of large and medium, in a special offer of Wagworm samples, was grotesque. They were youngish, pulpy, fair men, with long yellow moustaches and peach complexions, who looked as though they still fed through rubber teats; and as they were never seen apart I got the idea that they slept side by side in the same bed.

How I detested these men! They seemed to bring a spiritual effluvium with them when they came to my office in company with a gloomy, emaciated old estimating clerk to try and bluff me into certifying money they had not earned; or with men who were obviously sub-contractors, though stated to be in their employ, to cajole me into accepting work or materials inferior to those specified. The Wagworms were, however, capable organizers, bent on getting the contract finished out of hand, collaring the bonus for early completion which the company had offered them as a free gift after their tender had been accepted, and rushing off to land other fish.

The whole of the steelwork was on the site, erection-marked; exact drawings and a detailed specification were in the contractor's hands; they had brought their plant on to the ground allotted to them, and Piggott had put in a siding to receive trucks consigned to them. I saw all in train and the work started, and then went off for a four weeks' holiday after seventeen months of real, slogging work.

When I came back I could scarcely believe my eyes. The brickwork was everywhere up twenty feet; bricklayers were strung out along the walls like swallows on a telegraph line; and a forest of stanchions met my gaze. The weeks went by and the building rose like magic. By the time the walls were up the great lattice girders carrying the roof were being slung thirty-five feet into the air from shear-legs, and soon the patent glazing was slipping into place as one might tile a kitchen floor. Carpenters swarmed on the roofs; and slaters also, after I had condemned two samples of slates and sent back the first truck delivered, and had also had part of the roof stripped because I found slaters with composition nails in one pocket, only, of their aprons, and galvanized in the other. Piggott put me up to this: he noticed some galvanized nails dropped about. In this he served his own ends as well as mine, for he liked nothing better than doing a contractor in the eye: it was his view that no contractor did his work as it ought to be done, or, in other words, as Piggott himself would go for to do it. The building rushed up: the bonus, in fact, seemed in everyone's blood. It could only get there, of course, by way of the pocket.

Thus all went merry as a marriage bell. Beverly Kent had at last seen architect's work that he could suffer in silence; I was happy in the general atmosphere of success; and the directors were also highly content, but attributed the cause of their contentment, not to the activity of their Resident Architect, but to their own acumen in offering a bonus: yet in this they were hasty. When the last of the roof was being slated; the wood-block floor half laid and the painters getting along with the third coat; it was discovered that the hurry to earn the bonus had led to a mistake which, for more than a week, made it appear that the whole of the steelwork, including the stanchions and roof, would have to be taken down and re-erected.

NEXT WEEK: XVI—A FAILURE AND A SUCCESS

LETTERS FROM READERS

Art and Industry

SIR,—Mr. Carrington's proposals regarding an International Exhibition in London five years hence on Design in Civilization reminds me of Hans Andersen's story of *The Emperor's New Clothes*. If the newly formed Board of Trade Committee under Lord Gorell's chairmanship is to perform a real service to industrial design, it won't emulate the weavers in the story who persuaded the Emperor to have clothes made of the magic material that became invisible to everybody "who was either unsuitable for his position or very stupid." The weavers knew that the Emperor wouldn't admit that he couldn't see the new clothes they pretended to make of that material, and they banked on everyone else lying about the affair too, with the result that the Emperor paraded the streets of his capital in the best gent's underwear, while all the spectators pretended to admire the clothes that weren't there. If the committee is going to persuade this country that there is any industrial design worth exhibiting, and if the constitution of the committee is so august that people will be afraid of being thought "unsuitable for their position or very stupid" if they differ from its conclusions, we shall be landed into exposing British industry's deficiency to the world just as ridiculously as the Emperor's undergarments were exhibited to his subjects.

The committee's terms of reference are admittedly difficult; a trifle idiotic perhaps, but they are at least consistent with the English love of putting the cart before the horse. Only humourless officialism could conceive that preparations for exhibitions should come before a critical examination of whether there is anything fit to exhibit. Infernal phrases, like looking a gift horse in the mouth, are always being dragged from their tombs to frighten people from being candid about some potentially stupid thing at the particular time when its potential stupidity wants emphasizing. By great good fortune there are on this committee such men as Howard Robertson, Clough Williams-Ellis, C. A. Richter, Harry Trethowan, Roger Fry and Professor Tristram, and one cannot imagine those lucid and vigorous minds allowing the committee

to recommend anything that would bring upon British industry the sort of ridicule that would inevitably follow the application of Mr. Carrington's suggestions. Before those suggestions are seriously entertained, a period of constructive and intensive education in the economic significance of good design must first help industrial administrators to organize the production of "articles of everyday use and good design" that could be exhibited for the benefit, and not to the detriment, of British industry.

If the committee needs evidence of the peculiar deficiencies of British industrial design, the architectural profession, as Mr. Carrington points out, can indicate many of the directions in which education and improvement are essential. Such organizations as the Design and Industries Association and the Royal Society of Arts are also equipped with valuable experience in liaison work between design and industry. No doubt this experience, and indeed the whole body of constructive criticism that has been built up during the last quarter of a century, will be at the disposal of the committee. But what would help the committee's work, and the improvement of industrial design, and would indeed advance the whole cause of civilized prosperity in this country, would be two or three exceptionally severe winters, which would clear out of the boardrooms of the land the senile and obstructive survivals of that time of easy money and planless muddle—the nineteenth century. JOHN GLOAG

SIR,—I was interested to read the proposal made by Mr. Noel Carrington with reference to the setting up of a permanent or temporary exhibition with a view to stimulating industrial design. I am certainly of the opinion that there is a very wide scope in this country for improvement from an artistic point of view in many of the objects that we come across in our everyday lives, from the architecture of houses to the design of common articles of household use. Many of these, through lack of knowledge and taste, are unnecessarily far below a decent æsthetic standard, and if opportunities are afforded of seeing the best that can be produced in these directions I am sure it would have a valuable educative effect both amongst the public and among those whose task it is to produce such things.

I believe they have even gone so far in Germany as to have exhibitions of ugly articles showing what to avoid, and no doubt such a collection would be both valuable and interesting. I am inclined to think that exhibitions of a permanent nature are more useful than those that are gathered together for a temporary special purpose, and if representative designs and articles of the best that we can produce in this country were shown regularly in our museums and art galleries, both in London and throughout the country, this would seem to be most likely to produce the result desired.

No doubt we shall be receiving in due course expert advice on this subject from the recently-appointed Board of Trade Committee under the chairmanship of Lord Gorell, dealing with the relationship between art and industry.

There are some very good names on the committee, but glancing through them it does seem to me most regrettable that there is no direct representative of the craft of the decorator, in view of the vital part which it plays in the selection and use of the whole range of decorative materials, and I sincerely hope steps may be taken to remedy this omission. Architecture receives the recognition which it is richly entitled to, and it will certainly make a valuable contribution to the discussion of the subject and the conclusions drawn. GEOFFREY LE M. MANDER
(CHAIRMAN, MANDER BROS., LTD.)

[Mr. Henry G. Dowling, president of the Incorporated Institute of British Decorators, has now been appointed a member of the Committee set up by the Board of Trade, under the chairmanship of Lord Gorell, to deal with the relationship between art and industry, referred to in the preceding correspondence.—ED., A.J.]

The Cups Hotel, Colchester

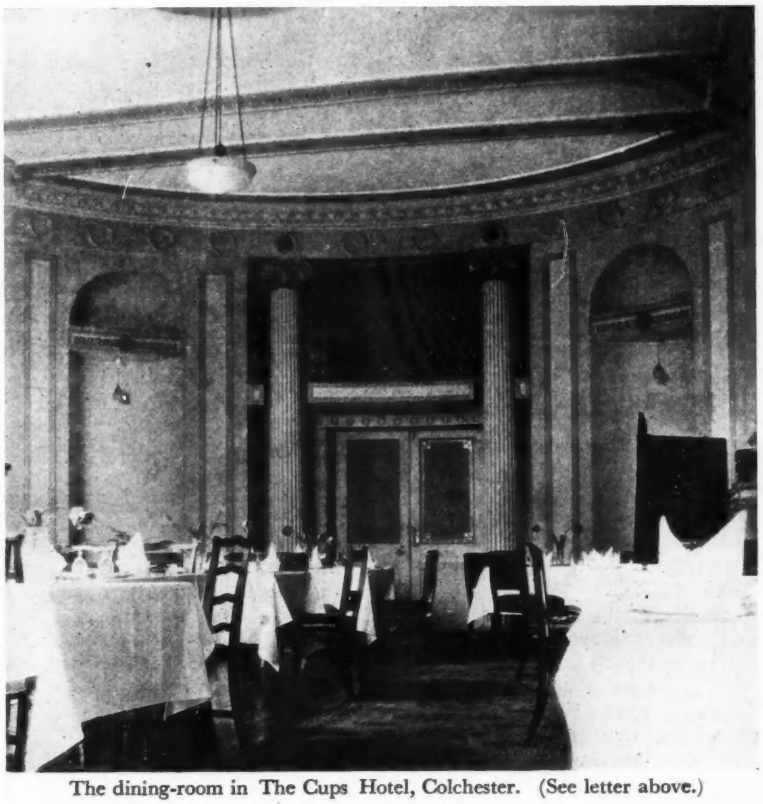
SIR,—The dining-room of The Cups Hotel, Colchester, of which I enclose a photograph, was evidently built as a ballroom, since when it has suffered many vicissitudes. One fireplace has been entirely altered, the doors have suffered mutilation and the floor-level has been raised about four inches.

In spite of this it still remains an imposing room, unexpectedly hidden behind an Edwardian front in the best villa-classic tradition of brick and stone.

Judging by the design, the architect was a local man working in the Adam manner, but influenced considerably by the Greek revival. The musicians' gallery shown in the photograph is a delightful piece of detailing. I was unable to discover any historical facts about the room beyond those deduced from its design. S. H. GARDNER

Building Costs

SIR,—In his references to an article that appeared in *The Times* as to building costs, Astragal, in the last issue of the JOURNAL, makes a small slip. The writer of the article does not contend that in 1913 the machine could do no more as regards lowering costs of building in the face of



The dining-room in The Cups Hotel, Colchester. (See letter above.)

advancing wages, but that such a time would come.

For all that, in connection with the erection of small houses with the older materials, it is at least arguable that such a time has come. Small builders, with no better equipment than the proverbial two trestles and a scaffold board, are even now assembling the machine-made parts at least as cheaply, if not more cheaply, as large contractors with thousands of pounds' worth of plant. Astragal, therefore, though slightly in error in detail, sums up the case very ably. "READER"

The Pedestal Basin

SIR,—The builders who fixed the particular fittings alluded to in your issue for August 19 are correct in stating that it is not, generally speaking, practicable to fit up pedestal basins in the way your correspondent desired his work done.

It can be, and has been done as we know, in the way desired. But it means that cost has not been taken into account, and if the supply pipes are laid in the floors, or brought up through the floors, a responsibility is undertaken by the owner, for there are possible leakages to be taken into consideration.

It is also necessary for lead or other easily pliable pipes to be provided in such cases, and the chance of damage to ceilings underneath has to be thought of, which is not always possible to avoid when pipes are hidden away out of sight.

As the pedestals are now made with large slots cut out at the back, pipes can be brought up inside them for a certain distance, and then taken out through the slot, shaped, and connected up to the taps and waste, but we do not consider this a very practicable job.

Another way would be to form a shield of pottery as a pedestal to use whenever it is desired entirely to cover pipes that are unsightly; but here, again, there are many disadvantages to be faced, and the cost of such a shield would be against its adoption. Also, to cut out a slot to the floor would lead to considerable loss to the manufacturer of the pottery; so that, considering everything, our opinion leads us to agree with the builder, who ventured the opinion that it was not at all practicable.

In fixing pipes, a great deal can be done to minimize the unsightliness of them by the skill of the individual workman. GEORGE JENNINGS, LTD.

SIR,—We note with interest your correspondent's letter regarding the pipes in connection with a pedestal lavatory basin, and feel, like the average politician, that we are able to sympathize with both parties.

Taking your correspondent's view first, we are entirely in agreement with him in desiring all piping to be as unobtrusive as possible. We are afraid, however, that he overlooks the point that the pedestal of a pedestal lavatory is designed chiefly as a support, other means not being suitable, or as a matter of personal preference. These pedestals, which vary greatly in shape and capacity, are made hollow solely for manufacturing reasons and not with the intention of concealing pipes, although the hollow nature suggests this. An experienced mechanic, under suitable direction and supervision, could arrange his supply and waste pipes with trap in a symmetrical fashion without offence to the eye of a cultured individual, curling and sprawling pipes being evidence of an uninformed outlook in these matters.

The pedestal forms an excellent screen where due regard has been paid to the arrangement of the pipes, and we repeat that this grouping need not be at all unsightly.

In conclusion, while it is not impossible to accommodate the hot and cold supply pipes, trap, and waste pipe in a pedestal of suitable dimensions, it is very close work, and frequently outside the capacity of the "curling pipe" exponent. The major objection, however, is that the important joints connecting the main supplies and waste to the branches at floor level are out of sight and inaccessible, as also is the cleaning screw of the trap. Consequently, any leakage therefrom must assume extensive proportions before indicating itself on the ceiling below.

In a good installation there is also the question of the disposal of the vent pipe, which can hardly be accommodated in the pedestal, and this question is not satisfactorily settled by the omission of this valuable detail.

REG. H. HELLYER
(DENT AND HELLYER, LTD.)

SIR,—Ample provision is made by earthenware manufacturers for the taps and waste to be taken through the pedestal, and we cannot for a moment see what objections the builder could raise to taking the pipes through it.

W. HULME
(MANAGING DIRECTOR
MORRISON, INGRAM & CO., LTD.)

HOLIDAY SKETCH CLUB COMPETITION: RULES

1. One more competition is to be held to cover the 1931 holiday season, the closing date being Tuesday, September 15 next.

2. The competition is open to any reader of THE ARCHITECTS' JOURNAL.

3. Two prizes, a first prize of Ten Guineas and a second prize of Five Guineas, will be awarded for the best and next-best sketches sent in.

4. No competitor can win more than one prize.

5. A maximum of five drawings may be submitted by individual competitors for the competition and must be sent complete under the same cover.

6. The size of the drawings is not to exceed that of Royal drawing-paper, i.e. 24 inches by 19 inches.

7. All drawings should possess some definite architectural or craftsmanship interest, but they need not be exclusively concerned with buildings, and drawings of boats, vehicles, etc., will also be eligible.

8. The drawings will be judged by the Editor of THE ARCHITECTS' JOURNAL, whose decision will be final.

9. Entries for the competition should reach the Editor of THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, Westminster, S.W.1, by the first post on September 15. The result of this competition will be announced in THE ARCHITECTS' JOURNAL for October 7.

10. A motto of one word is to be chosen by the competitor, who will remain known by this motto until the award has been made. Only then will his identity be divulged.

11. Each entry must be accompanied by a sealed letter giving the competitor's name, address and occupation (whether principal, assistant or student). The letter should also state that the competitor will observe the rules of the competition and that the drawings submitted are his work, executed on his holiday this year. It must be enclosed in an envelope sealed with a blank seal and bearing nothing but a motto label on which is written the motto chosen by the competitor and the number of drawings entered. Copies of this label will be found on page 291 of the last issue of THE ARCHITECTS' JOURNAL.

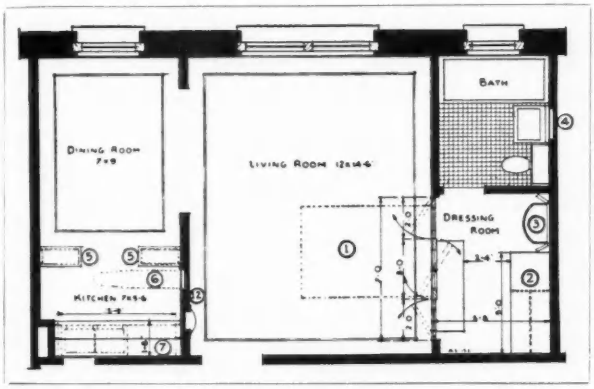
12. Each drawing must bear on the back a similar motto label bearing the competitor's motto and the number of drawings entered. No other means of identification must appear on the drawing. Drawings bearing a signature will be disqualified; so will drawings not bearing the printed motto label.

13. Owing to the drawings being submitted under a pseudonym no acknowledgment can be sent.

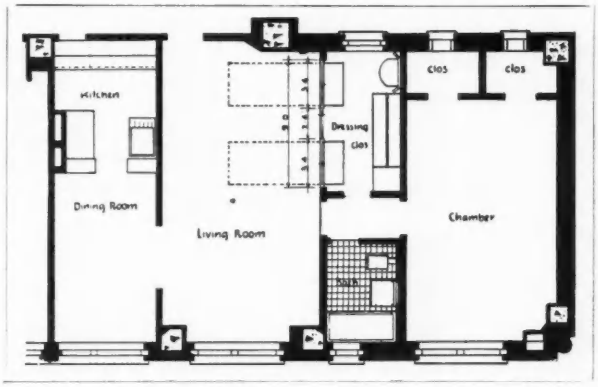
14. THE ARCHITECTS' JOURNAL will publish a selection of the drawings submitted.

15. No responsibility can be taken by the Architectural Press for loss or damage.

THE HOTEL OF YESTERDAY AND TODAY



Plan of a standard suite-flat in an Apartment Hotel in North Avenue, Chicago. Jarvis Hunt, architect.



Plan of a standard suite-flat in the Georgian Apartment Hotel, Evanston, U.S.A. Albert Hecht, architect.

THE eighth of the Julius Hoffmann Verlag's *Baubücher*[1] is absolutely indispensable to the hotel-architect and the hotel-proprietor. So exhaustively technical and detailed is its survey of everything pertaining to hotel construction and hotel equipment that its appeal to the general reader is perhaps rather more doubtful. And yet this is an absorbingly interesting book.

Problems such as centralized and decentralized kitchen layouts are authoritatively and dispassionately discussed. We learn that for every square metre of restaurant space, 0·3 square metre of kitchen floor-space will be required; whereas for the preparation of breakfast alone only 0·02 square metre of kitchen space per square metre of bedroom is necessary. Restaurants must aim at intimacy and no longer exceed one floor in height. A *bidet*, which not one English hotel in 500 provides, is a necessity, not a rather dubious Gallic luxury. Suppression of boot-jacks has disastrous results for the chairs and curtains. The question of wood and metal for beds has apparently not yet been definitely solved. The rug has

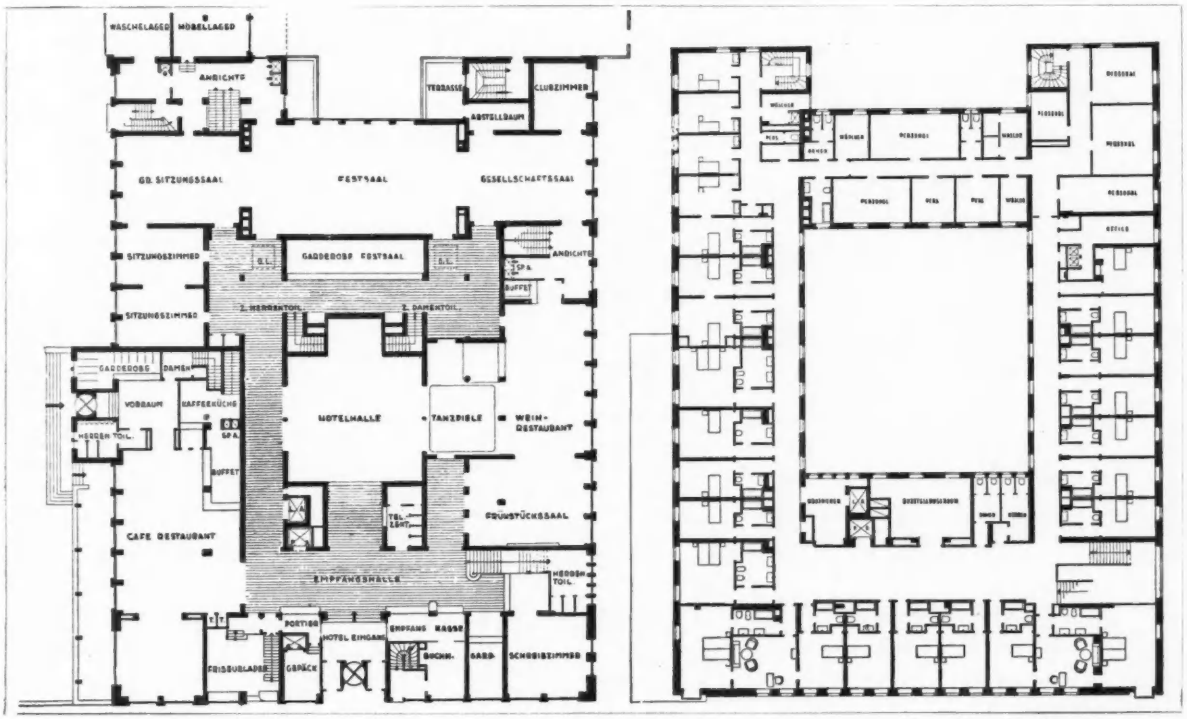
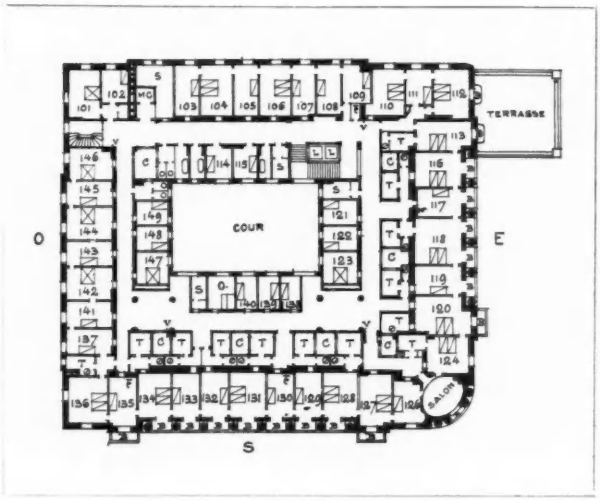
Breidenbacher Hof Hotel, Düsseldorf. View from the Hindenburg wall. Professor E. Fahrenkamp, architect. The hotel at last succeeds in achieving true civic dignity without ostentation or bombast. This building, one feels at once, could not possibly be in America, or the work of an American architect.



[*From* Der Hotelbau von Heute.

Ground-floor and typical upper-floor plans of the Breidenbacher Hof Hotel, Düsseldorf.

Bellevue Palace Hotel, Berne: a typical pre-war Swiss example of the "luxury" hotel, in which great importance has been attached to façade values.



from one's bed. Hand-drying apparatuses are on the market, as are also washing basins with a separate vent for gargling. Baths, like furniture, are built as much into the walls as possible. In some cases the bed alcove is being revived for the same reason. Bath rooms need to be automatically ventilated ten times per hour, though in the case of the kitchens this has to be increased to 25–30 times an hour.

As regards construction, the steel frame has certain undeniable advantages over the concrete skeleton: it occupies a shorter time in erection, it saves valuable space in basement floors, its parts are largely interchangeable, it offers greater facilities for building on new stories, it affords a saving in weight, it has an ultimate value as scrap iron. The last is a more important consideration than it might seem at first sight, for Herr Kunz scales down the life of a modern hotel from 35 to 20 years. P. M. S.

A general view of the Hôtel de Paris, a plan of which appears below.

Hôtel de Paris, Boulevard de la Madeleine, Paris. Molinié et Nicod, architects. An ugly, but ingeniously planned triangular building of reinforced concrete construction, faced with stone. The four top floors are progressively set back.

THE SPECIFICATION WRITER

Steam-heating an Open-air Swimming Bath

THE effective heating of an open-air swimming bath naturally presents difficulties not encountered with covered baths. With the latter, some form of heating and purifying apparatus is always used, but only a few cases are known where plants have been installed for open-air baths. In the case of the swimming bath at St. Helen's School, Northwood, Middlesex, electric power was not available for the pumps, etc., and the building of a deep stokehole would have been difficult and costly. A simple form of steam-heating plant, therefore, was decided upon, to circulate and warm the water by means of steam injection.

The bath is fitted with four chromium-plated gratings, 9 ins. in diameter, two at the deep end and two at the shallow end, connected by a galvanized steel pipe running underground. At one point in this pipe a specially-designed ejector heater is fixed, and is supplied with steam at 60 lbs. per square inch pressure from a vertical steam boiler erected in the boiler house adjacent to the bath. The ejector heater is fitted with isolating valves and a special by-pass arrangement whereby the bath can be filled through the ejector at the same time as steam is being blown in. Thus, there is no delay in filling and warming the bath, both operations being carried out simultaneously if desired. The layout of the boiler house is as simple as possible. Ample space is provided for coal storage, and the boiler is fitted with the necessary gauges and boiler-feeding equipment.

The action of the plant is as follows : As soon as the valve is opened in the boiler house, steam is supplied to the nozzle of the ejector heater, and water from the deep end of the bath is drawn through the connecting pipe and discharged, warmed by the steam, into the shallow end of the bath at the rate of 15,000 gallons per hour.

The advantages of these arrangements are :

1 : The water from the deep end of the bath is drawn out and delivered into the shallow end at high velocity, so that a continuous circulation is set up, and the temperature of the water throughout the length and breadth of the bath is raised uniformly.

2 : The steam used for heating the water also promotes circulation, so that no power is required for the pumps, and there are no moving parts to the apparatus.

3 : Live steam is not admitted to the bath direct, and it is safe for persons to swim while heating is taking place.

4 : As the water is being continually circulated during the heating period, there is no chance of stagnation and a certain amount of aeration and sterilization takes place owing to the action of the steam jet.

The whole plant was designed to raise 75,000 gallons of water 10 deg. Fahr. in ten hours, due allowance being made for the loss of heat by wind, etc. Actually the bath was a little deeper than originally planned, so that the total contents are now over 80,000 gallons. Nevertheless, it was found on test that the plant was capable of raising the water 1½ deg. Fahr. per hour, as against the designed rate of 1 deg. Fahr. per hour. The difference in temperature between the deep and shallow ends after heating was very small, there being not more than 1 deg. Fahr. variation throughout the length and breadth of the bath.

The pool itself is 80 ft. long by 30 ft. wide, and is 7 ft. 6 ins. deep at one end and 3 ft. at the other. The walls and floor are of reinforced concrete. At the N.E. and the S.W. ends white glazed scum channels are built in the wall. Along each side of the length of the bath a perforated galvanized iron handrail is fixed, slightly above water level. This can be used for shower purposes, and is controlled by a number of hand-operated valves within easy reach of the bathers. The deck or path surrounding the bath is formed of red

The steam-heated open-air swimming bath at St. Helen's School, Northwood, Middlesex.

and buff tinted paving slabs. The diving stage has two diving boards, with adjustable fulcrum, 4 ft. 6 ins. and 10 ft. from the water level.

Foundations i: The Site

BY B. O. NASH

THE strength and stability of a building depends to a large extent upon the design of the foundations, and the cracks so often seen might have been prevented if a little more attention had been paid to the bearing value of the ground. It is of primary importance when choosing a site to ascertain that the ground is capable of supporting the loads it will be called upon to carry. Trial holes should be excavated at convenient spots and carried to a depth of three or four feet below the probable lowest foundation. Care should be taken to avoid choosing positions near the future foundations of the building, otherwise a weak bearing area will occur in the region of the filled-in trial hole.

VALUE OF TRIAL HOLES

I recall a case in which the foundation concrete of a building was deposited on good red marl, but at the rear of the site a soft spot was found. This led to further investigation and it was discovered that within a foot of the underside of the concrete there was a bed of running sand. This entailed a complete re-design of the foundations and the formation of a reinforced concrete raft over the whole site. Considerable delay and expense could have been avoided in this case if trial holes had been sunk before the building was commenced.

Trial holes also indicate whether excessive water is likely to be encountered, and whether close or open boarding will be necessary to the sides of the excavation. It is a good practice to include a section of the trial hole in the bills of quantities. Borings are sometimes substituted for trial holes, but they are not so satisfactory, as the material brought to the surface by the boring tools does not give a fair estimate of the consistency of the material in its natural bed. Trial holes also are of great assistance in deciding whether the basement floor and the walls should be designed to resist water pressure. If subsoil water is met with, the probable increase in height during wet periods must be allowed for in the design.

The probable collection of surface water round the walls of a basement constructed in an impermeable clay is a frequent source of danger. I have known basements constructed in a perfectly dry clay site, but within a few months cracks have appeared in the basement slab, and has lifted it owing to water pressure—the excavation into the clay for a basement forming an impermeable tank for the collection of surface water. This has mounted up behind the walls and found its way under the basement slab, until the pressure has caused the water either to work through the basement slab or has lifted the slab itself.

SUPPORTING THE BUILDING

Reverting to the actual foundations, there are two methods by which a building is supported: first, by direct bearing on the ground, and secondly, by friction against the material of which the ground consists.

In the first case the foundations are spread, in order that the load per foot super does not exceed the load that the ground will safely carry. In the second case piles are driven into the ground until a satisfactory set has been obtained and it is estimated that the pile will not appreciably settle under the load it will be called upon to bear.

In the case of spread foundations, care must be taken that the load per foot super over all the foundations should be equal, otherwise unequal settlement will occur and cracks will appear.

The materials most commonly founded on, in this country, are as follows: rock, chalk, ballast, clay, and sand.

Rock will support a considerable load, providing it is solid and not laminated. If the rock strata is sloping, there is a danger of sliding, but the more frequent source of danger is due to founding on a thin stratum of rock having a void or a layer of soft material between it and the stratum below. When the foundations are loaded, settlement takes place. It is nearly always advisable before the concrete is placed to jump or drill a hole one or two feet into the rock to ensure that it is solid. For wall foundations on rock the concrete is often dispensed with, for, as the rock will take as high a load per foot super as the brickwork, a spread foundation is not required, and the rock will only require cutting to a level bed ready to receive the brickwork. Finely-laminated rock is frequently found in South-West England and forms a satisfactory foundation, although water is often found flowing between the laminations.

"SOFT" SPOTS

Chalk and limestone form a satisfactory bearing material and can be stressed to loads varying from four to eight tons per ft. super. The danger with chalk is the liability to faults due either to upheavals or to deep roots of trees. On a site in Surrey two trial holes were sunk, both indicating solid chalk for a depth of at least twelve feet from the surface. When the excavation for the basement of the building commenced, a fault approximately fifteen feet wide was found with vertical layers of white sand, brown sand and hoggin, i.e. ballast bound with clay. As no bottom could be found to these layers, the foundations were re-designed giving a considerable spread on these softer materials. The original spread on the chalk was reduced in order to increase the load and to prevent unequal settlement. The foundations were also reinforced longitudinally with the idea of bridging over "soft" spots which might occur.

Ballast can be loaded to four or six tons per ft. super providing it is closely packed and is well graded from coarse to fine. Where water is flowing through the ballast a lighter load must be taken as the water tends to withdraw the finer particles, leaving voids with consequent settling of the ballast under load. Foundations in ballast must be taken sufficiently far below the surface to prevent the danger of the ballast heaving up at the sides of the foundations. If this occurs the ballast under the concrete will tend to move laterally and settlement will occur. The effect of this is obvious when walking on any beach. Ballast bound with clay is more stable and is less liable to this fault.

LONDON CLAY

There are many types of clay. Red marl is found in many parts of the country and forms a very satisfactory bed for foundations. The London blue clay found in the Thames Valley is not, as its name implies, peculiar to London, as it is also found in Dorset. The grey shaley clay found in many mining districts is usually very closely packed, and I should have little hesitation in loading either of these materials to three or four tons per ft. super. The clay found most frequently within twenty or thirty miles of London is a compact brown clay with blue veins due to a water deposit. This can be safely loaded to two or two-and-a-half tons per ft. super, dependent on the depth of the foundations below the surface. There are many types of sandy clay and these should not be too heavily loaded, as they easily break down in contact with water and form a very soft mixture.

Foundations in clay should never be nearer the surface than three feet, as during dry weather surface cracking of the clay occurs, and these cracks often extend to a depth of several feet. This opening of the clay in dry weather and closing in wet weather is a frequent cause of cracks in foundations and walls. For the same reason the last six inches of excavation for foundations in a clay subsoil should never be carried out until the concrete is ready to be deposited, otherwise cracks will form, and when the wet concrete is deposited general swelling and

movement of the clay will occur, thus preventing satisfactory setting of the concrete.

The permissible load on sand varies considerably. My remarks on the heaving of ballast under load and the advisability of depth applies particularly to sand. A coarse, compact dry sand at a depth of four or five feet from the surface can be subjected to a load of two to three tons per ft. super. A fine wet sand is often a doubtful proposition for half ton per ft. super. The chief danger in sand is the presence of water, as any movement of the water causes movement of the sand. This is particularly noticeable in the Lancashire coast towns, where the subsoil water and the sand ebbs and flows with the tide.

The most unstable material is silt. This very fine waterlogged sand is a water-deposited material and is found chiefly near river banks and largely in the Fen district. The country here is subject to successive floodings from the canals, and when the water drains away a deposit is left which is undoubtedly good for the crops but not for foundations. This "warp," as it is called, extends to a considerable depth, and on a site at Hull it extended to a depth of sixty feet and had a bed of peat underneath it. In cases like this the foundations should consist either of a raft or a system of piling. In the case of a raft, settlement should be anticipated, but the raft must be strong enough so that the whole structure settles equally, and the loading must be carefully balanced to avoid the liability of tipping.

In mining districts where there is a liability to local settlement of the subsoil, longitudinal reinforcement is necessary in all continuous foundations designed to span over "pot-holes" or local weak spots, and isolated foundations are also tied to the main foundations by reinforced concrete beams constructed in the ground.

The thickness of the concrete in foundations depends upon the spread or the "overhang" of the concrete beyond the brickwork, or pier above. The depth should be approximately $1\frac{3}{4}$ times the overhang of the concrete, but it can be reduced by designing the base in reinforced concrete as an inverted double cantilever, subject to an upward pressure equal to the load per ft. super brought on the soil by the superstructure.

(To be concluded)

SOCIETIES AND SCHOOLS

R.I.B.A. COUNCIL MEETING

FOLLOWING are some notes from the minutes of the last meeting of the R.I.B.A. Council :

Faraday Centenary Celebrations : Lt.-Col. P. A. Hopkins, F.R.I.B.A., Chairman of the Science Standing Committee, was appointed to represent the R.I.B.A. at the Institution of Electrical Engineers celebrations of the centenary of Michael Faraday's discovery of electromagnetic induction, to be held in London on September 22 and the following days.

Visit of the Council to the Soane Museum : It was decided to accept the invitation of the Curator of the Soane Museum to arrange a visit of the Council to the Museum early in the new session.

British Waterworks Association : Standing Committee on Water Regulations : Mr. H. D. Searles-Wood, F.R.I.B.A., and Major C. F. Skipper, F.R.I.B.A., were appointed to represent the R.I.B.A. on the Standing Committee on Water Regulations of the British Waterworks Association for the ensuing year.

Proposed British Standard Schedule of Unit Weights of Building Materials : Mr. L. W. Thornton White, A.R.I.B.A., and Major F. W. Rees, L.R.I.B.A., were appointed to represent the R.I.B.A. on a Technical Committee which has been set up by the British Engineering Standards Association to prepare a standard schedule of Unit Weights of Building Materials.

The Institute of Architects of Malaya : The Council formally approved the change of title of the Singapore Society of Architects to that of the Institute of Architects of Malaya and the amended Memorandum and Articles of Association.

The Nottingham, Derby and Lincoln Architectural Society : The Council formally approved the change of title of the Nottingham and Derby Architectural Society to that of the Nottingham, Derby and Lincoln Architectural Society.

Reinstatement : The following ex-member was reinstated : As Licentiate : John Waterworth.

Transfer to the Retired Members' Class : The following member was transferred to the Retired Members' Class : As Retired Fellow : Watson, Adam F. (A. 1879, F. 1905).

Resignations : The following Licentiate Members' resignations were accepted with regret : Messrs. Charles Frederick Marston, Thomas Frost May, Harold William Rogerson and Alexander Robertson.

Election of Students : The following probationers were elected as students of the R.I.B.A. :

Aikman, A. E.
Alp, W.
Armitage, H.
Atkinson, G. A. S.
Baddiley, F. O.
Barker, H. M.
Barlow, L.
Beard, P. B.
Beattie, W. H.
Beaumont, M. G.
Beecham, T. W.

THE WELSH SCHOOL OF ARCHITECTURE

The Welsh School of Architecture, which has been granted the status of "Final Recognition" by the R.I.B.A., is accommodated in excellently furnished and well-equipped new studios, lecture rooms, library, etc., in the new wing at the Technical College, Cardiff.

At this college, ten scholarships, covering tuition fees and maintenance grants of £40 per annum for three years, are offered for competition annually. As candidates for entry to the Welsh School of Architecture are eligible to compete for these scholarships, they are of considerable interest to those contemplating entering the architectural profession. The scholarship examination is a competitive one, and is of about the same standard as matriculation. In the case of candidates for the School of Architecture, the subjects are :

1 : English. 2 : Mathematics, two papers—(*a*) Algebra and arithmetic; (*b*) Geometry and mensuration. 3 : History or geography.

4: Physics with mechanics, or chemistry, or higher mathematics. 5: A modern language (French, German or Welsh). *Note.*—Elementary drawing may be taken in lieu of (3) or (4) or (5), and candidates not taking elementary drawing as an examination subject must satisfy the Head of the Welsh School of Architecture as to their ability in elementary drawing from the solid and in freehand drawing.

The Welsh School of Architecture has now been at work for rather more than eleven years, under the charge of Mr. W. S. Purchon, M.A., A.R.I.B.A., the lecturer in architecture being Mr. Lewis John, M.A., B.ARCH., A.R.I.B.A., and the assistant lecturer, Mr. A. MacLean, B.A., A.R.I.B.A.

The following local architects assist in the work of the advanced course as honorary lecturers:

Messrs. Percy Thomas, F.R.I.B.A., Ivor Jones, A.R.I.B.A., T. Alwyn Lloyd, F.R.I.B.A., M.T.P.I., H. Teather, F.R.I.B.A., A. L. Thomas, F.S.I., M.T.P.I., C. S. Thomas, F.R.I.B.A., J. H. Jones, F.R.I.B.A., C. F. Jones, A.R.I.B.A., and H. Norman Edwards.

Students in the department also attend courses of instruction in the departments of engineering, technical chemistry, mathematics, physics and the school of art, all of which are housed in the same building, while special lectures on (*a*) "Geology of Building Materials"; (*b*) "Growth, Characteristics and Diseases of Timbers," and (*c*) "Law as Applied to Professional Practice," are given respectively by Messrs. F. J. North, D.SC., F.G.S. (Keeper of Department of Geology, National Museum of Wales), H. A. Hyde, M.A., F.L.S. (Keeper of Department of Botany, National Museum of Wales), and E. W. David, LL.B.

The three years' full-time day course leads to the award of the certificate, to the holders of which the R.I.B.A. grants exemption from its Intermediate Examination, while those students who successfully pass through the diploma course are exempted from the R.I.B.A. Final Examination, a special course of lectures on professional practice and a special examination in this subject being held in the school. This diploma course follows the certificate course, and consists of two sessions, the former of these being of six months' duration only, the intervening six months being spent in architects' offices.

There is also an evening atelier for architects' assistants who cannot attend the day courses.

The department is in close touch with the South Wales Institute of Architects, representatives of this body being on the Advisory Committee of the School, and students of the school are eligible for the prizes awarded by the Institute. In addition to these awards, there are a number of school prizes presented in the main by local architects.

Students of the Welsh School of Architecture have won various important scholarships of an advanced type, including a "Dovey" scholarship for post-graduate work, value £75 per annum; the R.I.B.A. Fourth and Fifth Year Maintenance Scholarship, value £100 per annum; the Archibald Dawnay Scholarship, value £50 per annum, and the Rome Scholarship in Architecture, value £250 per annum for three years.

The external examiners are Professor L. B. Budden, of the University of Liverpool, and Professor A. C. Dickie, of the University of Manchester.

The school year commences on Monday, October 6, but intending students are advised to apply at an early date for the particulars of the courses of instruction and of the entrance and scholarship examinations. Candidates for the latter should obtain application forms which must be completed and submitted by September 19.

QUESTIONS THAT ARISE

Aluminium for External Use

M. D. writes: "*Is it possible to use aluminium externally on a building in a similar manner to cast iron or bronze? Would the material need painting or cleaning at frequent intervals? If it does not, the material appears to me to have great possibilities and one wonders that it is not more used.*"

Although used more in this country for interior decorative work, in Canada aluminium is largely used for external ornaments and panels.

It is usual to employ an aluminium alloy containing silicon, which, on exposure, becomes covered with a film of aluminium oxide protecting the metal from decay. The only apparent effect of the oxide is a slight dulling of the surface. The more silicon there is in the alloy the nearer will the final colour approach to that of pewter.

To keep a polished surface it would be necessary to treat the metal with a lacquer, and of course this would have to be renewed at intervals.

One great advantage of aluminium when used with stone is the fact that rain washings do not discolour the surrounding masonry, as so often happens with bronze. LL. E. W.

Varnished Distemper

F. writes: "*I should be glad of your expert's advice regarding varnishing over distemper. Is it possible to obtain a good surface or is the distemper likely to flake off on application of the varnish? If a good job can be obtained, this would be a cheap method of decorating.*"

A good washable distemper or water-paint can be varnished without fear of flaking or blistering when the surface is thoroughly hard and dry, but it is useless attempting this work on new walls.

It could not be called a good finish for high-class work, and the application of the varnish is the most important factor towards a successful finish.

There are many grades of varnish, but good copal varnish should be specified.

The most common defects are usually the result of using a cheap varnish, having an excess of drier or lack of oil in its composition, and in brushing the work out. The varnish should be flowed on rather than brushed out.

The effect of varnishing distemper is to tend to deepen the colour slightly. Cream or light stone colour distempers do not take the application of varnish as well as other tints, and should be avoided, as they are inclined to dry out with an uneven texture.

G. E. D.

Decoration

H. writes: "*The texture effect of the decoration in many modern cinemas seems to be a coloured stucco. The effect produced is very good, and I should be interested to know how it is carried out.*"

Your correspondent is probably referring to the material known as plastic paint. The texture effect of this material can be produced almost in the same way as in external cement rendering.

The material is painted on thickly and worked up with a brush, scraper, or with the bare hand to the desired surface.

This treatment looks best when applied to a plain wall in panels to break up a large unrelieved surface.

The plastic paint must be coloured after it is set, and this is best done with a coat of ordinary internal oil paint, which must be carefully applied to cover and flow over all the irregularities.

If this coat is coloured to the highest light required in the scheme of decoration, the final glazing coat may be darker.

Before this last coat is applied it should be worked over with a cloth, which will allow the light colour of the undercoat to show on the high spots of the surface texture.

Another finish sometimes adopted in conjunction with plastic paint is colour spraying with metallic tints, gradually shading the panel from light to dark or from one colour to another.

G. E. D.

LAW REPORT

JUDGMENT RESERVED ON LEGAL POINT

Administrators of Mr. and Mrs. Bottomley v. Bannister and another. Court of Appeal. Before Lords Justices Scrutton, Greer and Romer

THIS was an appeal by Mr. George William Bannister and Mr. Walter Harris, builders, of Moyser Road, Streatham, from the verdict and judgment in an action tried before Mr. Justice Hawke and a jury, in which the appellants were sued by the co-administrators of Mr. and Mrs. Bottomley on behalf of their infant daughter, and damages in regard to their death.

The jury awarded the plaintiffs £1,700 damages.

Mr. and Mrs. Bottomley lived in Denmark Road, Carshalton, and it was alleged that they died from carbon monoxide fumes, which were said to come from a gas boiler in the kitchenette.

Mr. Powell appeared for the builders, and said the grounds of the appeal were that on the facts judgment should have been given for the defendants, and that there was misdirection both as to the law and the facts. Mr. and Mrs. Bottomley had arranged to purchase one of the appellants' houses and had gone into possession. The house was fitted with a gas boiler in the kitchenette, where there was also a linen shoot leading up to the bathroom. The fumes went up the shoot into the bathroom and were said to have caused the death of Mr. and Mrs. Bottomley.

Mr. Eastham, K.C., for the administrators, said his case was that the builders were negligent in fitting the boiler without a flue and were also negligent in making a linen shoot which opened into the bathroom.

Mr. Powell contended that at the time of the death of Mr. and Mrs. Bottomley they were tenants at will. The contract for purchase had not been completed, and therefore the legal position was to be ascertained on the principles of landlord and tenant. If he were wrong on that point, then he argued that the principle in *Bates* against *Batey & Co., Ltd.*, applied, viz., that the appellants' only duty was to give warning of a danger actually known to them.

Mr. Eastham submitted that here the case raised was not one of landlord and tenant.

Lord Justice Scrutton inquired why not bring the agreement. Mr. Bottomley was a tenant at will, as the purchase had not been completed.

Mr. Eastham replied that the liability on the part of the appellants arose apart from any contract, and observed that even a landlord was responsible for dangers he had created on the premises by any possible misfeasance.

After further legal argument, Lord Justice Scrutton intimated that the Court reserved its judgment till the Courts reassembled in October.

COMPETITIONS OPEN

September 5.—Proposed extension of the Town Hall, Hackney, for the Hackney Borough Council. Architects are invited to submit their names and brief particulars of their experiences. The competition will be limited to six architects to be selected from the applicants. Assessor: Professor S. D. Adshead, F.R.I.B.A. Premiums: £250, £150 and £100. The authors of the three unpremiated designs will receive a payment of £50 each. Applications should be submitted to R. H. R. Tee, LL.D., Town Clerk, Town Hall, Hackney, E.8, by September 5 next.

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions, etc., were obtainable from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 1.—Sending-in day. (Last day for conditions was June 3.) Pictorial Map of the Area of the West Yorkshire Society of Architects. Premium, 10 guineas. Particulars were obtainable from the Secretary, 62 Woodhouse Lane, Leeds.

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich.

THE ARCHITECTS' DIARY

FRIDAY, SEPTEMBER 4

INTERNATIONAL ILLUMINATION CONGRESS. At Glasgow. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Organization for the Development of Electric Lighting," by C. A. Atherton; "Progress and Teaching of Illumination in Italy," by C. Clerici; "Lighting Progress in South America," by A. M. Baidaff. Section 3: "The Provision of Adequate Daylight in Building Regulations," by P. J. Waldram; "Daylight Illumination and Town Planning," by C. G. Möller; "Visual Performance at Various Levels of Daylight Illumination," by K. Y. Yang; "Daylight Illumination of Art Galleries with Overhead Lighting," by T. Hirayama. Afternoon Session, 2.30 p.m. Section 1: "Home Lighting," by C. Haslett and N. E. Miller. Section 3: "Photo-Electric Measurements of Daylight Illumination by the Use of a Model Room," by Z. Yamauti and K. Hisano; "Mathematical and Graphical Determination of Direct Daylight Factors," by A. C. Stevenson; "Prediction of Natural Illumination in Interiors and on Walls of Buildings," by H. H. Higbie and A. D. Moore. **10 a.m.**

SATURDAY, SEPTEMBER 5

Sunrise, 6.17 a.m. Sunset, 7.40 p.m.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. 1 Wilbraham Place, Belgravia, S.W.1. Departure of a party of members for a fortnight's tour through Spain and the Balearic Islands. Returning on September 19. Full particulars obtainable from the Secretary.

MONDAY, SEPTEMBER 7

SANITARY INSPECTORS' ASSOCIATION. Annual Conference to be held at Bridlington. Until September 12.

INTERNATIONAL ILLUMINATION CONGRESS. At Edinburgh. Following are some of the papers to be read. Morning Session, 9.30 a.m. Section 1: "The Lighting of Seaside Resorts," by A. P. Allan and J. M. Campbell; "Mason Experiments in Street Lighting," by W. S. Stiles; "Modern Public Lighting by Electricity," by W. J. Jeffery. Afternoon Session, 2 p.m. Section 1: "The British Standard Specification for Street Lighting," by C. C. Paterson. **10 a.m.**

THURSDAY, SEPTEMBER 10

INTERNATIONAL ILLUMINATION CONGRESS. At Buxton. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Architectural Lighting," by R. Waldo Maitland and Howard Robertson, F.R.I.B.A. Afternoon Session, 2.30 p.m. Section 2: "Architectural Lighting," by L. Kalff; "Engineering Aspects of Architectural Lighting," by W. J. Jones. **10 a.m.**

SHIPPING, ENGINEERING AND MACHINERY EXHIBITION. At Olympia. Until September 16.

FRIDAY, SEPTEMBER 11

INTERNATIONAL ILLUMINATION CONGRESS. At Birmingham. Sessions at 10 a.m. and 2.30 p.m. Papers to be read will be mainly devoted to signal glasses and vehicle lighting. **10 a.m**

ARCHITECTURAL ASSOCIATION. Annual Excursion: to Austria. The programme will include six days in Vienna, followed by a six days' motor coach tour through Austria, returning to London on September 26.

SATURDAY, SEPTEMBER 12

Sunrise, 6.28 a.m. Sunset, 7.24 p.m.

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

TUESDAY, SEPTEMBER 15

Closing date of THE ARCHITECTS' JOURNAL September Holiday Sketches Competition.

WEDNESDAY, SEPTEMBER 16

INSTITUTION OF STRUCTURAL ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Manchester and District Branch. Visit to the Wardle (Watergrove) Reservoir.

FRIDAY, SEPTEMBER 18

NATIONAL SMOKE ABATEMENT SOCIETY. Annual Conference. Liverpool. Until September 20.

SATURDAY, SEPTEMBER 19

Sunrise, 6.39 a.m. Sunset, 7.8 p.m.

MONDAY, SEPTEMBER 21

INTERNATIONAL ILLUMINATION CONGRESS. Reception of the delegates at the Royal Institution, London. 3 to 4.30 p.m. **3 p.m.**

TUESDAY, SEPTEMBER 22

INTERNATIONAL ILLUMINATION CONGRESS. Conference of the Institution of Electrical Engineers, at the Kingsway Hall, W.C. 10.30 a.m. Conversaziones at the Royal Institution and the Albert Hall. 8 p.m. **10.30 a.m.**

WEDNESDAY, SEPTEMBER 23

R.I.B.A. STATUTORY EXAMINATION. Latest date for submission of applications for examination for the office of district surveyor. (Fee £3 3s.)

TRADE NOTES

A folder showing the reduction in prices of "Henley" tape has recently been issued by Messrs. W. T. Henley's Telegraph Works Co., Ltd., of Holborn Viaduct, London, E.C.1. The net prices of the tape have now been reduced twopence per pound, representing a reduction of 12½ per cent. on the largest quantity, and the net trade prices per pound, are now as follows: 56 lb. up to and including 112 lb., 1s. 2d.; 28 lb. and under 56 lb., 1s. 3d.; 14 lb. and under 28 lb., 1s. 5d.; 7 lb. and under 14 lb., 1s. 7d.; under 7 lb., 1s. 7d. All the foregoing quantities, with the exception of that under 7 lb., are supplied carriage paid throughout the United Kingdom. Tape, ½ in., ⅝ in., and ¾ in. wide is supplied in approximately ½ lb. net rolls, and 1 in. wide in approximately 1 lb. net rolls. It should be noted that the firm also supply the tape in 4 oz. and 2 oz. rolls, the prices being respectively 1d. and 2d. per lb. higher than those given above for the different quantities. These rolls are also packed in cartons. The firm state that the tape can be used for protecting rubber insulated joints and for all kinds of protective work, both interior and exterior.

*

Messrs. Benham and Sons, Ltd., of 64 Wigmore Street, W.1, have recently issued a leaflet illustrating and describing their Staybrite stainless steel sinks, draining boards and tables, all of which are made in standard sizes or varied to any requirement. The sinks are descaled finish inside and polished outside, and are complete with a 1½-in. chromium-plated standing corner waste with overflow pipe, the strainer plates being of perforated Staybrite steel. Staybrite drainers are polished on top, with draining grooves rolled in, short skirtings 1½-in. high at back, and the front and both ends turned up to form a drip fillet. The sink and drainers may be supported on enamelled cantilever supports for building into the wall, or on enamelled cast-iron legs and framing. Staybrite stainless steel tables are usually mounted on enamelled cast-iron legs, and may be fitted with galvanized or Staybrite shelves under between-legs, but, if desired, tops can be supported on enamelled cantilevers from the wall. Staybrite-fronted drawers, 24 ins. by 24 ins., with chromium-plated handles, can also be fitted. The standard sizes of the tables range from 4 ft. long by 2 ft. 3 ins. wide to 11 ft. 9 ins. long by 3 ft. 6 ins. wide.

*

Portland Cement Rendering is the title of a new booklet recently issued by the British Portland Cement Association, Ltd., of 20 Dartmouth Street, Westminster, S.W.1. It deals with the latest practice of cement rendering as a form of external decoration. The rendering is carried out primarily on concrete, brickwork, masonry, or suitable lathing. Its purpose is two-fold; it is a protective measure against the elements and it may also be used as a distinctive form of decoration. However large a part it may have to play in a scheme of decoration its main essential is to be a water-tight covering, and it must be so applied that wet cannot penetrate it to the detriment of the backing to which it is applied. The booklet covers the preparation of surfaces, materials to employ and operations, and will be sent, free of cost, on application to the British Portland Cement Association, at the address given above.

*

The possibility of danger to works of art by fluctuations of temperature has been exercising the minds of the curators and trustees of national collections for some time. A special committee has been appointed to examine the whole question, and the use of ceiling panel warming is being brought to the notice of architects, because of its low fixity of temperature. By this system the source of warmth is, it is claimed, removed as far as possible from the works of art themselves. The Mond and Duveen extensions at the National Gallery, the Courtauld Institute at the Fitzwilliam Museum, the Geoffrey Museum, and the Geological Museum are among the buildings fitted, or being fitted, with panel-warming. It has also been installed in part of Hampton Court Palace, and the historic hall of the Mercers' Company, London, is also warmed by this panel-warming system.

*

A booklet entitled *Drawing Office Progress* has been produced by the Drawing Office Material Manufacturers and Dealers' Association, of Windsor House, Victoria Street, London, S.W., for distribution at the Shipbuilding and Engineering Exhibition, to be held at Olympia from September 10 to 16. It is handsomely bound in cloth, and contains in its eighty-four pages articles on the policy of the Association, the psychology of the draughtsman and drawing office processes and equipment. A full list of the members is included. The illustrations comprise full-page photogravure pictures representative of different branches of modern engineering. There will be 10,000 copies available for distribution.

*

The British Electric Transformer Co., Ltd., announce that all remittances in settlement of accounts, and all correspondence in connection therewith, should be sent to their London office, Wellington House, Strand, London, W.C.2.

*

WALES

The Cardiganshire C.C. has asked Mr. J. Lewis Evans, the county architect, to prepare plans for extensions at the ABERYSTWYTH isolation hospital.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

ENTRANCE GATES AND LODGES

AT MELCHET COURT Nr. ROMSEY, HANTS

WROUGHT IRON SETTING FOR SCULPTURE

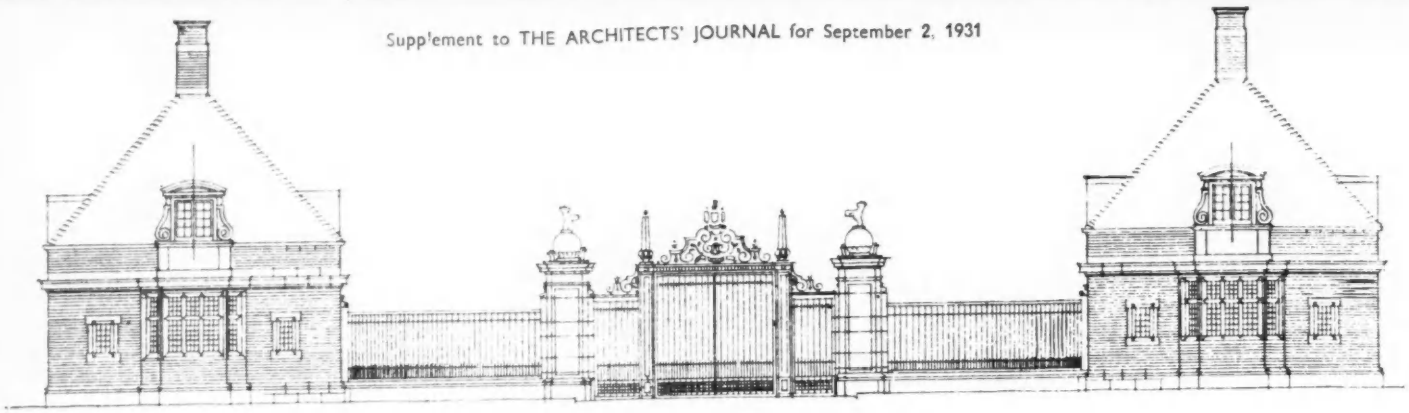
[*Buckland and Haywood, Architects.*

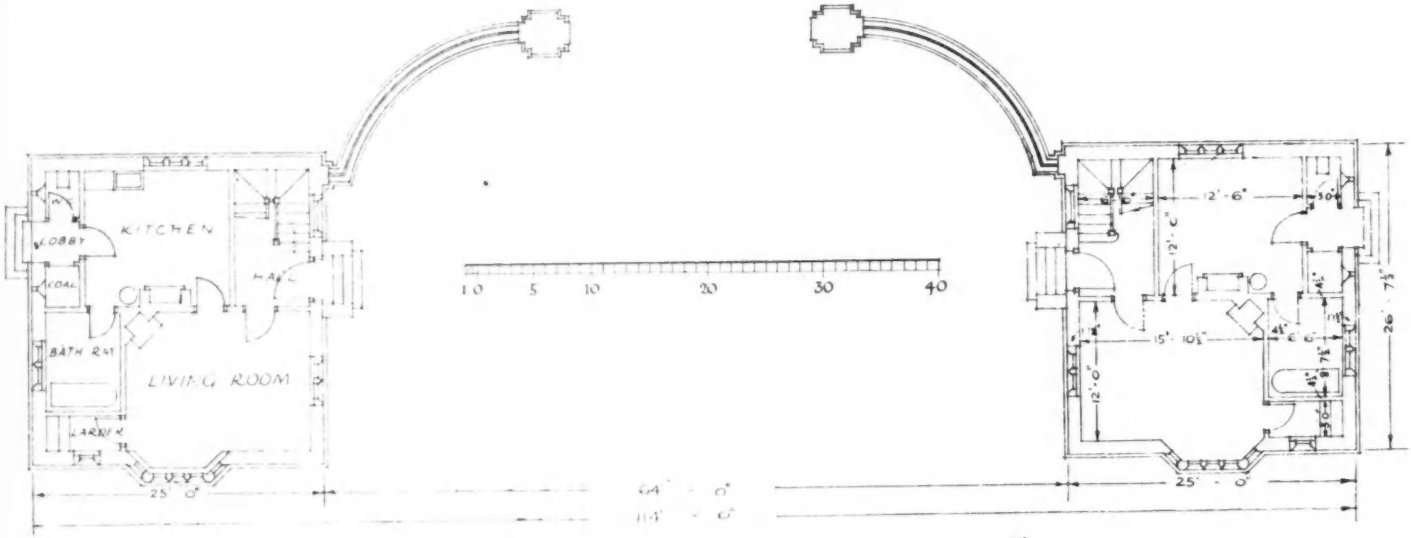
THE LANDFORD ENTRANCE GATES AND ONE OF THE TWO ADJOINING LODGES

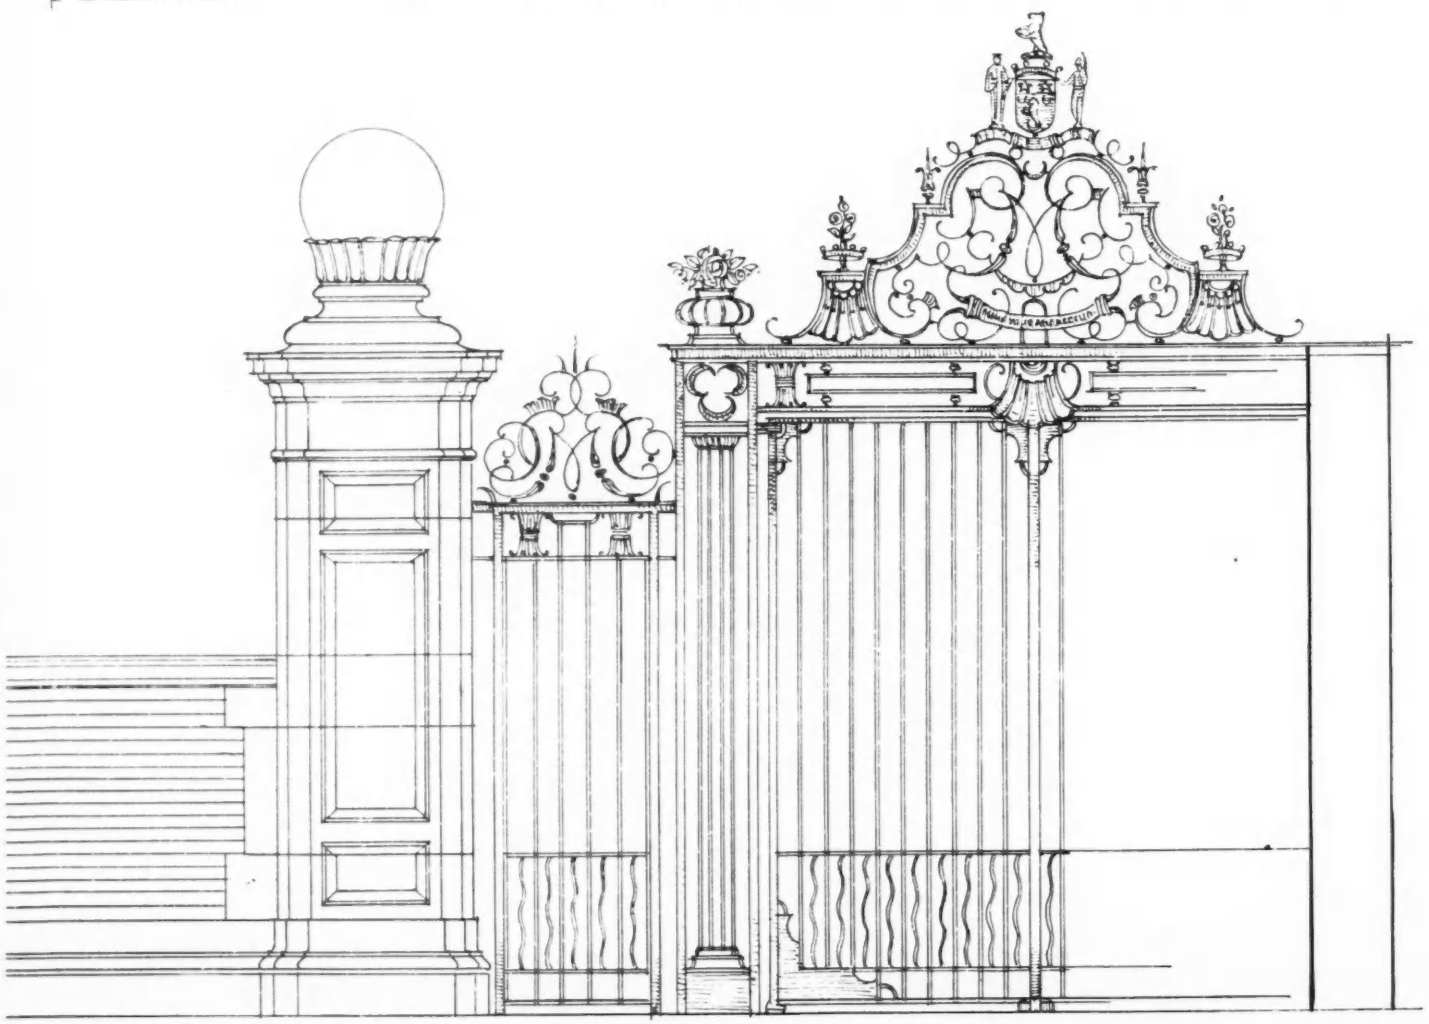
THESE gates and lodges, the architects' detail drawings of which appear overleaf, are situated at the main entrance to Melchet Court, and were specially designed for the late Lord Melchett. The former are a fine essay in the handling of wrought iron, and the design is fresh and full of character. The piers are in Bath stone and were carved by William Bloye.

On either side of the gates is a lodge, two stories high, each containing, on the ground floor, a kitchen, living-room and bathroom, and, on the first floor, three bedrooms. The lodges and dwarf walls are carried out in multi-coloured facing bricks with Bath stone dressings; and the roofs are covered with hand-made, sand-faced tiles.

Illustrations of other work recently completed at Melchet Court appear elsewhere in this issue of "The Architects' Journal."







For photograph and description, see preceding page.]

A SCULPTURE SETTING AT MELCHET COURT

THE wrought-iron glazed doors, a photograph of which appears above, while the architects' detail drawings are reproduced on the preceding page, have been executed with a martele finish and are designed as a setting for a piece of sculpture, the Greek goddess Hygieia, which stands in a garden house adjoining the main building of Melchet Court. They are as fine an essay in the handling of wrought iron and as full of character as the entrance gates and lodges, illustrations of which are given on the first two pages of this supplement.

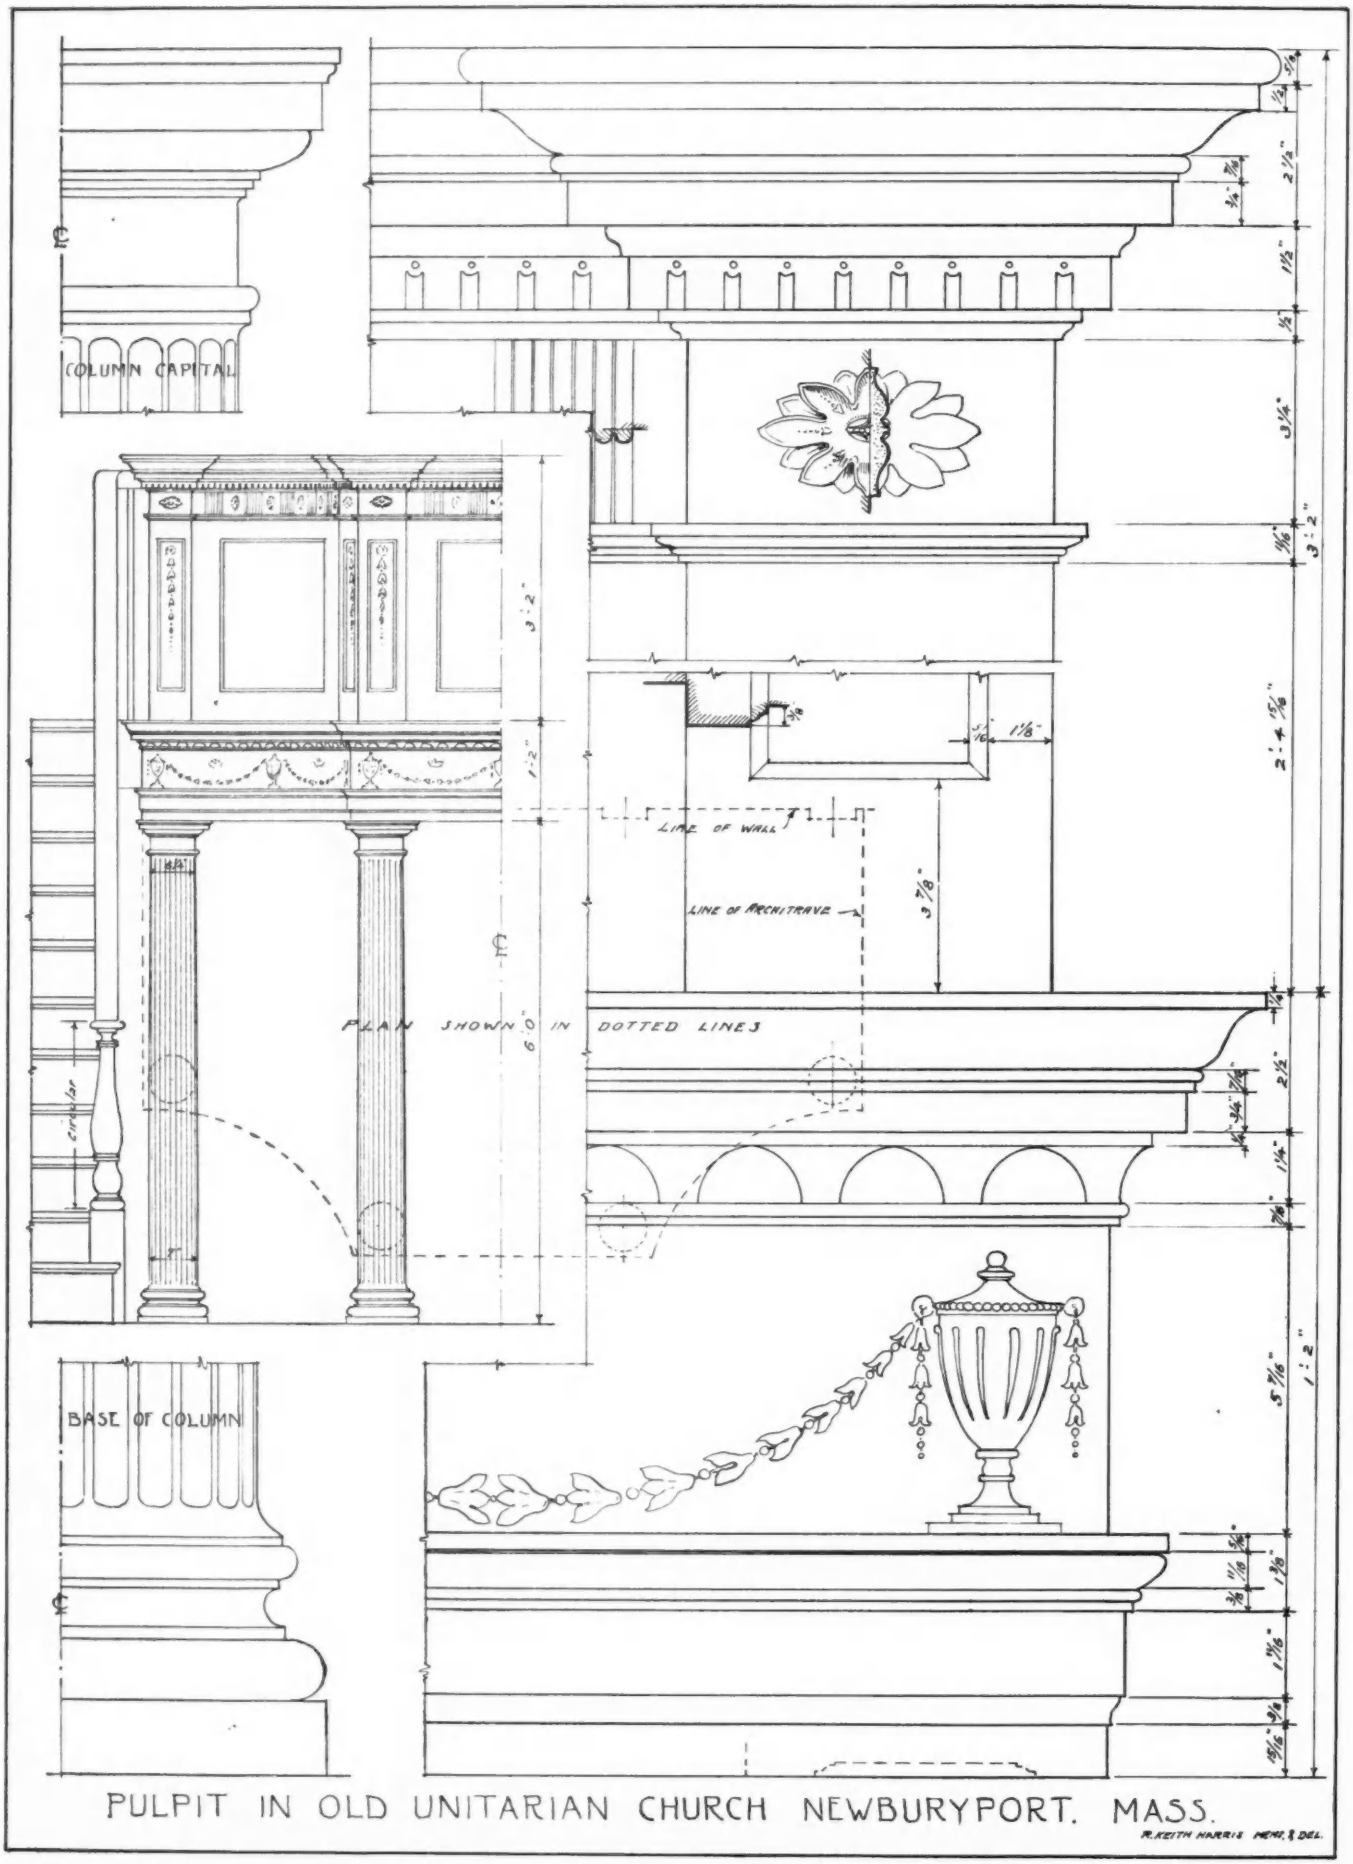
FROM THE NEW WORLD: 2

MEASURED DRAWINGS OF TWO AMERICAN COLONIAL CHURCH DETAILS

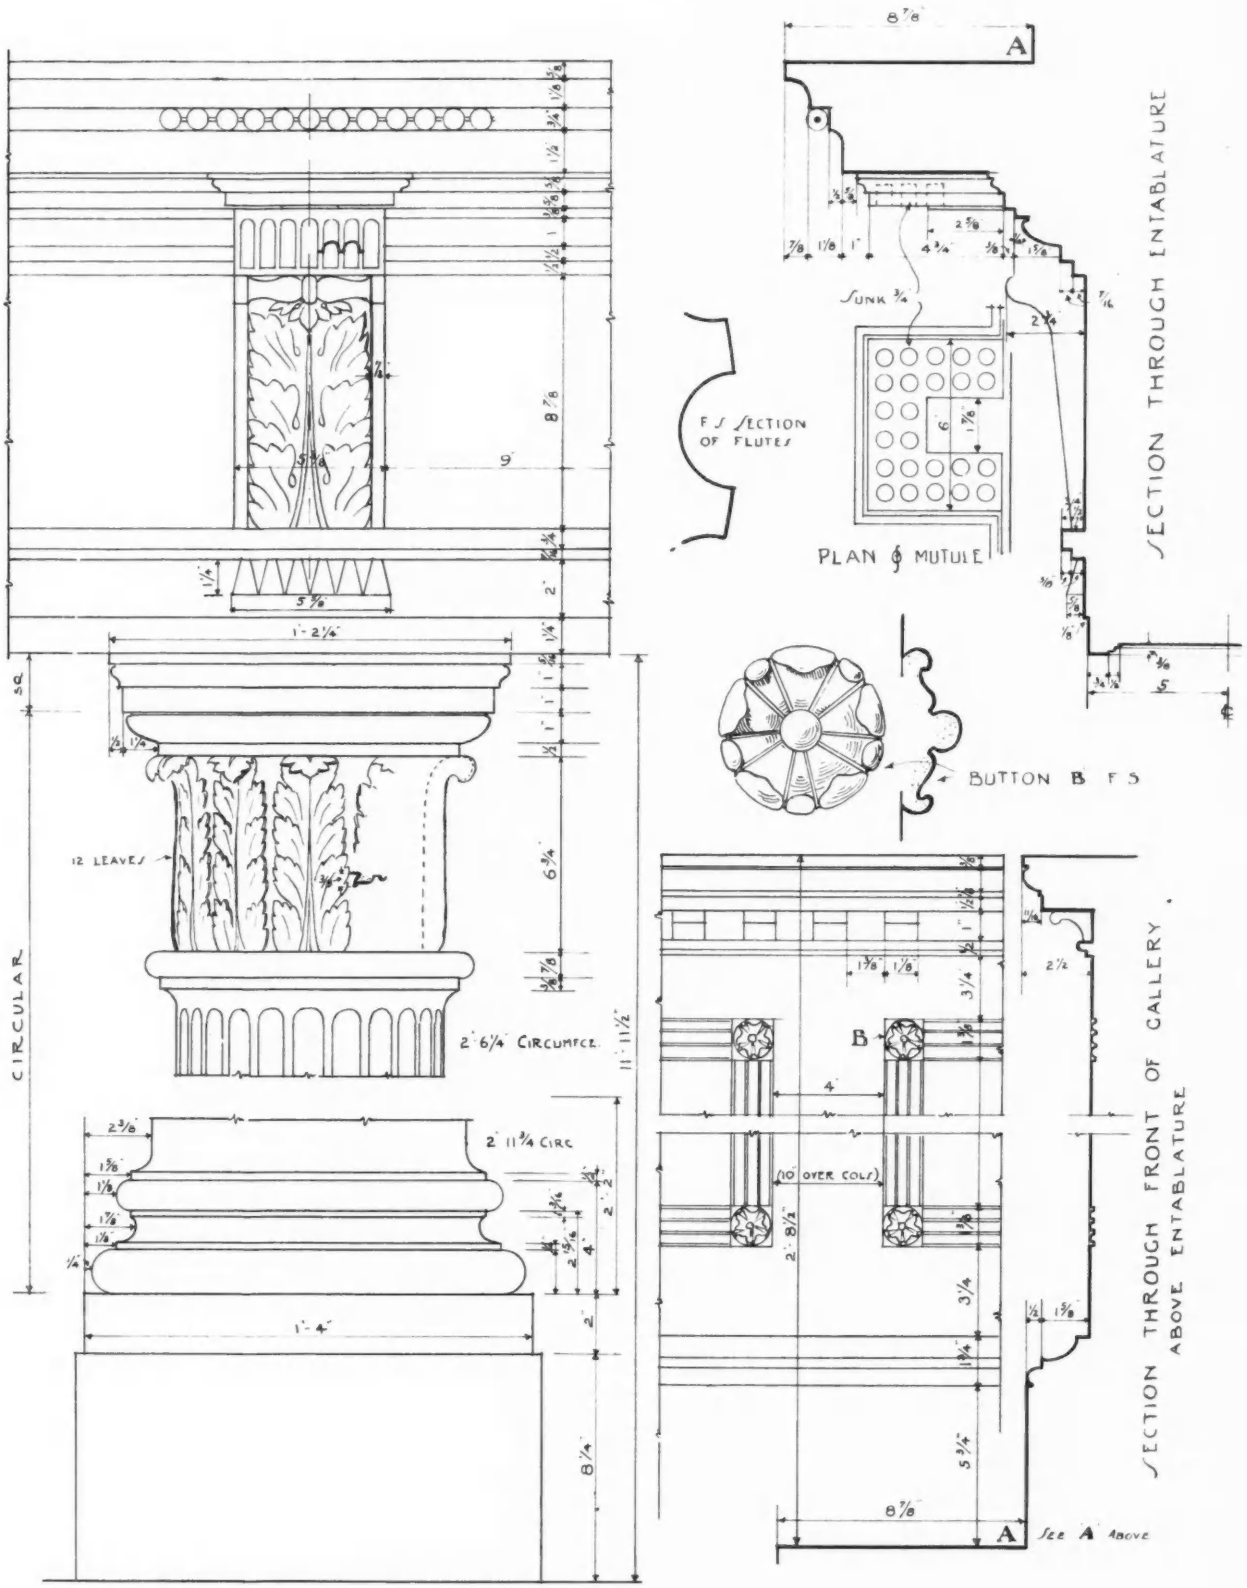
PULPIT IN THE OLD UNITARIAN CHURCH, NEWBURYPORT, MASS.

IT would be difficult to find in the small-town churches a more delightful example of the period than this pulpit. Design, proportion, detail and workmanship are equally worthy of more than passing interest. The design—obviously of Adam influence—is in harmony with that of the whole interior with its old box pews. An interesting note is provided by the contrast of the polished mahogany newel and handrail.

The details shown on the measured drawing on the following page are reproduced to scales of $\frac{1}{2}$ in. = one foot, and approximately one-third full size respectively.



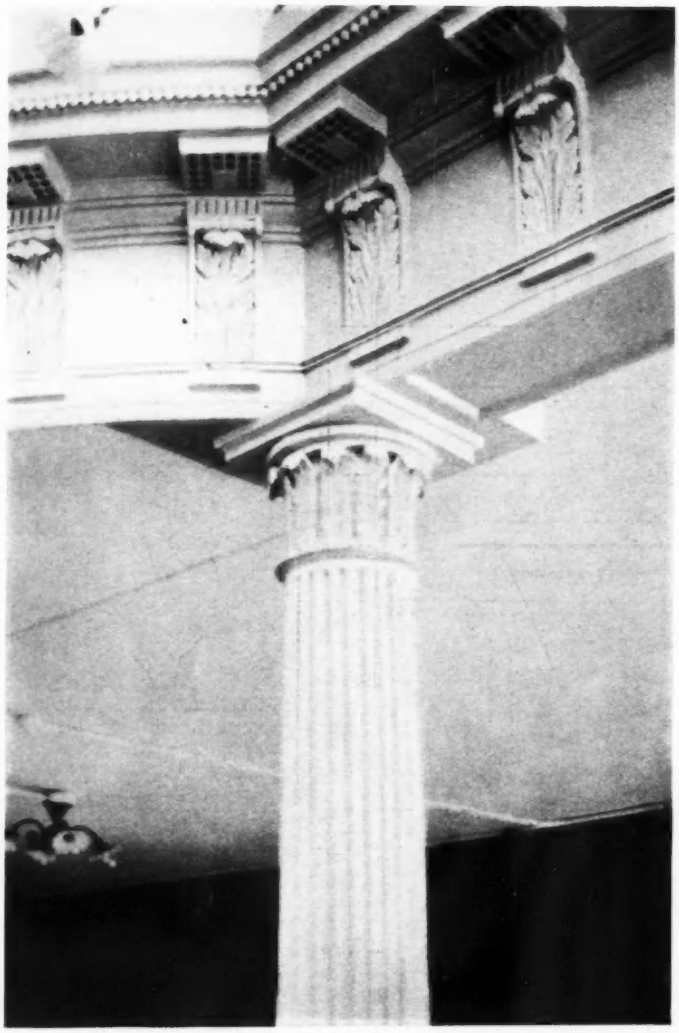
For photograph and description, see preceding page.]



ORDER TO GALLERY
OLD WEST CHURCH BOSTON MASSACHUSETTS

R. KEITH HARRIS MEM. S. DEL.

[For photograph and description, see following page.



GALLERY ORDER, OLD WEST CHURCH, BOSTON, MASS.

THE Order supporting the gallery in this old church, a measured drawing of which is reproduced on the previous page to a scale of approximately one-sixth full size, shows the ingenuity displayed in translating external classic detail for internal purposes. The substitution of sinkings—made with an auger—for guttæ in the mutule is at once apparent, and is moreover an effective method of obtaining accentuation at these points since the even, reflected light of an interior robs the entablature of that deep-shadow relief which it would have if used externally. It is, in addition, a logical treatment for wood. The careful design of the other members is also evident.

SELECTED PRECEDENTS:

FOUR SHOPFRONTS WITH TRADITIONAL SMALL PANES

THESE four examples, taken from different parts of the country, illustrate the use of the traditional small panes of glass in the show windows of old shops. From the view-point of design, where the shop front is wedded to a dwelling-house, the custom has its advantages in maintaining homogeneity of appearance and continuity in scale. At the same time, where the goods displayed are of small dimensions, the division of the window space by the glazing bars, so far from being a disadvantage—obstructing the view, as the common criticism goes—provides, as it were, a series of little frames which, by securing a partial isolation, enhance the value and importance of the goods.

The saddler's shop (figure 4), from Cerne Abbas, successfully negotiates the difficulties of a corner site. With the exception of the unfortunate lettering above the door, this little shop front is in its original condition. The wide doorway extends an open invitation, whilst the outward-curving windows give just the right hint of a well-stocked interior.

The ancient beershop at Chiswick (figure 3) and the little fruiterer's shop at Chipping Campden (figure 2), with their simple sashed windows, are models of sober hospitality and reticence.

At Tunbridge Wells (figure 1) we are neither surprised nor disappointed by the elegant sophistication of the tobacconist's shop in the Pantiles. Imagination may play its part, but cigarettes are always more delightful when bought in so elegant an emporium. J. B.

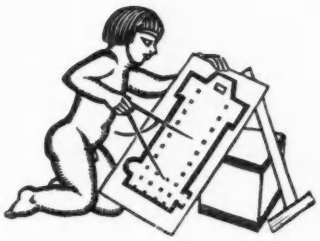
THE ARCHITECTS' JOURNAL



WEDNESDAY, SEPTEMBER 9, 1931

THE FUTURE OF LIGHT

AT nine o'clock on Tuesday of last week, on the first stroke of Big Ben, Britain switched on a great flood of national illumination, which revealed for the first time the architecture of our cities in a manner never before witnessed by the people of this country. London, the city of darkness, was transformed into a city of light : many prominent buildings, ancient and modern, forgot their age in donning dresses of many colours, fashioned by their designers—the illuminating engineers.

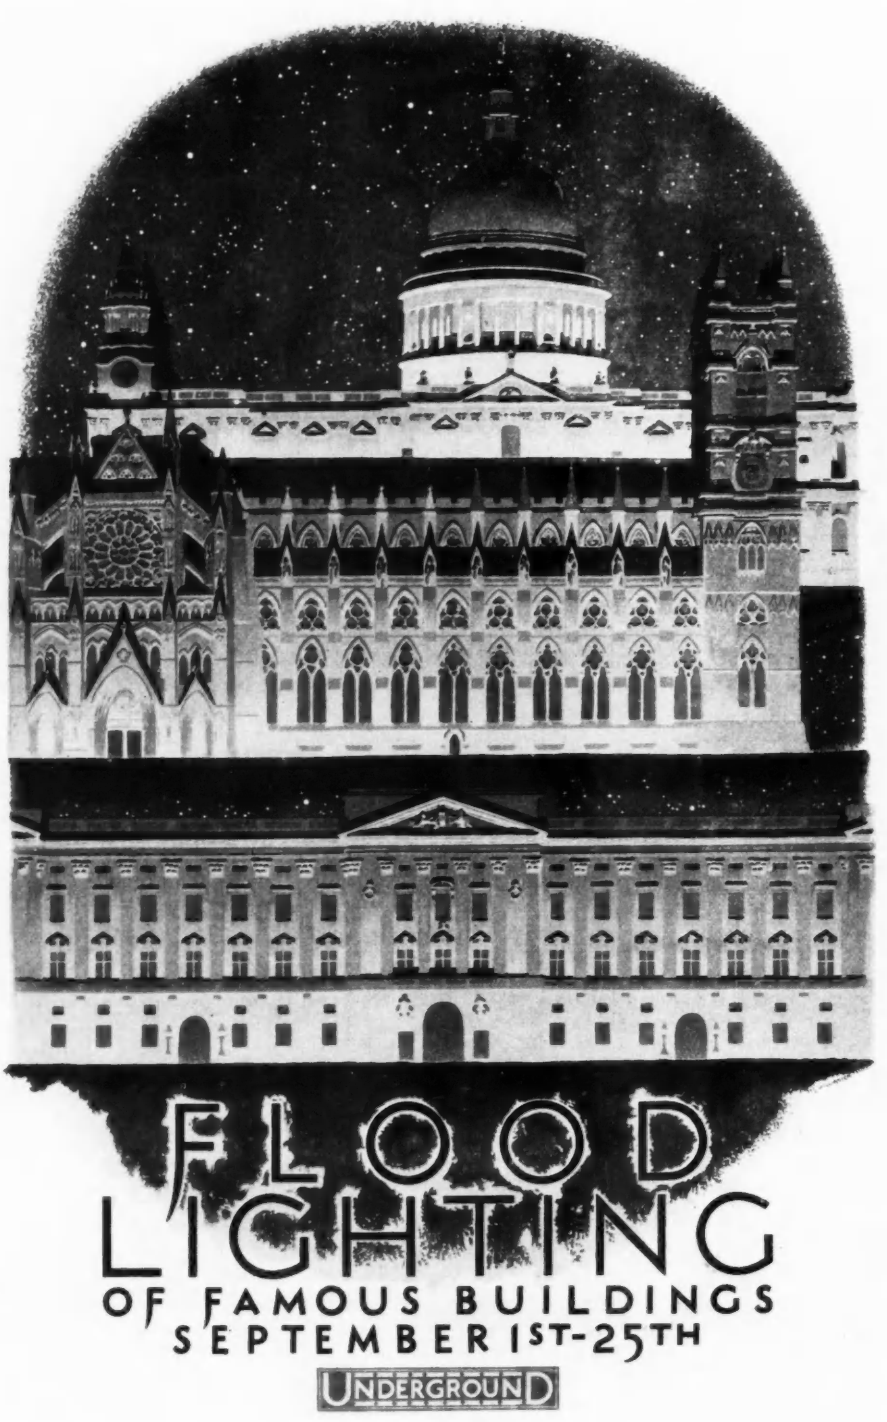
Hundreds of thousands of people flocked to the metropolis to see for themselves the new London. And they were not disappointed. The face of Big Ben, imbued with a healthy blush, looked down with pride on the illuminated Houses of Parliament and Westminster Abbey. Standing in the Mall, one saw in the distance Buckingham Palace bathed in a sea of marble-white and softened light, with St. James's Park on the left, a wide stretch of landscape, with its lake and stately trees flooded with light. Along the Victoria Embankment the long façade of Somerset House stood out boldly, garbed in a dress of rose-pink. The Tower of London guarded the entrance to the sea, clothed in glittering armour. The National Gallery, St. Martin-in-the-Fields, the County Hall, Thames House, the Admiralty and other buildings all stood resplendent in their new garb. St. Paul's Cathedral rose up like a sentinel of the night, with the illuminated spire of St. Bride's near-by. North, south, east and west, in the provinces as well as in London, the same story of light is being told, but will finish—like all stories must—at the end of this month.

The story, however, will have a happy ending. First, the several hundred delegates from twenty different countries, who are here in Britain in order to participate in the International Illumination Congress, will return to their native lands with a higher opinion of our architecture as a whole, than otherwise would have been possible, if the floodlighting of our buildings had not taken place. Gathering to celebrate a festival of light, these men were confronted with the fact that light requires an object before it can be seen and enjoyed. Indeed, until it has found something to fall upon, their light could hardly be said to exist at all. It thus became necessary for our engineers to look round for an object to gather and respect the rays of their far-flung line of lamps. Their choice—inevitably, an architect will say—fell upon architecture. And so the festival of light became a festival of architecture as well, but one so nicely compounded that few among the admiring crowds could tell which of these two was the source of their enjoyment.

Secondly, one of the most important features of the Congress are the papers that have been, and are to be, delivered by both English and foreign delegates. Those given at Glasgow on Friday last [extracts from which are given elsewhere in this issue] serve to prove the enormous advantage to be gained by all those connected with lighting throughout the world pooling their knowledge to advance the science of light. Illumination is still in a state of evolution; what science has in store for us only time can tell; it might even, in the words of Sir Hugo Hirst, speaking at the Congress dinner, held on Wednesday last, " hold the possibility of the reunion of the two great industries of gas and electricity."

It would appear that the architect has a new duty to his client imposed upon him, namely—that of providing in the case of commercial buildings at least—for the floodlighting of the structure after its erection. The advantages of this form of publicity are manifest, and the designer of the building will be wise to scheme his conception so that it may look equally well both by daylight as by artificial light. This will probably involve a reconsideration of his materials and his mouldings, that they may yield satisfactory effects under both conditions.

Floodlighting at present is often an afterthought, the architect must see to it that in the future it becomes an integral part of his scheme.



BUCKINGHAM PALACE, THE ABBEY, AND ST. PAUL'S

A reproduction, approximately one-fifth full size, of the poster by H. S. Williamson, issued by the Underground Railways to mark the floodlighting of prominent buildings in London during the International Illumination Congress this month. Buckingham Palace is seen in the foreground; above is Westminster Abbey, surmounted by the dome of St. Paul's.

NEWS & TOPICS

THE ECONOMY MANIA

IN the leading article published last week in THE ARCHITECTS' JOURNAL, reference was made to the decision of the Southwark Borough Council to postpone indefinitely the building of the projected new block of municipal offices which is so urgently needed if the administration of the borough is to be efficiently carried out. Following upon that, a long series of similar incidents have occurred, in which municipalities have determined to make sensational cuts in their expenditure.

*

The Borough of Cambridge, for instance, which had contemplated the rebuilding of its Guildhall at a cost of £100,000, will now postpone consideration of the scheme until better times. At Rotherham, where a site had been found for a new Employment Exchange, the project has been abandoned, for even before the political crisis and the formation of the National Government, Miss Margaret Bondfield had stated that it was necessary to reduce the vote for employment exchange premises, and this applied not only to Rotherham, but to many other municipalities besides. In Manchester, a committee of seven members of the City Council has just reviewed every department of municipal expenditure, and produced a list of forty-five recommendations for economy. It is assumed that the financial crisis will be of long duration, for the City Council is being urged to postpone projected schemes involving further outlay, to close down unremunerative enterprises, and to reduce prospected developments for the next five years. Sir William Davy, the Labour leader, opposed the motion on the ground that the independence of the spending committees was too severely infringed by the recommendations of the Economy Report.

*

In South Wales, where extensive schemes for the construction of new roads or the improvement of existing highways have already been started for the relief of unemployment, there is little doubt that in the very near future steps will be taken substantially to reduce all commitments for the spending of public money. In Plymouth, a number of big development schemes will be postponed indefinitely, including the construction of Central Park, and of a big central bus station, the need for which has been strongly urged by the Western Area Traffic Commissioner. In Derby, where a site was being cleared in the centre of the town for municipal offices, police station, the law courts and bus station, the erection of these new buildings will be indefinitely delayed. At Watford, it was decided not to proceed with the "Five Years Plan" for housing, which included slum clearance and re-housing, necessitating the expenditure of £300,000.

PROFITS IN SPITE OF DEPRESSION

Fortunately, there are signs that the Government itself, while naturally gratified at the quick response to its appeal for public economy, does not favour the entire cessation of necessary works of social reconstruction, and it may be hoped that in a few weeks, when the present panic is over, many of the municipalities will feel justified in resuming the greater part of their building activities. Meanwhile, it is gratifying to learn that many industries, in spite of the general financial depression, are able to make substantial profits, and especially is this the case when the industries in question have had the enterprise to advertise extensively.

AN AMERICAN'S ADVICE

Mr. Gilbert Hodges, the President of the United States Advertising Federation, has recently been talking to British advertising men on this very subject, and he produced facts and figures to prove that where a manufacturer is able to offer an article which is not only of sterling worth, but has also a touch of novelty, it will well repay him to advertise its merits. Mr. Hodges advocates "sound thinking, smart advertising, and aggressive selling"; he quotes a number of instances to show that large and increased profits have been made during the last year by a number of American companies which have refused, as far as their own businesses were concerned, to regard a "slump" as inevitable. This should surely be comforting news for those engaged in the building industry and the manufacture of household equipments. It is largely a matter of psychology, and if, instead of yielding to the depression, we stand up against it, happy results may follow, and not least in the case of the building industry, where there is so much inventive resource, and where architects and their clients take such a lively interest in new inventions which further the science and art of building and the comfort of the home. And architects would especially like to hear of new materials and processes which, while serving their purposes efficiently, result in an economy of building costs.

SAFEGUARDING THE DORSET COAST

Holidaymakers to Bournemouth or East Dorset should certainly make a point of studying recent developments in Poole Harbour. Owing to the foresight of a small group on the Poole Borough Council, there is control over the elevations of boathouses, and steps are being taken to demolish the disfiguring shacks, which have been allowed to be erected during the last twenty years. If the Dorset County Council favour the proposals put forward that the Islands of Brownsea and Fuzzy Isle should be included in the Borough under their extension schemes, it is likely that more drastic control over new building will be exercised so as to safeguard one of the most unspoilt and beautiful corners of Dorset.

MODERNIZING—WITH APOLOGIES

Post offices are to be modernized. It is about time they were, for so long as post office blotting paper was a reflection of its surroundings the public paid dearly for the stamps it bought. The announcement of impending changes has been made with many apologies, as though it were unnatural to expect post offices to be up to date; but in point of fact many of them *are* up to date already, especially new ones in suburbs and country towns. The Office of

Works, in a pompous sort of way, *does* do its best, but the type of modernization that I should like to see would spell revolution in Whitehall. Let us therefore give thanks for brighter blotting paper, and forbear to carp.

IF THAT CINEMA IS BUILT !

There is much talk of preservation, but most of it is still talk. I was recently in Truro, a city whose relics, in splendid town houses and interesting quayside buildings, unheeding citizens have not yet entirely destroyed. They have done their best, goodness knows, for the most interesting of these old houses is plastered over with the signs of the city printers' making, and the rest look neglected. The river, which could double the attractiveness of the town, is cold-shouldered, and the port has little share in the picture.

*

But much worse than this is the projected fate of Lemon Street. This invaluable street, which the sketch reproduced below does not flatter, was the outcome of Late Georgian expansion. Running from the city's centre, it sweeps boldly up the hillside, the cupola, a belt of great trees, and a good commemorative column—invisible until you near the top—all serving to mark the summit. As always, this architectural period has found favour with professional men, and Lemon Street is sacred to doctors, dentists and architects. This noble street is to be destroyed. About half-way up on the right-hand side a notice foretells the building of a super cinema !

*

If that cinema is built, Truro, which the zeal of Bishop Benson enriched with a beautiful cathedral, will have reason to be ashamed of itself, for Lemon Street, unaltered as it stands today, is one of its chief treasures.

A BUTTRESS AGAINST VULGARITY

It is gratifying to know that public spirit has helped to restore the unity of Charlotte Square, Edinburgh. This particularly fine example of the urban domestic architecture of Robert Adam had, during the years, suffered by trifling alterations, which, taken in the aggregate, served to destroy the unity of the original design. These alterations have been made good so that the north side of the square preserves its unbroken line.

*

The possession of such a work intact is, as in the case of Truro, a substantial buttress against the sea of vulgarity that threatens us, as it is a means whereby we shall be restored to a sure taste for good architecture.

FACTORY WELFARE

Excessive noise in the factory produces unnecessary physical fatigue in the worker, and factory welfare inspectors have long urged the silencing of machinery as a factor of increased production. Now the subject has been treated scientifically, and Dr. Kaye, in *Nature*, has given the results of his experiments. The intensity of noise is measured in decibels, and a clap of thunder registers 65 decibels, equal to the noise of a dog bark. A Bengal tiger at 15 ft. distance (presumably behind bars) registers 75 decibels, while the pneumatic drill of the London streets registers 90 decibels. Dr. Kaye does not say that these instruments of nerve-torture seldom work singly, and a battery in full blast will probably do better than 90 decibels. However, the New York correspondent of *The Times* promises relief, for he has inspected a new invention of Mr. Hiram Maxim. This is an instrument to exclude street noises from houses. It consists of a box which rests on the window cill, with the sash closed upon it. While admitting about 500 cubic feet of air per minute, it excludes all street noises, even those of the pneumatic drill. The one drawback to this little invention is the fact that it is not quite silent itself, but emits a contented hum like the drone of a ventilating fan. ASTRAGAL

Lemon Street, Truro, which, as Astragal points out in a note on this page, it is proposed to disfigure by the erection of a super cinema.

FELSTED SCHOOL: THE NEW GRIGNON HALL

DESIGNED BY CHETWOOD AND GRANT

The north-east front: the green room story and the cloister connecting it with the classrooms are seen in the foreground. Hand-made, multi-coloured stocks have been used for the facings; and purpose-made moulded brick mullions and transoms for the windows. The roof is covered with hand-made, sand-faced tiles.

FELSTED, one of the oldest of our public schools, was founded in 1564, by Richard Lord Riche, Lord Chancellor of England, whose estate, Leez Priory, is situated some two miles from the school buildings.

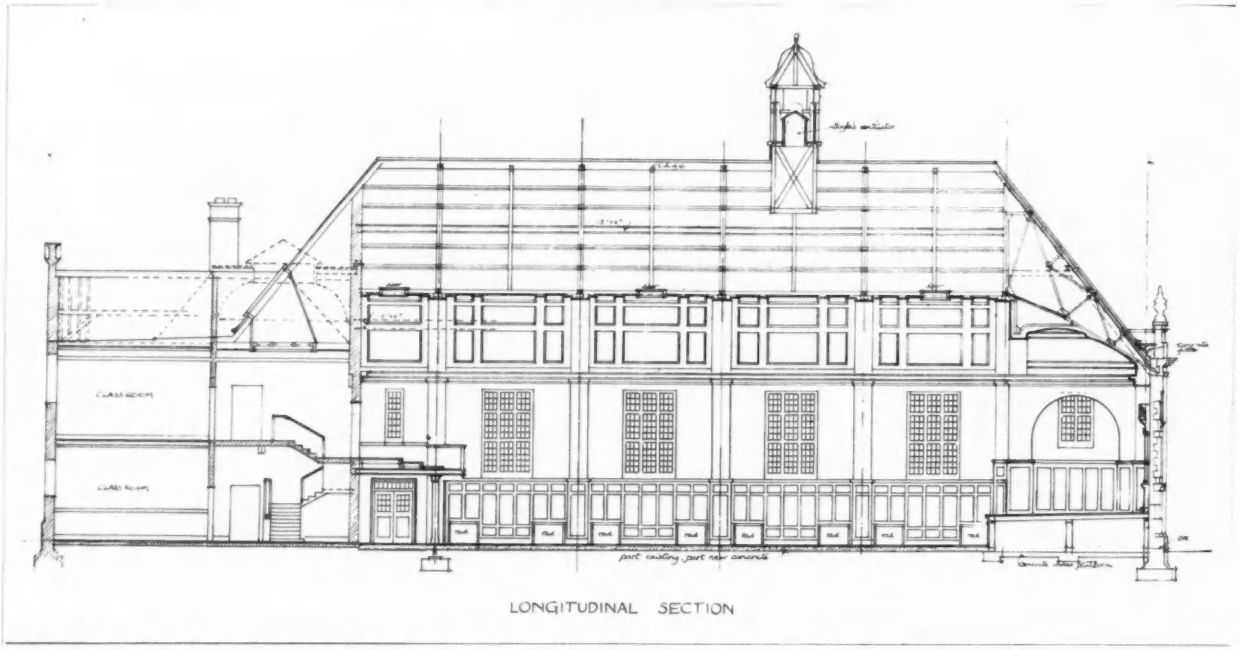
The new great hall, which was opened recently by Mr. S. A. Courtauld, the Chairman of the Governors, has been built to replace the original Grignon Hall, which was destroyed by fire in March, 1930.

The present building occupies a portion of the site of the old hall, but is considerably larger, and has certain special features which will be described later.

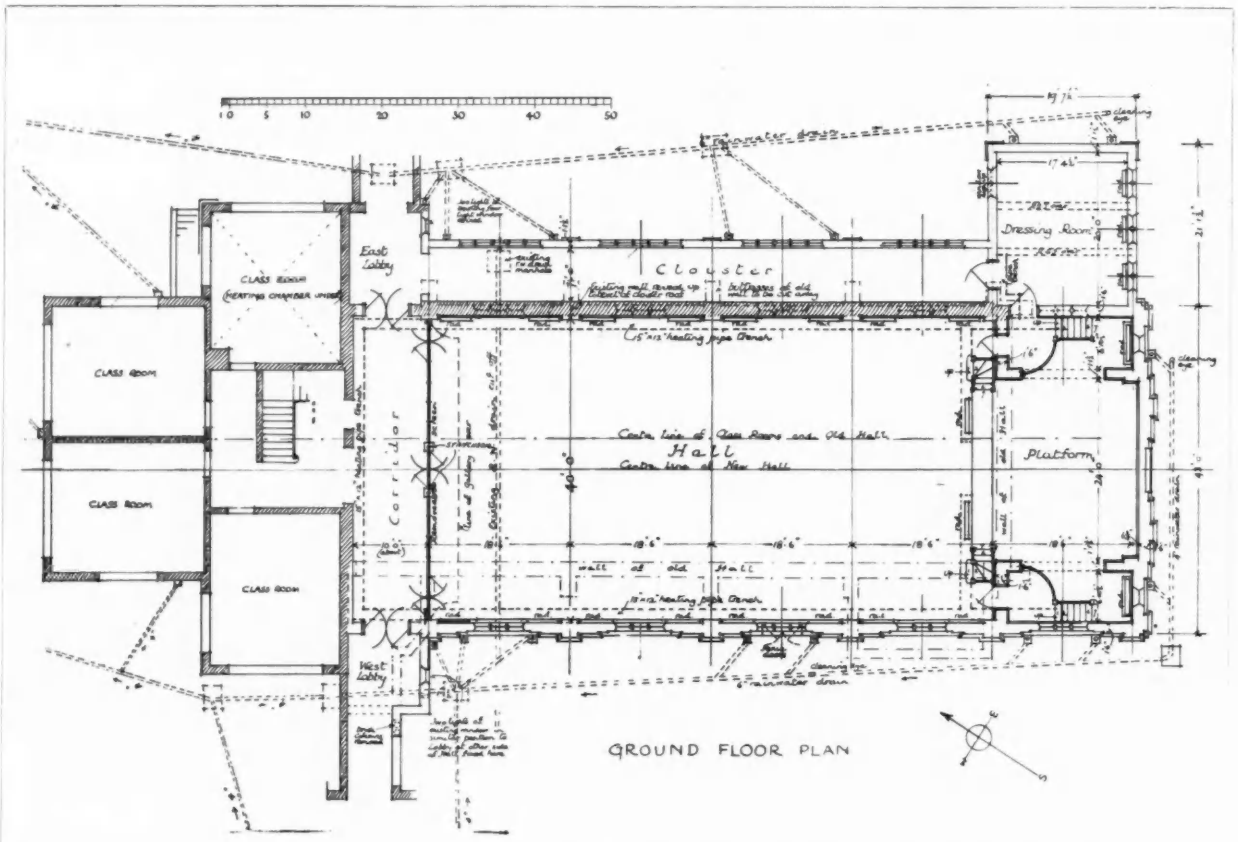
The problem to be solved was to provide a hall which, while still retaining the character of a school hall, should, at the same time, be adaptable for dramatic performances. A green room is placed at the platform end of the hall, connected with the main corridor of the school buildings by a cloister, which runs along the east side of the hall. Access can thus be obtained to the platform without passing through the hall.

The classrooms, which adjoin the northern end of the hall, were damaged

A general view from the south. The stone panel on the extreme right of the photograph records the destruction of the old hall and its rebuilding, while below the panel the old foundation stone has been refixed. The panic door shown leads to the hall.

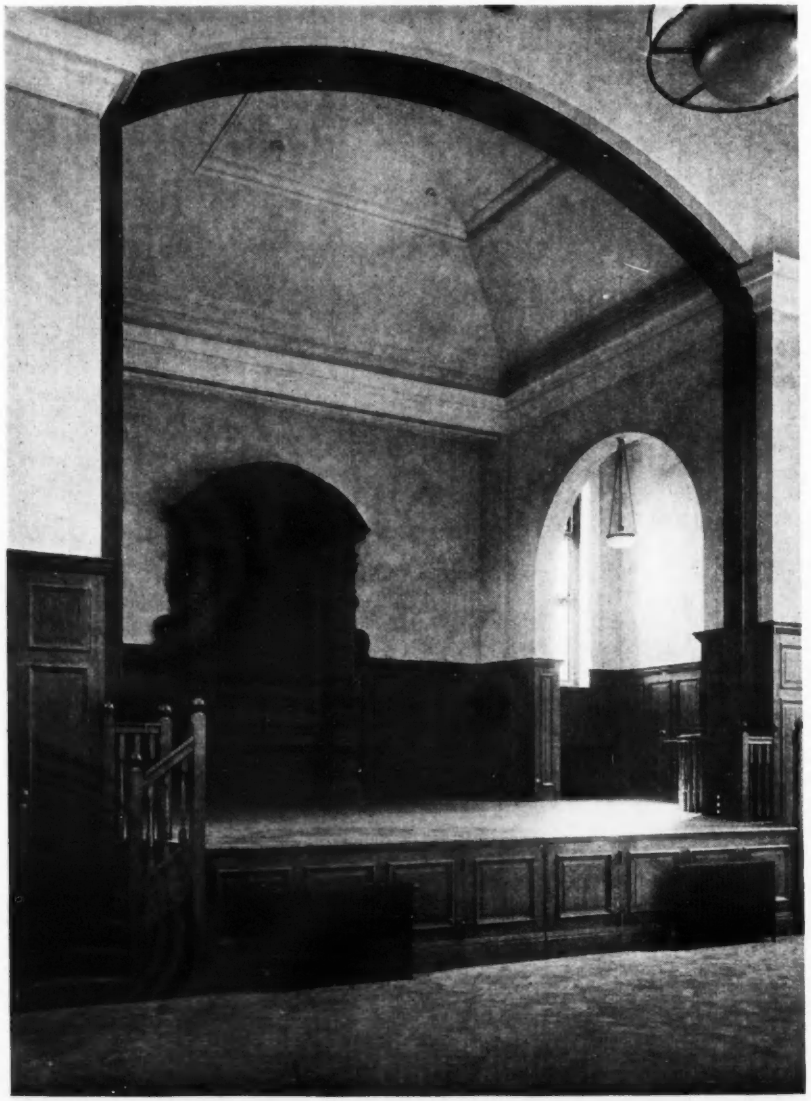


The architects' longitudinal section. The classrooms on the left, adjoining the hall, were damaged by fire, but were reconditioned without rebuilding, so that it was necessary to connect them in much the same manner as the previous building.



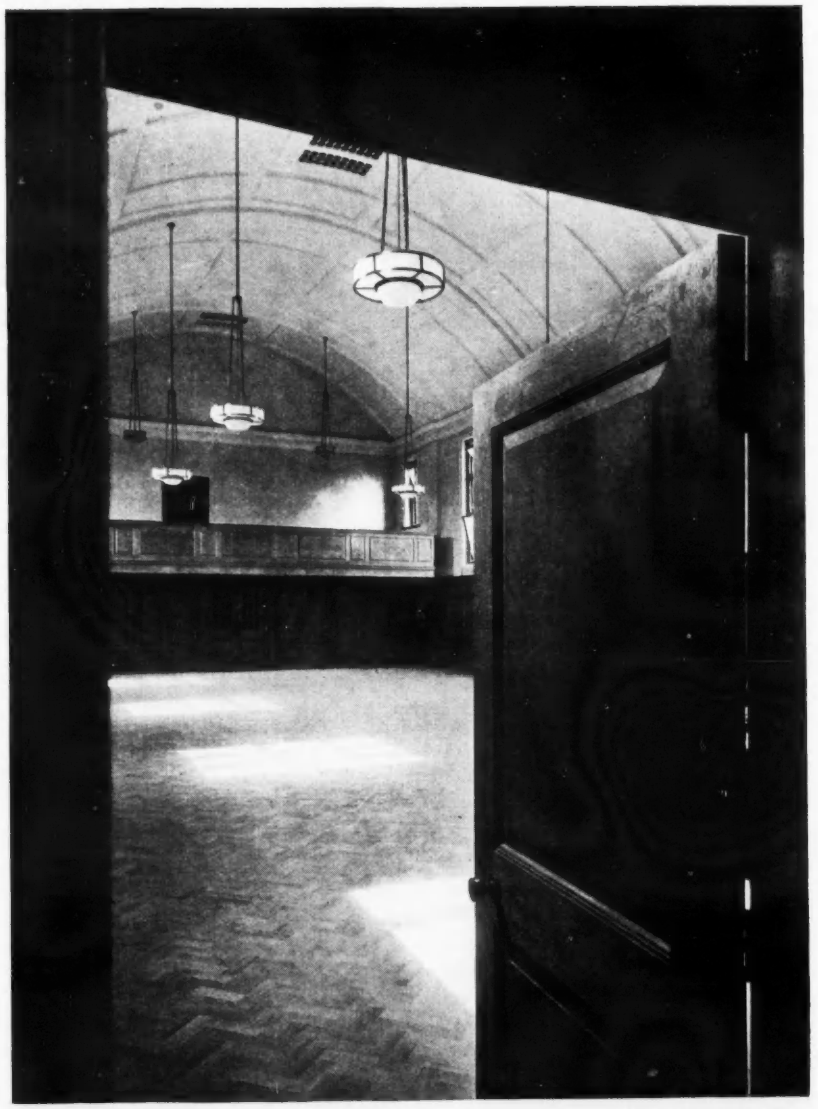
Felsted School: The New Grignon Hall.] [*By Chetwood and Grant.*

The hall is approximately 74 ft. long by 40 ft. wide, but can be further enlarged in order to provide additional accommodation, by removing the whole of the screen and access doors at its northern end, thus adding, approximately, 10 feet to its length.



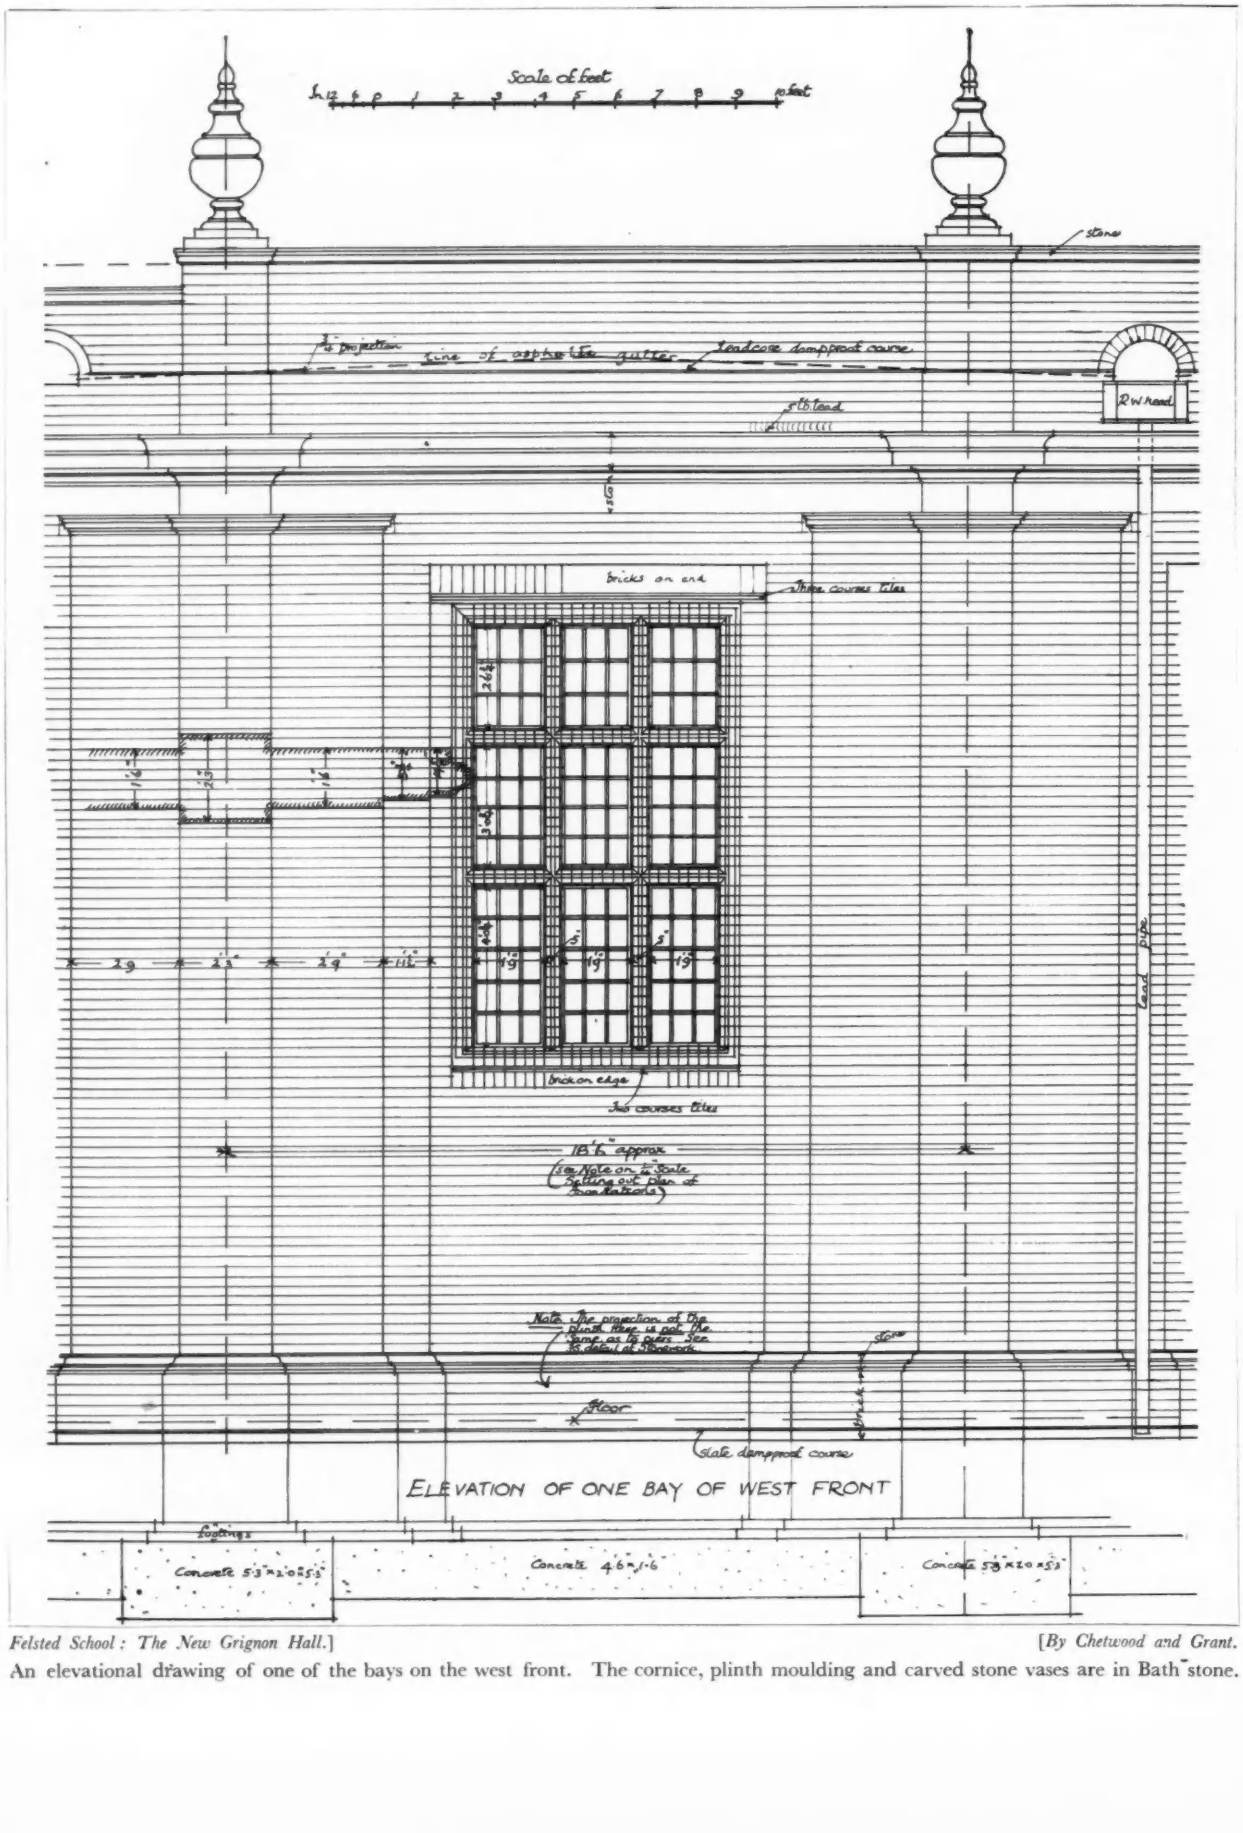
Felsted School: The New Grignon Hall.]

The platform in the hall has special lighting equipment, embodying ranges of footlights which can be brought into action by raising hinged boards in the flooring.



[*By Chetwood and Grant.*

Looking along the hall towards the entrance doors and gallery. The walls are panelled to a height of 8 ft. and are plastered and finished above with a wood float, and coloured cream.



Felsted School: The New Grignon Hall.] [*By Chetwood and Grant.*

An elevational drawing of one of the bays on the west front. The cornice, plinth moulding and carved stone vases are in Bath stone.

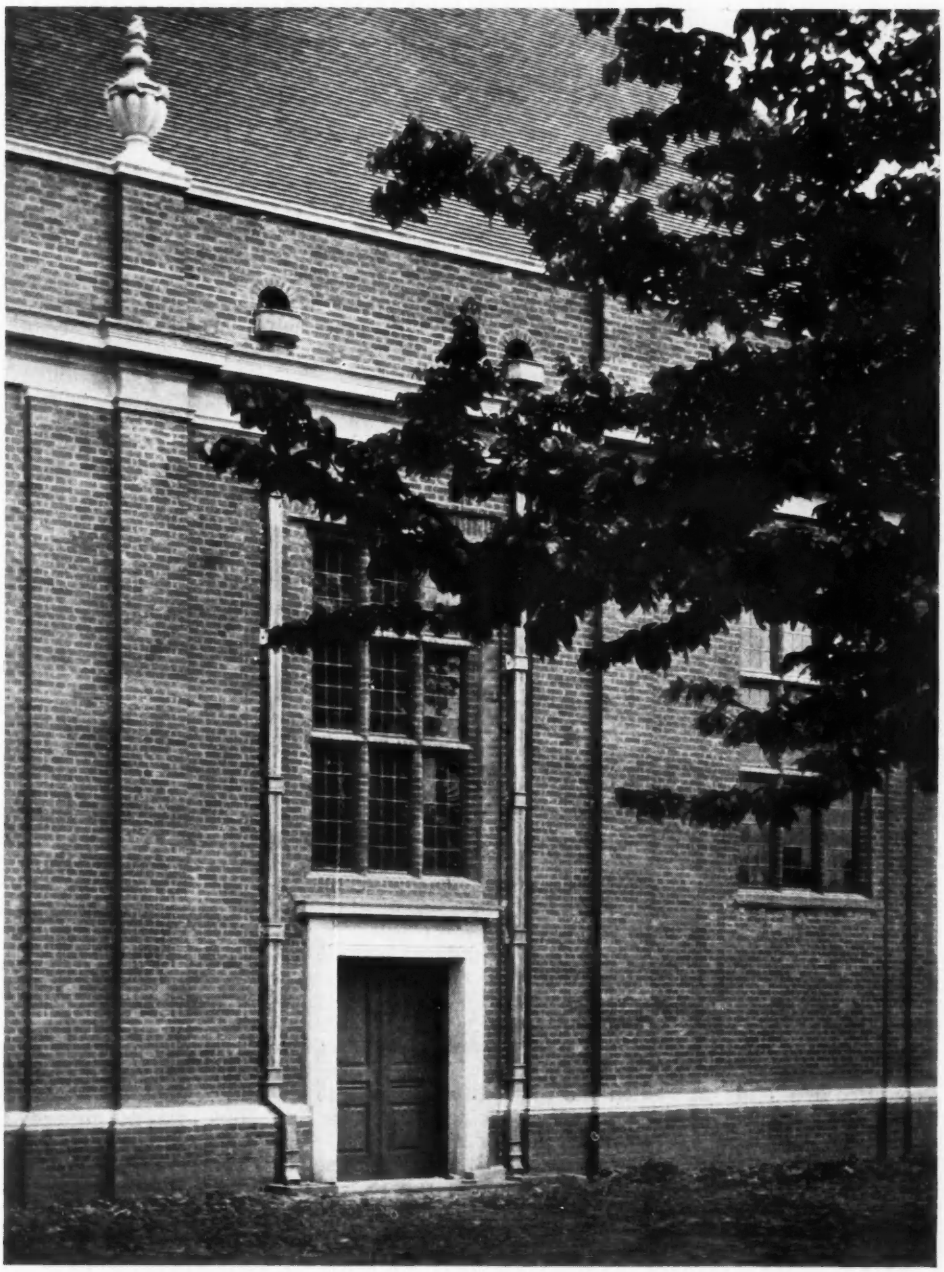
by fire, but were capable of being re-conditioned without rebuilding, so it became necessary to connect the new hall with these classrooms in much the same manner as the previous building. Beneath the gallery at the north end of the hall is an oak screen made in sections and removable, so that for special gatherings the whole of the screen and access doors can be removed and the corridor space at the back thrown into the hall.

The platform is specially designed for the presentation of plays, etc., and has special lighting equipment embodying ranges of footlights which can be brought into action by raising hinged boards of the platform. Winches and gearing for raising the proscenium curtains, etc., and electric lighting battens are provided; and there is large storage space under the platform for scenery, etc.

The seating accommodation of the hall is between 600 and 650, according to the arrangement of the seating.

The stone panel at the south end of the building bears an inscription in V-cut lettering recording the destruction of the old hall and the rebuilding, while below the panel the old foundation stone has been refixed.

The bronze lighting fittings in the hall were specially designed and can be raised or lowered by winches controlled from the roof space.



Felsted School: The New Grignon Hall.] [*By Chetwood and Grant.*

Central bay, west front. The door gives direct access to the hall and has been provided in case of panic.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xvi

A FAILURE AND A SUCCESS

BY KARSHISH

(H. B. CRESWELL)

THE mistake in the New Machine Shop Extension, which, for some time, made it appear that the whole would have to be gutted and rebuilt, was due to an error in the contractor's setting out; but as the extreme permissible deviation from truth was only *three-eighths of an inch*, it will be realized that "error in setting out" has here a meaning that few architects ever have occasion to give to it. The *degree* of error is indicated when I say that silk threads, stretched taut from end to end of the 280-ft. ranges of stanchions, revealed an extreme deviation of two and seven-sixteenth inches; but the *magnitude* of the catastrophe, and the predicament in which it placed us, will not be understood unless certain facts are explained.

The work of building the Machine Shop Extension consisted in joining up the existing shop with detached blocks on either side of it; and in carrying the whole back to a total length of 280 ft. by extending the eleven existing rows of stanchions by 160 ft.

The stanchions were built up of three 10 ins. by 4 ins. "I" beams distanced with plates riveted to their flanges, and with riveted angle-and-plate bases anchored with holding-down bolts to massive concrete foundations.

The central "I" beam members were carried up 30 ft. as bearings for lattice roof girders running *across* the shop to receive the feet of "weaver roof" principals: the two outer members were finished at 25 ft. from the ground with riveted angle-and-plate caps to receive the traveller girders running *down* the shop to which were riveted the rails on which the traveller cranes, straddling the bay, ran. These traveller cranes consisted of a frame on four wheels carrying a winch that ran upon it across the bay, so that a weight could be lifted from any point in the bay and deposited at any other.

It will be clear from this, that the rails on opposite sides of each bay had to be *exactly parallel*, or else the traveller would override them and fall to the ground; but it was necessary, also, that the *alignment* of the rails should be exact, or the same thing might happen; for the travellers were made on a principle which disallowed their running, in any degree, on a curve.

We now come to the crucial point. It is obvious that the traveller's ends had to extend over its wheels in order to get a proper bearing on them. This extension—or wheel-box—stood over the rail towards the roof stanchion; and as the position of the rail was fixed by the bearing of the girder carrying it on the stanchion, it will be seen that the stanchions and travellers had to be made to fit. That "fit" allowed a clearance of half an inch between the outer face of the wheel-box and the near edge of the roof stanchion: the dimension from centre of rail to face of wheel-box being 8½ ins., and to roof stanchion, 9 ins. Three-eighths of an inch was, however, the utmost encroachment on this half-inch clearance that would secure that the wheel-box should not foul the roof stanchion; for there might be vibration, and slight movements due to other causes.

The predicament in which I found myself will be realized if the site of the shop is imagined to be an open floor with eleven pairs of parallel straight chalk lines at 22-in. centres (allowing 4 ins. for width of roof stanchion), each pair parallel with other pairs 30 ft. on each side of it; and these chalk lines are then regarded as the centres of the traveller rails. In order for the stanchions to be placed so that the wheel-boxes would clear the central roof-supporting member, they had to be spaced out centrally between each pair of lines with a maximum deviation of any stanchion of three-eighths of an inch to right or left of the centre. What the contractors, the Wagworm brothers, did for me, was to put the stanchions out of parallel as well as out of alignment with themselves; and make the maximum deviation two and seven-sixteenth inches to right or left of the centre. They then fixed, glazed and slated the roof. My gratitude to the Wagworms for doing this for me was beyond all powers of expression.

What was to be done? The distance across the bays from rail to rail was fixed by the travellers which allowed of only a very small adjustment; the position of the traveller girders was fixed to within one inch, for the stanchions had not been designed for an eccentric load; the over-hang of the wheel-boxes could not be reduced and the travellers had, in fact, already been made. Hart and Beverley Kent agreed with me in seeing no means of getting things right except by pulling down and rebuilding.

I have always been grateful to Hart for his treatment of me when I carried him diagrams showing certain tentative proposals for restorations arrived at after days and nights of brain-wearying toil. The entanglement was so intricate that I could not do more than point out possibilities—I had not myself, in fact, entirely mastered the problem.

"Well," said Hart, "you've got us into this mess, and we shall look to you to get us out of it."

I felt then, and still think, that in saying this he showed deep sympathy and a kind heart. I was not—as I have to explain—responsible for the mess, except that I shouldered an architect's responsibility for the mistakes of those under my direction; but considering all the circumstances it would not have been unnatural for Hart to have turned his back upon me and looked for more experienced guidance. I was greatly consoled by his confidence in me; but the act which I have already spoken of—with great complacency—as entitling me to more gratitude for pulling the Company out of pickle than blame for pushing them in, no doubt operated with him.

By a most lucky chance—as it proved—the inaccuracies which were discovered when Beverley Kent began finally testing the alignment of the traveller girders, were only gradually revealed. The first irregularity reported to me affected only some corbelled brick brackets designed to carry pad-stones on existing walls, and did not in any way involve the main extensions. When I spoke to Beverley Kent on this matter he told me privately that he had discovered deviations from true alignment in certain stanchions, and suspected the irregularities were widespread. We were by this time good friends, for his opinion of all architects had been considerably raised by the ability of one of them to flatter him. I asked him to prevent the trouble from being known, and to this he agreed. Mr. Stevenson was on holiday, and Hart was also away that day; but on the next I saw him. He was greatly annoyed and upset, although the extent of the catastrophe was, at that time, not guessed.

"Well," he said, "they will earn no bonus, that's clear; and they must be made to put things right at once, and told that the Company will claim full penalties for delay as well as any other damages they can enforce for interference with the work of the shops; and understand that they cannot look for consideration or help of any kind whatever."

"No, sir. I mustn't do that."

"Why not? That's the position, and they'd better know it at once!"

"Because if they get to know the full extent of the errors they will disclaim responsibility."

"But they *can't* disclaim responsibility!"

"They will, sir: I know the men. They will invent excuses; raise quibbles; say that I approved and accepted the setting out——"

"You didn't, did you?"

"Certainly not; but they will say I did—they will say anything. They will also put the blame on the sub-contractor who is erecting the steel work, and, when he refuses to make good, claim time-allowance under the strike clause. The work will come to a stop and we shall be forced into litigation."

"What, then, do you propose?"

"Make them admit liability."

"But how are you going to do it?"

"Well, sir, they don't know anything is wrong yet;—except perhaps, through their foreman, that the corbelling in the old fettling bay is not parallel. I will call upon them to put that right—it is a very small matter; and when they have accepted the order I will tell them to adjust the traveller girders in bay 27. There is not much amiss there, and they will probably obey as a matter of course; but once they have accepted responsibility for true alignment, they cannot contend they are not responsible."

It will be observed that I had profited by experience, and that two years' acquaintance with commercial enterprise and of conflict with the shrewd business man, had taught me also to be shrewd. Although I think that my slyness was entirely justified by the circumstances as well as by its complete success, the occasion stands alone in my mind as the only time I have employed slyness; for I have all my life, since, had to do with accredited builders; and as I should be sly only as a last recourse in dealing with rogues, I have never had any reason even to contemplate being so.

In what degree I was responsible for the Machine Shop misfits may be judged when I say that the drawings were completely dimensioned after careful survey of the existing buildings, and a divergence from parallel in adjoining blocks—amounting to five and three-sixteenth inches in 160 feet—was exactly compensated and accurately figured in them; and that the contract laid down that the contractor was to be "solely and entirely responsible" for accurate setting out of the building and erection of the steelwork.

When I went away for my holiday I left the works in charge of a senior assistant who had been employed on the drawings, and gave him particular instructions to check the contractors' setting out in every part and to require them to set out anew if he was not satisfied with any setting out. Further, in order to compel the contractors to act independently, he was not to give any reason for being dissatisfied; he was on no account to express approval of, or accept, any setting out, but was to understand that his checks were for my satisfaction, only. In addition, I wrote to the contractors and told them that the fact that no objection was raised to any setting out did not imply that it was approved or accepted.

On my return, this assistant of mine answered my questions with adequate assurances. He was the first man I ever sacked—not, as I explained to him, in retribution; but because his position was one of trust, and I could no longer trust him. He was a well-spoken fellow, of fair general education and some social pretensions, who was a first-class draughtsman and well equipped technically for his standing of twenty-seven years; yet when I met him by chance in Holborn, a quarter of a century later, he was still an architect's assistant, and did not seem to occupy a much better position in life than when I said good-bye to him at Albion works. Such is life!

The Wagworm twins, finding themselves involved up to the knees before they knew it, accepted the inevitable—I will not say "like lambs," but like two bears with two sore heads. I had no sympathy with them, for they had embarked on the work with no other idea than of scrambling through it and getting away with bonus and profit. The restoration was achieved partly by reducing the straddle of those travellers that were still in the hands of the makers; partly by corbelling out from walls and bracketing out and stiffening stanchions; and partly by cutting through anchor bolts, and drilling for and running new ones, after remaking the bearing-connection with roof-girders at the heads of stanchions—a most tedious and difficult business. The actual delay of the company's business was not so great as was expected; for the machine tools could only be installed by degrees, and the various bays were accordingly completed in the same order as they were to be brought into use. The cost to the contractors, in addition to loss of bonus, was over one thousand pounds—as I was told by the foreman of the sub-contractors for steel-work erection.

It was the capacity and loyal co-operation of this foreman erector that achieved this success. He was, without exception, for his station in life, the most uncompromisingly dirty man I ever saw. If he carried away a smudge on the forehead with him on Monday, he brought back memories of it on Tuesday, and it was difficult to suppose he ever took off his clothes, or even his boots: they seemed to be grimed on to him. He had difficulty, with his thick fingers, in handling the silk threads that engaged so much of his time.

"I can't hardly feel 'em, even," he said.

"Why don't you wash your hands, then?" I suggested.

Although he did not act on this advice, he was clearly greatly struck by the freshness of the idea.

The cheerfulness and obliging activity of this little man was one bright spot among many clouded weeks; and he seemed well aware of this for, when all was finished, he came to me wriggling with solicitude like a spaniel and, after puzzling me with confidential allusions to our cordial relations, delivered himself frankly of what was on his mind.

He wanted a tip.

I was most grateful to him for so energetically helping the business through; I knew that Beverley Kent shared my feelings and that the Directors were appreciative; but the idea of rewarding the man for taking care of the Company's interests rather than his master's, stuck in my throat. However, Mr. Stevenson authorized me to make the proposal to his firm; the necessary permission was forthcoming; and I had the pleasure of presenting my grimy friend—for instant thumb-marking—with two new five-pound notes, which amounted to the sum he had very frankly told me would meet his ideas of what was "fair." The money represented about twenty pounds at present values, and the recipient was recompensed and grateful.

It may seem that since the disasters which overtook each of my first contracts were not due either to any one serious act, or to successive trivial acts of negligence, on my part, that I, therefore, learned no useful lesson from those unlucky experiences; but, in point of fact, I learned a most valuable lesson which was: that in the absence of the bona-fide good intention of an honourable and capable builder, no building will, by any coercion of Law, ever be successfully completed; and all architecture becomes impossible. The mistake I made—or which, rather, was made for me—was the employment of contractors whose standards of fair dealing and of accomplishment fell far short of what was due from them. As a consequence, the first contract which called for speed, produced delay; and the second which demanded exactness, ended in confusion; for in both, the contractors had no other care for the work than the money to be gained from it. If I had handed the same drawings and specifications to reputable firms of established builders, they would each have made the accomplishment of speed and exactness a point of pride and honour, and I should have been able to chronicle two complete successes instead of two complete failures.

I got this lesson, as has been seen, by negative proof which, though an unpleasant method of gathering knowledge, is certainly an impressive one; I was now to confirm it, more agreeably, by proof positive.

While the Wagworn twins were eating their insides out, I had been completing designs for new shops on land acquired by the Company adjoining the western boundary of the Albion Works. It is only necessary for me to say that these shops were between three and four acres in extent; that they were intended for light work; that they formed a separate group of buildings; and that the front elevation —still to be admired from the railway, by passengers of taste—was my first architectural design.

When my contract drawings, specification and bills came before the Board for final sanction, and the question of inviting tenders was under discussion, Mr. Stevenson broke out :

"Er—ahem—— Why not—it occurs to me—ask Farrar and Oldport for a tender ?"

"They always have tendered."

"Pardon me, Mr. Whistlow, I am addressing the Board. Ahem—er—I propose that we do not invite competitive tenders, but ask Farrar and Oldport for one. We need not accept it if we do not like it—are you listening Hart ? After our experiences, it would be a good bargain if we could get Farrar and Oldport for ten, or even fifteen per cent. above rock-bottom prices."

"They always have been far above the lowest," I said.

"As we are aware, Mr. Whistlow. Hart, what do you think ?"

It was soon settled that I should ask this firm for a tender, and explain that there was no proposal to invite other tenders if theirs was acceptable; and that I should direct them to attach their priced bills to their tender, so that I might examine them and make my recommendation.

Farrar and Oldport were a well-known firm of builders whose joiners' shops and head offices were in Nollingborough. They built churches, mansions and public buildings all over the country for leading architects, but had been unsuccessful in all their tenders to me, except for a club-room addition to the works mess room.

To cut the story short, I got from them a tender for £57,000 odd, which I made out to be 6½ per cent. more than Wagworm's rates would have given; but at the bottom of the summary at the end of the bills a deduction of "5 per cent. for full quantities" had been made. I told their manager the quantities were not "full," but he said that Mr. Farrar had himself made the allowance; as he thought the character of the work justified the deduction—in fact, I have no doubt whatever that, from a wish to respond to the confidence shown them, and in confidence that they would meet with fair treatment, the firm put in a lower tender than they would have risked in competition.

I now for the first time knew what it was to have a good builder to work with, instead of men who were not so much bad builders as no sorts of builders at all. Scales fell from my eyes. Things were all right then ! There was work in the world worth doing, and men who found it worth doing well ! Finnian, the firm's manager, was a sleek, fair, cheerful little fly-weight of a man who regarded me as an accredited architect —which no one before had done; and there was never a shadow of distrust between us. I was made aware, before work was done, that my wishes were being observed, instead of having to keep track of things like a bloodhound to discover, after work was finished, that my instructions had been eluded—if I could; I was freed from the anxieties of supervision—in fact, I was allowed to feel that the work would have been completed just as speedily and efficiently if I had been a hundred miles away, as it had been under my eye. When any point involving diverse interests had to be agreed, Finnian and I did not wrangle over it, but put our heads together to arrive at a just compromise; and, if I had to bear a little hardly on him Finnian might perhaps give a funny little grunt of concern—as though someone had tapped him in the wind—but he cheerfully accepted the rebuff, knowing that I would help him when I could.

The shops were beautifully built and up to time—after certain contract allowances had been made; and Finnian came to me with the final Statement of Account in draft, to get my approval of two extras for which he had omitted to get written authority, and one which he had forgotten to mention; because, as he said—"We do not want any questions raised after our account has been rendered."

Farrar and Oldport did much work for me in future years, and always punctually and well, whatever their profit—or possible loss—might be; and if, afterwards, I learned to prefer smaller firms whose principals came on to the works themselves, that is no disparagement of Farrar and Oldport, who were organized for big contracts as well as small ones.

By the time these large buildings were completed I had been employed by the Eureka Plough Company for almost three years; the time had come—as Mr. Stevenson put it—"for a slackening of the ties"; and by a most happy chance—if anything in life is "chance" — the stick I had thrown into the walnut tree so devotedly years before, brought me an unexpected reward of nuts.

NEXT WEEK—XVII : PRIVATE PRACTICE AT LAST !

The previous instalments appeared as follows :

May 27. i : I am Articled.
June 3. ii : Episodes of Pupilage.
June 10. iii : Episodes of Growth.
June 17. iv : My First Job : The Sewer.
June 24. v : My First Job: The "Pipes."
July 1. vi : I Turn Clerk of Works.
July 8. vii : Bradshaw & Son: Builders.
July 15. viii : Joe Richards : Foreman.
July 22. ix : Trials of a Clerk of Works.
July 29. x : A New Venture.
Aug. 5. xi : The Resident Architect.
Aug. 12. xii: An Architect's Early Gruel.
Aug. 19. xiii: An Uphill Fight.
Aug. 26. xiv: A Disaster.
Sept. 2. xv : The Law's Majesty.

The Reconstruction of Alexandra Palace

The intentions of the National Government in regard to the scheme for the reconstruction of Alexandra Palace, North London, are stated, says *The Times*, to be uncertain. The chairman of the trustees, Mr. E. A. Cawdron, announced on Saturday last, however, that preparatory work will be continued. Accordingly, arrangements will proceed for the demolition ceremony and the opening of the North London Exhibition by the Lord Mayor and Mr. George Lansbury, M.P., on October 14.

Mr. Cawdron said the trustees could not admit the right of the Government to turn down the scheme at this stage, and they assumed that a letter they had recently received from the Home Development Committee at the Treasury was merely a temporary hold-up until all the schemes before the Government had been gone into thoroughly and passed on their merits. A letter from the London County Council was merely the result of the Treasury decision. The letter from the Treasury stated that, "having regard to all the factors which the committee has to take into account when considering claims for grants, they have reached the decision that they cannot regard the work proposed as suitable for State assistance under Section 4 of the Development (Loans and Grants) Act, 1929. They are accordingly unable to recommend the grant desired by the trustees."

If the decision were final, Mr. Cawdron argued, then the term "scrap of paper" could be applied to the obligations of the Government. The trustees were urged by the late Government to raise the money to proceed with the scheme.

KING GEORGE HOSPITAL, ILFORD, ESSEX

C. J. DAWSON, SON AND ALLARDYCE, ARCHITECTS; T. A. POLE, CONSULTING ARCHITECT

The main front, housing the administration and out-patients' department, as seen from Eastern Avenue. The walls are faced with Brentwood red bricks, with artificial stone copings, cills and strings; and the roof is covered with hand-made, sand-faced tiles.

THE King George Hospital is built on the site of the Ilford Emergency Hospital, which was erected in 1909. The various buildings, together with the Children's War Memorial Hospital Wards, are incorporated in, and form part of, the new hospital. The area of the site was originally 4½ acres, but by the recent acquisition of adjoining land this has been increased to about 6 acres. Further permanent open space is provided by the adjoining war memorial garden, the grounds of the Borough Maternity Hospital, and the Horns School playing fields.

At the time the emergency hospital was built, the site was comparatively in the country, and the most direct and convenient access to it was from newly-formed and made-up roads on the northern boundary, the southern being a narrow country lane. A few years ago, however, this lane was widened and made up, and became a portion of the new main arterial road from London to Southend. It now forms the most direct road for access to the hospital.

As will be seen from the plans reproduced on page 340, and on one of the supplements accompanying this issue, the administration and out-patients' block has been erected with its principal front and main entrance facing this arterial road. To shorten the distance between the administration block and the wards, and also to provide additional sun-balcony space, a colonnade has been provided between the ward blocks in line with the sun balconies at the southern end of the wards.

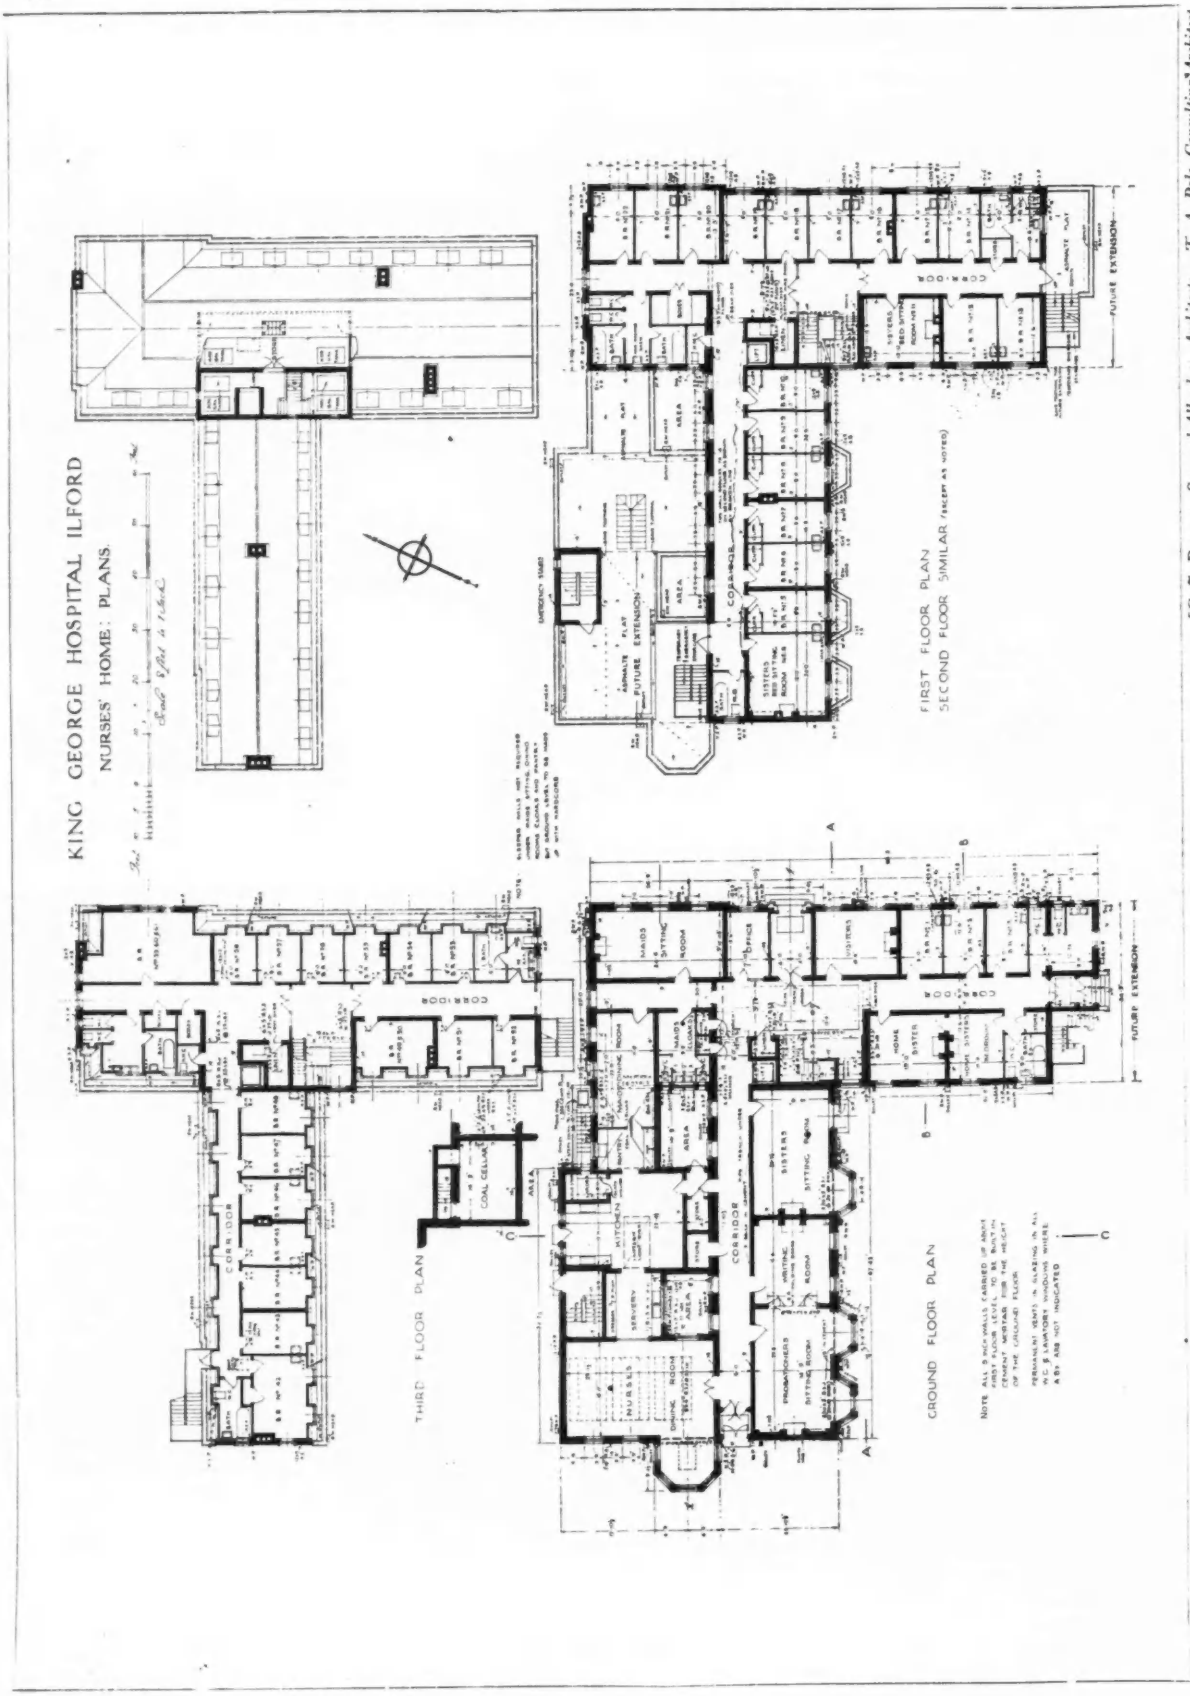
The main entrance surround is carried out in Portland stone. On the right can be seen the foundation stone, laid by Brigadier-General R. B. Colvin, in July, 1930.

From the central entrance hall of the outpatients' and administration block, a new connecting corridor runs north to the original main corridor, which runs east and west on the northern portion of this site.

On the south side of this main corridor are the five ward blocks, so placed that each ward gets the maximum of sunshine and is protected from the northerly winds. On the north side are the kitchen and stores blocks, dispensary, operating and massage blocks and the casualty block, so that practically the whole of the various units of the hospital are directly accessible from this corridor.

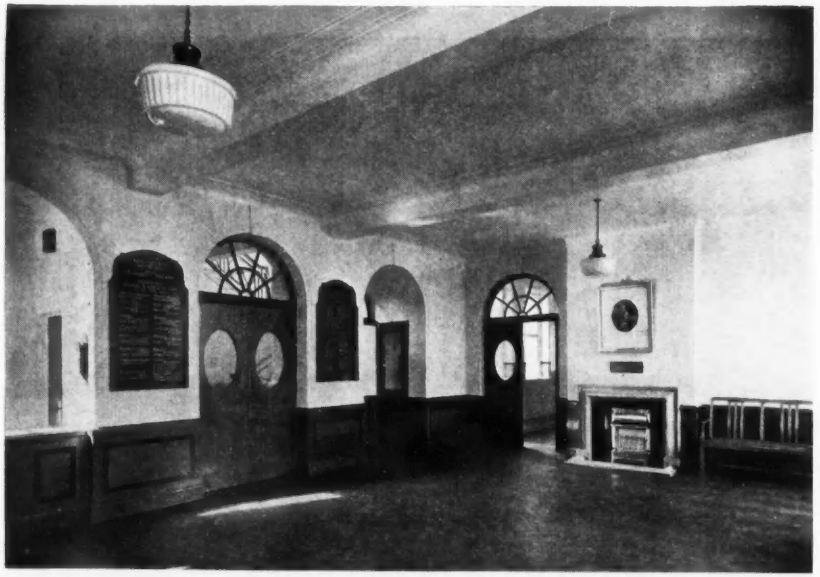
At the north-east corner of the site are the boiler house, mortuary and pathological laboratory, and at the north-west corner are the nurses' home and garden, between which space is reserved for future extension.

The Ilford War Memorial children's wing and hall was erected and opened in 1927.



King George Hospital, Ilford. [*C. J. Dawson, Son and Allardyce, Architects. T. A. Pole, Consulting Architect.*

Ground, first, second and third floor plans of the nurses' home. For plans of the out-patients' and administration building, etc., see supplement accompanying this issue.



The main entrance hall of the hospital, in the centre of the administration block. The doors lead to the porter's room, staircase, and the corridor to the out-patients' department.

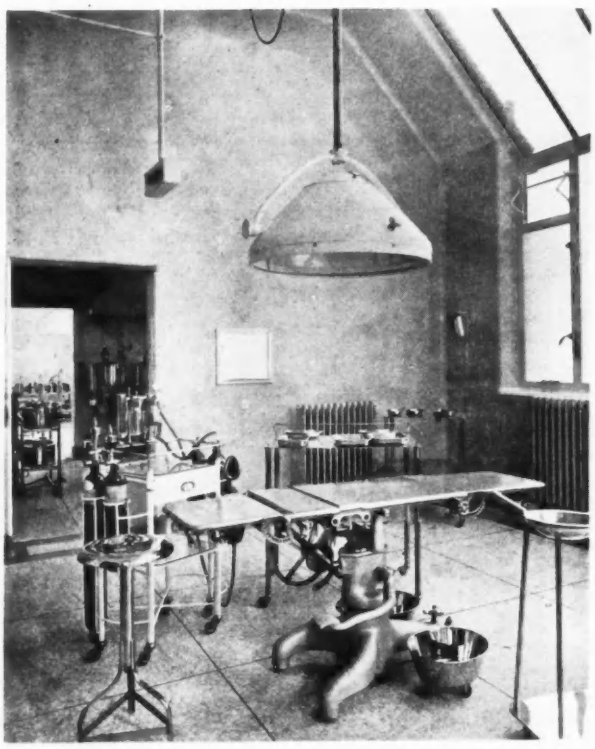
The boardroom is on the west side of the entrance hall to the out-patients' and administration block. The doors on the right give on to the corridor and secretary's room, respectively.

King George Hospital, Ilford.]

In this men's ward accommodation is provided for twenty-three beds. At the end are the doors leading to the sun balcony.

[*C. J. Dawson, Son and Allardyce, Architects. T. A. Pole, Consulting Architect.*

The kitchen. The first door on the right gives on to the vegetable scullery and the second to the corridor leading to the goods hall. That on the left leads to the kitchen, etc.



On the first floor: an operating theatre, looking through the sterilizing room towards another operating theatre.

This corridor connects the main entrance hall with practically the whole of the various units of the hospital.

King George Hospital, Ilford.] [*C. J. Dawson, Son and Allardyce, Architects. T. A. Pole, Consulting Architect.*

The main entrance to, and the hall of, the Ilford War Memorial Children's wing. The walls of the hall are lined with Roman marble and inscribed with the names of over 700 Ilford men who fell in the Great War.

LETTERS FROM READERS

Art and Industry

SIR,—My first thought on reading the announcement of the formation of yet another Board of Trade Committee to foster good industrial design was: Surely there already is the British Institute of Industrial Art, for that very purpose, with its permanent but ever-changing exhibition in a small dark corner of the Victoria and Albert Museum.

It is difficult to keep pace with the multiplicity of committees, commissions and societies which are so fashionable nowadays, and which so frequently cover the same ground.

What, for instance, is the precise difference between the D.I.A. and the B.I.I.A.? And has not the Royal Society of Arts' Annual Exhibition of competitive industrial designs (held this month at the Imperial Institute) been overlooked? I have visited this exhibition and was amazed at the general high standard of technique, if not of design, and it definitely *is* the means of bringing manufacturers and young designers together.

When I saw the well-organized Swedish Exhibition of Industrial Art, in Lower Regent Street this year, it occurred to me that it should be followed by an all-British Exhibition, on similar lines, to be held in the same building, and equally well advertised. We could have put up quite a good show, as was indicated by the small exhibition of table-glass in Grafton Street which followed soon after.

As an architect I know it is often difficult to obtain simple, well-designed fittings, free from the kind of eccentricity that so frequently masquerades as art, and I agree with Mr. Noel Carrington that simplicity often costs more, but I do not agree with him in thinking that the organization of an exhibition—or even periodical exhibitions—should be so formidable as he supposes.

The Arts and Crafts Exhibition Society, with only slender financial resources, but with much enthusiasm, holds triennial exhibitions and is, by the way, to hold one at the Royal Academy during the last three months of this year.

It is true, of course, that mass-produced goods do not make the same appeal as handicrafts, but the choice, at least, is less limited with good machine-made objects.

I suggest, as a start, wider publicity for the existing permanent B.I.I.A. Exhibition, enlargement of its scope and removal from its present obscurity at South Kensington to a more central position, as convenient as the lately opened Empire Marketing Board's shop in Burlington Gardens, but that requires money, and where is it to come from, at the present time, except from a limited number of impoverished manufacturers with artistic ideas? BASIL OLIVER

SIR,—Mr. Carrington in his letter rightly points out the important position occupied by the architectural profession in relation to the big subject of industrial design.

The thing that is most needed today is concerted effort along a clearly defined course. What is required is not so much an agreement as to the style on which the new designs should be based, but a firm determination on the part of all designers to keep fitness for purpose always before them as the common basis, and to insist on the severe elimination of the non-essentials.

The acceptance of this as the foundation of design would go a great way towards harmonizing the work of the designers for industry.

CHARLES HOLDEN

SIR,—Mr. Noel Carrington, in his very interesting letter to your JOURNAL, has in view an exhibition of an international character which will endeavour to show the functions of design in civilization.

This project is surely deserving of the most sincere consideration by all the authorities concerned, and although such a subject is necessarily too wide for general contemplation, yet experience has proved that "the house" and all it stands for is, as he suggests, the real background or "central unit" for all practical purposes.

The preparation of such an exhibition would undoubtedly take some considerable time, but perhaps an optimistic view of three years might still allow time for the findings of the Board of Trade Inquiry to be incorporated in the exhibits (or some of them); in fact, any such findings will hardly be intelligible to the public unless they are demonstrated in some equally practical way.

It is fortunate that two such able architects have been included among the Commission which is formed to discover a method of bridging the differences which are supposed to exist between art and industry; they cannot, however, be expected to achieve all the desirable solutions without the assistance of other members of the profession.

That talent exists for this purpose is proved by the fact that the schemes and articles which finally become "la mode" are invariably produced by the architect in the course of his practice; his ability to harmonize the necessary functions with his problem is only excelled by his powers to produce individual objects of design, should the occasion demand it.

There is also in existence a large body of excellent craftsmen, in the majority the product of the various art schools and studios, and these craftsmen-artists are capable of achieving the desired results if they could be organized and directed along the right lines. The competitions of industrial designs, which are organized by the Royal Society of Arts and now on view at the Imperial Institute, show much individual initiative, despite the fact that the large proportion are, as yet, students; the nature of the problem is also limited to the particular requirements of the firms or donors of the prizes. Our manufacturers are not blameless in the matter of the selection of "Design," but I am confident that, were some comprehensive scheme adopted, the work of our national craftsmen—and women—would not be found lacking in artistic merit.

The stimulus of such an exhibition as the one suggested by your correspondent would be immensely beneficial to our many artistic industries and, of course, the D.I.A. and kindred bodies have urged the opportunity for many years, and would be able to offer valuable experience with the manufacturer. The large art schools and institutions usually keep in touch with their ex-students and other bureaus exist for similar purposes.

If our manufacturers could be persuaded to realize that the promoters of such a scheme were interested in the welfare of English craftsmanship, were competent to assist in the choice of "design" in every production, and were more certain in their judgment of things artistic than is the average "buyer" (who now seems to be chief in control of such important things), then the success of the exhibition and of its objects would be immediate.

WALTER M. KEESEY

SIR,—Mr. Noel Carrington, in his interesting letter printed in your issue for August 26, stresses the important part which architects will have to play in relation to the forthcoming committee to be set up by the Board of Trade, to deal with the relationship between Art and Industry.

Any architect who has seen the inside of his building wrecked by ugly furniture and decoration, the outside ridiculed by its veneer of advertisements and other evidence of modern commerce, cannot fail to realize that the interests of the community, even his own reputation—a matter of small importance to anyone but himself, and therefore not, perhaps, to be considered—are really bound up with this committee. It is the chance of a lifetime to put

forward in a compelling manner views which, in the ordinary course of events, an architect might consider untimely through a misunderstood sense of "boosting his own wares."

Apart, however, from the views of the architectural profession, such bodies as the D.I.A., the Society of Arts and Crafts, etc., have such a large number of architects in their ranks that there should be no risk of lack of representation, so long as they recognize that their aims are similar and therefore present a united body of opinion.

Mr. Carrington suggests an international exhibition in three to five years' time. This would be time enough in which to prepare and organize such an exhibition, but not, perhaps, in which to organize and prepare industry. For a bad exhibition, or even an exhibition in which bad things occur, would do more harm than good, and might merely show that things could be done better abroad.

The holding of smaller permanent or temporary exhibitions is of paramount importance, and much will depend on the controlling organization. This should be strong enough to act as a real selection committee, above the influence of trade interests, and see to it that anything ill designed or unfit for its purpose is rigorously excluded. But these are presumably questions with which the committee will deal. It will take a great combined effort to get the public there, but it might be done by careful propaganda !

In the meanwhile, what is wanted is public criticism, fair criticism, which in this country is often stifled by the risk and cost of fighting an action for libel.

W. RALPH BRINTON

A.A. Materials Bureau

SIR,—It was good to see your reference in the JOURNAL for August 19 to the Architectural Association's Sample Bureau.

Not only is such a bureau invaluable to the architect, but it is also invaluable to the manufacturer, for he knows that when his products are exhibited in the bureau they will get a fair deal, and that there will be no question of the highest bidder getting the best recommendations, but his products will be judged on their merits and suitability for specific jobs.

The Committee of the Architectural Association and their able secretary, Mr. Yerbury, are to be congratulated on their forethought in creating and developing this service and for finding Mr. Winser to run it.

J. C. P.

HOUSE AT SEAL, SEVENOAKS, KENT

DESIGNED BY W. H. ANSELL

The garden front. The walls are in multicoloured stock bricks, and the roof is covered with hand-made tiles. The steps on the left of the photograph lead down to the lawn, which gives on to the rose-garden, the wild garden and the orchard.

"LITTLE PADDOCK" is situated on a delightful site of four acres at Seal, near Sevenoaks, Kent. The land slopes to the south and west. On the north side is the Maidstone road, but a belt of high trees, and the bank formed when the road was widened a hundred years ago, effectively shield the site from north winds and the noise of traffic.

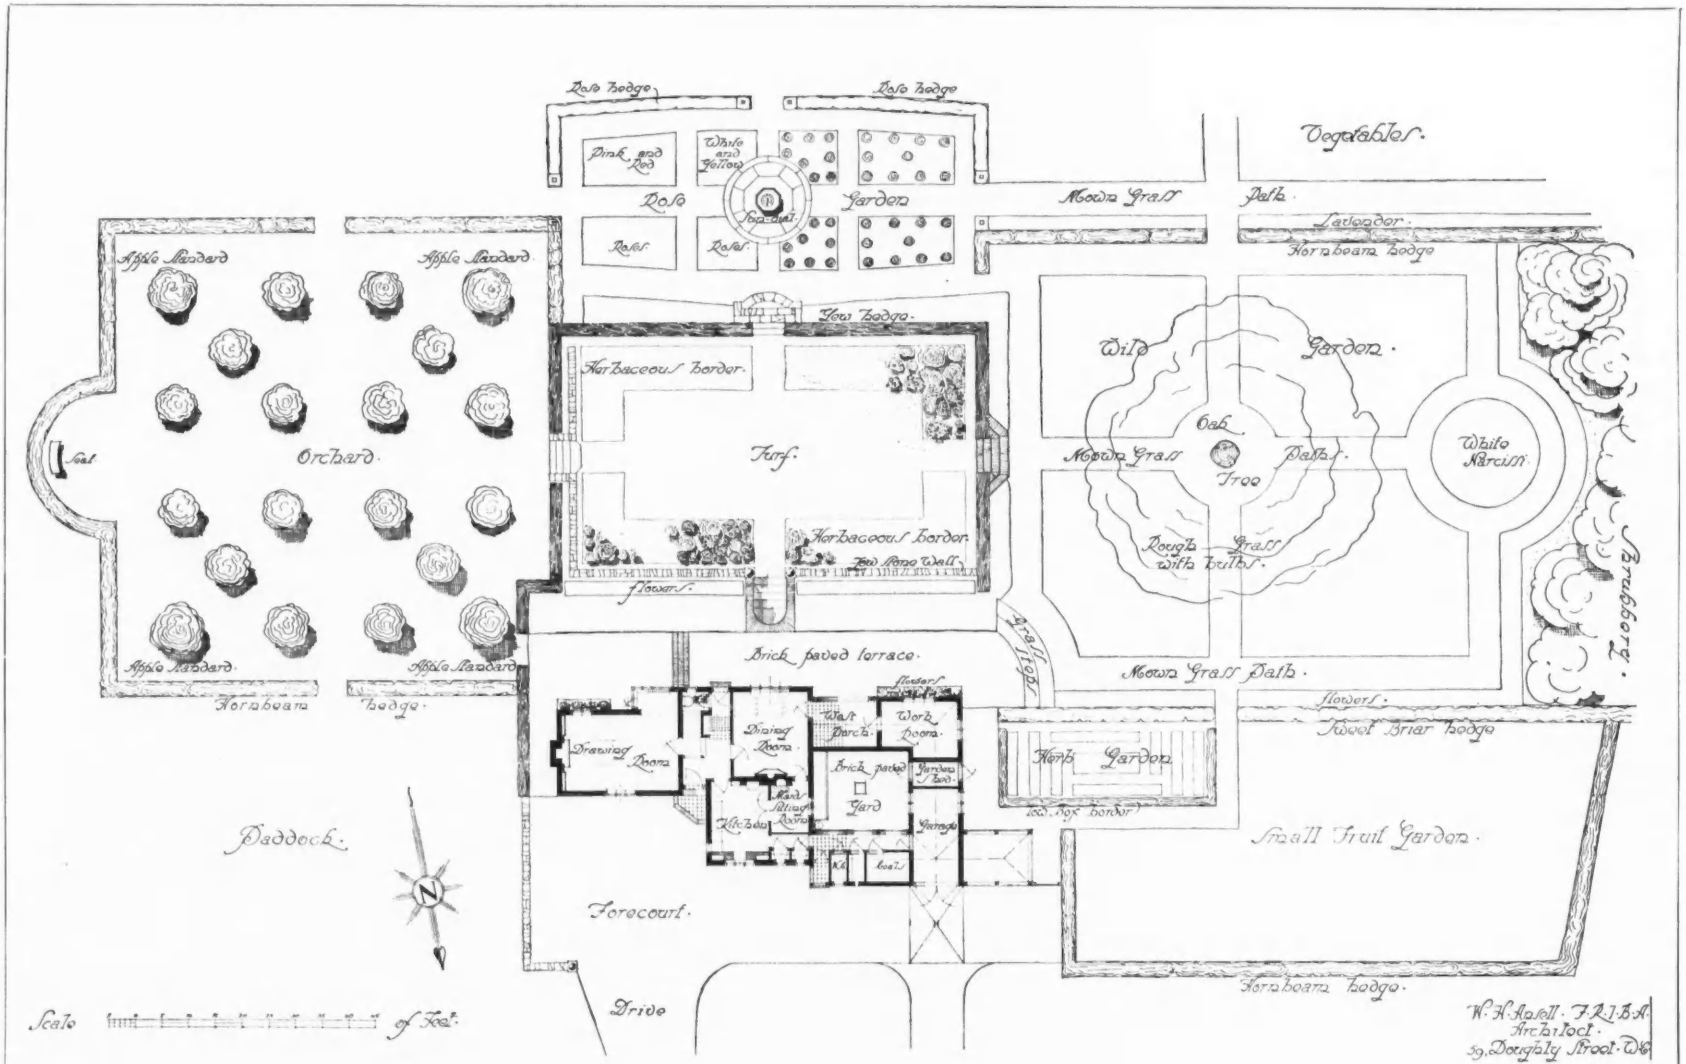
The wood curves round to the east, giving protection on that side also, but the south view is open, and extends for about a mile over the Wildernesse golf course. Chance Wood, a fine beech wood, bounds the view on the left.

Another view of the garden front, taken from the south-west. The one-story projection on the left houses the west porch and a workroom; and the door on the extreme left gives access to the garden shed.

The fall of the ground being considerable, the placing of the house on the site and its approaches was a matter for a good deal of consideration. A magnificent tree standing clear in the paddock was an obvious focal point in the garden design, and was made the centre of the wild garden. Hornbeam was used for the hedges to the orchard and wild garden; yew for the central lawn, and rose hedges for the rose garden.

As will be seen from the plan reproduced on the facing page, the kitchen and dining-room are on one level, but the large drawing-room is approached from a landing a short way up the main stairs.

A little enclosed brick-paved court provides a private yard to the kitchen quarters, and a covered way leads from the house to the garage.



"Little Paddock," Seal, Sevenoaks, Kent.] [*By W. H. Ansell.*

To obtain a level base for the house, a small lawn, with herbaceous borders all round and a yew hedge enclosure, was formed directly in front of it. This has steps up to the house terrace, and up to the orchard on the east; steps also lead down to the south rose garden, and to the wild garden to the west. The axial line of the whole converges on the oak tree.

THE SKETCH CLUB

THIRTY-SEVENTH SESSION

AUGUST HOLIDAY COMPETITION PRIZE AWARDS

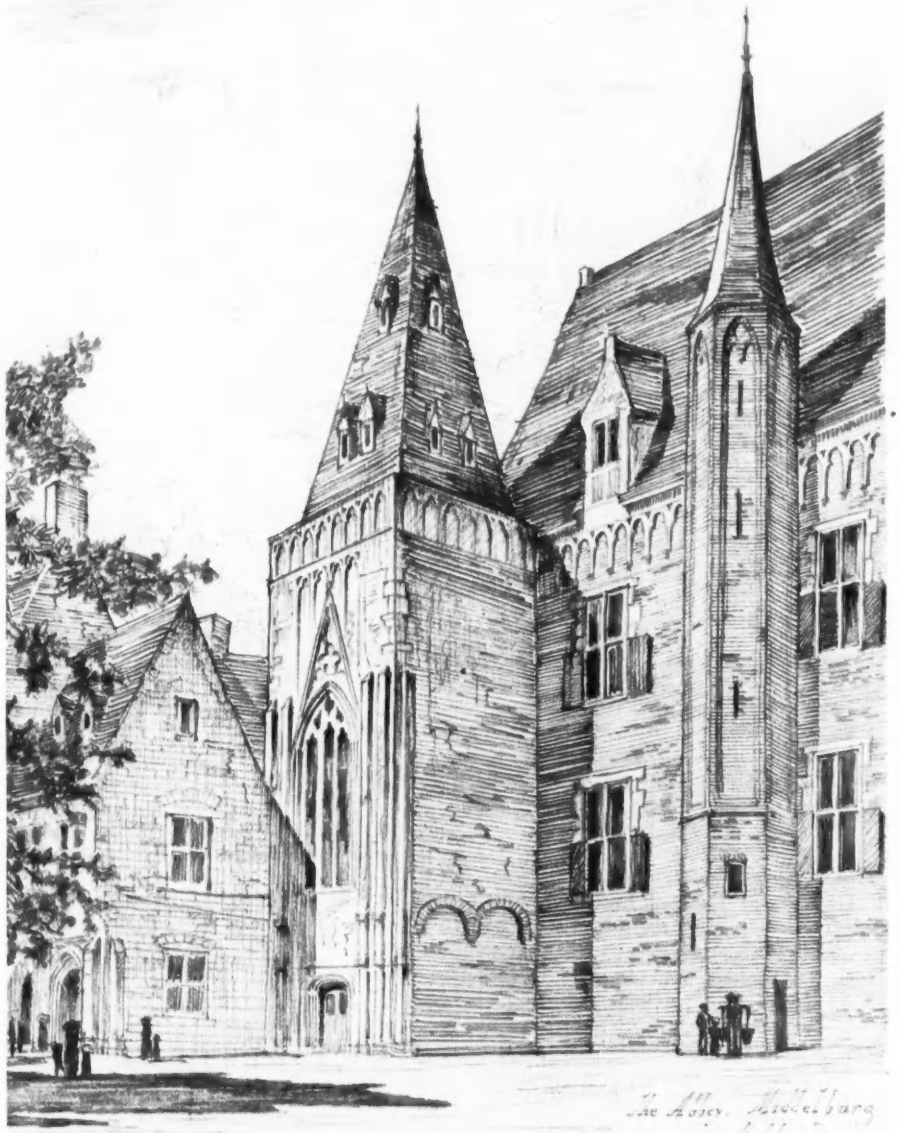
By Peter B. Dunham.] (Pencil 9¾″×13¼″)

Sluis, Holland.

THIS session is devoted to some of the sketches submitted in the second of this year's three Holiday Sketch Competitions. After careful consideration of sixty-six sketches submitted by twenty-two competitors, the assessor awarded first prize to "The Abbey, Middelburg, Holland," submitted by "Sniff." On opening the sealed envelope the sender was revealed as

PETER B. DUNHAM,
Streatley House,
Streatley, Luton, Beds,

who therefore is awarded the prize of ten guineas.



(Pencil (10¼″×12¼″)

FIRST PRIZE: PETER B. DUNHAM.
The Abbey, Middelburg, Holland.

By Peter B. Dunham.] (Pencil 13″×16½″)

Bruges, Belgium.

The second prize of five guineas was won by "The West Front of Bourges Cathedral," submitted by "Fyzabad." He is

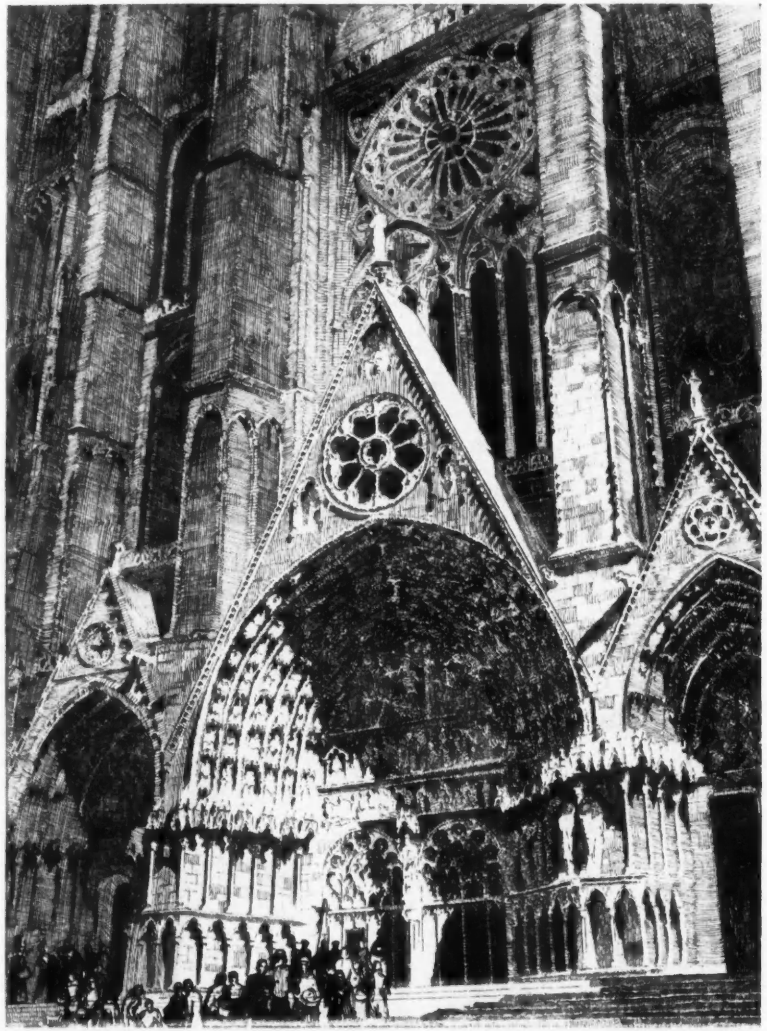
H. F. HOAR, B.A. (ARCH.).,
5 Gunnersbury Drive,
Ealing, W.5.

It is proposed to publish a further selection of the August Competition sketches in forthcoming sessions.

The winning designs in the first of this year's competition were reproduced in our issue for August 12. The closing date for the third and final competition is Tuesday next, September 15.

By W. E. Wilmshurst.] (Pencil 9¼″×13½″)

Couch's House, Polperro, Cornwall.



(Pen and Ink) (13″×18″)

SECOND PRIZE: H. F. HOAR.

THE ILLUMINATION CONGRESS

On this and the following pages are printed extracts from some of the papers read at the Glasgow session of the International Illumination Congress, held on Friday last. The forthcoming sessions and arrangements of the Congress are given in the Architects' Diary on page 351 of this issue.

THE PROVISION OF ADEQUATE DAYLIGHT IN BUILDING REGULATIONS

By P. J. Waldram

IN Great Britain close study of daylight was enforced by the survival of the ancient Roman law of light. This, being a law which gave rights of light to individuals rather than to communities, led to frequent disputes between individual property owners in towns as to whether some new proposed building would or would not leave to its surrounding neighbours a sufficiency of light and air.

For so long as the measurement and predetermination of daylight were virtually nothing better than guess-work and opinion, generally unconsciously biased, and, for so long as definite standards were non-existent, such disputes almost invariably led to bitter litigation.

There was an insistent demand both from architects and the courts for methods of predetermination and measurement which should be at once scientifically accurate and applicable to the most complicated case, and yet sufficiently simple to be applied by draughtsmen. There was a demand no less insistent for standards, which would command respect from both sides of a dispute, of adequate light for ordinary purposes such as offices and dwellings, and for special purposes such as elementary schools.

There was at the same time a demand also for methods of representing adequacy and inadequacy on drawings in some simple, obvious, yet accurate manner to enable the facts as to light to be grasped readily by litigants, potential or actual, and by non-technical lawyers.

All these demands have been met. In Great Britain certain standards of adequacy are well established; and convenient methods of measurements, predetermination and representation have been evolved, and considerable experience has been acquired of their use.

The question naturally arises as to whether such tools ready to our hand are such as the Commission can recommend to those who bear the great responsibility of framing building regulations. The fact that they have been adopted by practical people necessarily interested in the results of disputes is strong *prima facie* evidence of their reliability.

The meteorological data of the crowded industrial and commercial centres of the world and the need both for concentration of buildings and also for the light and air are similarly convincing; for in all these centres the periods of dull weather bulk far too largely to be neglected.

When the architect is designing windows to light the interiors of buildings and the legislator is fixing the permissible limits of external obstruction, neither can consider averages, any more than an engineer can consider average loading when designing a bridge. The engineer must design for the most severe loading reasonably to be expected, even though at other times his bridge may have nothing to carry—the architect and those who frame building restrictions must legislate for those periods of dull and wet weather which can reasonably be expected, even though at other times there may be a surplus of light.

It is possible, of course, to visualize particularly favoured localities where a wet or cloudy day is so rare that the health and eyesight of the inhabitants would not suffer by being forced to use artificial light all day on such infrequent occasions.

Such places might consider that they could afford so to frame their building regulations that sufficient light will penetrate buildings in cloudless weather. But even if they did, the practical difference between building regulations based on the generous amplitude of sunny weather and building regulations based on the requirements of dull weather cannot be large; even in midsummer the lower rooms lit, or alleged to be lit, from the internal light wells of a skyscraper require artificial light all day and every day. In so far as research has yet proceeded, the criterion of inadequacy of daylight appears to be a matter of ratio only and to be largely unaltered by variations in amount.

The British legal standard of adequate light for ordinary purposes is 0·2 per cent. daylight ratio (0.4 per cent. cill ratio). As this means only 10 lux or 1 foot-candle in dull weather, it is scarcely likely to be objected to as excessive; and no country in the Temperate zone, however sunny its summers may be, is at all likely to be content with less over the winter months, which must of necessity be the governing factor.

It is very important to bear in mind that this standard was in no way founded upon any theoretical opinion as to what people *ought* to require, but was founded upon and has been checked by long series of measurements of the daylight ratio at positions fixed by a large consensus of reliable opinion as being the positions where light changed from adequate to inadequate. Also, since it was first ascertained, suggested and published some twenty-three years ago, long before any records of sky brightness were available, it has remained absolutely unaltered in spite of the most searching and hostile criticism, and in spite of the most rigid and comprehensive tests culminating in the long test carried out by Government departments described in the Paper 12 Great Britain 10, circulated last year.

It possesses another advantage of no small practical value. In all cases of external obstructions which present a more or less level sky line, such as houses of a given height on the opposite side of a street, light wells terminating in flat roofs and the like, its position in any interior is for all practical purposes identical with the "no-sky line" or limit of penetration at table height, i.e. the point which is so far distant back from an obstructed window that sky ceases to be visible between the top of the obstruction and the top of the glass—a point which can quickly be ascertained without any calculation of ratios or illumination.

This is the standard of inadequacy adopted in the communication from Germany (12 Germany 1) circulated in 1929.

The limit of visible sky which has been largely used in this country as an alternative in suitable cases to the 0·2 per cent. daylight ratio or legal "grumble point" has the advantage that it can readily be set out by any architectural draughtsman upon alternative designs for new buildings.

It is therefore suggested that the minimum standard of adequate daylight, viz. 0.2 daylight ratio recommended by the British Committee, is amply justified on the grounds of (a) reliability proved by long experience, (b) applicability to all countries.

It remains to be seen whether the methods by which such standards can be applied are convenient for use by architects and legislators.

DAYLIGHT ILLUMINATION AND TOWN PLANNING

By C. G. Moller (Architect, Budapest, Hungary)

THE designing of windows for adequate daylight illumination presents an entirely new problem to most architects. In Hungary, building bylaws give some simple rules as to the minimum size of windows

compared to the floor area of the room, but any simple rule is liable to break down on account of the difficulty of the problem.

There is no established good practice in the size and arrangement of windows; architects following tradition are apt to use inadequate fenestration; modernistic designers very often overdo the size of windows, creating glasshouses instead of well-lit apartments and offices.

Scientific design of windows should be made familiar to architects, as proper daylight illumination is one of the most important factors, both hygienically and financially, in the use of a building.

Luckiesh quotes cases where the improvement of deficient illumination resulted in an increase of 79 per cent. of the output, in a decrease of 71 per cent. of rejected products and of 60 per cent. of accidents. But we cannot join him in advocating factories without windows or skylights, depending entirely on "constant well-distributed" artificial illumination and ventilation. Apart from the beneficial psychologic and physiologic effects of daylight, artificial illumination is—at least in our country—very expensive.

In Budapest yearly, with 250 workdays of ten hours each, the current for a lamp of 100 w. costs approximately 100 pengös = £3 11s.—whereas the heat-losses caused in winter by a 1 sq. m. single-glazed window amount to 3s. 6d., and those for a double-glazed window to 1s. 6d. only.

On the other hand, windows are much more expensive than any wall structure. A sq. m. of 1½ brick wall, plastered on both sides, costs 16 pengös = 11s., and a sq. m. of double window with rolling blinds, glazed with flat-drawn glass, costs 100 pengös = £3 11s. Large size windows in sunny aspects are also apt to lead to the overheating of rooms. Thus an upper limit of window size is commending itself.

We know of methods for determining approximately the daylight illumination. I say approximately, as in all methods known a series of variables we cannot easily get at are simply disregarded, and in the best case replaced by a "coefficient of ignorance." Nevertheless, as the faults are in many instances of sensibly the same magnitude, comparative values may be obtained with fair accuracy. A better knowledge of the "environment factors" and of the determination of indirect illumination is still needed, but the information already available is sufficient to be a practical guide to architects.

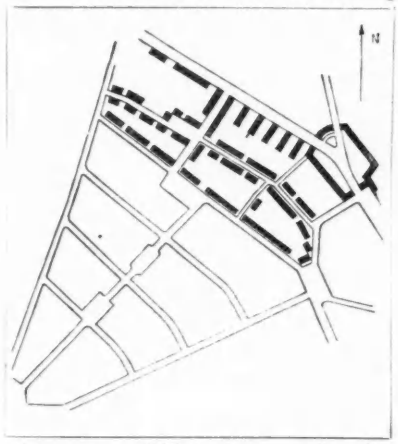

Figure one. Old development plan of Dürrenberg (Germany).

But what can illumination experts and architects do in cases where building bylaws and common practice allow the erection of high houses in narrow streets, of narrow courts and light shafts, making proper daylight illumination for lower stories quite impossible?

Here the town-planner comes in. He has to provide, in collaboration with the illumination expert, for the possibilities of adequate diurnal illumination.

The author then exposed the problem of daylight illumination with reference to the Budapest building regulations, which he divided into two headings under: (*a*) Actual conditions, (*b*) What is to be done? Regarding the latter, he said:

I should like to press the point that a town planning expert cannot be satisfied with merely ensuring proper illumination for all rooms; he has to set himself a higher aim in ensuring *direct sunlight*, for all dwelling-houses, hospitals and for corridors, at least in schools.

This is easily done in giving all the secondary streets an approximately north-south direction, so that all dwelling rooms should face east or west, the main arteries keeping their direction determined by traffic conditions and other considerations (figures one and two). According to A. Rey, the French town planning scientist and his astronomical collaborator, if the light and heat radiation should be equally distributed to both sides of the street, the direction of same should at Paris deviate + 19° from the north-south line. He calls this direction the heliothermic axis. Given the great economy in heating derived from sun radiation, I myself advocate the setting out of streets parallel to the heliothermic axis. In east-west streets one side gets an excessive sunshine, while the other obtains practically none.

Reflected light should be given more consideration. Having visited London, I quite agree with Mr. Waldram that there the coefficient of reflection of buildings is very low. But in brighter climates, with less smoke pollution, light reflected from the buildings opposite and from the walls and ceilings inside a room is not to be neglected.

As to the latter, at my desk 1·70 m. from the window, the indirect illumination is 28 per cent. of the total illumination on a dull day, whereas in the most remote point from the window indirect illumination is greater than the direct illumination. Applying these experiences to building bylaws, provision should be made for the compulsory maintenance of reflective surfaces where necessary.

I should be glad if I could draw your attention to the connecting points necessitating a close collaboration of illumination and town planning experts.

DAYLIGHT ILLUMINATION OF ART GALLERIES WITH OVERHEAD LIGHTING

By T. Hirayama (Assistant Professor of the Tokyo Imperial University)

TO ascertain the most satisfactory intensity of illumination in an art gallery, the following measurements were taken at an exhibition of the Imperial Academy of Art last year (1930). Inspectors, critics, architects, amateurs, and a number of students of the Imperial University estimated the amount of illumination at each picture. At the same time we measured the intensity of illumination at the surface of each picture with the illuminometer.

The intensities of illumination ascertained by these observers, who were forty in number, were 148 lux in the case of Japanese paintings and 87 lux in the case of oil paintings and water-colour paintings. Therefore, the average intensity of illumination suitable for an art gallery should be considered as 118 lux.

From the measurements made in existing galleries generally considered as adequately lighted, it may be concluded that an intensity of illumination of about 120 lux on the wall represents a satisfactory standard.

To obtain a suitable measure of illumination in an art gallery, i.e. about 120 lux, the sill ratio must be variable

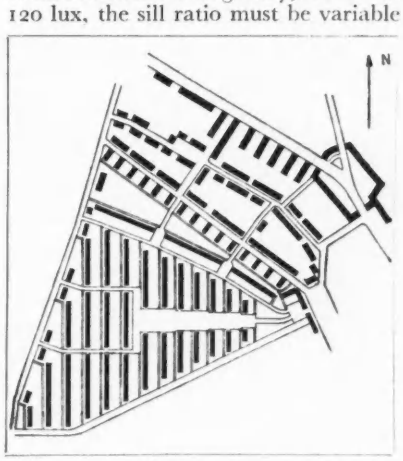

Figure two. New development plan of Dürrenberg. Alex Klein, Architect.

D

from 10·4 per cent. in the evening to 1·0 per cent. at the brightest hour of the day. It has been found that the most satisfactory lighting is obtained with an area ratio between the skylight surface and the floor surface of about 0·25; it is also found that the maximum sill ratio is about 10 per cent., and that the minimum sill ratio is about 1·0 per cent.

HOME LIGHTING

By Caroline Haslett and Nora E. Miller

ANY serious campaign to raise the standard of home lighting would have its effect on the building industry. At present the lighting question receives too little consideration. Even in the homes of the wealthy, the architect is too often given entire responsibility for the lighting arrangements, the purchaser requiring to be consulted only in respect of the fittings and any special lighting arrangements. In regard to the vast majority of middle class homes, however, the lighting question is hardly considered, the electrician often merely contracting to put in a certain number of points for the builder at the lowest possible price. In too many cases the purchaser is content to leave it at that, until the question of buying the decorative fittings arises. Careful consideration and discussion of the wiring installation before approval of the building plans would subsequently bring its reward in the home in the form of comfortable and useful lighting.

During the past fifty years, the progress of illumination in the home has been wonderful, but with the more rapid education of the public, and the greater co-operation of the engineer and the artist, the development in the next ten or twenty years should be absolutely revolutionary.

Modern architecture and decoration encourage original ideas in illumination; modern art, probably more than anything else, stimulates the use and appreciation of good lighting.

Rooms which are architecturally and decoratively pleasing are enhanced by harmonious lighting effects, while they would be entirely spoiled by incorrect lighting. One of the best ways of interesting women in domestic lighting is by means of novelties in the form of electric light ornaments and decorative fittings. Interest in these soon leads to a greater appreciation of lighting possibilities, and the desire for decorative lighting as well as good general illumination.

LITERATURE

STRESS DIAGRAMS AND DRAWING-OFFICE PRACTICE

THE principles of graphic statics, like those of the slide rule, although simple in themselves, often present unexpected pitfalls for the student who attempts to apply them to the calculations of an unfamiliar structure. Both must be thoroughly mastered before they become obedient servants, and mastery only comes by much practice. The mathematician may be scornful of the graphic method as one that cannot exclude errors up to two places of decimals, and which depends for accuracy entirely upon the skill of the draughtsman and the delicacy of the drawing instruments used. But graphic statics have the advantage of disclosing any serious error in the design of the structure for which the calculations are being made by the visible impossibility of closing the polygon of forces, and are therefore a useful check, even when the calculations have been made mathematically.

As so much depends upon the accuracy of the drawing, the author has divided his book into two parts. Part I deals with drawing instruments and their use, and is intended for beginners. Some readers may be impatient at being told how to sharpen a pencil when they itch to calculate a Warren girder, but Mr. Digweed is wiser than they and knows how closely the accuracy of the calculation is bound up with the fineness of the lines drawn and the proper handling of the set square. The remarks on drawing-office practice in this section, however, seem more applicable to the routine of an engineer's than an architect's office.

Part II comprises some thirty problems in graphic statics, ranging from the determination of the forces in a simple triangular frame, to the calculations of the stresses in girders and cranes. Each example is carefully worked out and the illustrations in the text show clearly the methods by which the stress diagrams are built up; any student who has mastered them will have obtained a good working knowledge of the subject and be able to solve most of the problems that are likely to arise in general practice. It might have been useful to include an example of the method of calculating the stresses in buttresses and retaining walls, and also to have expanded the notes on roof trusses sufficiently to show how wind pressure and loads may be combined in a stress diagram, and to have omitted some of the less usual types of girder construction; but the book should prove a real help to beginners, who are more frequently confused than helped by the multitude of examples given in the larger standard works on the subject.

LL. E. W.

Stress Diagrams and Drawing Office Practice. By E. N. Digweed, A.M.I.MECH.E. London: Williams and Norgate, Ltd. Price 8s. 6d. net.

MODERN BRIDGE CONSTRUCTION

IN *Modern Bridge Construction* the author has, in the short space of some 230 pages, successfully condensed the essentials of the one hundred odd subjects, for information on which the bridge engineer has usually to refer to at least one-half that number of different textbooks.

Illustrated by excellent diagrams, the volume is written in a style which makes easy and attractive reading, due to a large extent to the absence of those irritating interruptions so often caused in works of this nature by the inclusion of pages of intricate mathematical argument.

When mathematics are necessary, as they must be when one is dealing with a subject which is largely technical, the working formulæ, with which the practical engineer is mainly concerned, are established in a clear and concise manner, and in many instances a practical example follows.

In the opening pages the reader will find one chapter dealing with an obsolescent type of construction—the masonry bridge. Commensurate with the importance of the subject, the next five chapters are devoted to fixed steel girder and steel arch bridges, while the two following chapters treat the structural and mechanical aspects of movable steel bridges of various types in a thorough and interesting manner.

The problems of erection and fieldwork are also dealt with, and in this connection the author has been able to devote a number of pages to the problem of constructing underwater foundations. The method of constructing such foundations by sinking caissons, and the application of compressed air to such work, are explained with great clearness and detail, and a table of useful data on cylinder sinking is appended.

The factors which determine the choice of a method of erection of a bridge superstructure are then explained by the author, and the procedure adopted on a number of important bridge contracts also described.

The book concludes with an interesting, if somewhat short, chapter on suspension bridges.

It has been the author's principal aim to serve the needs of the average civil engineer rather than those of the bridge specialist, while the needs of the civil engineering student, whose curriculum includes bridge engineering as one of many subjects, have been kept in view.

In these respects the author has certainly achieved his object, but, in the pages of *Modern Bridge Construction*, the specialist also will find much useful information and very pleasant reading.

J. B.

Modern Bridge Construction. By S. Johnstone Taylor. London: Crosby Lockwood and Son.

COMPETITIONS OPEN

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions, etc., were obtainable from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions, etc., obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 1.—Sending-in day. (Last day for conditions was June 3.) Pictorial Map of the Area of the West Yorkshire Society of Architects. Premium, 10 guineas. Particulars were obtainable from the Secretary, 62 Woodhouse Lane, Leeds.

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

March 1. 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

LOAMY SAND

S. J. V. writes: "*Textbooks, both as regards materials and on general building supervision, usually state that sand for building purposes should be entirely free from loam. While I appreciate that clean sand is necessary for good work, many rules given in textbooks are not carried out in practice. On many building works sand containing a certain amount of loam is observed, and builders generally consider that a little of this is necessary to make a good mortar. Do the views given by authorities on this matter lean too much towards theory?*"

It is essential, to obtain a strong mortar or concrete mixture, to use clean sand free from dirt or loam, and loam is an impurity.

Clean sand is usually asked for in specifications, and if loamy sand is submitted it should be washed.

Builders are not keen on washing sand: it costs money; and they are sometimes persuasive as to the necessity of loam in sand.

Loamy sand works fat when mixed with cement or lime, with a saving in the use of the latter materials and in labour.

This is especially so in cement mortar, which works hard and gritty, and in which bricklayers prefer to add lime to assist in easier manipulation.

I was speaking to a builder recently who said that he was using cement mortar in lieu of lime mortar gauged with cement on some works. I was rather puzzled by his preference for a mixture which would involve extra expense.

I found that whilst he was obtaining cement at a cheaper rate than current prices, he was using loamy sand, and he admitted that it would not have been worth while as regards cost of labour to use cement mortar if he had to use clean sand. If sand is washed on the site, water should be passed through it, and it should not be washed in a tub, where water is not frequently changed, and the loam settles on top and mixes again with the washed sand.

W. A. D.

ANNOUNCEMENT

Mr. C. B. Willcocks, F.R.I.B.A., and Mr. J. R. Greenaway, F.S.I., of 11 Friar Street, Reading, have dissolved partnership by mutual consent. They will continue in separate practices, in different offices, at the same address; Mr. Willcocks as an Architect and Surveyor (telephone number Reading 644), and Mr. Greenaway as a Quantity, Building and Land Surveyor (telephone number Reading 2860).

THE ARCHITECTS' DIARY

WEDNESDAY, SEPTEMBER 9

SANITARY INSPECTORS' ASSOCIATION. Annual Conference to be held at Bridlington. Until September 12.

INTERNATIONAL ILLUMINATION CONGRESS. At Sheffield. Visits to various buildings.

THURSDAY, SEPTEMBER 10

INTERNATIONAL ILLUMINATION CONGRESS. At Buxton. Following are some of the papers to be read. Morning Session, 10 a.m. Section 1: "Architectural Lighting," by R. Waldo Maitland and Howard Robertson, F.R.I.B.A. Afternoon Session, 2.30 p.m. Section 2: "Architectural Lighting," by L. Kalff; "Engineering Aspects of Architectural Lighting," by W. J. Jones. **10 a.m.**

SHIPPING, ENGINEERING AND MACHINERY EXHIBITION. At Olympia. Until September 16.

FRIDAY, SEPTEMBER 11

INTERNATIONAL ILLUMINATION CONGRESS. At Birmingham. Sessions at 10 a.m. and 2.30 p.m. Papers to be read will be mainly devoted to signal glasses and vehicle lighting. **10 a.m.**

ARCHITECTURAL ASSOCIATION. Annual Excursion: to Austria. The programme will include six days in Vienna, followed by a six days' motor coach tour through Austria, returning to London on September 26.

SATURDAY, SEPTEMBER 12

Sunrise, 6.28 a.m. Sunset, 7.24 p.m.

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

INTERNATIONAL ILLUMINATION CONGRESS. At Birmingham. Whole day motor coach tour to Stratford-on-Avon and the Shakespeare country.

SUNDAY, SEPTEMBER 13

INTERNATIONAL ILLUMINATION CONGRESS. At Cambridge. Until September 19.

TUESDAY, SEPTEMBER 15

Closing date of THE ARCHITECTS' JOURNAL September Holiday Sketches Competition.

WEDNESDAY, SEPTEMBER 16

INSTITUTION OF STRUCTURAL ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Manchester and District Branch. Visit to the Wardle (Watergrove) Reservoir.

FRIDAY, SEPTEMBER 18

NATIONAL SMOKE ABATEMENT SOCIETY. Annual Conference. Liverpool. Until September 20.

SATURDAY, SEPTEMBER 19

Sunrise, 6.39 a.m. Sunset, 7.8 p.m.

MONDAY, SEPTEMBER 21

INTERNATIONAL ILLUMINATION CONGRESS. Reception of the delegates at the Royal Institution, London. 3 to 4.30 p.m. **3 p.m.**

TUESDAY, SEPTEMBER 22

INTERNATIONAL ILLUMINATION CONGRESS. Conference of the Institution of Electrical Engineers, at the Kingsway Hall, W.C. 10.30 a.m. Conversaziones at the Royal Institution and the Albert Hall. 8 p.m. **10.30 a.m.**

WEDNESDAY, SEPTEMBER 23

R.I.B.A. STATUTORY EXAMINATION. Latest date for submission of applications for examination for the office of district surveyor. (Fee £3 3s.)

INTERNATIONAL ILLUMINATION CONGRESS. Faraday Exhibition Private View, Albert Hall. 10 a.m. to 4 p.m. British Association Centenary meeting. Delegates' Reception, Albert Hall. 3 p.m. Gen. Smuts (President, British Association) opens the Exhibition, Albert Hall. 4.30 p.m. Presidential Address to the British Association by Gen. Smuts, at the Central Hall, Westminster, S.W.1. 9 p.m. **10 a.m.**

INSTITUTE OF FUEL. At the Chemical Society's Premises, Burlington House, W. "The Reactivity of Coke. A Report to the Blast Furnace Committee, Iron and Steel Industrial Research Council." By J. G. King and J. H. Jones. **6 p.m.**

THURSDAY, SEPTEMBER 24

INTERNATIONAL ILLUMINATION CONGRESS. Garden Party at the National Physical Laboratory, Teddington. 3 to 6 p.m. Soirée at the Royal Society, Burlington House, W. 8.30 p.m. **3 p.m.**

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At Newcastle. "Modern Decoration." By John Gloag and Mrs. Grace Lovat Fraser, F.I.B.D.

FRIDAY, SEPTEMBER 25

INTERNATIONAL ILLUMINATION CONGRESS. At the Dorchester Hotel, Park Lane, W. Dinner given by H.M. Government to representative delegates and guests. Chairman: The Rt. Hon. Ramsay MacDonald, P.C.

TUESDAY, SEPTEMBER 29

R.I.B.A., 9 Conduit Street, W.1. Exhibition of drawings, including the whole of the British Section of the recent exhibition held in Berlin during the Congress of the International Federation of Housing and Town Planning.

LAW REPORT

DISPUTED RIGHTS OVER A DIVIDING WALL

Davis v. *Pepper. Chancery Division. Before Lord Justice Romer*

THIS was an action which had reference to the ownership of a dividing wall at Piccadilly, Hanley, Staffs., the plaintiff being Mr. A. S. Davis, of 67 Piccadilly, who sought a declaration against the defendant, Mr. J. Pepper, owner of adjoining property in Piccadilly, that he had trespassed on a wall which abutted on a passage-way which divided his and defendant's property, by cutting away portions of the wall, into which he had inserted girders or supports.

Mr. Archer, K.C., for the plaintiff, said that the plaintiff also sought relief by way of injunction to restrain alleged trespass. The point in the case was: Was this a party wall or not? The defendant alleged that it was. Each had purchased from a common owner, and the plaintiff's case was that the wall was his entire property. Plaintiff's plans showed that, without touching the wall, the defendant had had conveyed to him his full extent of property. Plaintiff had a right of way over the passage which ran alongside the wall, and he used it as a back way to his shop. What plaintiff complained of was that the defendant was putting in girders in the wall in order to extend his shop, with the result that the burden on the wall would be increased as much as eight times, and as it was only eight or nine inches thick, the plaintiff feared that it might do injury to his property.

Mr. R. T. Longden, architect and surveyor, of Messrs. Longden and Venables, called on behalf of the plaintiff, stated that he surveyed the property when plaintiff made certain alterations, and he came to the conclusion that the wall was the property of the plaintiff, though right of support for it was with the defendant.

Mr. G. O. Slade, for the defendant, argued that the wall was a party wall and what defendant had done was not beyond his legal rights.

Mr. H. Goldstraw, architect, of Messrs. Wood and Goldstraw, Stoke-on-Trent, was called on behalf of the defence and expressed the opinion that the wall was a party wall.

His lordship, after hearing the arguments of counsel, dismissed the action with costs, and held that the wall was a party wall, the plaintiff having failed to discharge the onus which rested upon him of proving that the wall was in 1919 assured to him. Here the plaintiff had contended that the defendant had no interest at all in the wall. But it was obvious that if the plaintiff were right the defendant must have numerous easements over the wall. His lordship could not conceive what possible damage plaintiff could have suffered or would suffer by reason of anything the defendant proposed to do. Nevertheless, the plaintiff was entitled to a declaration if the wall did belong to him. It seemed to him improbable, having regard to the state of the premises in 1919, that the wall should have been conveyed to the plaintiff, and not have been treated as a party wall, which apparently it was. He granted defendant an inquiry as to damages.

TRADE NOTES

On the occasion of the sixth anniversary of the foundation of Messrs. Mortimer, Gall & Co., Ltd., electrical and illuminating engineers, of 26 Cheapside, E.C.2, a party of architects, engineers and friends, at the invitation of the firm, made a charabanc tour of London, in order to see the illumination of the various buildings. Prior to the tour, the party visited the model theatre at Messrs. Holophane's, Ltd., premises, in Elverton Street, Westminster, S.W.1, where an interesting demonstration of the application of the latest conceptions of scientific illumination was given, interspersed with descriptions by Mr. H. Gillespie Williams.

*

A leaflet showing the twelve coloured cements which constitute the standard range now supplied by the Cement Marketing Co., Ltd., of Portland House, Tothill Street, Westminster, S.W.1, has recently been issued. It is stated that during the last two years the following cements have been placed on the market: Snowcrete; Snowcrete No. 2 cream (the cement used for the facing slabs of the Dorchester Hotel); Snowcrete No. 3 light cream; and Colorcrete, a rapid-hardening Portland cement, supplied in two shades, buff and red. Additional coloured cements are also available, the colours of which are illustrated in the leaflet. These illustrations are actual photographic reproductions of slabs made with the particular cements referred to, mixed with the special white aggregate supplied by the firm. It is pointed out that it is essential that a suitable aggregate be used in order that the finishes obtained by the use of these cements may possess full brilliancy of colour and evenness of texture. To secure the best results, these cements (with the exception of the black) are also sold with the special white aggregate ready mixed in suitable proportions for rendering. In addition to giving perfectly even and permanent tones in the concrete, the use of these mixtures, it is claimed, eliminates the difficulty in obtaining a suitable aggregate, whilst the need for storing two separate products on the site, with the consequent greater risk of contamination by dirt, is also obviated. Special coloured cements can also be made to meet customers' requirements. Sample pats will be forwarded on application to the Cement Marketing Co., Ltd., at the address given above.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

New Grignon Hall, Felsted, Essex (pages 331–335). General contractors, Walden and Sons. Sub-contractors: W. H. Collier & Co., facing, common, and purpose-made moulded window bricks, and roofing tiles; Wm. Aumonier and Sons, stone carving; T. S. Knight and Sons, heating engineers; Tyler and Freeman, electric lighting; H. H. Martyn & Co., Ltd., fibrous plaster work; Matthew T. Shaw & Co., Ltd., constructional steelwork; C. E. Welstead, Ltd., metal casements; Clubb and Son, wrought-iron and copper-gilt weather vane; Ewart and Son, Ltd., copper roofing, etc.; Comyn Ching & Co., Ltd., bronze radiator surrounds; A. Jones Lock Co., Ltd., ironmongery; Art Pavements and Decorations, Ltd., terrazzo paving; Acme Flooring and Paving Co., Ltd., oak block flooring; Chater and Sons, Ltd., Copperlite glazing; Higgins and Griffiths, Ltd., electric light fittings; Stoner and Saunders, cast lead rainwater heads, etc.; Synchronome Co., Ltd., clock.

King George Hospital, Eastern Avenue, Ilford, Essex (pages 339–342 and supplement). General contractors, Ashford Builders' Co., Ltd. Sub-contractors: Limmer and Trinidad Asphalt Co., Ltd., asphalt; Kleine Co., Ltd., reinforced concrete; James Brown (Brentwood) (1919), Ltd., facing bricks; Bath and Portland Stone Firms, Ltd., stone; Girlings Ferro-Concrete Co., Ltd., artificial stone; Sanders and Forster, Ltd., structural steel; Hollis Bros. & Co., Ltd., wood-block flooring; Marbolith Flooring Co., Ltd., patent flooring; Colley, Meikle & Co., Ltd., central heating; Bratt, Colbran & Co., Ltd., stoves and grates; Davis Gas Stove Co., Ltd., cooking installation; D. Paxman & Co., boilers; J. Briggs & Co., Ltd., lighting, power and equipment; Shanks & Co., Ltd., sanitary fittings; Carter and Aynsley, Ltd., door furniture; James Gibbons, Ltd., casements; E. Shipton & Co., Ltd., telephones; Milners Safe Co., Ltd., fireproof doors; F. A. Norris & Co., iron staircases; S. W. Farmer and Son, Ltd., main gates, railings and balustrades; W. Hitchins & Co., board-room and entrance hall panelled dadoes and hospital-type doors; J. Bysouth and E. J. and A. T. Bradford, carving stonework; Fenning & Co., Ltd., marble; E. Parkinson (London), Ltd., tiling; Bratt Colbran & Co., Ltd., mantels; Hobart Manufacturing Co., Ltd., electrical food-preparing machine; Hammond Bros. and Champness, Ltd., lifts; Landis and Gyr, Ltd., synchronized clock; Gent & Co., turret clock; South Essex Water Co., Ltd., water supply; Wallington Jones & Co., Ltd., cold stores; May Oil Burner (England), Ltd., oil burners; Carl Zeiss (London), Ltd., lighting in operating theatre; Moler Products, Ltd., Fosalsil partition blocks.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The Essex Education Committee has purchased a site in BARKING for the erection of a secondary school.

The governors of the Sir John Cass Technical Institute, CITY OF LONDON, have purchased property for extensions.

The Essex Education Committee has purchased land for the extension of the EPPING secondary school.

The Essex C.C. is seeking sanction to borrow £48,000 for the provision of a nurses' home at the EPPING and ROMFORD institutions.

The Ealing Education Committee is to erect a senior block at the Stanhope school, GREENFORD.

The GREENWICH Borough Council is to erect a welfare centre and sunlight clinic in Chevening Road.

The Essex Education Committee is seeking sanction for a loan of £13,500 for the erection of an elementary school in Suttons Lane, HORNCHURCH.

The L.C.C. is to erect a school for 450 girls on the Bellingham estate, LEWISHAM.

Mr. W. D. Caroe has prepared plans for the erection of a new church at MUSWELL HILL.

The L.C.C. is to erect a trade school in Cassland Road, SHOREDITCH.

The Essex Education Committee is seeking sanction to borrow £8,000 for the enlargement of the SOUTH BENFLEET council school.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

THE "NEUE WACHE" MEMORIAL, BERLIN

PLAN, SECTIONS AND DETAILS OF A SHRINE OF MEMORY WITHIN THE OLD GUARD-HOUSE

[*Professor Heinrich Tessenow, Architect.*

A GENERAL VIEW OF THE BUILDING: THE OUTER SHELL IS A CENTURY OLD

THE "Neue Wache" was built after the wars of the German Freedom in the years 1816-18, from designs by Carl Friedrich Schinkel, expressly as a post for the King's Guard. It was intended, in Schinkel's own words, to maintain the character of a monument and is, from its historical associations, its position in the most beautiful of Berlin squares and its architectural beauty, at once one of the most important national buildings of the country's capital. Since the end of the war it had stood empty. In 1930 the Prussian Government decided to complete it as a war memorial. A limited competition was organized between six nominated Berlin architects. Professor Heinrich Tessenow won the first prize. Executed from his designs, the building was formally opened in June, 1931.

Tessenow's conception was of an inner room, approached from the existing portico by three low grille doors, and thus visible from the nearby street. It is lit by an open circular top light in the centre of the ceiling. Thereunder, as beneath the open sky, stands the memorial stone, a large monolith of black Swedish granite. On this lies a wreath of oak-leaves, silvered and gilt, modelled by Professor Ludwig Gies. On either side, behind the stone, stand two candelabra of bronze with ever-burning flames.

The walls are lined with slabs of limestone, the flooring is a mosaic of variegated large squares of Rhenish basalt, set in lead, and the ceiling is finished grey-white. From the black block which bears the wreath, the dark flooring, the grey walls and the light ceiling lead the eye successively to the opening in the ceiling, which again stands in close relation to the glittering wreath, the proper symbol and central point of the memorial.

By the wish of the architect the room is not, in general, open to the public, but spectators are intended to look in through the portico grilles. From this standpoint may be had the most impressive aspect; at the same time the intended aloofness of the memorial stone, as of an altar, is preserved.

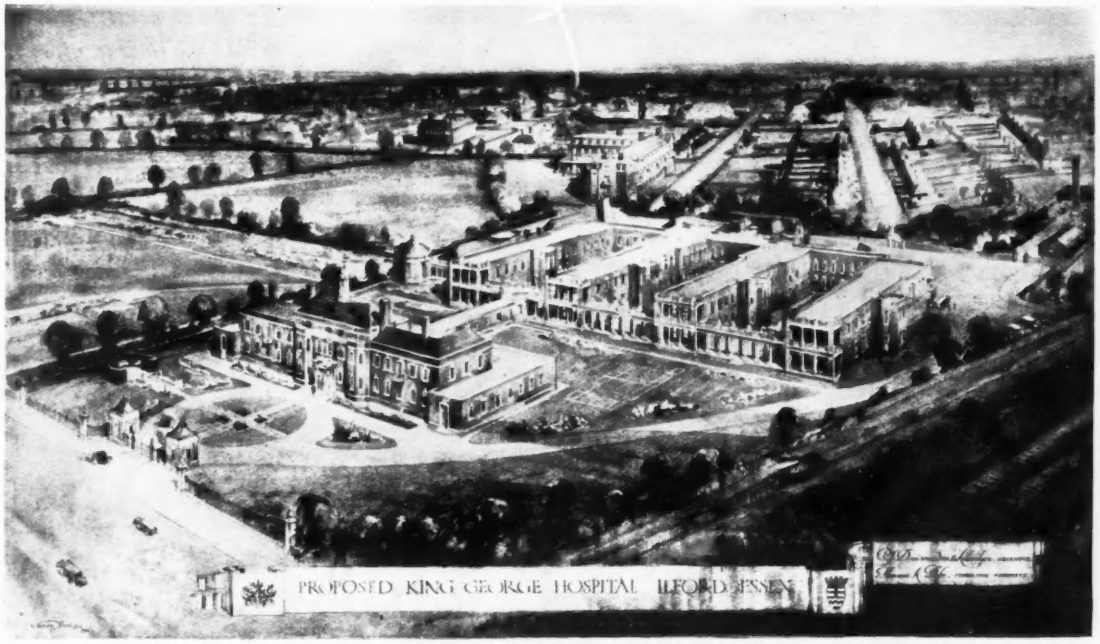
KING GEORGE HOSPITAL, ILFORD, ESSEX

OUT-PATIENTS' AND ADMINISTRATION DEPARTMENTS, WARD BLOCKS AND KITCHEN UNIT



[C. J. Dawson, Son and Allardyce, Architects. T. A. Pole, Consulting Architect.

PERSPECTIVE DRAWING OF COMPLETE HOSPITAL

THE perspective reproduced above should be studied in conjunction with the architects' block plan, which appears on the last page of this supplement. The main drive in to the hospital from Eastern Avenue leads to the out-patients' and administration department, behind which are five ward blocks.

As will be seen from the plans on the following pages, the principal entrance hall to the hospital is in the centre of the out-patients' and administration block. Folding doors on three sides of the hall give access to the corridors leading to the out-patients' and X-ray departments and various rooms and staircases in the building, and also to the main connecting corridor of the hospital.

The out-patients' and X-ray departments are on the east side of the entrance hall, and comprise, among other accommodation, a separate entrance with patients' cloakrooms and a large waiting room with registration office.

On the first floor are a library and lecture room, a small chapel for the nurses, and the residential quarters of the matron, assistant matron and resident medical officers. On the second floor are further bedrooms and a sitting room, etc., for the residential staff.

Further illustrations and particulars of the hospital are given elsewhere in this issue of "The Architects' Journal."

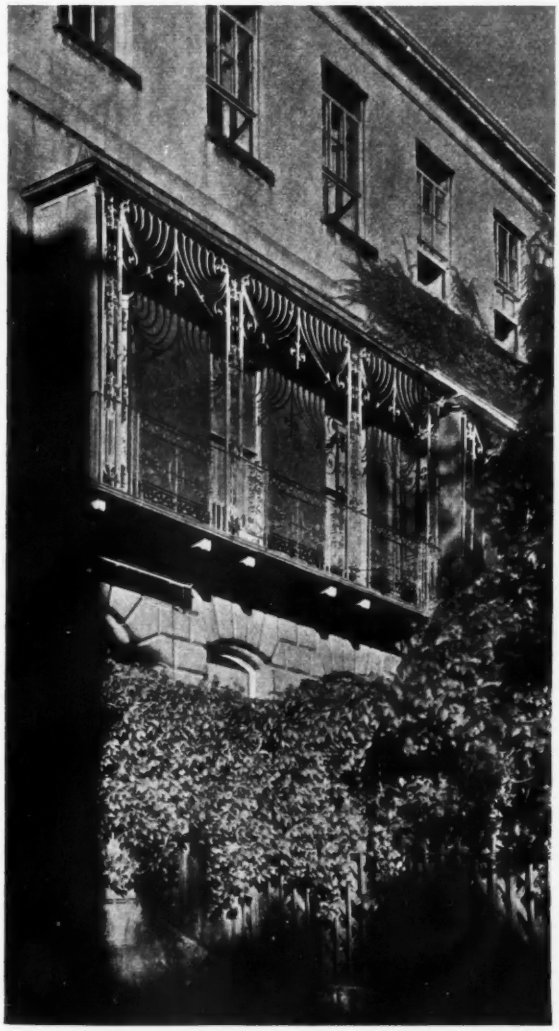
SELECTED PRECEDENTS:

FOUR FAÇADES IN THE ENGLISH TRADITION

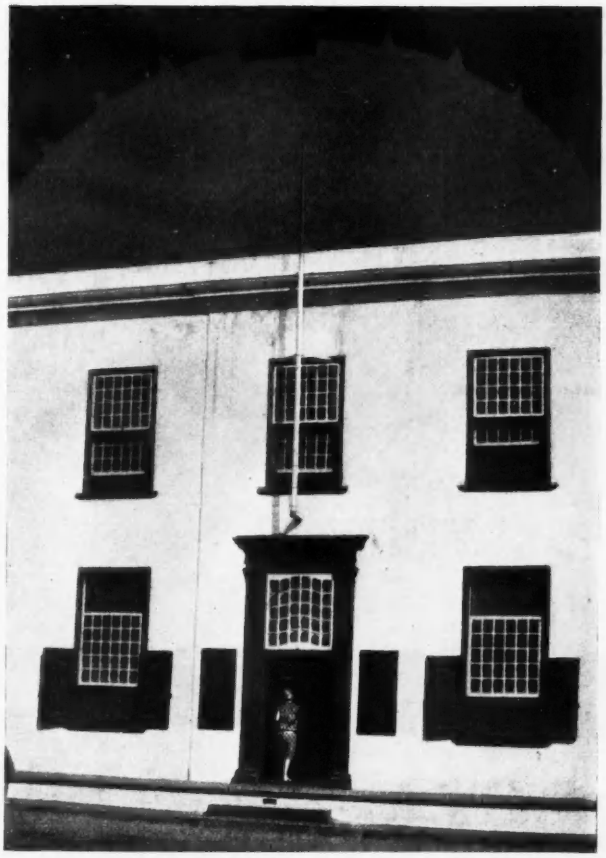
THE house at Cheltenham (figure 1), dating from the early nineteenth century, is in the best tradition of English urban architecture. We here find that the flat façade is a perfect background for the ornate balcony. It is noteworthy that the balcony was first introduced into this country some two hundred years before the period of the house here illustrated, but it was not until the popularization of cast iron that this feature lent itself to the decorative treatment at which our Georgian forefathers were so adept.

The County Hall at Lewes (figure 3) has refined and scholarly detail in the Classic convention. One cannot fail to admire the skill with which the architect has assembled the



1. *HOUSE IN PRIORY PARADE, CHELTENHAM.*

various motifs of his repertory of ornament. The Tuscan columns are in perfect scale with the balustrade above, and are in admirable contrast with the rusticated wallage on either side; while the



2. *HOUSE IN KEEROM STREET, CAPE TOWN.*

windows, with their delicate architraves and bracketed hoods surmounting medallions, to accord with the sculptured panels. Here, too, we find that the requisite repose is attained by setting these features against the plain wall surface of ashlar, which is well punctuated at its upper terminal by the modillion cornice.

It is remarkable to what extent the vernacular Classic convention established in England during the eighteenth century influenced architectural developments in our colonies. The design of a house in Cape Town (figure 2) has a close affinity with those Georgian houses which were distinguished by rectangularity of outline and an orderly pattern of fenestration. The panes of the windows, however, are smaller and the sash-bars thicker than in contemporary examples in this country.

The second example of the South African style (figure 4) has the type of elegance often associated with our own Regency work. It will be observed that the architect did not consider himself under an obligation to take his Order from the copy-books, but had sufficient self-confidence to devise his own proportions for column and entablature. Yet his experiment seems entirely successful, for the tall and slender pilasters which project so little from the wall surface seem quite adequate to support the entablature which surmounts them. The raised blocking course at the centre of the façade in an economical and unaffected manner gives an added formal emphasis to the entrance doorway. A. T. E.

SHIPS AND BUILDINGS

THE Shipping Exhibition, which opened at Olympia last week, is certain to attract a large number of architects, who will visit it with the intent to find stimulating parallels between the design of ships and that of buildings. In recent years it has been customary to pursue these parallels a little too persistently, as if it were possible and even desirable to give to structures on land some of the formal characteristics which have hitherto been associated with vessels floating on the sea.

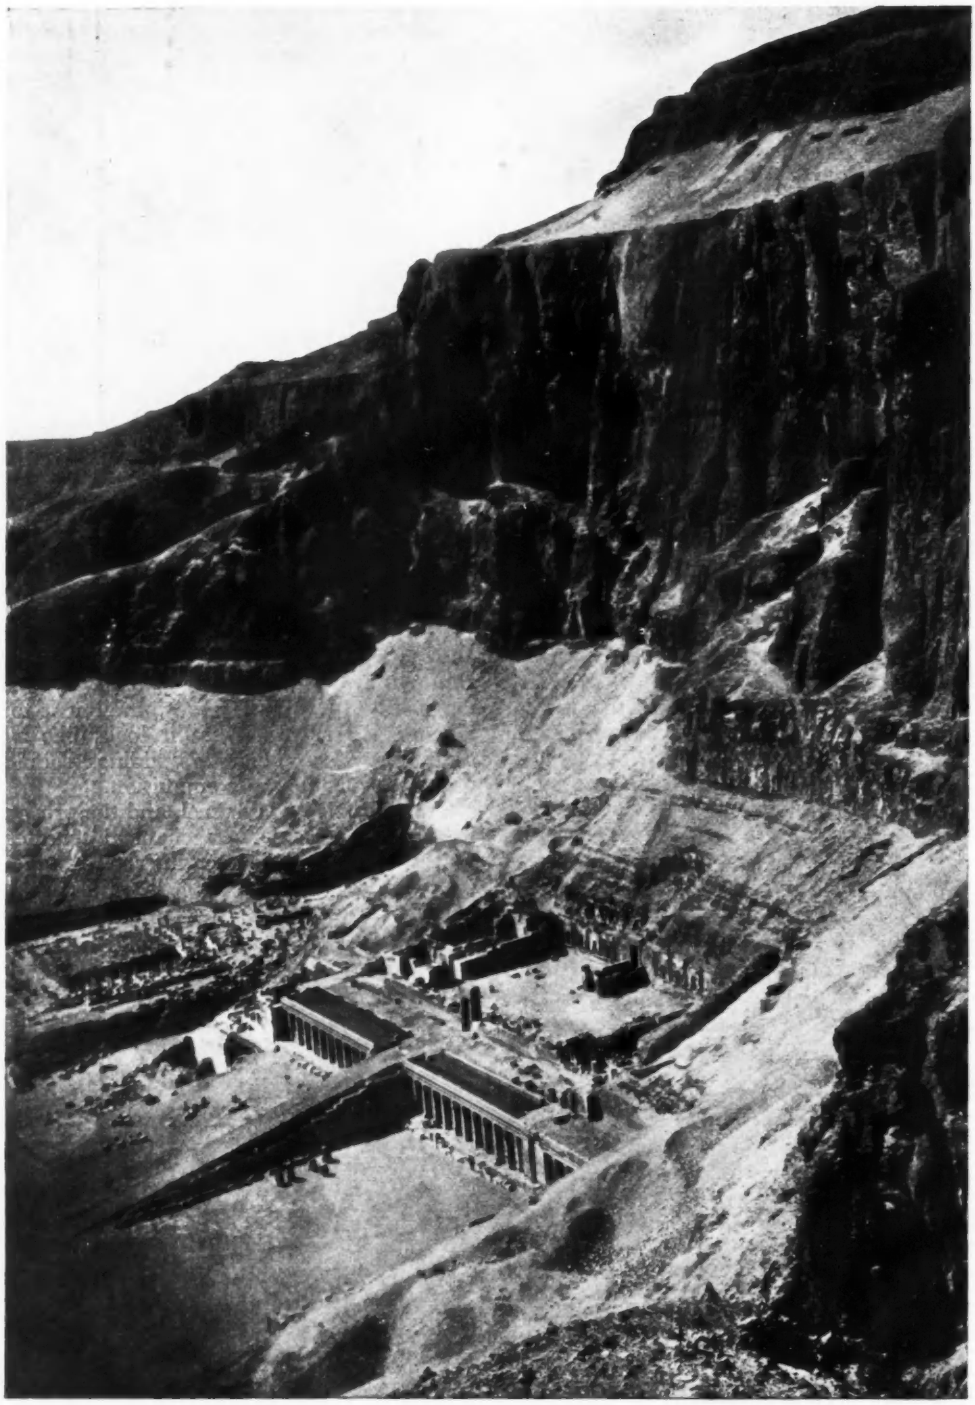
If we succeed in making our buildings look too much like ships, we do an injustice to ships, and deprive them of their artistic birthright, for it should surely be the privilege of ships to have marked characteristics of their own, and we become their enemies rather than their friends if we steal their clothes to give a fictitious interest to the structure of our buildings. For a ship is a thing that moves, and a well-designed one expresses this capacity of movement by its very form. But a building which is of necessity stationary should look stationary, and should therefore express a character indicating stability and repose.

In the case of ships, this impression of possible movement is usually obtained by the marked asymmetricality of the side elevations of the vessel, where we find that the bow is very different from the stern, and all the features of the superstructure are inflected in one direction. A ship so designed that its funnels and masts made an absolutely symmetrical pattern would appear capable of moving either backwards or forwards indiscriminately, and such a degree of insensitiveness would not be pleasant to behold.

Where the two arts have points of resemblance is in the grammar of design, which is fundamentally the same for each. But while the artist, whether he designs a ship or a building, should strive with the same zeal to establish æsthetic relationship between the parts of the structure, there is no excuse to translate into architecture from ship design features which, by the nature of their subject, belong exclusively to the latter art. In the conning tower of a man-of-war we find long continuous windows of small vertical dimension, which are designed to enable the occupants of the tower to obtain an uninterrupted vision of the sea in all directions, and this continuous window at eye level appears as a rather narrow horizontal slit. The justification for this form is also due to the necessity for protecting the conning tower with as much armament as possible, and hence the smallness of the window area. But to transfer such narrow horizontal slits of windows to buildings of an ordinary type is extremely illogical. One pays a poor compliment to a building when one says of it that it looks like a battleship. Yet ships, just as much as buildings, should exemplify organic principles of composition.

The lines of the hull, keel, and the prow are, indeed, largely determined by mechanical considerations, but the superstructure of a big liner, for instance, is largely determined by the desire of the ship's architect to give it a neat and attractive appearance. Visitors to Olympia will doubtless have reason to acclaim the skill with which in many of the ship designs there displayed the artists concerned have deliberately arranged the masts, funnels, bridges, and cabin decks to form simple and elegant patterns. Our modern architectural Puritans, who profess to believe that the beauty of ships is entirely due to their compliance with the dictates of utility, are doing a grave injustice to those who have succeeded in advancing the art of ship design to the high standard it now so often attains. Nor need we subscribe to another doctrine of these latter-day critics—that all ships are beautiful. Some ships are beautiful, and others are the reverse, as every sailor knows. Architects will find an added enjoyment in their visit to Olympia if they exercise their critical faculty freely and distinguish between the various degrees of excellence shown in the exhibits.

Architecture and ship design stand or fall together. In the eighteenth century, for instance, when architecture attained to a great and noble style, our ships also were supremely beautiful. In the mid-Victorian period even ships tended to become ugly. But today, when we like to imagine that architecture is on the upward grade, ships, in sympathy with buildings, are acquiring a new elegance. It may be hoped that the present exhibition at Olympia will convince us of this, besides declaring to us the remarkable proficiency of our marine engineers, of which, indeed, there was never any question.



A MORTUARY TEMPLE ON THE EDGE OF THE LIBYAN DESERT

The Mortuary Temple of Hatshepsut at Der el Bahari is different in plan and conception from all others in Egypt. It is built in three tiers or terraces, with a central ramp sloping upwards to a sanctuary cut in the limestone cliff at the back of the sacred edifice. It was never finished, but it has not suffered greatly at the hands of time. On its northern side is a colonnade of sixteen-sided columns, and a small chapel dedicated to the jackal-headed deity, Anubis. The natural setting of this monument of Egypt's famous queen is one of the most beautiful that can be imagined. The architect who designed it, by name Senenmut, was privileged to excavate his own tomb in the living rock face below its floor. [*From* The Art of Egypt through the Ages. *See page* 378 *of this issue.*]

NEWS & TOPICS

INJURIOUS ECONOMIES

I NOTICE signs that many of the municipalities who, at first, were somewhat panic-stricken by the urgent appeals to public economy are now regaining their sense of proportion in this matter and are beginning to distinguish between economies which are necessary and beneficial in the present national emergency, and those which, if insisted upon, would be definitely injurious to the community. For instance, the Oxford City Council has decided that expenditure on improvements at Oxford should not come under the economy axe, and it has sanctioned tenders amounting to nearly £13,000. At Finsbury, speaking at the opening of four blocks of flats, built as part of a slum clearance scheme, Councillor Charles R. Simpson, the Mayor of Finsbury, strongly deprecated the cessation of building projects which were being undertaken for the purpose of housing reform, and his attitude in this matter is typical of many other municipal councillors throughout the country.

*

Last week, preliminary to the meeting of the Trades Union Congress, there was a conference of the National Labour Housing Association on the subject of housing and slum clearance, and Mr. F. A. Broad, M.P., president of this association, urged that if this temporary economy stunt were to put an end to housing reconstruction at the present moment it would make the ultimate problem much more difficult and would involve the present waste of a tremendous amount of money. The result would be not only a great unsatisfied demand for houses but an increase in the unemployed building operatives by such numbers as would put a greater strain on the unemployment fund than it could stand. Fortunately, there is in the House of Commons a group of housing reformers, by no means confined to one party, who will make it their business to point out to the Chancellor of the Exchequer the inadvisability of ruthless cuts on national housing.

BALANCING THE BUDGET AT NOUGHT

Unfortunately, there is no industry which has so much to lose by an indiscriminate economy campaign as the building industry, and I am afraid that architects, too, must look forward to lean times ahead of them unless steps are taken to establish the fact that the cessation of all building work is not only a great hindrance to the development of industry and commerce but will itself aggravate the unemployment problem. As Mr. J. M. Keynes remarked in *The Evening Standard* last week, " exclusive concentration upon the idea of economy, national, municipal and personal, meaning by this the negative act of withholding expenditure which is now stimulating the forces of production into action, may, if, under the spur of a sense of supposed duty, it is carried far, produce social effects so shocking as to shake the whole system of our national life." And the eminent economist goes on to say that " if we carry ' economy ' of every kind to its logical conclusion, we shall find that we have balanced the Budget at nought on both sides with all of us flat on our backs starving to death from a refusal for reasons of economy to buy one another's services."

HOOVER'S CURE FOR DEPRESSION

In America, they are proposing to tackle their own difficulties in quite a different spirit, for President Hoover, in a recent address at Indianapolis, proposed a gigantic scheme of commercial and industrial expansion. During the next twenty years he would have his countrymen build " 4,000,000 new and better homes, thousands of new and still more beautiful city buildings, and thousands of factories." He urges them to provide new parks, schools, colleges and churches as a cure for the present state of " depression." The Federal Government of U.S.A. is engaged upon the greatest programme of waterway, harbour, flood control, public building and airway improvement in all its history. The construction works already authorized and the continuation of policies of Government aid will require a total expenditure of upwards of half a billion dollars annually. This combination of energy and optimism should surely be an example to us and act as a national tonic.

REGISTRATION AND THE LONE ARCHITECT

Now that Architectural Registration is at last an accomplished fact, there comes an announcement from the Home Office that the Secretary of State is required to appoint five persons who are in practice as architects to represent the interest of those who do not belong to the various architects' associations. Out of the five persons who are appointed, three will be selected to serve on a preparatory committee for the purpose of summoning the first meeting of the Council and determining certain matters in connection therewith. The first meeting of the Council will not be held until the beginning of next year, when the Act comes fully into force. Persons appointed to the Council will hold office for a year. This preparatory committee will enter on its duty as soon as practicable on appointment, and its work will finish with the first meeting of the Council.

*

Any architect not represented by one of the associations of architects is at liberty to propose a person to be appointed as above, and should send his proposal in writing to the Under-Secretary of State at the Home Office, giving full particulars of the architectural work of the person proposed, the name of any profession or name of any institute to which he belongs, and the names and qualifications of those who support his candidature. As the opponents of the Registration Act attach such very great importance to this clause, which makes it obligatory that a certain number of architects not belonging to the professional organizations should have a hand in determining the first constitution of the Architects' Registration Council, especial interest attaches to the names of the persons so chosen. It has never been claimed that all the architectural talent that there exists in this country is to be found within the ranks of professional organizations. Yet it remains to be seen that these special representatives will possess the type of personality and general qualification which alone would seem to make their appointment worth while.

LONDON GOES TUDOR

There are two rumours going about, and both, alas! I have on unimpeachable authority. Poor London is to suffer new indignities from the horrors of " pseudo-Tudor " architecture. It is said, by this unimpeachable authority, that all the houses erected at next year's Ideal Home Exhibition will be made to form part of a Tudor Village. This Exhibition is fortunately a transitory affair, but what effect and influence does it have ? How many of the lay folk who visit it will go away with the horrible idea that

those Tudor cottages are "picturesque," "cosy," even "thoroughly English"? The Ideal Home Exhibition is surely intended to show the ideals of the present, new and better materials, new and better ideas. And all it is going to do for us this next year is to recommend that we should house our cars, aeroplanes, wireless sets, all our modern lives, in sham sixteenth-century shells. Or do the controllers of the Exhibition wish us to revert to sixteenth-century lives too? It is unfortunately impossible to think that of the many thousands who will visit the Exhibition none will be influenced.

*

The other rumour, equally unimpeachable, is worse in the sense that when it becomes a fact it will be a permanent horror in London. Shepherds' Market is to be pulled down and replaced by blocks of flats, which will also resolve themselves into a Tudor Village. Shepherds' Market has a charm of its own, although it has no very remarkable buildings, and there will be many who will regret its disappearance. If it had to be pulled down to make way for good modern development we should not be justified in complaining very much. But who can adequately claim that this sham Tudor stuff has anything to do with progress in the twentieth century? A Tudor Village in the West End, only a few yards from Piccadilly! The only words that meet the case are quite unprintable. Is there no hope of stopping these things?

ANCIENT MONUMENTS

We have reason to be glad that no axe of economy has deprived us of the quiet but steady labours of that section of the Office of Works which is engaged upon the preservation of ancient monuments. A report of progress recently issued includes ten castles, six abbeys and one cathedral church, only a few from the longer list of works, both great and small, which this zealous department are carefully preserving for posterity and us.

*

Its method of working has caused much trepidation among those whose notions of antiquity are still decked with ivy, for the preliminary in the case of most ruins is to strip the fabric of parasitic growth, so that it may be carefully examined before it is repaired, and, if necessary, reset with plants and grass of less harmful nature. In many cases the draining or clearing of ancient moats has discovered either the old springs or the conduit that brought river or sea water to fill them, so that a restoration of function, exceedingly valuable to a proper understanding of their true nature, has taken place.

*

To a nation so plentifully enriched, as we are, with reminders of our past, it is a fine education to have the best of these monuments in such a state as will make their story readable. Too often such things crumble away unheeded while a race grows up in ignorance of what it sprang from, denuded of those roots in their soil which in subtle ways feed character and stamina. Quite another aspect of the work will be the recommendation to foreign visitors to see what we ourselves so patently value. It is possible that extended publicity of the work which the Office of Works is doing will have its just reward.

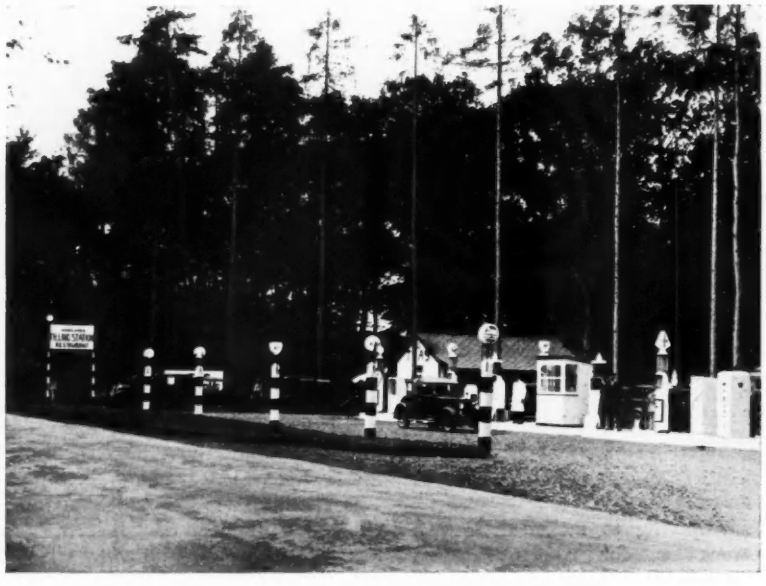
"TO BE, OR WHAT TO BE" (WITH APOLOGIES)

On October 1 the National Trust and the Society for the Protection of Ancient Buildings are holding a meeting at Whitehall, Shrewsbury, for the purpose of arousing interest in that house. Whitehall was built in 1582, and is a fine example of the rather unusual square Elizabethan house with three gables to each side. The two societies have been interested in its fate for some years, and now a decision must be reached. Its recent owner, who was an antique dealer, has had for financial reasons to vacate it. Not very long ago the interior was fitted out with bathrooms and modern sanitation, and it was used as an hotel. The house is therefore in good condition, and does not need large sums of money spending on it to make it fit for modern usage.

*

When there was a Bill before Parliament for making Shrewsbury a bishopric the house seemed admirably suited for the Bishop's Palace. But the Bill was unfortunately turned down. And now the house is empty, and something must be done about it. There are one or two unofficial schemes in the air, but all schemes for a house of this kind need money, and its future seems very precarious.

ASTRAGAL



"Woodlands" Filling Station, which won the first prize of £10 for the neatest filling station in the New Forest Area. The design shows simple and unpretentious buildings made of cheap materials and painted white.

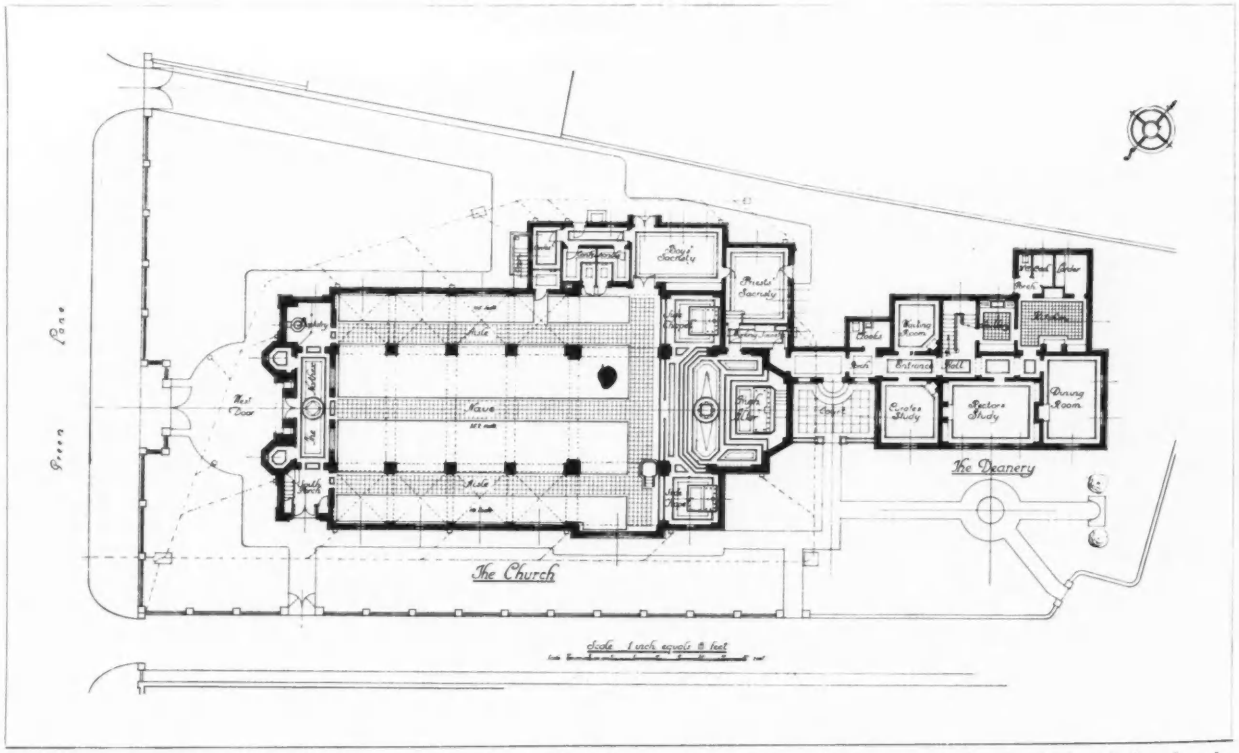
ST. CECILIA'S CHURCH, LIVERPOOL

DESIGNED BY E. BOWER NORRIS (SANDY AND NORRIS)

The main front, as seen from Green Lane. The walls are of highly-coloured rustic bricks, pointed with silver sand and cement. The roof is covered with tiles. A photograph of the entrance doorway is reproduced on the following page.

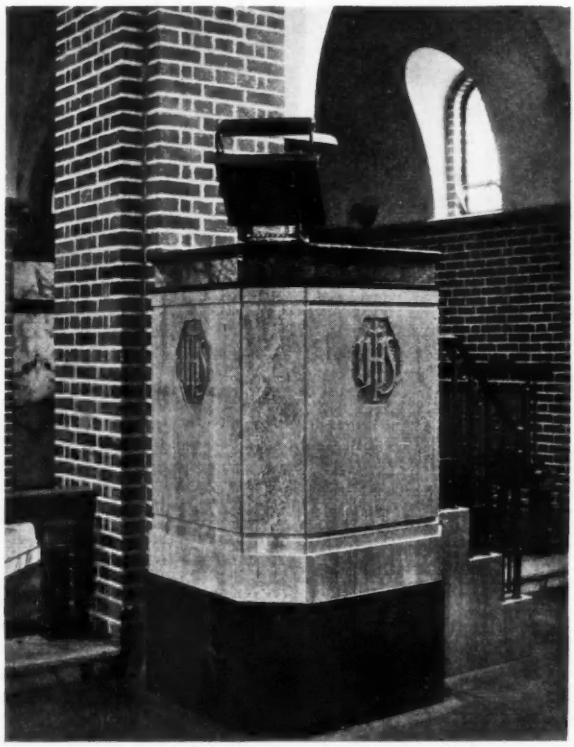
THE general design of St. Cecilia's Church, Liverpool, here illustrated, was conceived on sturdy lines, owing to the fact that the building is situated in the centre of villas of the usual suburban type.

The central feature of the exterior is the deep recess over the main entrance doorway, which has a triple light window, lighting the main body of the church. Internally, the effect is one of impressive proportions, the main focal point being the High Altar. The design generally, while being of modern tendency, is at the same time devotional and colourful. The church was opened by His Grace Dr. Downey, Archbishop of Liverpool, in December of last year.

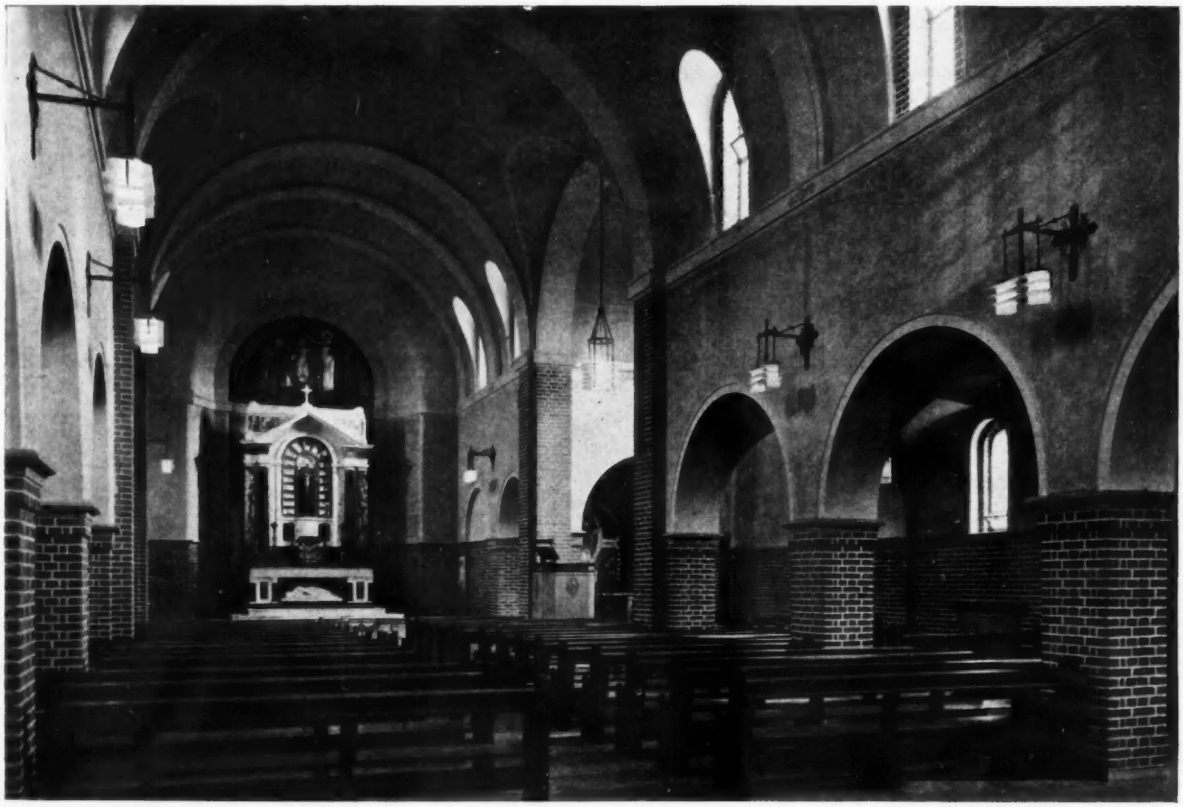


The ground-floor plan. Seating accommodation is provided for 575 persons, comprising 352 seats in the body of the church, and 105 and 118 on the north and south sides, respectively.

The main or west entrance is surmounted by the figure of St. Cecilia, the Patron Saint of Sacred Music. The three windows above light the nave of the church.

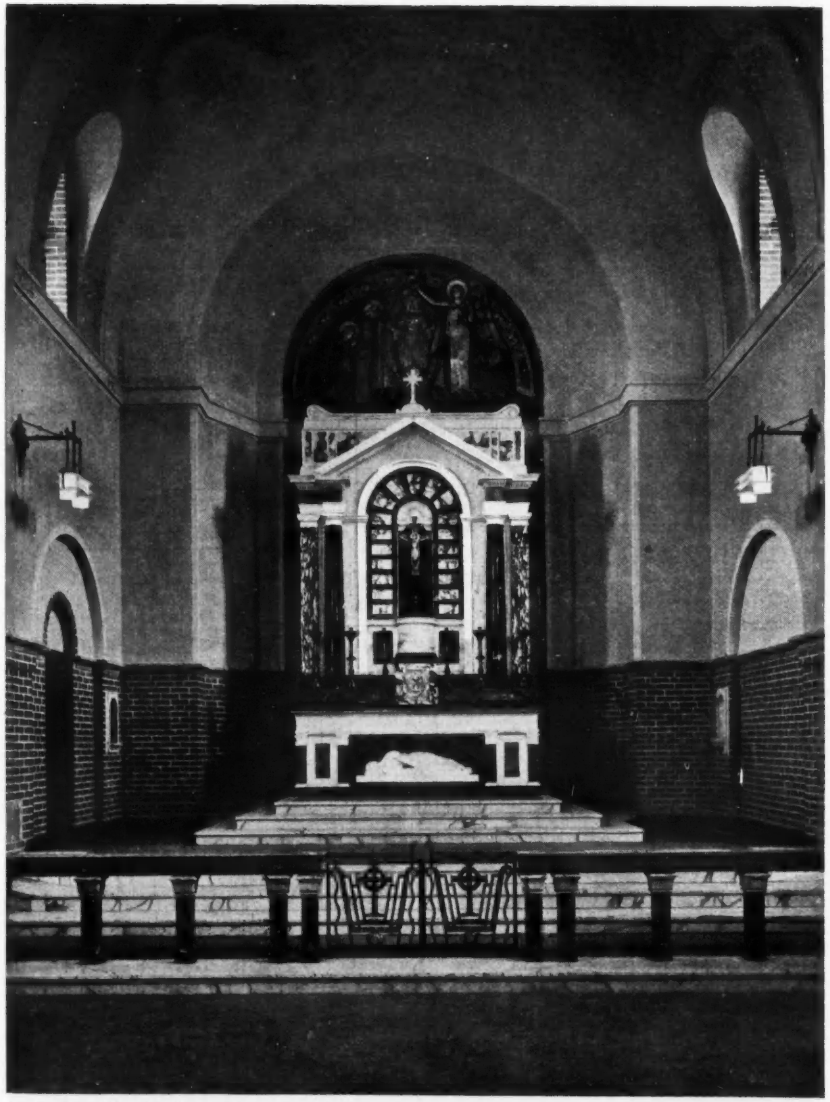


The pulpit is in polished Roman stone, and has a base of Tinos green marble. The window shown lights the side chapel, dedicated to the Sacred Heart.



St. Cecilia's Church, Liverpool.] [*By E. Bower Norris (Sandy and Norris).*

Looking down the nave towards the High Altar. On the right is seen the pulpit, a near view of which is reproduced at the top of this page. The arches are in brick to a height of about 8 ft., and are plastered above.

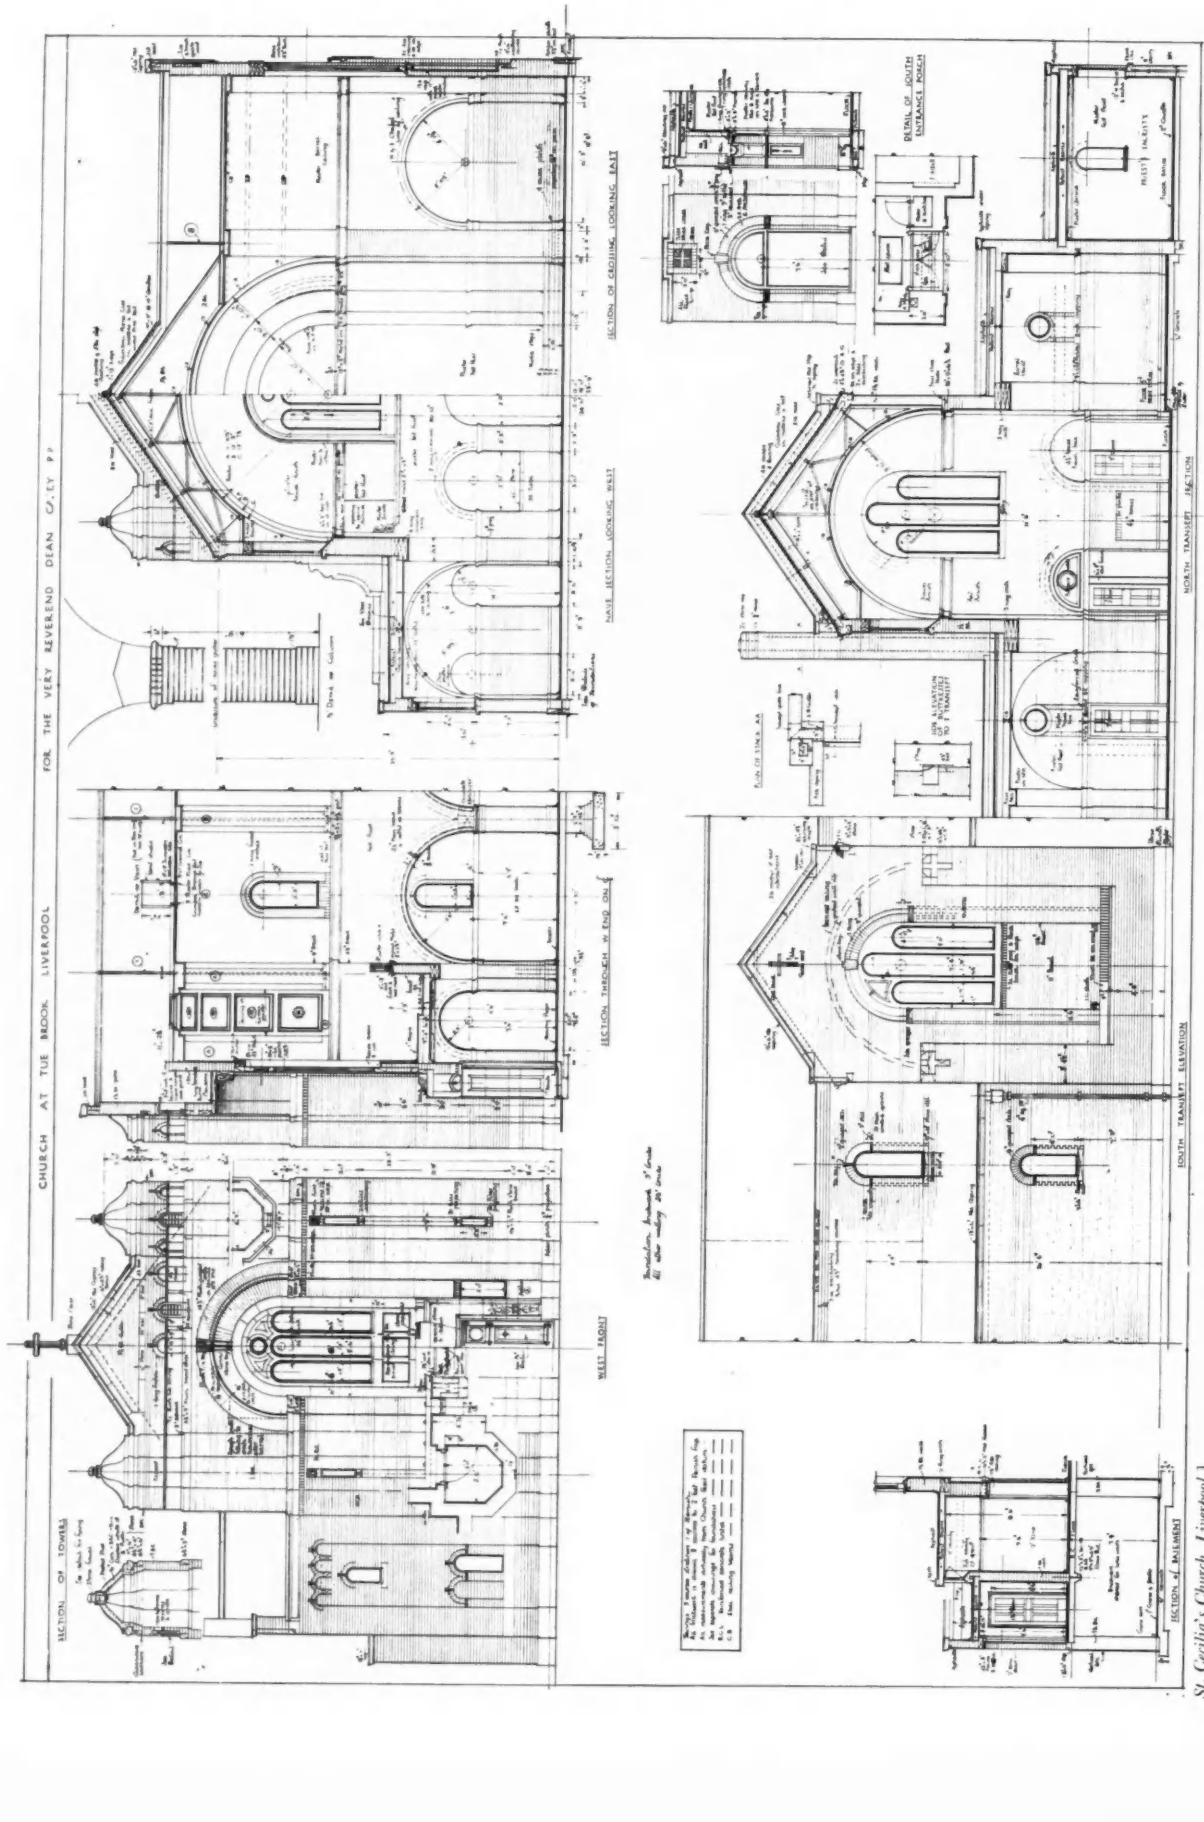


St. Cecilia's Church, Liverpool.]

The tympanum of the arch over the marble High Altar is decorated with a highly-coloured gesso panel, depicting the Annunciation. The door on the left leads to the sacristies.

[*By E. Bower Norris (Sandy and Norris).*

The vistas at the ends of the north and south aisles are terminated by two side chapels; that at the end of the former—dedicated to Our Lady—is shown above.

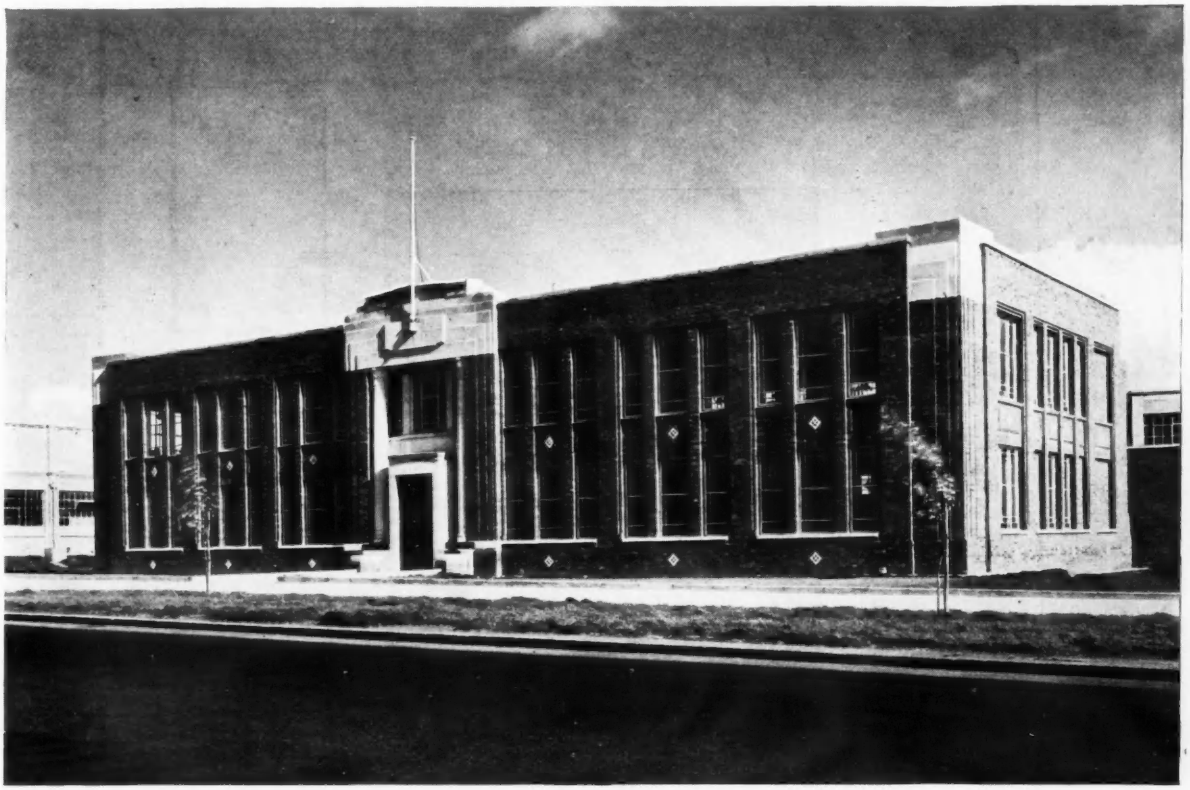


St. Cecilia's Church, Liverpool.

[*By E. Bower Norris* (*Sandy and Norris*).

The architect's drawings of the elevations of the west front and the south transept; sections through the north transept, the west and eastern ends of the Church; and of the basement.

THE SPERRY GYROSCOPE FACTORY, BRENTFORD



The main front, facing the Great West Road, houses, on the ground floor, the administration offices, and on the first floor the drafting and experimental rooms. At the rear are bicycle and car parks, and the workshops, glimpses of which are shown.

ON THE GREAT WEST ROAD, MIDDLESEX

H. COURTENAY CONSTANTINE AND F. W. MOORE
Associated Architects

PREVIOUSLY the Sperry Gyroscope Company, Ltd., occupied offices in Victoria Street, Westminster, and works at Shepherds Bush.

The new building on the Great West Road provides, on one site, for the administration and manufacture of the whole of the work specialized in by the firm, which is primarily the production of gyroscopic compasses, gyro stabilizers, searchlights, and apparatus of a similar nature.

The administration building (see plan on the following page) is separated from the factory by triangular paved yard spaces, enclosed by screen walls and used as bicycle and car parks. It is a two-story building, providing general offices on the ground floor, and drafting and experimental rooms on the first floor, and is connected with the factory at the rear by a corridor. The factory is divided into sections for the various processes in connection with the company's work, and includes workshops, factory offices, stores and impregnating and painting, polishing and plating shops. On the left of the site is the works entrance, and on the right the roadway to the loading dock.

The whole of the factory building is provided with north light roof construction, giving the maximum amount of daylight, and natural ventilation is obtained through opening lights in the glazing.

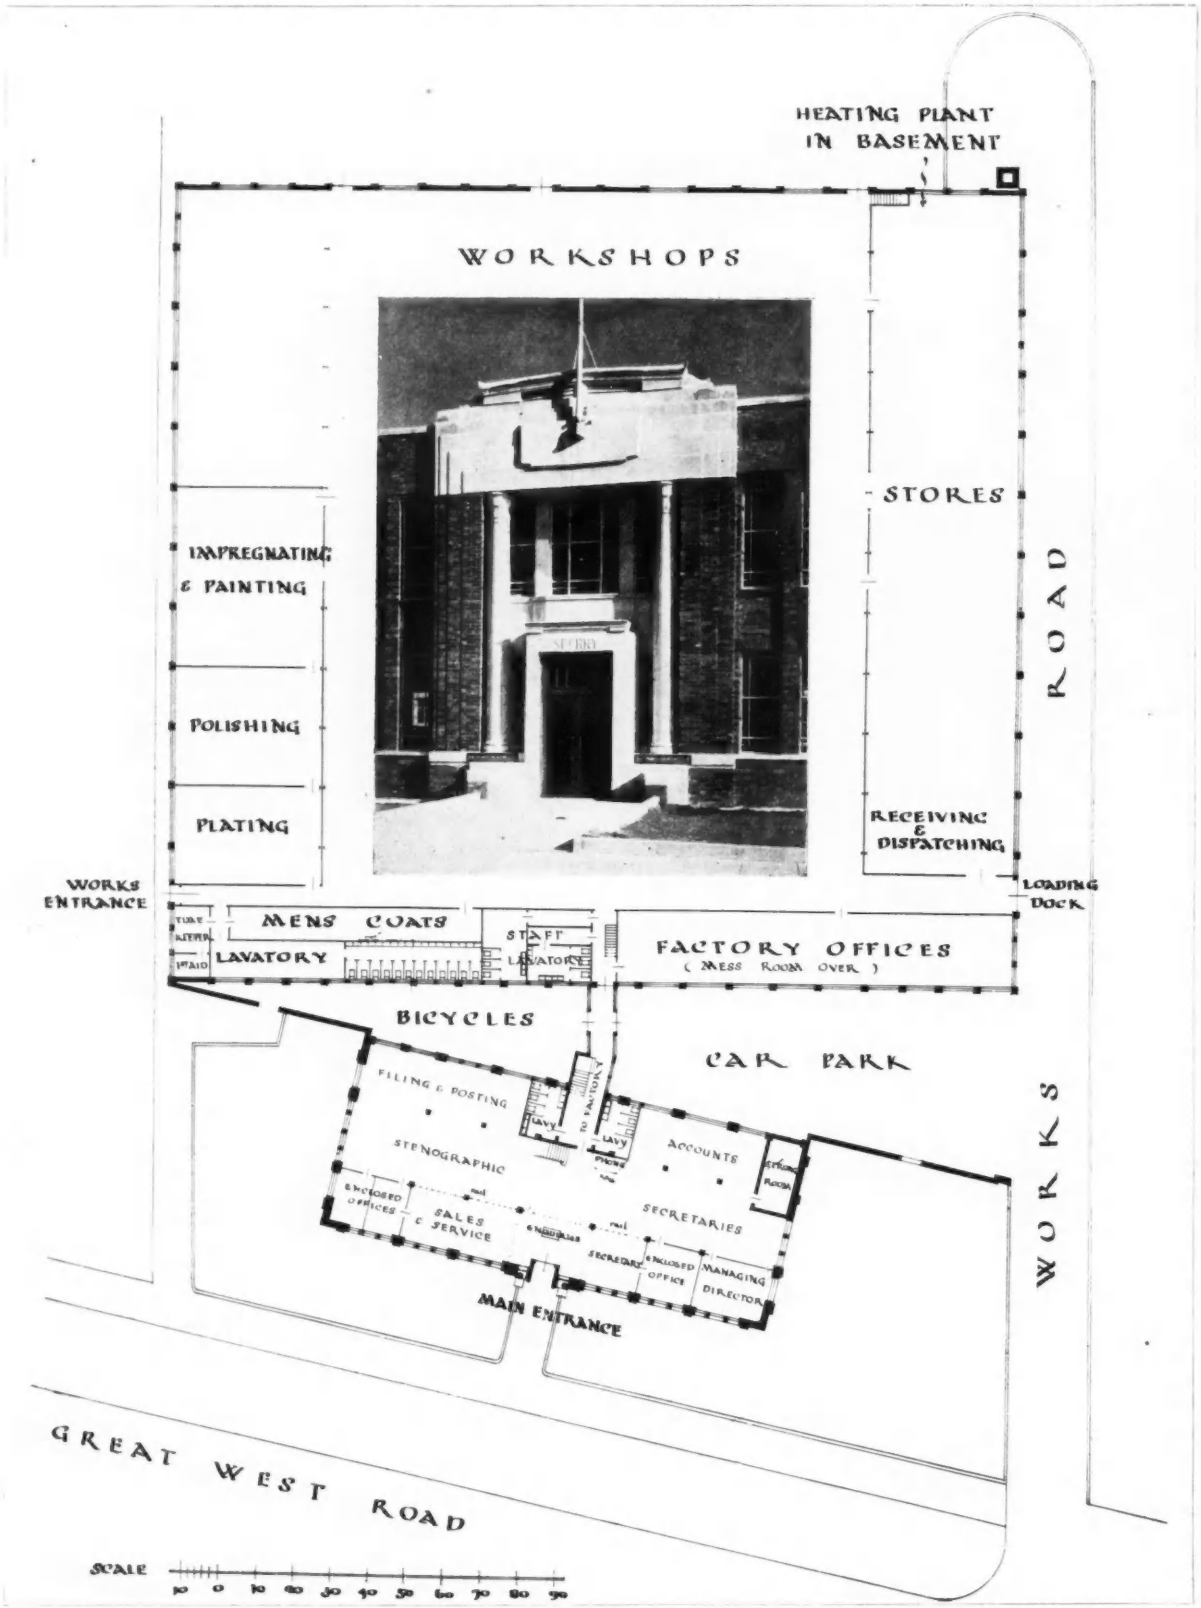
There are a large flat roof for testing searchlight equipment, and a mess room for the factory hands. The heating throughout is by accelerated hot water, the factory being primarily heated by ray-rads accommodated in the south slopes of the main roof.

The offices and factory have been designed to give the maximum amount of clear uninterrupted floor space, and internal partitions have been dispensed with wherever practicable. Accommodation is provided for 300 workers in the factory building, and all the sanitary equipment is of the very latest design, and in several instances especially designed for its purpose. Provision has been made in the design of the buildings for future extensions.

The exterior is faced with white Suffolk bricks with Portland stone dressings. The roof is covered with asbestos tiles.

The factory is one of the latest to be built on the Great West Road. The site has a frontage of some 260 ft., the main front of the administration building being about 130 ft. long and roughly 50 ft. deep. Behind are the factory offices and workshops, housed in a building 230 ft. long by 220 ft. wide. Of this, the floor space occupied by the workshop, impregnating and painting and polishing and plating shops measures 190 ft. long by 180 ft. wide.

During the last few years there has been a strong tendency for manufacturers to remove their factories beyond the Greater London area, sites on the new arterial roads being generally favoured. This reflex has had its influence on the Great West Road, where, perhaps, are to be seen as many factories of good design as on any arterial road from London.



Sperry's Gyroscope Factory, Brentford.] [*H. Courtney Constantine and F. W. Moore, Associated Architects.*

A photograph of the principal entrance from the Great West Road; and the plan at entrance level. The building has been specially designed for use in the manufacture of gyroscopic compasses, searchlights and similar apparatus.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xvii

PRIVATE PRACTICE AT LAST

BY KARSHISH

(H. B. CRESWELL)

MY condition at the time I was miraculously floated off on the wide seas of private practice was as follows :

I was twenty-nine years old, and had still to pass the final examination for Associateship of the Royal Institute. I had been pupil and assistant for six and a half years; had sketched and measured considerably in England; was a past student of and exhibitor—with perspective drawings—at the Royal Academy; had knocked about in various offices as assistant; joined my friend Garston on five unsuccessful competitions designs; spent a year as Clerk of Works under the Office of Works and three as Resident Architect to the Eureka Plough Company at Nollingborough—and that is all ! I was entirely dependent upon my earnings, and had no powerful friends or family connections to whom I could look for a shove off; my capital was represented by nine hundred pounds I had managed to save, and my claim on the public notice was my name painted on an obscure door-jamb in Charles Street, Adelphi, which no one passed except for the purpose of going to Adelphi Terrace. The fact that I launched myself from so high-and-dry and sand-docked a stranding was due to the conjunction of a circumstance with an event. The circumstance was the slackening of my ties with the Eureka Plough Company : the event was a church bazaar.

My engagement to the Company required me to give my whole time for three years. This did not prevent my working on competition designs and odds and ends of little jobs scavenged by Garston, nor from spending week-ends with him at his Charles Street office—with perhaps a day thrown in—slogging away gloriously at the vast gambles in Whatman's H.P. drawing paper that engrossed his energies. By the time these three years were drawing to a close, " our building programme," as Mr. Stevenson called it, was completed; no further buildings were immediately in view, and no extensive ones were contemplated. The offer Mr. Stevenson finally made me was that the Company should pay me three hundred pounds a year for organizing the maintenance of their Albion Works, attending board meetings when required, and directing and supervising alterations or additions carried out under Piggott (my works foreman), with the Company's own labour. I was to have a clerk at the Company's offices, to represent me there, and was otherwise to be free of my own time. If any work was carried out under contract I was to act as architect and be paid " additional fees commensurate with my services." As no rate of commission could have fairly met all possible cases, and the Directors had always treated me with liberality, I had no hesitation in accepting this offer; but my doing so involved my setting up in practice in Nollingborough if I was to set up at all without breaking my connection with the Company. I had never had any idea of practising in the provinces, and Nollingborough offered no sort of attractions to me; but with one leg in Charles Street the prospects were endurable, and the certainty of earning a livelihood in the first precarious years of the adventure exactly fitted my needs. It was just at the time that I had made this decision and was looking about for an office in the town that the famous bazaar was held.

It will be understood that during the three years I had been at Nollingborough I had made friends—as it is called—and formed a circle of social acquaintances. Of this I shall have to speak later, for I was to discover that in the provinces social pretensions are of more value to an architect than professional attainments; I have only to say here that, my father being by that time an honorary Canon of Peterborough, I came to know several of the clergy in the place, including its tremendous rector, the Venerable the Archdeacon (and arch snob) of Nollingborough, Mr. Ambrose Brythwater.

Thus it came about that when Mr. Brythwater organized a Grand Bazaar to pay for a bit of commercial church furnishing—an organ case, the price of which went largely to pay tout's wages and advertising expenses—which he had bought with no other means of paying for it than his ability to exact contributions from those who sought his social condescension, I was asked to lend a hand.

My early home training had by this time been replaced by the religious teachings of Garston, and I had little interest in church matters and none in a shoddy, machine-made, sham Gothic filagree which, in its subversion of the pure aspiration of humanity, in offering to the Almighty a thing that was no other than a mere adventure in money-getting, was, to me, nothing but a sin against the Holy Ghost; yet I agreed to help in the work of raising the £1,257 still needed to satisfy the manufacturers of the ugly thing, for not to have done so would have been as much as my social life was worth.

Before I was told in what way my services would be useful, the motives which daily made the Bazaar swell like a balloon under inflation was borne in upon me; and I, like everyone else, became concerned, not with how *I* could be of use to the Bazaar, but with how I could make the Bazaar of use to *me*. In this my hour of need, as so often happens, inspiration hit me like a bullet in the forehead when I saw one day, in the window of a fancy stationer's, picture-postcard views of Nollingborough coloured to represent the town in the flush of high fever. The only building in Nollingborough that was worth record was its thirteenth-century spired church, built, as was evident, by craftsmen from Northamptonshire. It occurred to me that if I made half a dozen water-colour drawings of this church, and presented them for sale at the Bazaar, I should satisfy the demands made upon me and, what was much more important, celebrate myself.

Garston's " puddle merchant," accordingly, got to work. The subject lent itself to pictorial treatment, for a fine ilex hung over the stone wall of the rectory which flanked the churchyard, and gave scale to the church; and its deep bronze-green foliage provided a delicious contrast to the cold, bluish-grey of the limestone which was exquisitely mottled with an orange lichen that also bedizened the tiled roofs. I made, in fact, not half a dozen, but fourteen such drawings, the size of a sheet of quarto paper—for I worked in loose, free washes. The whole thing was a huge lark, and gave me no trouble whatever, for I took snapshots; had three of them enlarged—but *not*, of course, in the town; traced them with black lead and a burnisher on to the paper, and turned off fourteen records of the wettest days Nollingborough had ever known, with varied sunsets and thunderclouds, and reflections so immaculately rendered that I found myself actually packing up one of the drawings upside down ! I finished two in the week and four at the week-ends; signed them with extreme legibility, and sent them to the appropriate stall-holder—a lady who,

socially, was labelled as "County." With the parcel, I sent a neatly lettered exhibition card :

Original Watercolour Drawings
of
St. Michael's,
by
BERNARD WHISTLOW.
One Guinea Each.

The effect I made was extraordinary. I was present at the Bazaar, where I helped to run a most unfair and most profitable Coconut Shy, which yielded us 2s. 7d. for every coconut won—in fact, the thing was so flagrantly dishonest that I felt overwhelmed with shame. Here, at the Bazaar, I was flattered by many compliments; but it was in the days following that I gathered unction to my soul. I found my social weight increased : those who had strained to assume equality with me—clerks at the works, for instance—surrendered their claim and retired crestfallen to wait on my condescension. Those who had previously condescended to me greeted me with complaisance; acquaintances took stock of me anew; friends set me in a higher esteem, and the shop-keepers, and even Piggott himself, adopted a more respectful bearing. The thing was subtle, but it was unmistakable, and it astonished me. It was as though my small accomplishment was an unheard-of marvel. More perplexing was a kind of resentment in some quarters, as though I had marked myself off by making claims that were unjustified. This I took to be a symptom merely of that jealousy and grudging envy that poisoned the whole place. I gathered, for instance, that it was resented I had valued my work so highly as a guinea a time. There seemed, however, some grounds for this view; for I learnt with annoyance that, late in the day, five of my drawings had been disposed of at 10s. 6d. each, and the last actually sold for five bob, proving that dog is not above eating dog at Church Bazaars. However, I was to find that I was more deeply involved in public opinion than I had any idea of. The thing I have to tell will appear incredible, but it was, nevertheless, characteristic of the absurd little place.

In those years J. McNeil Whistler was at the zenith of his notoriety, and was famous as a person to millions who knew nothing of his paintings. Will it be believed that the crowd of choice donkeys who got into the Bazaar at half price after six o'clock in the evening, muddled by a similarity in the names, incubated and hatched the idea that *I was the famous Whistler!* When this notion came afterwards to be discredited, there was an equally muddled idea that my drawings were not so good as they were supposed to be, and that I had been impersonating someone else and getting credit for the work of a better man. However, all this did me no harm, but only good; for everyone in the town came to know of me as an architect and as an individual.

It was in other fields, however, that I did best for myself out of this truly blessed Bazaar; for many among the socially eminent, who were patrons and attended the opening, bought my sketches; and some whom I knew—for I was in request at lawn-tennis parties—noticed my work. Mr. Stevenson's extraordinary and complete ignorance of art was a great asset to me at this juncture; for his admiration was enhanced by astonishment at having entertained so accomplished a being as myself unawares, and led him to regard my attainments as distinguishing himself. He had, with characteristic kindness of heart, bought one of my drawings, choosing one in which I had horribly overdone a sunset effect; and some time afterwards I overheard him in his drawing-room, where he had hung the framed sketch, calling the attention of a guest to it : "A—ahem!—er—a little thing by our resident architect, Mr. Bernard Whistlow—ahem!"

He asked me to make a "picture," as he called it, of his house and garden; but as he had a very clear idea in his mind of what he wanted, and was totally unable to convey that idea to me; and as it is doubtful whether the united forces of Messrs. Windsor and Newton and Mr. Reeves could produce the pigments adequate to his conception of his geranium beds, I had a heavy task and a not perfect success when all was done; but though I wished to make my good friend a present of the drawing, he would not allow it, but insisted on my accepting a cheque for ten guineas. This was twice as much as I should have asked at the time; but was only characteristic of his generosity at *all* times.

It was in this drawing that I first used my famous waterspout. The long streak of blue-black cloud, trailing down the side of the drawing, set off the staring brilliance of the dreadful house. Watercolours lend themselves entrancingly to such things, and it is a regret to me that I have never seen a waterspout in nature.

It was, then, from my adventure of the Bazaar that I was floated off in private practice—not with commissions in Nollingborough itself, but in the country round about; with a gradually extending connection among hunting people and the landed gentry of the neighbourhood, under circumstances which were, in many ways, wholly delightful—as I have presently to relate. Before, however, I close the history of the Resident Architect and open the new chapter I must tell of two experiences I had when employed by the Eureka Plough Company, both of which, although characteristic of the field in which I laboured, stand alone in my experience.

The first of these refers to circumstances, already referred to, in which I unwittingly invited and accepted a bribe. The kinds of buildings I put up called for large quantities of materials and of manufactured goods: and I soon grew weary of the delivery on the site of truck-loads of bricks, slates and whatnot that were not fairly up to sample or to specification, and of the awkwardness of sending away materials actually delivered, and condemning goods already manufactured. Thus I soon made it a rule to approve materials in bulk before delivery, and to overlook the work of manufacturers at their shops; and thus, I came to travel about the Midlands, and even sometimes to Glasgow, and once, as I remember, to Portmadoc.

I do not recollect where it was that I once found myself short of the money necessary to complete my tour of inspection; but I got into that predicament, and asked the Manager of works I was visiting if he could oblige me by cashing a cheque for ten pounds. Without saying a word, and with a curious perfunctory air, he at once took a quantity of sovereigns out of his waistcoat pocket and passed ten of them into my hand, as we stood. He then walked with me to the entrance and was on the point of saying good-bye when I reminded him I had to draw a cheque. I went to his office, where the transaction was completed by my making the cheque payable to self, and endorsing it.

Some months later I was counting my money—in those days an agreeable task, for I was earning much more than I spent; and, in ticking off the counterfoils in the stump of an old cheque book, was unable to find this ten pounds debited in my pass book. It took me a moment to realize that the cheque had never been cleared, and I can remember now the horror of that realization. I was conscious that the blood receded on to my heart before I flushed over my whole body. Not only had I been bribed, and accepted a bribe, but evidence of the fact existed in the uncashed cheque. Suppose that by any channels or intimacies of which I had no knowledge, Mr. Stevenson should get to know of this thing! It was nearly ten at night, but I had an impulse to walk over at once and see him, for I knew him to be at home. I am glad I did not do so, for I should have won more discredit for my simplicity than respect for an honesty of which he had good reason to be already satisfied. What I did was, then and there, to write privately to the Secretary of the firm, stating the facts, although I was unable to recall the name of the

official who had obliged me. The Secretary replied that the cheque had in some way been overlooked; that one of their Assistant Managers had lately left their employ, and that it had not been possible to trace any record of the transaction. Thereupon I drew a cheque in favour of the firm, which I insisted upon their accepting; and received in due course their receipt, together with a further protest from them and the statement that they were crediting the amount to their Superannuation Reserve, and that if at any time I found, as they expected, that I was in error, they would refund the amount.

The second gleaning from the ways of the business world I have to tell of, concerns the purchase of the land adjoining Albion Works upon which I built the new shops. The owner of the land was the proprietor of a small corset factory and lived in the town: but in negotiating the purchase I dealt entirely with his solicitor, a Mr. Pettigrew, who performed on the ground floor of a dismal old house, shrouded in gloom and dust and without any ventilation. Mr. Pettigrew kept his clients' papers stacked two feet high, and covered with a dust sheet of hideous age, on a large table at the side of his room; and when he wanted any document two desponding clerks answered his call, removed the dust sheet, and scratched in the heap until the required tit-bit came to the surface.

After the contract to buy and sell had been signed, and while the solicitors on each side were engaged in checking the abstract of title, Pettigrew's clerks one day scratched to such good purpose that they clawed into the light a forgotten deed which recorded that the Nollingborough Urban District Council had, many years before, paid fifty pounds to a previous owner of the land for the right to lay and maintain an 18-in. pipe sewer across it, on the understanding that after the expiration of ten years the owner of the land might require them to remove it if he desired to develop the land for building.

It may be supposed that the Urban Council of those days must have been hard up to find a run for their sewer; at any rate, there was now no easement over the land, and the sewer had been unknown to me and, apparently, forgotten by others.

I was present at the Board Meeting when the owner of the land attended to sign the conveyance. The documents were laid out on the table and the Company's seal was unlocked with the keys of the Secretary and of two Directors, by which its unauthorized use was triply safeguarded; and Mr. Reynard Borson was then introduced.

Mr. Borson had an air of resentful gloom, and it at once appeared that he also had a grievance. He told the Directors that he had sold the land under a misapprehension; that the Company were getting more than they had bought and he giving more than he had sold; and that he considered the Directors, as honourable men, should release him.

"But—ahem!—" said Mr. Stevenson, "we do not know to what you refer."

"Oh, yes, you do, sir," was the answer. "That sewer is worth a thousand pounds to me, and it's worth a lot more to you—as you must know perfectly well."

The Board's mystification was only increased by this.

"But the sewer is only an embarrassment to us. Will you please explain how it can be worth a thousand pounds to you?" Mr. Stevenson asked.

"Well," said Mr. Borson, "the Council would pay me a thousand pounds or more to let that sewer be."

"But," said Mr. Stevenson, "no question arises unless you intend to build."

"Well, and who'd know that I didn't want to? I can have plans made, can't I? And then they must either pay me compensation for refraining from building, or I can make a start and break the sewer. They'd pay me; but you are in a much stronger position, as you must know well. They might call the bluff on me, but you being here and extending all the time, they can make no stand at all. So far as I can see it would run them into three or four thousand, at least, to adapt the town sewers so that this one could be cut out; and there's no need to reconstruct the town's sewers for many a year yet."

Mr. Stevenson's protest that the Company had no intentions of extracting forfeiture from the town, and that I had planned their buildings so as not to interfere with the sewer, left Mr. Borson incredulous and unappeased. He executed the conveyance under protest and went away an injured man.

NEXT WEEK—XVIII: PROVINCIAL PRACTICE

The previous instalments appeared as follows:

May 27.	i:	I am Articled.
June 3.	ii:	Episodes of Pupilage.
June 10.	iii:	Episodes of Growth.
June 17.	iv:	My First Job: The Sewer.
June 24.	v:	My First Job: The "Pipes."
July 1.	vi:	I Turn Clerk of Works.
July 8.	vii:	Bradshaw & Son: Builders.
July 15.	viii:	Joe Richards: Foreman.
July 22.	ix:	Trials of a Clerk of Works.

Sept. 9.	xvi:	A Failure and a Success.

QUESTIONS THAT ARISE

Flaking of Glazed Tiles

I. and S. write: "*About a year ago we covered the walls of a bathroom with 8 in. by 8 in. Dutch glazed tiles. A number have recently had the enamel come away from the backing. We should be extremely obliged if you could suggest the cause. We enclose herewith piece of the enamel and backing.*"

Generally speaking, the cause of flaking in glazed tiles is due to the fact that the tiles have not been raised to a sufficient temperature when being fired.

During firing the heat should be of such a degree that the biscuit and the glaze bind together, so that they will very nearly expand and contract similarly to varying temperatures. If, however, the tiles are submitted to an insufficient temperature, the glaze and the body remain as what may be described as two insecure bodies, and any sudden heat, such as steam in a bathroom, etc., will cause the glaze to fall away.

On examination of the portion of tile submitted, the biscuit appears to have the substance of a Spanish rather than a Dutch tile; furthermore, it is most unusual for 8 by 8 tiles to be manufactured in Holland, or for that matter in England either (except fireclay), as there is a tendency for the tiles to twist during firing. In Spain they do not appear to have the same trouble regarding tiles of the above size, this being probably due to the local conditions, etc.

It will, therefore, be found that in the majority of cases where 8 by 8 tiles are used, Spain is the country of origin.

W.

Running Rules

"Northend" writes: "*On page* 16 *of the* Standard Method of Measurements of Building Works, *the second paragraph of clause* 89 *(Asphalter) reads: 'All measurements shall be net and shall include for running rules.' I should be obliged if your expert would define the term 'running rules'.*"

I understand "All measurements shall be net and shall include for running rules" to mean that the work is to be measured as laid, and that no allowance can be claimed for any material left over and not used. By "running rules," I understand the temporary movable wooden fillets by which are gauged the various thicknesses of the work, and which are also used to define each particular section of the work.

S. U. R.

The garden front, as seen from across the lake, showing the charming surroundings in which the house has been placed, and the steps up to the garden.

HOUSE AT WEYBRIDGE, SURREY

DESIGNED BY IMRIE AND ANGELL

Looking along the main front toward the servants' quarters, housed in the projecting wing on the left of the photograph. The garage window is on the extreme right.

"CONEY WARREN" stands on high ground at St. George's Hill, Weybridge, Surrey, on a site sloping to the golf course. The walls externally are covered with plaster and weather-tiling; and the windows, gutters and rain-water pipes are of hardwood, to minimize painting.

The planning and internal finish of the house was influenced by a desire to reduce labour and upkeep. All wood is unpainted; the ground-floor rooms are finished in oak or elm and the bedrooms in basswood. The ground floors throughout and the dining-room ceiling are carried out in English elm.

There are only three fireplaces and one stack, the house generally being heated by radiators.

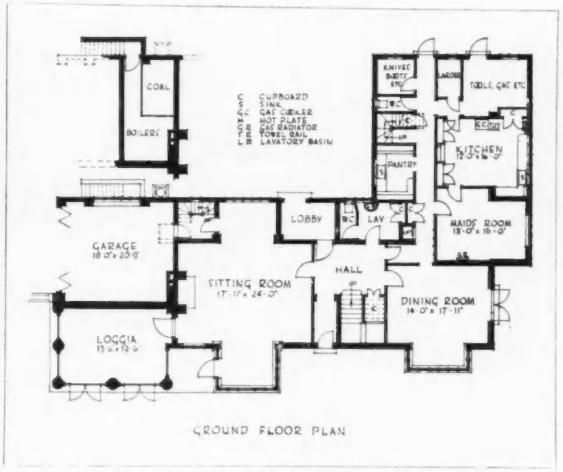
Cooking is by petrol gas.

The bay window to the dining-room and the gable addition to the dressing-room on the first floor are later work, and did not form part of the original design.

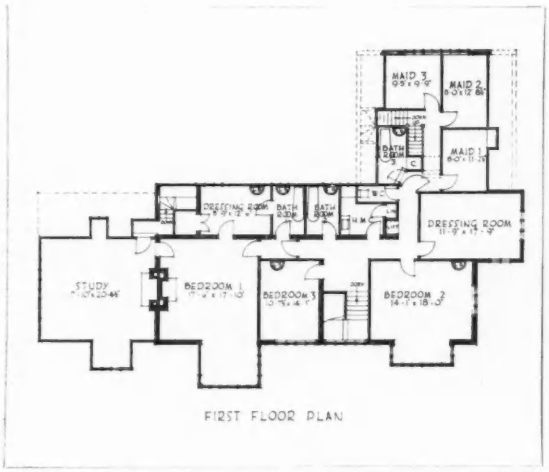
Another view of the garden front. The projecting bay on the right houses the dining-room; and that on the left the sitting-room.

The loggia is totally enclosed and heated. The windows above light the study.

The sitting-room, looking towards the loggia. The alcove on the left overlooks the garden. The fireplace is one of three installed ; the house is heated generally by radiators.



As will be noted from the ground plan above, there are five garden entrances. The house has many labour-saving fittings, of which a key is here given.



On the first floor the principal accommodation includes a study, three bedrooms (all overlooking the garden front), two dressing-rooms and two bathrooms.

The dining-room, looking towards the door leading to the entrance hall. The ground floor throughout the house and the dining-room ceiling are of English elm.

A view of the garden side. The walls externally are covered with plaster and weather-tiling; and the windows, gutters and rain water pipes are of hardwood. The gable seen in the above photograph is one of the later additions to the house.

LETTERS FROM READERS

Art and Industry

SIR,—Experience supplies the only test of the efficiency of exhibitions, but, judging by their frequency, they appear to be worth while.

For those who can visit them, they must be highly instructive, but the number of those who can get to them must be small in comparison with those who cannot. The latter class ought, nevertheless, to be reached in the endeavour to stimulate a desire for good design in common things. Still, if those who know advocate a great exhibition, by all means have one.

If I may venture to make a suggestion to all those concerned, from the committee downwards, it would be that in industrial design, especially in relation to objects of ordinary use, the result to be aimed at should be common sense made beautiful. J. A. GOTCH

SIR,—I think Mr. Noel Carrington's interesting proposal to give effect to the pious aspirations of Lord Gorell's committee would be most useful in "telling the world" that we can produce as good designs as foreigners, make it easy for designers, producers and the public to compare British with foreign design (and to learn all the lessons we can from such close comparison), to open up the market for better designs, and to help to educate the eye of producers and public.

There is one further way in which such an exhibition could help the harassed countryside. I refer to the ghastly standardized garages and bungalows. Perhaps the organizers could get a few manufacturers to exhibit some of good design, but no more expensive than those now on the market. County and other councils, as town planning authorities, are in considerable difficulty at present over granting or withholding Interim Development Orders for this type of building, especially when they know that the applicant is a person of small means. If designs such as I have indicated were on the market as well, local authorities would have no compunction in refusing to allow bad designs in similar cases. This would commence to free the face of the countryside from these pernicious pimples which show the unhealthy state into which the country has sunk in its outlook on beautiful things.

I don't envy the organizers in having to refuse a very large proportion of entries, ruthlessly yet tactfully, if such entries are anything like those which appear annually in the so-called Ideal Home Exhibition. Mr. Carrington would be a public benefactor if the only result of his suggestion were to improve the manners of *The Daily Mail's* turbulent offspring.

He also proposes that architects should be largely responsible for the designs. It is an excellent suggestion, but I should like to see this carried a step further to help achieve one of the aims of the D.I.A., namely, to get closer co-operation between manufacturer and artist, whether architect or otherwise. Plainly, the proposal would only do this to a limited extent. In the past, artists employed by firms do not seem to have been businesslike in the production of their designs, and it has been found difficult to fit them into a highly-organized concern. Some of those manufacturers who, up to now, have been doubtful about such co-operation might go, and be converted, but those who have always objected would have to be convinced in some other way that artists or architects are now reliable. Mr. Carrington's proposal seems to me to be trying to induce closer co-operation, but substituting architects for artists. If artists, however, will not be businesslike, and architects will, then there seems every reason to try co-operation along the lines of the proposal.

THOMAS A. EMMET

SIR,—I am entirely in accordance with the idea of Mr. Carrington's proposal to hold exhibitions of the common products of this mechanical era with a view to improving their design, but would suggest that small exhibitions should be held under the ægis of the Board of Trade, at which manufacturers and their designers, and that composite person, at best, half artist and half business man, "the architect," should meet to discuss technically the possibilities of improving the design of the innumerable articles in use in every household, club, restaurant, and tea-room throughout the Empire.

The outcome of such discussions on individual articles might result in a great exhibition, some years hence, of manufactured goods from Manchester, Stoke-on-Trent, Birmingham, and Sheffield, showing at least a commonsense development of the mass production of this period, and maybe a sound æsthetic development also of the inherent qualities of this method.

I think these exhibitions and discussions should be open to the public, to allow those who are at present interested to see and hear what is being done.

At the present time such a person as myself, visiting the ordinary store, finds so little giving a thrill of pleasure that he perforce goes to the Continent to find articles for the household that have some element of interest and beauty, at a low price. The money thus spent should not, in my opinion, leave this country.

As far as I have observed, there is scarcely a single article in everyday use by the great majority of people that is not capable of being improved in design and colour, without increasing the cost of production; indeed the cost of production might be reduced by the omission of extraneous ornament.

The day of mass production is undeniably here, and the circumstances of the time force most of us into continuous contact with things produced by that method.

It is therefore high time that those who realize it should take some definite action to obtain the best results from the machinery we have become heirs to, and direct this great power in such a way that the results would give pleasure to everybody.

Those who are indifferent would soon become accustomed to the changing form of things, and in a short time the higher standard would be absorbed and further initiative required to create something better.

The next generation would enjoy the improvement as the air it breathes, and would in fact be largely unconscious of it.

As a matter of historical interest, the ugly articles of today might be collected in a museum to show what we submitted to. W. H. COWLISHAW

The Pedestal Basin

SIR,—A few weeks ago you printed a letter of mine concerning a pedestal basin. I had thought the matter almost too slight to merit your readers' attention. Alas! I learn, as Anatole France learnt when he came to name his cat, that the business is not so simple. It is, in fact, so difficult that it may be termed altogether past solution. And from whom shall I seek justification, if not from the makers of basins? Yet the half of them say roundly that my builder was an ignoramus; while the other half say, with equal emphasis, that no sensible fellow would dream of introducing the pipes into the innards of the pedestal. And there are a few more who prefer to hum and haw. As one says so readily to the conundrumist at Christmas, I give it up.

Yet, Sir, a parting shot at my sanitary friends. Why, if this pedestal was never meant to house the pipes, had it a vent fashioned in its rear as if to admit them? (A rudimentary organ, maybe, of prehistoric significance.) Or why, at Olympian exhibitions, are the pipes so ashamed of their nakedness that they all take shelter in their pedestals? Or, why, if leaking pipes

must be anticipated, could not the pedestals be made of glass, frosted in front perhaps, so as still to permit of inspection? Any why . . . But enough, lest a parting shot become a barrage.

N. L. C.

Housing and National Economy

SIR,—There are two important considerations in connection with housing and State assistance, and these are the necessity to reduce the financial drain on the country, which has now assumed such large proportions, and the necessity to provide houses for the people. The discontinuance of the 1924 Act subsidy in respect of any houses not completed by a certain date would relieve the country from a cost which is growing at the rate of £1,000,000 a year.

The number of houses built by private enterprise without any subsidy from the State has increased in a very satisfactory degree, and if the competition of the local authorities is eliminated there will be a considerable revival in building houses for the workers.

The number of houses built by private enterprise without State assistance during the past three years has been as follows:

Year ended March 31, 1929, 64,740
" " " 1930, 91,691
" " " 1931, 138,728

During the same years local authorities have completed the following numbers: 1929—55,723 houses; 1930—60,245 houses; 1931—52,514 houses.

From these figures it is evident that private enterprise will very soon replace the shortage which a discontinuance of local authorities' building would create.

Such a course would leave the local authorities free to devote all their attention to slum clearance, in which direction the real housing question exists.

NORMAN MCKELLEN
(SECRETARY, NATIONAL FEDERATION OF HOUSE BUILDERS)

THE DEATH-WATCH BEETLE

Some Advice by A. R. Powys

FOLLOWING are some extracts from a monograph on *Timber Decay Due to the Death-Watch Beetle and the Furniture Beetle*, by A. R. Powys, issued by the Society for the Protection of Ancient Buildings, and published in the Royal Society of Arts Journal for September 11.

It is noticed that the timbers most affected by death-watch beetle are:

(*a*) Those bedded in or on walls (here there is liability to slight or excessive moisture). (*b*) Those where moisture is entering from leaking roofs or has in the past entered. (*c*) Those subjected to condensation water from roofs and walls; and (*d*) particularlysap wood, which, it is thought, most easily absorbs moisture from the air, and which is more suitable for the growth of fungi which are thought to be propitious to its life. (*e*) Timbers cut from trees past their prime, particularly those where the very centre of the tree has already begun to "lose its nature" before being felled. Such timbers are commonly more "shakey" than others—the shakes in converted timber provide a ready entry for the baby grub. The presence of fungus is suspected in such timber. (*f*) It is present also in timbers that have not these qualities or defects, but which are structurally in close connection with them. (*g*) At the joints between timber and timber, i.e., at the mortice and tenon. At these joints there is, perhaps, more moisture present than elsewhere, owing to capillary attraction, and at these points there is certainly a more ready entry for the baby grub than there is elsewhere. (*h*) It is noticed that mediæval rafters cut from the heartwood of oak trees, but not from their cores, are often immune from the beetle in roofs where it is elsewhere present; that is, unless these timbers have been subject to constant wet.

It is stated by Professor Munro, and it was stated by Professor Lefroy, that the presence of the exit holes of the beetle is not proof of present activity. It is said that present activity can only be verified by finding the beetle in the timbers, by finding the grub in the timbers, or by the evidence of the beetle dust discharged from the holes while yet the timber is unmoved and unshaken.

It is said that it is sometimes possible to find whether the beetle is active or not by pasting on the face of beetle-holed timber a piece of paper. New exit holes will, thereafter, easily be apparent in the paper if the beetles emerge.

It is certain, if there is no immediate danger, and in positions where this is practicable, that the continued activity of the beetle can be tested by marking the existing holes on chosen areas of timber and observing, after a year or two, whether the number of holes increases.

It is probable that the researches being made by scientists will before long be rewarded by the discovery of a way to check this scourge; and it is likely that this way will be either by taking steps to prevent the occurrence of fungi, which may be necessary to the life of the beetle, or by attacking it at some vulnerable period of its life, as for instance, immediately after hatching, when the newly-emerged grub crawls for a while over the surface of the timber. It is, for instance, suggested that at this stage the insect then lives on certain moulds commonly present on the surface of oak.

Until some discovery of this sort is made, the repairers of old oak structures can rely on structural methods of repair, and can hope, by the use of insecticides, to kill the insect and check its increase. The proper ventilation of timber in a building under cover is certainly desirable. But the prevalence of the beetle in timber in the open is proof that ventilation alone will not end the pest. Yet ventilation in the open and in buildings is not comparable. Fungi and moisture are the two factors required for its life, and, under the cover of a roof, ventilation is a deterrent to both those.

The present method of checking the activity of the beetle grub, apart from structural repair, is by means of insecticides applied to the timbers.

It is certain that progress of decay caused by the death-watch beetle is very slow. The following general advice is given to architects and others when they have to report on the stability of roofs affected by this form of rot:

Where the framework in question is structurally sound, and if the strength remaining in the timbers is for the most part sufficient for its purpose, there is no need to condemn a structure on account of the presence of the beetle.

In these circumstances, and because of the present limited knowledge of the life history of the insect, it is advisable to check the activity of the beetle by using an insecticide.

Sapwood should always be removed from new and old oak in the course of framing a new structure or repairing an old one, with the one rare exception, namely, the existence of moulded or carved sapwood that yet retains the shape given it by old carvers. There the wood should be sterilized and hardened and left.

Adequate ventilation, access for cleaning, and, if possible, for daylight, should be provided.

It is not thought that varnish or a similar surface covering will hinder the young grub gaining access, because it seems unlikely that the grub would attempt an entrance from the smooth surface, where it could obtain no purchase to start its tunnels. It is probable that it starts its active life by entering the timber from an open shake or an open structural joint, and in both cases the cracks would be wider than a coat of varnish could close. Varnish and like surface treatment is to be avoided, for æsthetic and other reasons, where old oak in ancient buildings is concerned. The closing of open shakes and other like crevices with wood-stopping preparations of the right colour and consistency is desirable.

SWIMMING BATHS AT HELSINGFORS

DESIGNED BY
VÄINÖ VÄHÄKALLIO

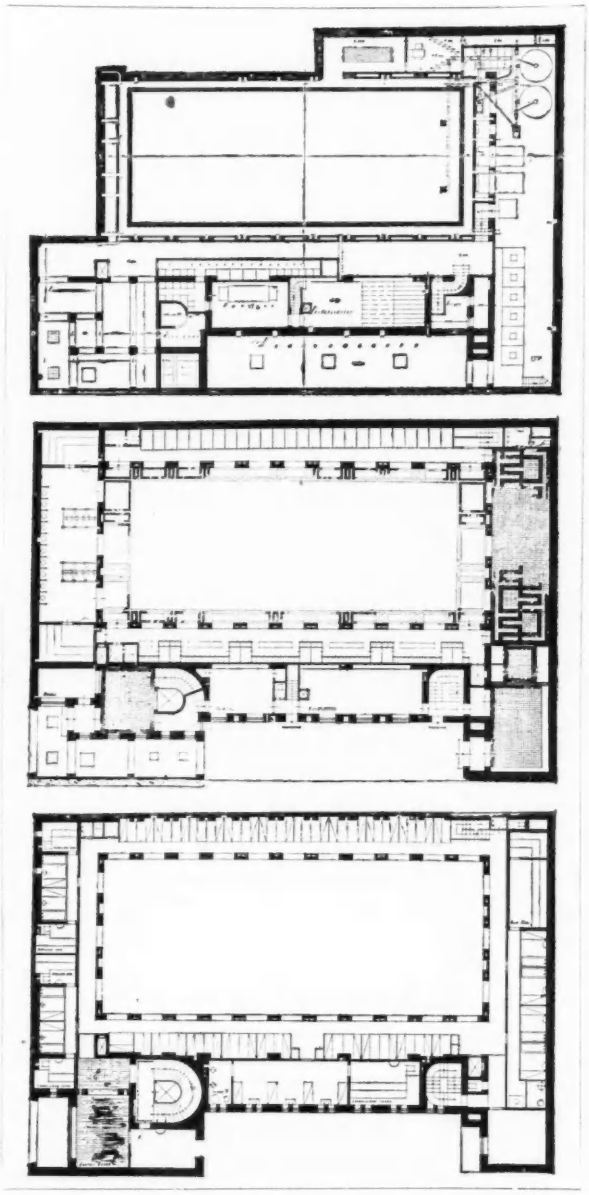
The entrance bay of the main front. The building has been erected in a central position of the town to increase its serviceability.

VARIOUS sites were under consideration for the new Helsingfors swimming baths, including several on the outskirts of the town. It was decided, however, that the usefulness of the building would be very much increased if it were put up in a central position so that city workers with only a little time to spare could make use of it at every possible opportunity.

It was, consequently, necessary to carry the building up to the full height permissible under the building law, and to include under the one roof a great deal of accommodation besides the swimming bath; some of it being capable of producing useful revenue.

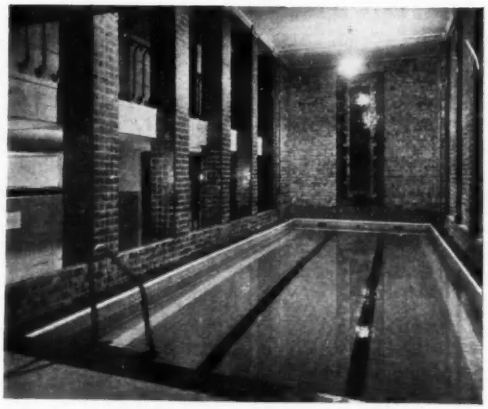
Among these other features are a covered tennis court, bowling alleys, rooms for boxing, fencing, massage and electrical treatment. The building also contains a restaurant, and hairdressing rooms for both sexes. There is a valeting service, which enables visitors to have their clothes pressed while in undress. The laundry, which washes the bath linen, also takes in outside washing.

In addition to the slipper, Turkish and other special bathing arrangements, the building contains two swimming pools, one for either sex. As a thorough

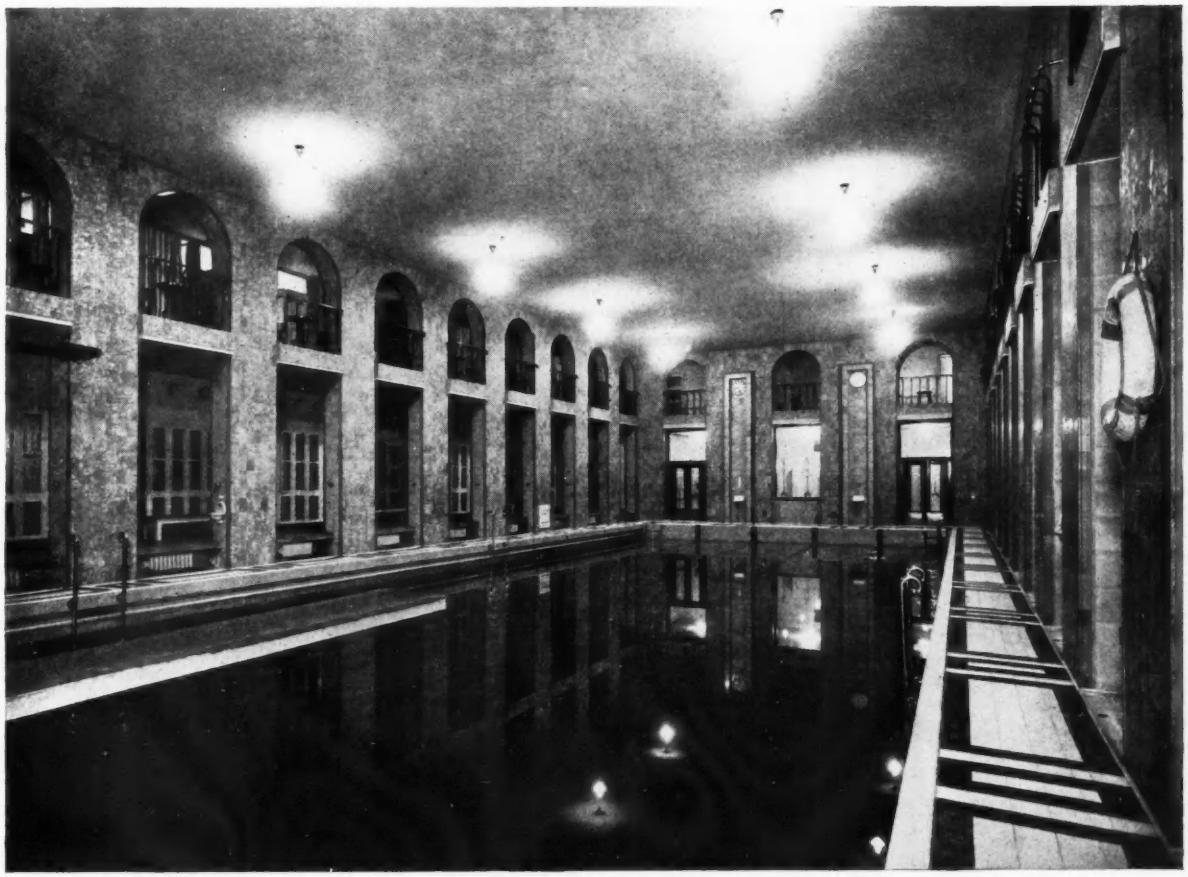


Basement, ground- and first-floor plans, reproduced to a scale of 1 : 500. The men's bath extends through two floors; the women's is above it.

A view of a shower-bath room. The use of costumes is forbidden. But visitors can have their clothes pressed in the valeting department; and may even send their linen to the laundry under the same roof.



The ladies' swimming-bath, showing the pool and spectators' gallery. This is on the second floor immediately over the men's bath.



A general view of the men's swimming-bath looking towards the shallow end. The depth at the deep end is 3½ metres, and the highest diving-board is at a height of 5 metres above the surface of the water.

washing is insisted upon before visitors are allowed to enter the swimming pool, the use of costumes is forbidden.

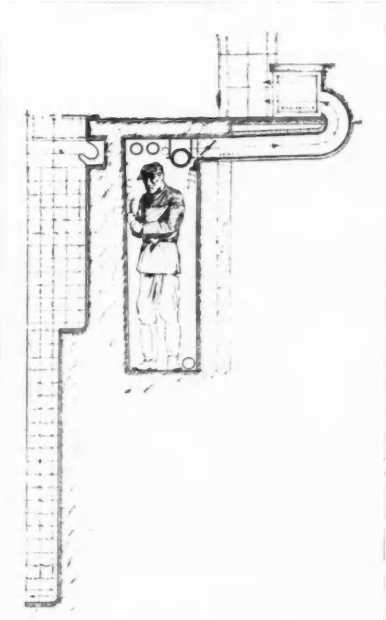
The men's pool, the larger of the two, is situated on the ground floor and is housed in a hall two stories deep.

The ladies' pool is on the second floor, immediately above the other. The dimensions of the pools are based on the swimming distances current in championship events, namely, 100, 200 metres, etc.; the length, consequently, is 25 metres and the width 10 metres, which allows five competitors to start side by side, each having 2 metres clear width.

The water depth at the deep end is 3½ metres, while the highest diving-board is 5 metres above the surface of the water.

The heating installation is on the low-pressure steam system. There are six coke-burning boilers. In addition to heating the building, the steam is utilized to heat the bath water, the drying closets in the laundry, and a special apparatus for melting snow on the roof during the winter months.

With the outside temperature taken as 22° F., the heating installation is capable of heating the main departments to 75° F., the tepidarium to 140° F., the calidarium to 158° F., the laundry to 50° F., and the lesser rooms and passages to 64° F.



Vertical section through edge of pool, showing inspection trough and ducts for ventilation, heating, etc.

The ventilation is partly central and partly direct. The central system is worked by means of an air-warming and conditioning plant placed in the basement, by which the air is heated to a temperature of 77° F.

The swimming halls also contain a number of radiators with fresh-air inlets adjacent. The outer temperature being between 50° F. and 14° F., it is calculated that the air is changed completely once an hour in the principal rooms, twice an hour in the laundry and in the ladies' swimming hall (which is of comparatively small cubic capacity) three times an hour in the slipper baths, shower baths, etc., and in the kitchens, and five times an hour in the lavatories.

As will be seen from the small sectional drawing reproduced herewith, the pool is surrounded by a hand-hold, a foot-step, and a trough, deep enough for a man to stand in, which serves for inspection and for conveyance of various pipes.

LITERATURE

THE ART OF EGYPT THROUGH THE AGES

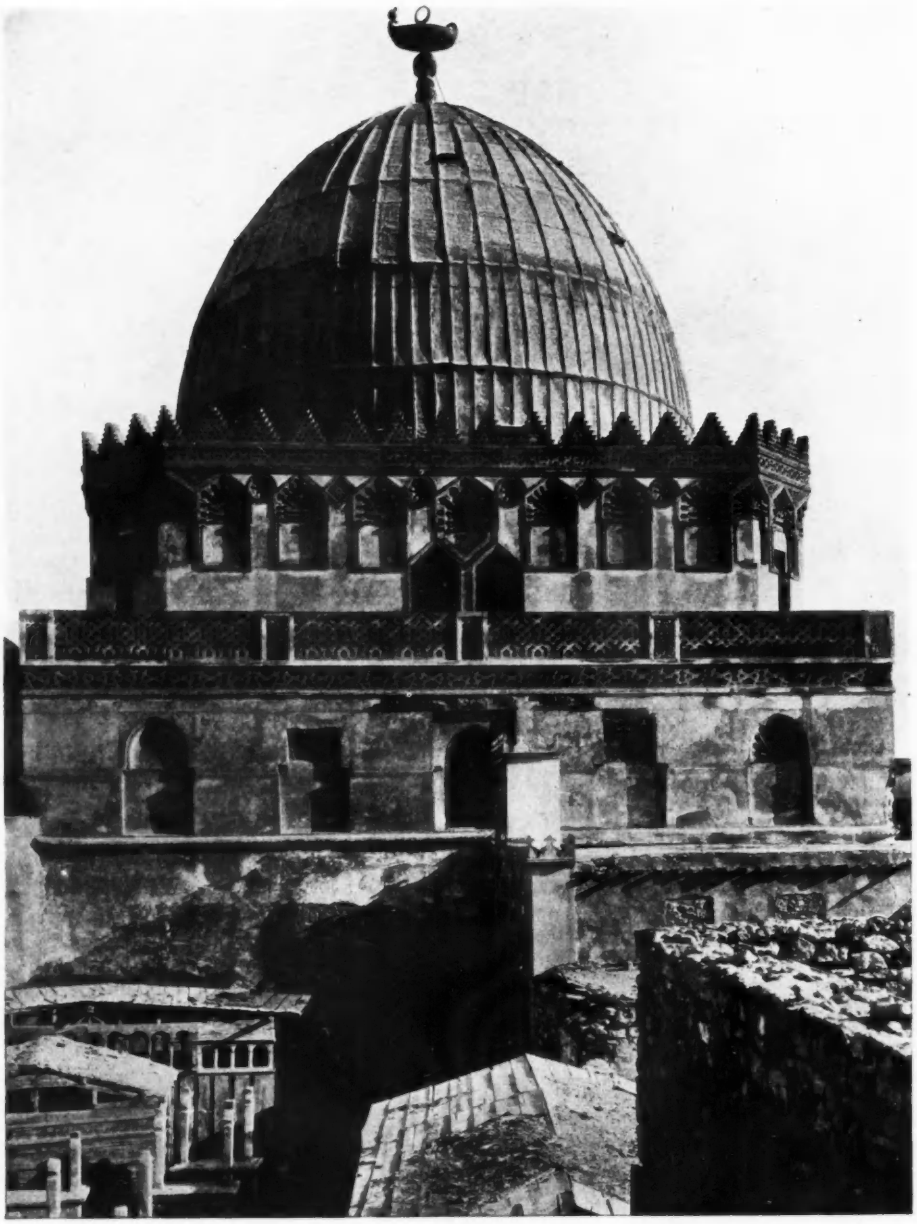
THIS important work, edited by Sir E. Denison Ross, signally fulfils its object of presenting in a convenient form an illustrated survey of Egypt's art from prehistoric to Mohammedan times.

Its 300 photographic plates—many of which are superb examples of reproduction—are prefaced by eighty pages of descriptive text. These comprise nine articles, which have been contributed by some of the foremost authorities of the present day.

The book covers a period of six thousand years of history, and includes an account of the four great civilizations that have flourished on the Nile—the Pharaonic, the Alexandrine, the Christian and the Muslim.

In his introduction, Sir Denison Ross pays a deserved tribute to the work of such archæologists as Sir Flinders Petrie, who have rolled back the pages of history and revealed to us a definite knowledge of Egypt's culture from the remotest times.

Professor T. E. Peet writes on "The Predynastic and Early Dynastic Period"; Dr. A. M. Blackman and Professor Peet are jointly responsible for "The Intermediate Period and Middle Kingdom"; "The Hyksos Period and New Kingdom" are dealt with by Professor P. E. Newberry; "The Reign of Tutankhamen" is most appropriately from the pen of Mr. Howard Carter; Dr. E. A. Gardner contributes "The Saïte, Ptolemaic and Roman Periods"; "The Coptic Period" is the work of Mr. Stephen Gaselee; and "Muslim Architecture" is described by Mr. K. A. C. Creswell. The editor and publishers record with profound regret the death of Sir Thomas Arnold, whose unfinished article on "Muslim Applied Art" has been edited and completed by Mrs. R. L. Devonshire; and of Dr. Hall, the proofs of whose chapter on "The Old Kingdom" have been corrected and the illustrations to it finally selected and arranged by Mr. S. R. K. Glanville,

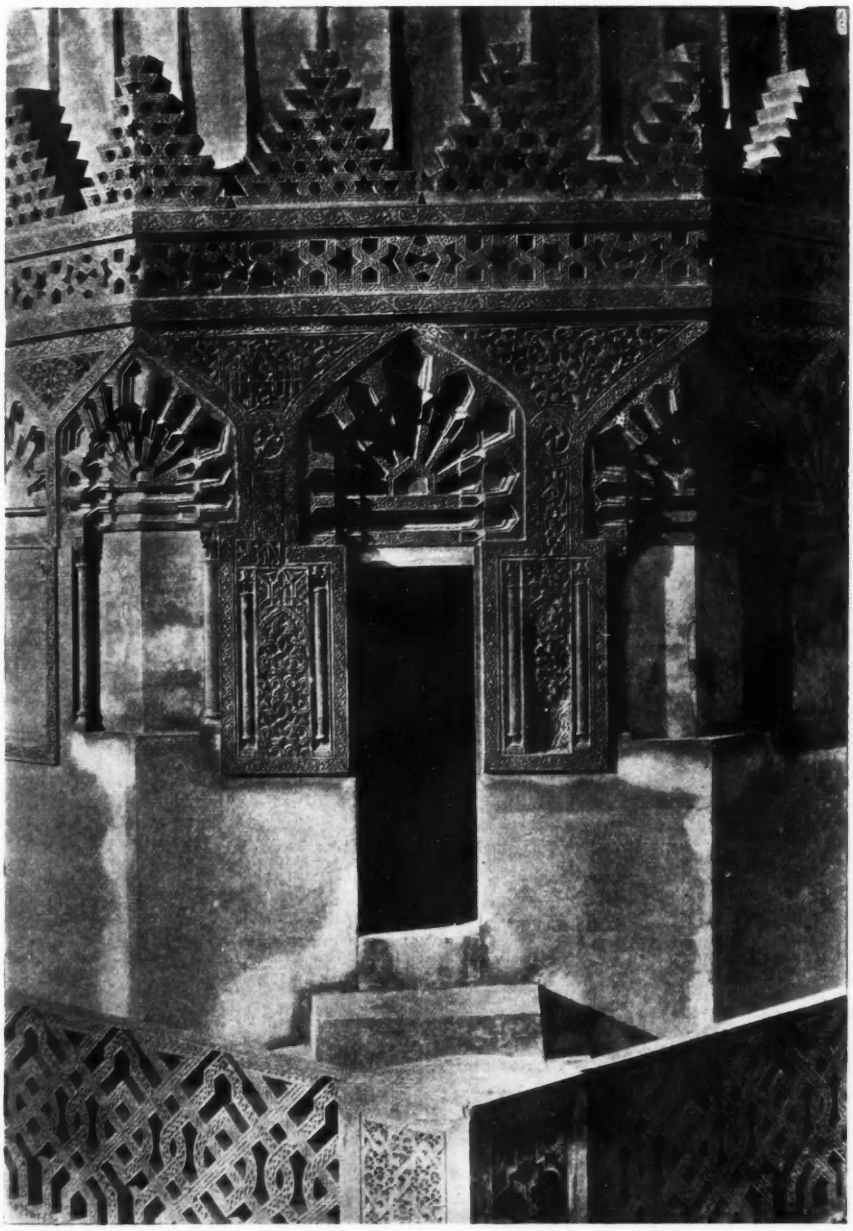


Mausoleum of the Imām Ash-Shāf'ei, built in A.D. 1211. The dome is a single shell of wood, with the ribs outside, the whole being covered with lead. At the summit is a bronze finial in the form of a boat.

[*From* The Art of Egypt through the Ages.]

of the British Museum. It has hitherto not been usual to find in works on Egyptian art anything approaching the adequacy with which Saracenic architecture and decoration are represented in the volume under review. This is a most welcome departure. As Mr. Creswell points out, "There are few visitors to Egypt who can fail to be thrilled by the charm of Islamic art, the splendid façades of the fourteenth and fifteenth centuries, the beautiful forms of its innumerable domes and minarets, and the extraordinary refinement of its ornament."

Particular attention is drawn to the six colour plates which adorn the book. Of these, perhaps the representation of a gilt and enamelled glass mosque lamp of the fourteenth century is the finest. This delicacy of treatment reaches an extraordinarily high level in the bronze-plated wooden doors from a thirteenth-century mosque in Cairo (p. 315), and the brass tray—inlaid with silver—of a century later, represented on page 316. In both instances very beautiful and characteristic Arabic inscriptions form integral parts of the design. The photographic reproduction on page 330 of the plaster frame for a coloured glass window of the early nineteenth century should, in my opinion, have been made the subject of a colour plate showing the iridescent and bejewelled effect of light transmitted through the glass. The plaster framework is an incident of construction and quite subsidiary to the actual window, as are the lead cames in the windows of Notre Dame. Only those who have been privileged to see the sun's rays slanting through a Cairo mosque dome window have any conception of the riot of living colour which is produced, as green, ruby, purple and rose scintillate and glitter like the flashes of a kingfisher's plumage.



Mausoleum of the Imām Ash-Shāf'ei. Detail (telephoto) showing the beautiful stucco ornament on the exterior of the zone of transition between the square mausoleum and the circular base of the dome. See photograph on facing page. [*From* The Art of Egypt through the Ages.]

While the format and appearance of the volume are alike admirable, this publication is likely to become an invaluable work of reference to the Egyptologist and Orientalist, and a really reliable source of information to an even wider public.

The Art of Egypt through the Ages. Edited by Sir E. Denison Ross. London: The Studio, Ltd. Price £2 2s. net.

THE SPECIFICATION WRITER

The Bayonet Connector for Gas Poker Burners

THE discovery and perfecting of an easy and reliable means for connecting flexible tubing to a gas-supply point on the wall, skirting or floor have had a stimulating effect during the last few years on the production of a number of labour-saving portable gas appliances. Among these appliances are the gas poker burner, small gas heaters, table lamps, standard lamps, gas irons, and the like.

As will be seen from figure one, the new bayonet connector for flexible tube connections consists of two parts: the flex socket, which is permanently attached to the wall, skirting board or floor, and is connected up to the gas supply, and the flex plug, which is permanently attached to the flexible tubing.

When it is desired to connect the flexible tubing to the gas supply, the

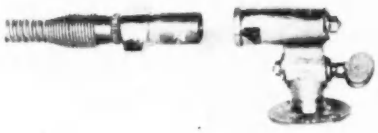

Figure one. The new bayonet connector for portable gas appliances. By a simple push and turn the flexible tube attached to the appliance may be connected up to the gas supply.

flex plug is inserted into the socket and given a turn. The turn not only ensures a gas-tight joint between the socket and the plug, but also allows the gas to flow through the plug and flexible tubing to the attached appliance. The gas flow may be varied by turning the plug backwards or forwards slightly.

The socket of the standard fitting is provided also with the ordinary type of gas tap. This, too, can be used for regulating the flow of gas; in addition, it can be used, at will, for cutting off the gas supply to the appliance when the flex plug is left connected to the flex socket. This type of fitting can be connected to any conveniently placed gas point. It can be fixed with the outlet end pointing in any direction other than an upward one. It must not be made to point upwards, as dust and dirt would collect in the interior. The fitting is quite small—it projects only 2½ ins. above floor level or away from the wall.

An alternative concealed type of fitting has been developed for use in cases where the gas supply can be brought behind the skirting. The wood has to be cut away to allow the connection to be made with a union, and a

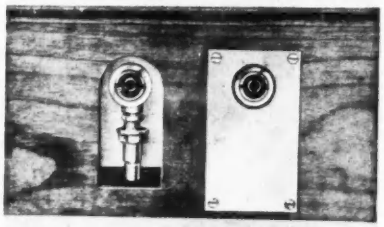

Figure two. An alternative type of flex socket for the bayonet connector. The gas supply is brought up behind the skirting, as shown on the left, and is hidden by a plate, as shown on right.

plate is used to which the fitting is held by screwed washers. This fitting is shown in figure two, and is available in various finishes, such as polished brass and bronze. If there is no tap on the gas supply, and one is considered desirable, it may be inserted immediately before the connectors. A plate having a flap in it for access is available for this purpose.

The internal action of both types of connector is the same. The gas seal is made by a rolling rubber joint ring, the rubber being in compression after insertion of the plug. In the event of the rubber ring becoming defective, its replacement by another can be carried out without taking the fitting to pieces.

One of the great advantages of the bayonet connection is that the gas point can be used as a means of supplying gas for more than one purpose. Take, for example, a room heated by smokeless solid fuel or coal. If a bayonet connector is fixed at the side of the hearth, it can be used for connecting a gas poker burner to light the fire without recourse to sticks and paper. Alternatively, it can be used for connecting a small portable gas-heater to the gas supply, so that during cold periods (when it is not desired to light up the solid-fuel fire) heat may be made instantly available. Any other appliance, such as a gas standard lamp or a gas iron, can be attached to the same point, provided the flexible tube to the appliance is equipped with the necessary flex plug.

Figure three. The new pattern gas poker burner for lighting up solid fuel fires and coke boiler fires without recourse to sticks and paper. The burner is connected up to the gas supply, lighted, and then pushed into the solid fuel.

The new pattern gas poker is shown in figure three. It has a small gas consumption, and will quickly light up solid-fuel fires in grates and coke boilers. With gas at, say, 8d. a therm, six coal fires can be lighted up at a total cost of 1d. for gas. What is more important, however, is the saving of trouble involved in the collection and carting of sticks and paper and in "coaxing" the fire to draw up, and of space required for the storage of fire-lighting materials. Again, however badly a fire may be laid, the gas poker burner will always kindle it. The poker is connected up to the gas supply by means of the bayonet fitting, and is lighted. It is then pushed under the heap of coal or coke, and in from 10 to 20 minutes the fire is well kindled.

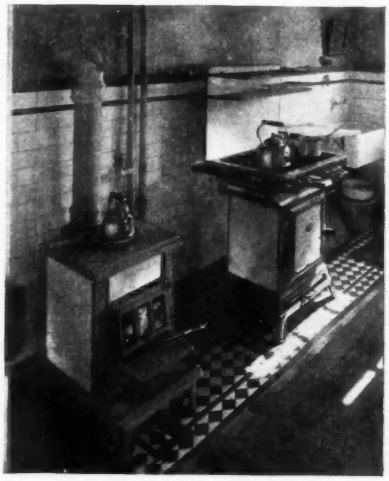

Figure four. An up-to-date labour-saving kitchen, with a modern enamelled coke boiler and gas cooker.

The poker burner has four parts: blade, shield, handle and end cap, any one of which is replaceable. It is made with shield, handle and end cap in aluminium, or with the handle in various colourings. The burner (or blade) has been specially made noisy in action, to prevent its being forgotten and left burning wastefully. It can be transferred easily from room to room for fire-lighting purposes, provided there is a flex socket in each room.

A gas poker burner may be used for lighting up the one solid-fuel fire in a house where every other room has gas fires. After spring-cleaning operations and the usual late spring sweeping of the chimney, it is not generally

considered desirable by the housewife to have the coal fire in action again. On the few days of the early summer and late autumn when a little artificial heat is required, the bayonet connection is used as a means of supplying gas to a small portable gas heater of the "bowl" type, which is placed on the hearth or in any other convenient position where local radiant heat is required.

At Chiltern Court, one of London's new blocks of flats, the five hundred

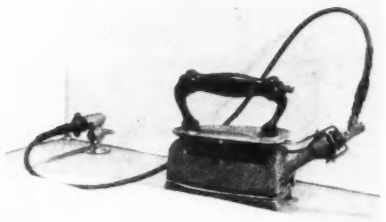

Figure five. The gas iron can be connected up to the gas supply by a push and turn if a bayonet connection is provided at a convenient point in the kitchen. With equal ease it can be disconnected and put away as soon as it is no longer required.

fireplaces are of the low-fire type, with rustless steel edgings and marble hearths and surrounds. They are designed primarily for burning solid fuel, but facilities have been provided for their easy conversion to other means of heating. A gas supply was taken to every hearth during the course of the building operations, and at the side of each fireplace a bayonet connection was fitted. To this point the flexible tube of the gas poker burner (one of which was provided for each flat) can be connected by a simple push and turn. The gas supplies to the fireplaces are of the concealed type, the supply pipes being taken under the hearths to points right under the fires.

The bayonet connection and poker burner can also be installed in kitchens and sculleries where coke boilers are used for heating the domestic supply of hot water. In such cases the poker is lighted and inserted in the fire, a little coke is put on the top of the previous night's ashes, and the fire is kindled in a few minutes. A typical example of such an installation is shown in figure four.

Foundations :—ii Piling

BY B. O. NASH

PILING is resorted to when the loads are heavier than the soil will safely carry without excessive spread. The piles are dependent for their bearing value on the skin friction of the material through which they are sunk, and often on the direct bearing of a lower stratum upon which they rest or into which the shoe is driven. Short piles are sometimes used owing to difficulties of excavation to a good bed through a soft upper stratum. If the upper stratum is fine waterlogged sand, the excavation of this material and the continual pumping of water would be dangerous to the foundations of adjoining buildings and a system of piling would be advisable.

Timber piles are used for temporary work, but they are liable to rot if subjected to alternate wet and dry, and are very little cheaper than reinforced concrete, which has almost entirely superseded timber for this purpose. There is also the difficulty in forming a satisfactory concrete foundation on the heads of timber piles. Again, if a satisfactory set has not been obtained with a concrete pile it can be lengthened and re-driven. This cannot be satisfactorily carried out with a timber pile.

There are two types of concrete pile, the precast and that cast *in situ*.

The Precast Pile

The precast pile is cast in moulds and is reinforced with longitudinal rods with helical or circular binding. The shoe is of chilled cast iron with mild steel straps cast into the concrete. In order that they can be driven as soon after casting as possible, a rapid-hardening cement is generally used, and, with careful maturing with plenty of water for the first forty-eight hours, they should be ready for driving in about fourteen days after casting. They are driven by a monkey varying in weight from 1 to 2½ tons, the head being protected by a steel cap padded with a bag of sawdust and iron filings, and having in addition a timber dolly in order to avoid breaking the head of the pile during driving. This driving is continued until the specified "set" is obtained, i.e. until the pile does not move more than a certain amount per blow of the monkey falling freely through a distance of two or three feet.

The disadvantage of precast piles is the uncertainty as to the actual length of pile required to be cast in order to avoid lengthening and re-driving, or alternatively wasting a portion of the pile if the set is obtained before the pile is driven for its full length. This can be largely overcome by arranging to drive several trial piles prior to the general casting of piles. These are driven at suitable positions on the site, so that they form part of the final scheme, and from the results of the driving the length of the remainder of the piles can be estimated. This works out satisfactorily if the strata are uniform, but it is better to have piles cast varying in length in order that, if it is found during the driving that longer or shorter piles are advisable, the requisite length will be to hand instead of having to wait for a fresh casting. It should be borne in mind that it is cheaper to cut off a few feet of pile head than to lengthen and re-drive a pile which is too short to obtain a satisfactory set. I had a case recently in which, although trial piles were driven, the actual piles used varied in length from twenty feet to sixty feet over a site area of only eighty feet by sixty feet.

In the case of a pile which has been driven for its full length without obtaining the specified set, the layout of adjoining piles if not already driven can be varied and extra piles used to reduce the load on each pile, or the pile can be lengthened and re-driven. This necessitates stripping the head of the pile to expose the reinforcement for a length of about three feet. A lengthening framework of rods similar to the main reinforcement is then securely wired on, generally with steel thimbles to ensure correct butting to the main reinforcement. The lengthening concrete is then cast *in situ*, and after maturing for two or three weeks the lengthened pile is ready for re-driving. When piles are cast *in situ* the waste entailed in cutting off piles which are found to be too long, and in lengthening and re-driving piles which are found to be too short, is avoided.

In Situ Piling

There are many systems of *in situ* piling which have been patented by various firms, but they are mainly divided into two categories.

The first consists of a lining tube which is driven into the ground in a similar manner to a reinforced concrete pile. A shoe is fitted to the bottom of the tube to facilitate driving, and if it is intended to withdraw the lining tube after concreting, the shoe is not fixed, but merely rests in the bottom of the tube. When a satisfactory set has been obtained, the skeleton pile framework of reinforcing rods is lowered into the tube with distance spacers to keep the framework central, and the tube is then filled with concrete. The driving is usually carried out with a steam hammer, and, if it is intended to withdraw the lining tube, this is done by reversing the action of the hammer, which, during withdrawal, gives a light tap downwards to consolidate the concrete and a heavier blow upwards on to a framework attached to the lining by two lugs, and has the effect of lifting the tube slightly out of the ground at each blow.

The second system of *in situ* piling consists of the removal of the material inside the lining tube, which sinks or is worked into the ground as the material is removed. In this case a pile driving-frame is not required and the system is similar to the ordinary boring operation. The soil is removed by a

tube with a cutting edge, which is either jumped down or rotated inside the lining tube or, when excavating through clay, by an auger. As the soil is excavated the lining tube sinks under its own weight or is worked down by hand. When, in the opinion of the engineer, a stratum has been reached which will support the load, the reinforced skeleton framework is inserted, and a mixing of concrete is placed in the tube. An airtight cap is fitted to the top of the lining and pressure of about 100 lb. per sq. in. is applied. This has the double effect of forcing the concrete out of the bottom of the tube, and the pressure acting upwards on the cap raises the lining tube.

Casting of Pile

This operation is repeated until the whole pile has been cast and the lining tube withdrawn. This system does not depend on the skin friction of the pile alone, as in forcing the concrete out of the tube, collars and irregularities are formed according to the resistance of the strata into which the concrete is being forced, thus providing a certain amount of actual bearing. This system has the great advantage that no noise or vibration is entailed and it can be satisfactorily used on many sites where the action of a pile-driver would be inconvenient or dangerous to adjoining buildings. It is also very suitable in congested areas where it is not practicable to erect a pile-driving frame.

Piles cast *in situ* have the great advantage in so far as that they can be of any length dependent on the driving or the materials penetrated. The lining tubes are in six or seven feet lengths, and fresh lengths are added to the top as the tube sinks. There is not therefore the waste so often entailed in the use of precast piles.

For wall foundations the piles would be either in pairs or would be driven at intervals of five to eight feet as required by the load to be carried, and the foundation concrete would be designed as a continuous reinforced concrete beam with a distributed load and having points of support at each pile head.

Minimum for Stanchion Bases

In the case of stanchion bases, a minimum of four piles is advisable, the total number being dependent on the load to be supported and the estimated bearing value of a pile. The piles must be spaced symmetrically with the upper load and should not be closer together than three feet. After the piles are driven, the heads are stripped and a framework of reinforcing rods is securely bound to the reinforcement of the piles, and the whole encased in concrete.

(Concluded.)

LOWEST TENDER PASSED OVER

Councillors Angry at Choice of Architect

SHARP criticism of the recommendation of the Housing Committee of the West Ward Council of the Hackthorpe Council over the appointment of an architect was made at a recent meeting. The following report has been taken from *The Westmorland Gazette* :

The Housing Committee reported that at its first meeting it discussed the question of the appointment of an architect, and resolved that in respect of the Patterdale portion of the scheme Mr. A. Knewstubb, of Penrith, should be authorised to proceed. It was also resolved that Messrs. Dobell and Baldry, with the architect and inspector, should visit the sites at Patterdale and report on means of water supply and sewerage. It was also resolved that an architect for the rest of the houses in the area be advertised for. At a subsequent meeting Mr. Knewstubb reported that the sub-committee had viewed the two proposed sites at Patterdale, and were awaiting further information about a water supply at the Glenridding site. Five applications were received for the post of architect, and it was resolved on the motion of Mr. Turner, seconded by Mr. Baldry, that the committee recommend the appointment of Mr. Knewstubb, on the terms of his application, as architect for the proposed forty houses.

Mr. R. Winster asked to be furnished with the names of the five applicants, and the amounts they required to do the work. He also asked whether the committee had chosen the architect who had tendered to do the work for the least money ?

The Chairman : Pretty nearly.

5s. a House Difference

Mr. Wood : There was only a matter of 5s. a house.

Mr. Winster said they advertised for an architect, and if applicants had all the qualifications necessary, even if there was only 5s. a house difference, it meant £10 on forty houses. He moved that the matter be referred back to the committee. He might only be by himself in the opinion, but if a gentleman like Mr. Shaw, of Kendal, was turned down, even when he was 5s. a house less, as he was told, he would like to know the reason. Why did the committee advertise at all ? Why did it not merely elect the man it wanted ?

Mr. Dobell : Is there any objection to our knowing the names and the amounts of their tenders ? We can go into committee.

The Chairman : I strongly object to the last remark—" the man they wanted."

Mr. Winster : I can only conclude that there must have been some special reasons, if they are equally good men, for re-electing a man who is £10 more.

The Chairman : There are.

Mr. Winster : May this meeting have the information ?

After further exchanges the Chairman was moving the adoption of the report when Mr. Dobell said : Will you have the courtesy to answer my question ?

The Chairman : You are a member of the Committee.

Mr. Dobell : I could not get to the meeting.

The Other Tenders

The Clerk said the following were the applicants : Mr. R. Morden Rigg, Penrith, £13 10s. per house: Mr. J. Hutton, Kendal, £10 10s.: Mr. A. Knewstubb, Penrith, £10 15s.: Mr. M. Shaw, Kendal, £10 10s.: Mr. Morland, Kendal, R.I.B.A. scale.

Mr. Turner seconded the adoption of the report, and said Mr. Knewstubb was worth 5s. a house more. He agreed to carry out certain conditions which the others did not agree to in their applications.

A Member : They were never asked.

Mr. Turner : We decided that Mr. Knewstubb was the most likely to carry them out. For any member of a committee to cast suspicion on the committee is not sport—not cricket.

Mr. Dobell : If you had told us at the beginning that there were conditions there would not have been this bickering.

Mr. Hindson asked why houses at Patterdale were to be £4 5s. each more than those at other places.

The Chairman : Very likely because they are fewer in number.

Mr. Hindson : There would be special plans to draw for each.

The Chairman : Who told you that ?

Mr. Hindson : No doubt there will if they are in different parts.

The Chairman : There may be more paper plans, but that won't be difficult.

Mr. Winster moved that the matter be referred back to the committee. He thought that the Council had no right to throw away £10.

Mr. Winster : These two gentlemen are equally good architects of excellent standing in the county, and it seems to me there must have been some " back " reason why they were not taken.

The report was adopted, only two voting against.

COMPETITIONS OPEN

September 21.—Sending-in day. (Last day for conditions was May 29.) Proposed Public Baths, Police and Fire Stations, Sessions Court, etc., to be erected on a site in Campbell Square and Upper Mounts, Northampton, for the Northampton Corporation. Assessor: Percy Thomas, O.B.E., F.R.I.B.A. Premiums: £500, £400, £300 and £200. Conditions, etc., were obtainable from W. R. Kew, Town Clerk, Guildhall, Northampton. (Deposit £2 2s.)

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions were obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 1.—Sending-in day. (Last day for conditions was June 3.) Pictorial Map of the Area of the West Yorkshire Society of Architects. Premium, 10 guineas. Particulars were obtainable from the Secretary, 62 Woodhouse Lane, Leeds.

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

LAW REPORT

ALLEGED EYESORE

Shaw v. *Brodribb. Chancery Division. Before Lord Justice Romer*

THIS action raised many points of interest to house-owners in country districts. The plaintiff, Mr. G. C. Shaw, of High Beeches, Great Missenden, Bucks., took the view that sheds erected by Mrs. L. F. A. Brodribb, of Early Rivers, Nags Head Lane, Great Missenden, were æsthetically displeasing to him and he sought an injunction restraining her from retaining on her premises four sheds. He said the sheds were detrimental to his property and other property he owned, and further he set up that the defendant had acted contrary to her restrictive covenants, which ruled out any type of building but dwelling and garage, and forbade structures for animals, except at certain specified distances from the back line of the property.

Defendant replied that she had only put on the land a garage and a thatched summer-house and goat houses. These were not in the permitted belt, but she contended that plaintiff had acquiesced in this and said plaintiff himself had grazed sheep.

Evidence was given on behalf of the plaintiff that the structures the defendant had erected were unsuited for the type of property and that they were detrimental to it.

His lordship entered judgment for the plaintiff, without costs, as in his opinion the plaintiff had failed as to every structure but the goat-house. In his view the hen-houses were outside the covenants, but as to the goat-house it must be moved into the permitted belt. In this case plaintiff took the view that all the sheds were æsthetically displeasing to him. But this point had already been before the Courts, and a decided authority made it plain that what would succeed in that type of complaint was not the annoyance or grievance of a sensitive person, but a disturbance which would trouble the mind or pleasure of an ordinary sensible English inhabitant of a house. His lordship had listened carefully to the evidence and the arguments of counsel and he came to the conclusion that the plaintiff's peace of mind had not been affected, though his æsthetic susceptibilities might have been. He was therefore satisfied that plaintiff had not been annoyed within the meaning which the courts had already decided must be given to the words.

THE ARCHITECTS' DIARY

WEDNESDAY, SEPTEMBER 16

R.I.B.A., 9 Conduit Street, W.1. Exhibition of work submitted for the R.I.B.A. (Archibald Dawnay) Scholarships. 10 a.m. to 7 p.m. (Saturdays, 10 a.m. to 2 p.m.) Until September 25. **10 a.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Manchester and District Branch. Visit to the Wardle (Watergrove) Reservoir.

INTERNATIONAL ILLUMINATION CONGRESS. At Cambridge. Until September 19.

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

SHIPPING, ENGINEERING AND MACHINERY EXHIBITION. At Olympia. (Last day.)

FRIDAY, SEPTEMBER 18

NATIONAL SMOKE ABATEMENT SOCIETY. Annual Conference. Liverpool. Until September 20.

SATURDAY, SEPTEMBER 19

Sunrise, 6.39 a.m. Sunset, 7.8 p.m.

MONDAY, SEPTEMBER 21

INTERNATIONAL ILLUMINATION CONGRESS. At the Royal Institution, London. Informal Meeting, 11.30 a.m. Reception of the delegates, 3 to 4.30 p.m. Meeting at the Queen's Hall, Langham Place, W.1. 8 to 10.30 p.m. **11.30 a.m.**

NORTHERN POLYTECHNIC, Holloway, N.7. Commencement of New Session.

TUESDAY, SEPTEMBER 22

INTERNATIONAL ILLUMINATION CONGRESS. Conference of the Institution of Electrical Engineers, at the Kingsway Hall, W.C. 10.30 a.m. Conversaziones at the Royal Institution. 8.30 p.m. **10.30 a.m.**

WEDNESDAY, SEPTEMBER 23

R.I.B.A. STATUTORY EXAMINATION. Latest date for submission of applications for examination for the office of district surveyor. (Fee £3 3s.)

INTERNATIONAL ILLUMINATION CONGRESS. Faraday Exhibition Private View, Albert Hall. 10 a.m. to 4 p.m. British Association Centenary meeting. Delegates' Reception, Albert Hall. 3 p.m. Gen. Smuts (President, British Association) opens the Exhibition, Albert Hall. 4.30 p.m. Presidential Address to the British Association by Gen. Smuts, at the Central Hall, Westminster, S.W.1. 9 p.m. **10 a.m.**

INSTITUTE OF FUEL. At the Chemical Society's Premises, Burlington House, W. "The Reactivity of Coke. A Report to the Blast Furnace Committee, Iron and Steel Industrial Research Council." By J. G. King and J. H. Jones. **6 p.m.**

THURSDAY, SEPTEMBER 24

INTERNATIONAL ILLUMINATION CONGRESS. Garden Party at the National Physical Laboratory, Teddington. 3 to 6 p.m. Soirée at the Royal Society, Burlington House, W. 8.30 p.m. **3 p.m.**

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At Newcastle. "Modern Decoration." By John Gloag and Mrs. Grace Lovat Fraser, F.I.B.D.

FRIDAY, SEPTEMBER 25

INTERNATIONAL ILLUMINATION CONGRESS. At the Dorchester Hotel, Park Lane, W. Dinner given by H.M. Government to representative delegates and guests. Chairman: The Rt. Hon. Ramsay MacDonald, P.C.

SATURDAY, SEPTEMBER 26

Sunrise, 6.50 a.m. Sunset, 6.53 p.m.

MONDAY, SEPTEMBER 28

L.C.C. SCHOOL OF BUILDING, Ferndale Road, Brixton, S.W.4. Commencement of New Session.

TUESDAY, SEPTEMBER 29

R.I.B.A., 9 Conduit Street, W.1. Exhibition of drawings, including the whole of the British Section of the recent exhibition held in Berlin during the Congress of the International Federation of Housing and Town Planning

WEDNESDAY, SEPTEMBER 30

SCOTTISH IDEAL HOME EXHIBITION. At Kelvin Hall, Glasgow.

SATURDAY, OCTOBER 3

Sunrise, 7.2 a.m. Sunset, 6.37 p.m.

MONDAY, OCTOBER 5

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. First General Meeting of the Session.

BARTLETT SCHOOL OF ARCHITECTURE, University College, Gower Street, W.C.1. Commencement of New Session.

TUESDAY, OCTOBER 6

INCORPORATED INSTITUTE OF BRITISH DECORATORS, Painters' Hall, Little Trinity Lane, E.C.4. Council Meeting, followed by "The Great Decorative Artists—Past and Present." By Major A. A. Longden, D.S.O.

SATURDAY, OCTOBER 10

Sunrise, 6.14 a.m. Sunset, 5.22 p.m.

Secretaries of architectural and allied societies are invited to forward particulars of their forthcoming meetings and visits for publication on this page. They should be addressed to the Editor at 9 Queen Anne's Gate, S.W.1.

TRADE NOTES

In the July–August number of *Paint*, a bi-monthly magazine issued by the Walpamur Co., Ltd., of Rathbone Place, W.1., the following short article on "Chalking" is published:

"Chalking is the condition of a paint coating which has become loosely bound and powdery. In the ordinary course of events the normal deterioration of a sound paint film should take place by a very slow process of chalking, as such takes place from the surface downwards, and if unaccompanied by any other defect, the paint retains its preservative value until the process of chalking has passed through the whole thickness of the paint coating.

"Rapid chalking at an early stage is, however, a very different matter, and when this takes place the result is that instead of natural wear and tear we get premature disintegration, which becomes a serious defect. Chalking of this description indicates clearly that either the paint is at fault or is unsuitable to withstand the particular conditions to which it is exposed. When the medium in which the paint is ground and mixed begins to perish, it ceases to bind or fix the pigment particles of the paint, and a powdering of the surface results.

"White lead, particularly if undermatured, is subject to chalk. This tendency is accentuated when the paint is exposed to sea air. The pigment in combination with linseed oil forms lead soap; this chemical union renders the oil—under the action of salt—more easily destroyed as a binding agent. Under such conditions the use of zinc oxide in combination with white lead will minimize the tendency of chalking.

"The first sign of chalking is loss of gloss, and may be readily detected, even in its mild stage, by wetting and gently rubbing, when the colour will work up with the moisture. Paints exposed to severe atmospheric conditions should either be well bound with suitable varnish medium or be high in oil to avoid or minimize the risk of chalking. The use of unsuitable paints, such as flat paints on exterior work, will result in the defect. In preparing a chalky surface for repainting it is necessary to remove all traces of powdery material by washing and rubbing down in order that the maximum adhesion of the new paint may be obtained."

*

Messrs. Parker, Winder and Achurch, Ltd., of Broad Street, Birmingham, have recently placed on the market a new automatic oil check and spring door closer. Built, it is claimed, on entirely new lines, it is known as the Page automatic door closer. It is a little under 9 ins. in depth, only a fraction over 1½ ins. in diameter, and fits very closely on the door stile (wood fixing 1½ ins. by 2¾ ins.), whilst on the door frame there is a very narrow plate connected with the main barrel of the door spring by a resilient arm. The finish is chromium plated. Whilst the door closer is new to this country, it has been tried out abroad, and, it is stated, some 48,000 have been sold in Sweden alone; whilst hundreds are in use in the U.S.A. It is British made, and its principal advantage is, it is claimed, the impossibility of damaging or loosening it by slamming or roughly closing the door, and is also suitable for light, medium and heavy doors (up to 2¼ ins. thickness). It can be supplied right- or left-handed.

Inside the cylinder is a spindle operated by a spiral spring, the tension of which is affected by the revolving of the spindle caused through opening and closing the door. The tension of the spiral spring increases when the door is open, and actuates the door so as to close it. A checking effect is obtained by the oil in the fluid chamber, which works in conjunction with a valve to obtain a cushioning action in order to retard a too sudden motion and to prevent slamming. Should, however, the door be closed with excessive force, tending to shut the door more quickly than the checking means in the apparatus allows, the special resilient arm, marked (a) in the accompanying illustration, is so made that it will yield and prevent any damage or loosening of the working parts.

Adjustment, it is also claimed, is rarely required, as the door closer is sent out already adjusted. If adjustment becomes necessary, however, it is made by means of the hexagon nut (d) and locking screw (b).

A list of the Page door closer may be obtained from Parker, Winder and Achurch, Ltd., at the address given above.

*

Messrs. Birmabright, Ltd., of Dartmouth Road, Smethwick, announce that Mr. David Hamilton, B.SC., A.M.I.C.E., has been appointed the firm's representative for the London area. His address is as follows: Abford House, Wilton Road, Westminster, S.W.1. Telephone number: Victoria 0932.

*

The Anglo-Persian Oil Co., Ltd., have placed a further contract with the Leyland and Birmingham Rubber Co., Ltd., for Leyland rubber tiling. This will make a total of over 22,000 square yards of Leyland rubber floors installed in the premises of the oil company. Other notable contracts for Leyland floors executed during the past twelve months include the *Empress of Britain*, 8,000 square yards; *Winchester Castle*, 4,500 square yards, and *Warwick Castle*, 3,500 square yards.

The Page Automatic Door Closer.

*

In the list of contractors for the King George Hospital, Ilford, printed on page 352 of the last issue of THE ARCHITECTS' JOURNAL, the manufacture of the synchronized clocks was inadvertently attributed to the wrong firm. Messrs. Gent & Co., Ltd., were the firm responsible for these, in addition to the turret clock, while Messrs. Landis and Gyr supplied the staff signalling.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

St. Cecilia's Church, Liverpool (pages 363–366). General contractor, C. J. Doyle. Sub-contractors: E. and C. Smitton, stonework; Best and Lloyd, Ltd., electric light and fittings; Fraleys, marble wall; Stratford-upon-Avon Guild, stained glass windows; Morris-Singer Co., Gesso panel, altar rails, etc.; Jos. F. Ebner, wood-block floors; Bennet Furnishing Co., seating; Ed. Wood & Co., steelwork to roof; Wormells, Ltd., roof tiling.

Sperry's Gyroscope Factory, Great West Road, Brentford (pages 367–368). General contractors, Patman and Fotheringham, Ltd. Sub-contractors: A. Dawnay and Sons, Ltd., constructional steelwork; Henry Hope and Sons, Ltd., windows and roof glazing; John Boulting and Sons, heating and hot water; Electrical Installations, Ltd., electric lighting installation; Adamsez, Ltd., sanitary fittings; Diespeker & Co., Ltd., hollow tile floor and roof construction, and terrazzo flooring; Sankey Sheldon, steel lavatory partitions; Mather and Platt, Ltd., sprinkler installation; Helical Bar and Engineering Co., Ltd., reinforcement to floors; S. W. Francis & Co., Ltd., roller shutters; British Magnesite Flooring Co., Ltd., jointless flooring; Fredk. Sage & Co., Ltd., office screens and balustrading; Penfold Fencing, Ltd., chain link fencing; British Reinforced Concrete, Ltd., reinforcement to roadways and paths; Tondu Brick Co., facing bricks; Synchronome Co., electric clocks.

Chalet, Stockgrove Park, near Leighton Buzzard, Bedfordshire (Supplement). General contractors, J. W. Falkner and Sons. Sub-contractors: Daneshill Brick Co., bricks above waterline; Farman Bros., reed thatching; J. L. Emms, lead finial; Caston & Co., wrought ironwork.

ANNOUNCEMENT

Mr. J. Craven Pritchard, of Venesta, Ltd., Vintry House, Queen Street Place, E.C.4, desires the address of Mr. H. Selby, in order to return his designs submitted for the Building Trades Exhibition Stand Design Competition.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed by the BERMONDSEY B.C. : Showroom, corner of Rotherhithe Street and Raymouth Road, for Messrs. E. and C. Deavin; warehouse, Tower Bridge Road, for Messrs. W. H. Wagstaff and Son, Ltd.

Messrs. Murrell and Pigott are to reconstruct 1, 3 and 5 Jamaica Road, BERMONDSEY.

The BERMONDSEY B.C. has approved plans for the erection, by the works department, of forty-four flats on the Rotherhithe Street clearance area.

The BERMONDSEY B.C. has obtained sanction to borrow £17,190 for the Vauban Street rehousing scheme, which includes the provision of shops and a warehouse.

The DAGENHAM U.D.C. is to erect a branch library.

The Herts Education Committee has acquired a larger site at Leggats Way, WATFORD, for the erection of an elementary school.

The WATFORD Corporation proposes the clearance of several areas and the rehousing of displaced persons on various estates, and the erection of about 130 houses on the Leavesden Green estate.

Plans passed by the WATFORD Corporation : Recreation room, Lower High Street, for National Omnibus Co.; alterations, Victoria Stores, St. Albans Road, and alterations, "King's Head" public-house, High Street, for Messrs. Benskins; machine shop, Cherry-tree Road, for Messrs. Kempster and Williams; new roads on the Leavesden Green estate, for Watford Gardens Estate Co.; house, Cassiobury Drive, for Mr. E. Mushet; additions, Ashby Road, for Board of Guardians; extensions, Baryta Works, Cassio Bridge, for Cassio Photographic Paper Co.; two houses, Orchard Drive, for Mr. E. W. Puddifoot; alterations and additions, Harwoods Road, for the Watford West Conservative Club; house, Tolpits Lane, for Mr. Longman; house, Hampstead Lane, for Mr. T. H. Simmons.

SOUTHERN COUNTIES

The HASTINGS Corporation has obtained sanction to borrow £3,058 for the erection of eight houses in Grove Road.

The PORTSMOUTH Corporation recommends the Park Road depot site for the erection of the new central fire station.

Plans passed by the PORTSMOUTH Corporation : Fourteen houses, Thurbern Road, for Mr. R. J. Winnicott; two houses, Burrowfields Road, for Mr. E. Pulford; four houses, Hawke Street, Portsea, for Mr. A. A. Grubb; alterations and additions, Eastney cinema, Eastney Road, for Mr. H. J. Cook; two shops, Copnor Road, for Messrs. Tanner Bros.; additions, 84 Kingston Road, for Portsmouth Hostel for Boys; six houses, Hawthorn Crescent, for Messrs. G. and W. Mitchell; two houses, St. Simon's Road, for Mr. M. R. Berney; dairy depot and club-room, Heidelberg Avenue, for Mutual Co-operative Society, Ltd.; additions, "Thatched House" public-house, for Messrs. J. J. Young and Son, Ltd.; bank premises, High Street, Cosham, for Messrs. A. E. Porter and Son, on behalf of National Provincial Bank, Ltd.; twenty-one houses, Butts Road, for Messrs. G. McCormick and Son; two houses, St. Chad's Avenue, for Mr. F. Devenish; reconstruction work, 66 King Street, for Free Church Hostel, for Mr. F. J. Privett; five houses, off Tangier Road, for Messrs. W. H. Westbrook, Ltd.; twelve houses, off Tangier Road, for Mr. C. V. Thorpe; additions to Co-operative Hall, St. Mary's Road, for Mutual Co-operative Society, Ltd.; shop and flats, High Street, Cosham, for Mr. G. Smees; eight houses, Algier Road, for Mr. S. J. Todd; eight houses, Carshalton Avenue, for Mr. E. W. Payne.

The ROCHESTER Corporation is to erect ninety-two houses on the Temple Farm estate.

The WORTHING Education Committee is to enlarge the council school at Durrington.

SOUTH-WESTERN COUNTIES

Mr. G. A. Drake is to erect a cinema in Exeter Road, BRAUNTON, Devonshire.

The BRISTOL Corporation is seeking sanction for a loan of £33,500 for new public baths.

The Devon Education Committee is to enlarge the senior council school at HATHERLEIGH.

The PLYMOUTH Watch Committee is to prepare plans for the provision of a public bus station and car park in Glanville Street.

The TAUNTON Corporation is to extend the market house, at a cost of £11,000.

Plans passed by the TORQUAY Corporation : Alterations and additions, Lincombe Hall Hotel, Lower Woodfield Road, for Lincombe Hotel, Ltd.; two houses, Audley Park estate, for Messrs. H. Kershaw & Co.; four houses, Barton Hill Road, for Mr. F. White; printing offices, George Street, for Messrs. Bendle Bros.; six houses, Pine View Gardens, for Mr. H. J. T. Cruse; station master's house, Torquay station, for Great Western Railway; alterations, St. John's Schoolhouse, Braddons Road, for Girls' Friendly Society; seven houses, Warberry Vale estate, for Mr. H. I. Heard.

The TORQUAY Education Committee is to purchase land on the Cary estate for the erection of an elementary school.

The TORQUAY Corporation has passed plans, submitted by Mr. Banbury, for the development of the Shiphay estate, Collaton.

MIDLAND COUNTIES

The BURTON-ON-TRENT Corporation has obtained sanction for the purchase of a site for the erection of an infant welfare centre.

The BURTON-ON-TRENT Corporation has obtained sanction to borrow £13,000 for the erection of thirty-six houses in Woods Lane.

The British Goodrich Rubber Co., Ltd., is to erect a factory in Derby Road, BURTON-ON-TRENT.

The CHESTERFIELD Corporation is to erect twenty-eight houses on the Highfield estate, from plans prepared by Mr. W. A. Derbyshire.

The KESTEVEN (LINCS.) C.C. is to enlarge the council school at Little Batham, from plans prepared by Mr. C. B. Metcalfe, the county architect.

The MARKET HARBOROUGH U.D.C. has approved plans, prepared by Messrs. Coales and Green, for the erection of fifty houses on the by-pass road.

Plans passed by NORTHAMPTON Corporation : Two shops, Birchfield Road, for Messrs. S. G. Sale & Co.; two houses, Ridgeway, for Messrs. A. Glenn and Sons, Ltd.; factory extensions, St. James Street, for Messrs. Wareing, Ltd.; shops, Weedon Road, for Mr. W. Q. Adams.

NORTHERN COUNTIES

The CARLISLE Corporation has failed to obtain State aid for the scheme for the erection of new municipal buildings.

The MANCHESTER Corporation has obtained sanction to borrow £250,000 for further housing advances.

The Ministry of Health is to hold an inquiry into the proposal of the MIDDLESBROUGH Corporation to erect a fire station, at a cost of £34,000.

The PENRITH U.D.C. is to erect 120 houses on the council's new estate.

The RAWTENSTALL Corporation is to erect forty-eight houses on the Lower Carr Farm estate.

The Office of Works is to erect a telephone exchange at Woodseats, SHEFFIELD.

The STOCKTON-ON-TEES Corporation is to erect new municipal offices on the Church Row site, from plans prepared by Messrs. Lanchester and Lodge.

Plans passed by the STRETFORD U.D.C. : Fifteen houses, Low Moss Lane, for Messrs. Freeman, Evans & Co.; alterations, motor works, Market Street, for Mr. F. Lewis; municipal offices, Talbot Road, for U.D.C.; alterations, Ashburton Road, for Lloyds Bank, Ltd.

The WAKEFIELD Corporation has asked the housing architect to prepare plans for dealing with sites on the six clearance areas scheduled for re-development.

The West Riding C.C. has asked the WAKEFIELD Corporation to co-operate in a proposed joint scheme for the provision of an orthopædic hospital.

The WAKEFIELD Education Committee has approved plans for doubling the accommodation at the school centre in Ings Road; and for additional science and art and staff accommodation at Lawefield Lane senior school.

The WAKEFIELD Corporation has asked the housing architect to prepare plans for the erection, by direct labour, of another 200 houses on the Eastmoor estate.

The WAKEFIELD Corporation has asked the Hospitals Joint Committee to expedite the scheme for the provision of a clinic at Clayton Hospital, for early mental cases.

Plans passed by the WAKEFIELD Corporation : Works extensions, Denby Dale Road, for Spencer Wire Co., Ltd.; house, Cheviot Lane, for Mr. W. H. Ogden; alterations, Kirkgate, for Messrs. George Blakey and Son, Ltd.; additions and alterations, Presbytery, Wentworth Terrace, for Messrs. Newbald and Hartley, on behalf of Canon Leteux; house, Eden Avenue, for Mr. J. Redfearn; works extensions for Wakefield Express Services, Ltd., in Southgare, for Messrs. Simpson and Moxon; four houses, Flanshaw Lane, for Mr. J. P. Firth; alterations, Wellington Hotel, Kirkgate, for Beverley Bros.; billiard-room, Southgare, for Mr. L. Waring, on behalf of the West Riding Athletic Club.

The WAKEFIELD Education Committee is to prepare plans for the erection of an elementary school on the Eastmoor estate.

SCOTLAND

The ABERDEEN Education Committee is to erect an elementary school on the Tyrie estate.

The GLASGOW Education Committee is to prepare plans for the erection of a clinic in the Gorbals district.

Mr. Matthew Martin is to erect shops, house and garages in Meadowell Street and Amulree Street, GLASGOW.

Messrs. John Lawrence (Glasgow), Ltd., are to erect twenty-nine bungalows in Great Western Road, Drumchapel, GLASGOW.

The GLASGOW Corporation Streets Committee has sold land in Dumbarton Road, Dalmuir, to the Clyde Valley Electrical Power Co., for the erection of a sub-station.

The GLASGOW Education Committee has obtained sanction for a loan of £82,500 for the extension of the High School of Glasgow.

WALES

The CARDIFF Corporation is proceeding with the erection, at Llandough, of a large hospital which will eventually provide approximately 1,000 beds. For the present only part of the scheme is being undertaken, provision being made for 340 beds.

MISCELLANEOUS

Plans passed by the DOUGLAS (I.O.M.) Corporation : Alterations, 66–7 Strand Street, for Mr. E. A. Deane; twelve houses, Kensington Road, for Messrs. Creer Bros.

The NEWPORT (I.O.W.) Corporation has purchased five acres of land at Whippingham, for a housing scheme.

Plans passed by the NEWPORT (I.O.W.) Corporation : Saw mills, for Messrs. H. W. Morey and Sons, Ltd.; additions, premises in Avondale Road, for Mr. F. Chiverton.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

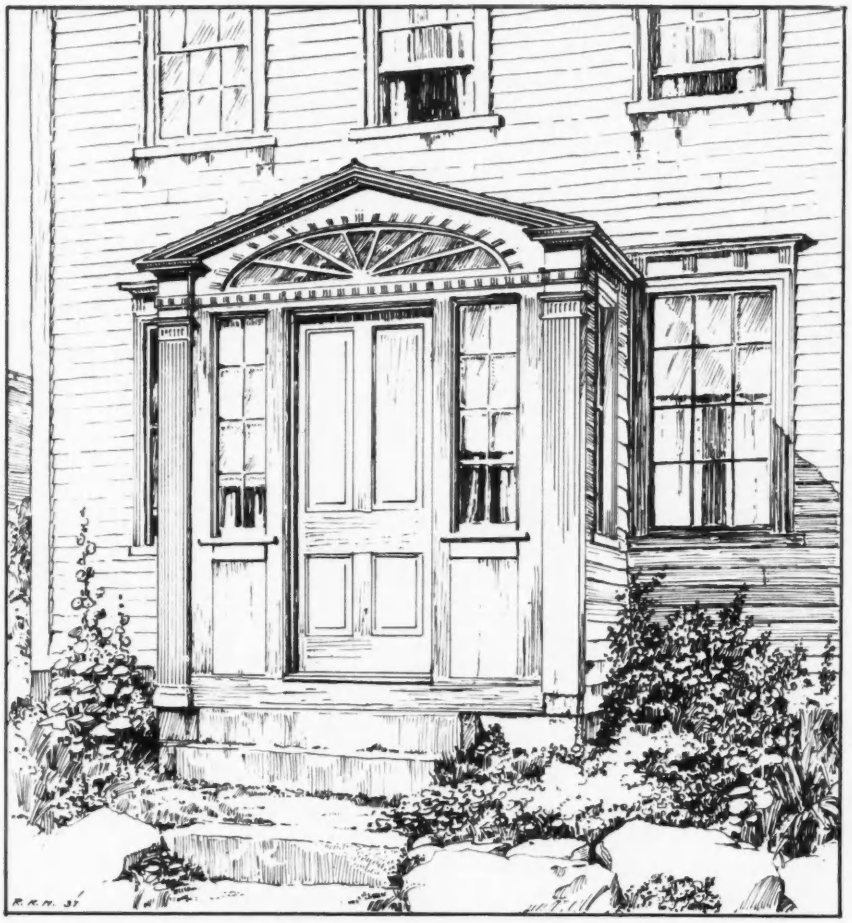
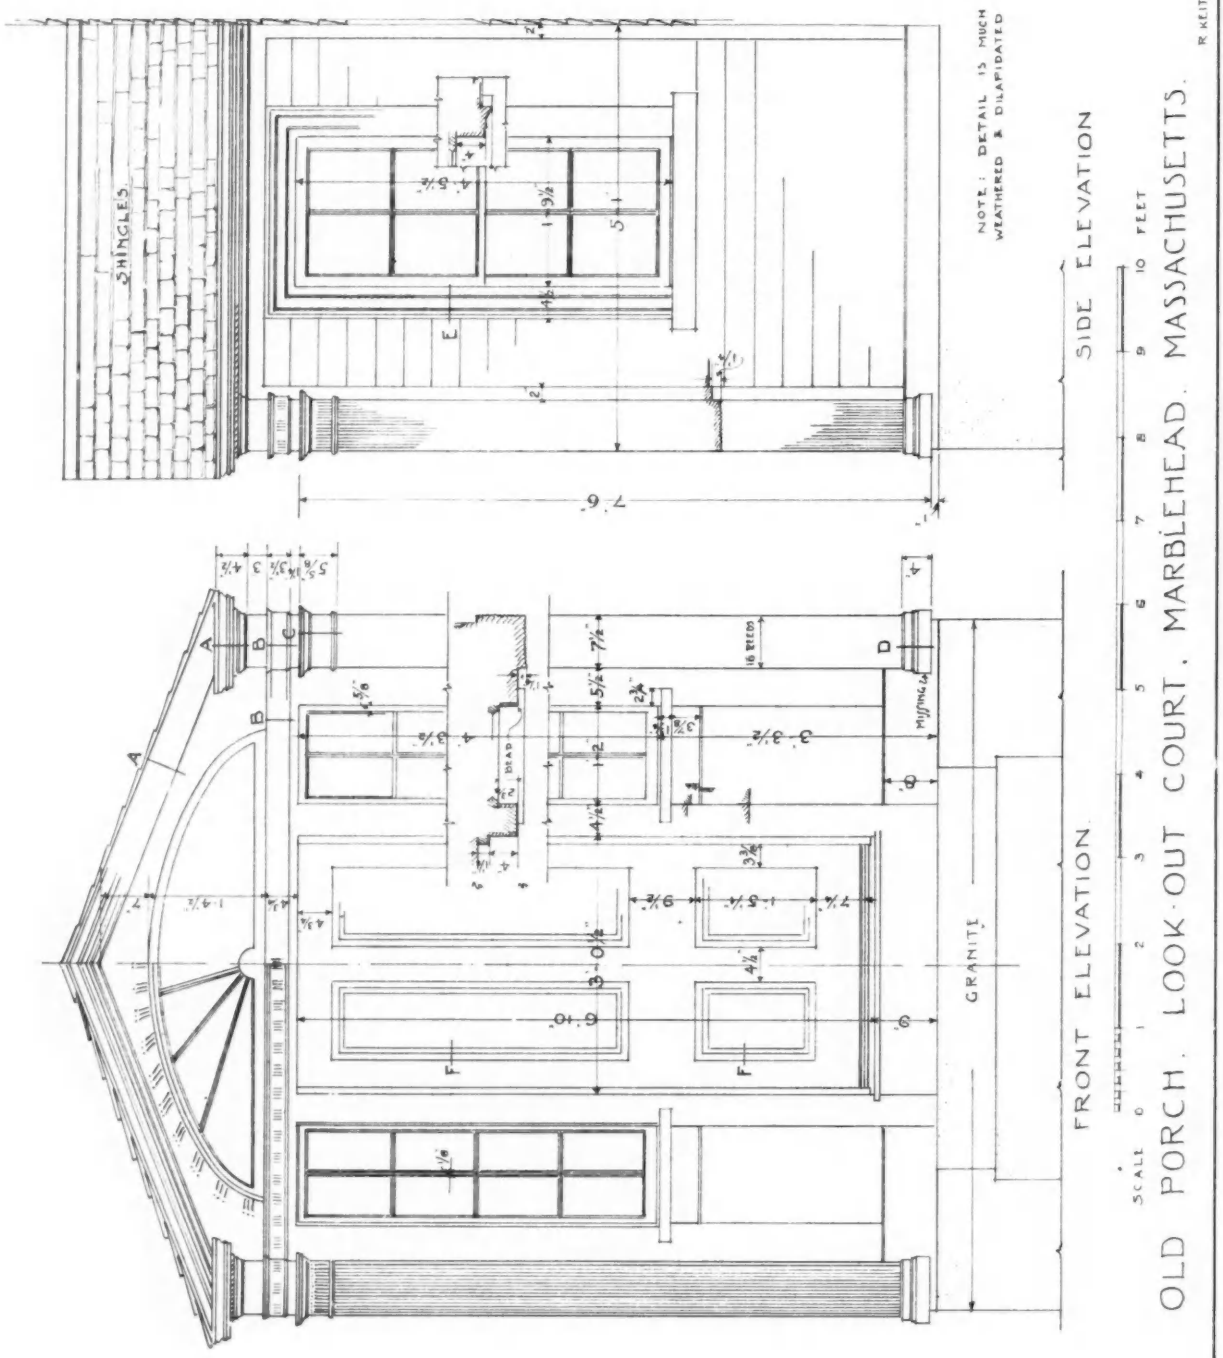
MEASURED DRAWINGS OF AMERICAN COLONIAL DETAILS



OLD PORCH, LOOK-OUT COURT, MARBLEHEAD, MASSACHUSETTS

THIS old porch is an interesting example of the use of thin casing, built up or planted on. The pilasters are formed of grooved boarding. In addition to the pleasing proportions as a whole, the delicate mouldings and "rope" enrichment are worthy of notice. Its most useful lesson lies, perhaps, in demonstrating what can be done with "stock" material, at a nominal cost.

The details on the following pages, which have been measured and drawn by R. Keith Harris, are reproduced to scales of $\frac{1}{2}$ in. = 1 ft. and two-thirds full size respectively.



OLD PORCH, LOOK-OUT COURT, MARBLEHEAD, MASSACHUSETTS.

THATCHED CHALET BY A LAKE

ERECTED IN STOCKGROVE PARK, NEAR LEIGHTON BUZZARD, BEDFORDSHIRE

[*W. Curtis Green, A.R.A., and Partners, Architects.*

A SIDE VIEW. ON THE LEFT IS A DRAWBRIDGE: ON THE RIGHT THE LANDING STEPS

AS will be seen from the drawings overleaf, drawn to scales of 16 ft. = 1 in., ¼ in. = 1 ft., and one-quarter full size, the chalet provides a parlour and two dressing boxes, beneath which is a space, measuring about 6 ft. at its highest point above water level, for the storage of boats. The lake is some 2½ acres in extent and has been formed in the park of a large house, recently completed. Where the chalet is situated, the ground slopes steeply to the water side. Communication from the shore is effected by a drawbridge, and on the front of the chalet, facing the lake, is a pair of steps, of Portland stone, leading down to the water.

The chalet stands, below water level, on a foundation of engineering bricks, rendered in waterproof cement, and laid upon a reinforced concrete raft. Facing bricks have been used for the base, above water level, the upper portion of the walls being constructed of 4 in. by 4 in. wood framing and 5-ply panels. The roof is thatched and is surmounted by a cast-lead finial.

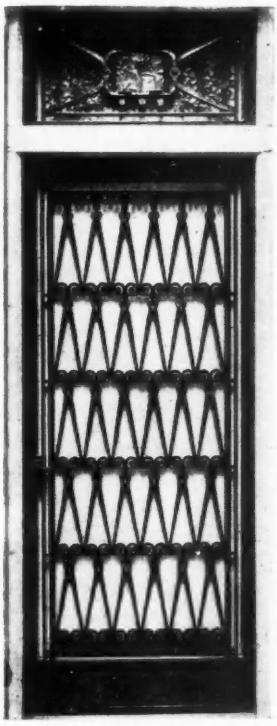
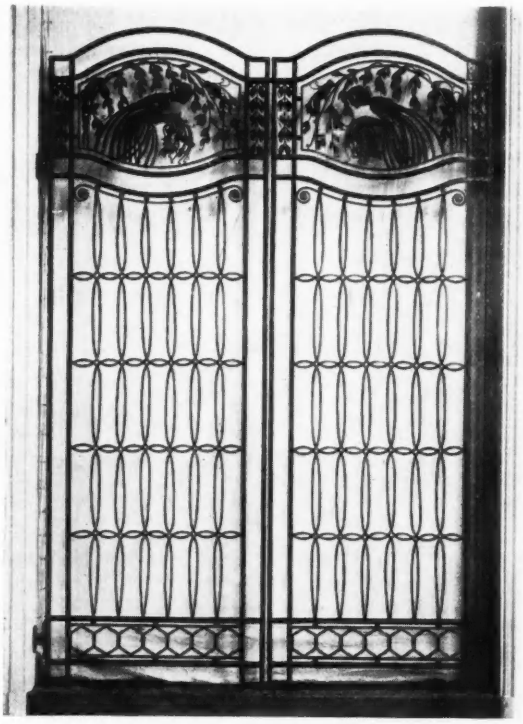
SELECTED PRECEDENTS:

THE MODERN WROUGHT-IRON DOOR ABROAD



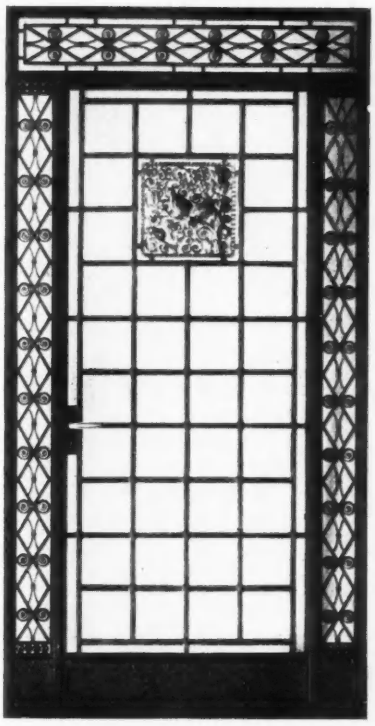
[Designed and executed by Charles Piguet.

1. STREET DOOR GRILLE, PIGUET'S SHOWROOMS.



[Designed and executed by Charles Piguet.

2. DOUBLE-OPENING LIFT ENTRANCE TO A LARGE BLOCK OF FLATS.



[Designed and executed by Charles Piguet.

3. DOOR WITH BACKING OF GLASS FOR A SUITE OF OFFICES.

MODERN wrought-iron front doors are comparatively rare in England, except in the case of public buildings like town halls. Although plenty of examples of the French type of glass-backed entrance grille can be found in Mayfair houses, and blocks of expensive flats of the kind which ape the mannerisms of French appartements de luxe (such as those in and about Portland Place), they nearly always seem to evince a rather exotic air. Wren remarked that even the Italians admitted the French were supreme in wrought-iron work: a dictum which is just as true today. "Wrought-iron," Jean Lamour, King Stanislas's master-smith, who wrought the magnificent gates of Nancy, used to teach his apprentices, "is dowered with majesty, delicate fancy, and charming surprises. It can assume all plastic forms, displaying at need both the energy of sculpture and the boldness of architecture. Everything that issues from the forge should have the solidity of a monument."

Among the acknowledged maîtres-ferronniers of contemporary France—men like Desvallières, Poillerat, Bergue, Brandt, Schenck, Szabo, Szetlak and Subès—none is more representative of the great French tradition in this medium than Charles Piguet.

Figure 1 shows the street door of M. Charles Piguet's showrooms and workshops in the Rue Creuzot, in Lyons. Here the design is based on repetitions of the smith's pincers (his most important tool after the hammer); while the fanlight medallion is enclosed within two pairs of wide-open pliers. Figures 2 and 3 are typical examples of Piguet's delicate design and workmanship. The former, a lift entrance, is particularly elegant; but the motif of the stooping girl, gathering a nosegay under a hanging bough, though charmingly graceful, is perhaps too feminine and sentimental a fantasy to be quite appropriate in a medium synonymous with strength. The latter combines a severely plain cross-bar pattern with a surround of scroll and lozenge design. The central plaque is a richly ornate and decidedly intricate composition of birds and flowers, rather reminiscent of the work of Edgar Brandt.

Figures 4 and 5 are Bavarian ecclesiastical examples of a Neo-Primitive type, designed by Professor O. O. Kurz for two new churches in Munich. The first is really a sort of rood screen in which a galaxy of Christian symbols in ribboned iron—the Alpha and Omega, sun, moon, and stars, and profiles of hovering angels and the Baptism in Jordan—serves as a background for the symbolical knocker of a small crucifix cast in bronze. The second, a double-winged chapel door, is simply a light framework on which texts and prayers, spelt out in bold wrought-iron lettering, and an attenuated Maltese cross above, constitute the only decorative features.

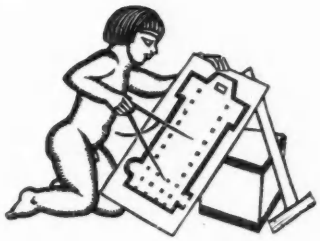
THE ARCHITECTS' JOURNAL



WEDNESDAY, SEPTEMBER 23, 1931

THE STONE OF CONTENTION

ANY principle which has once been generally accepted is in danger of being forgotten, and has constantly to be defended by new arguments. For instance, no sooner was the use of local materials in rural building a widely agreed axiom, than it was suffered to lapse, and needs now reaffirmation of the kind made last month at Chipping Campden.

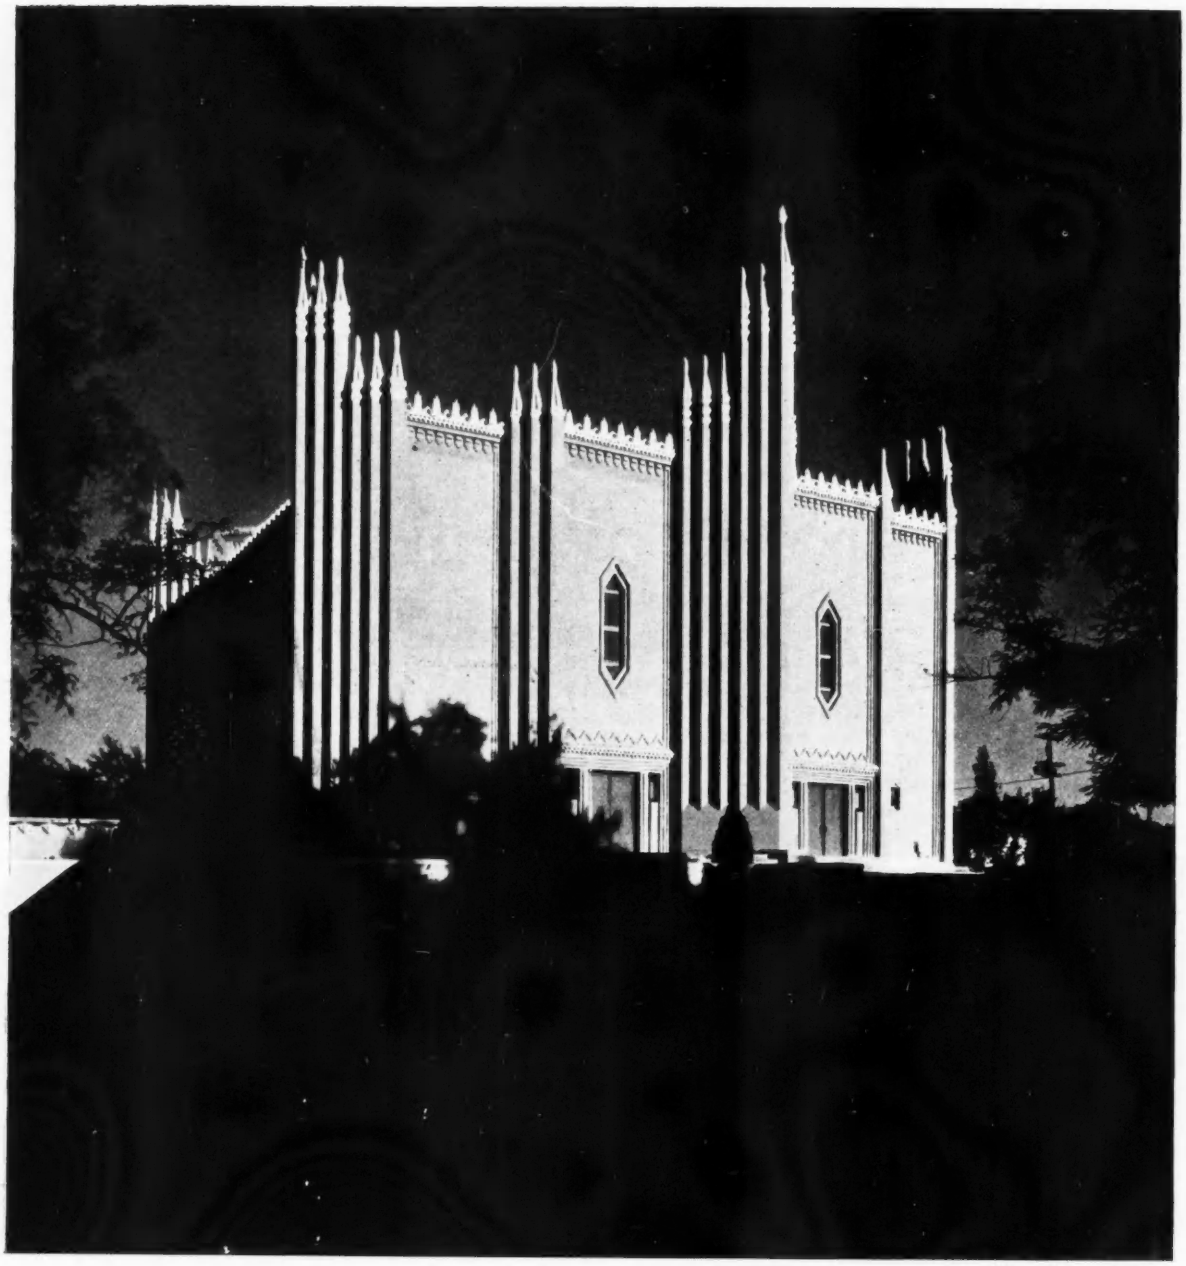
It is said, with considerable truth, that there is no longer any rural architecture, because means of transport and ribbon development have made the whole of England one vast city; and that therefore the use of local materials is a sham and delusion. For practical purposes, Sussex and Wales are one. The inhabitants of Lewes like the same things and have the same needs as the dwellers in Brecon. The difference in the cost of concrete today is negligible.

We have been told also that thatched cob cottages and Cotswold stone walls and roofs are just things that arrived from the use of materials which were the best of their time, and that if we would build as our fathers did we must look at things in the same way as they did, namely, that the cheapest efficient material was proper to be used. Living now, they would have built with bricks at Chipping Campden and roofed with slates at Old Basing. That this view of our ancestors is correct may be doubted, for they dearly liked a pattern; but even allowing it true, it does not contain the whole truth for us. It does not outline the whole of our problem. Our ancestors were modelling in the rough, but they left us pictures and patterns which are so satisfying that we cannot disregard them and start with a clear sheet. The intrinsic and original beauty of their farms, villages and cottage groups is so modest that it can be made all too easily to look pathetic and faded by an alien technique of building; just as a print dress and sunbonnet will look washed out beside the florid pyjamas of a Lido lady, and the quilted smock will seem grey by the stiff contrasts of men's evening dress.

There is a note in English rural scenery which belongs to no other. Italy and Spain and even France give us to understand that Nature keeps her savageness beneath her beauty, and is after all an untamed beast, subjecting man's dwellings to flood, earthquake and storm, and to reactions in defiance of and in contrast to Nature's moods. In England the land and the buildings have been, to a marked extent, modelled by the same hands, and have achieved ripeness together. The squires and dames and labourers of the sixteenth to the early-nineteenth centuries made English rural culture. They planned and planted great parks with avenues of trees, lakes and copses; they cleared wastes and brakes, and enclosed and divided common lands with hedges and rows of trees. They preserved the winding roads and the field paths. They sheltered their buildings from wind and sun by bastions of trees. To them was largely due, especially in the eighteenth century, the supersession of colour-washed walls and thatched roofs, materials needing periodical renewal and freshening with permanent materials—stone, brick and tile, which have only recently come to their full fruition and ripest beauty. Although this note of ripeness and of a perpetual autumn has suffered diminution from the increase of pasture over arable, so that the cornlands of Wiltshire and Berkshire have it more than the meadow country of Gloucestershire and Warwickshire, for instance, the appearance still broadly exists.

Our forefathers, who may perhaps have built entirely as a modernist works, for efficiency, had not this mellowness to consider, for it had not then arrived. It has come as an addition to our programme, and we can no more insensitively disregard it than we can disregard the presence of some Old Master in adding pictures to a wall. The times in which we live and the new materials which are the product of today must influence our work in such a way that tradition is developed, not broken.

We have been willing to pay for extra height of rooms and larger windows; it ill becomes us to be miserly in payment for the local material and ways of workmanship which alone will ensure the future of rural architecture being as lovely as its past.



[*Barry Byrne, Architect.*

A MODERN AMERICAN ESSAY IN ENGLISH PERPENDICULAR

The design of the Roman Catholic Church of Christ King, in the Parish of the Sacred Heart, Tulsa, Oklahoma, U.S.A., recalls the appearance of some of the chapels built in Ireland in the early nineteenth century. The main material is brick, and the dressings and crestings are in terra-cotta, designed in collaboration with the sculptor, Alfonso Iannelli.

NEWS & TOPICS

Lt.-Colonel G. Val Myer, F.R.I.B.A., the architect for Broadcasting House, Portland Place, W.1, which is illustrated and described on pages 395–400 of this issue.

THE ECONOMY EQUATION

THE Government's economy instructions are being given far-reaching effect in every part of the country. Work, much of it planned as part of the wise economy of urban development, has been thrown over, as surplus cargo is thrown from a sinking ship. Especially is this true of school building. Cutting down the building grant from 50 per cent. to 20 per cent. means in effect that the Government is no longer concerned to realize the importance of education in the districts in which it has increased population through subsidized housing.

*

Economy proposes a new equation in which spending on new works is to be reduced to the point where it will cause new indirect burdens, through the medium of added unemployment, out-door relief and heavier local rates. The sooner this equation is resolved the better. At the moment there is panic among local authorities, who have all been reading their ultimatums from the Government. A little later, perhaps, expenditure will be reviewed in a clearer light, and a nearer estimate taken of the extent to which well-laid plans of needed development are to be set aside.

ART, INDUSTRY AND EXHIBITIONS

The habit of tackling a problem without plan lies heavy upon the English. Planning in its larger civic aspects has been abandoned for over a century; and when faced with some defect or abuse in the industrial or social scheme, the need for "something to be done" is so strong upon us that haste, rather than thought, controls the action that fulfils the need. In the correspondence that has followed Mr. Carrington's letter about the work of the Board of Trade Committee, the idea of an exhibition of the products of industrial design has, with one or two exceptions, been the main theme of those contributing to the discussion. The fact that there is a discouraging shortage of anything fit to exhibit has been dismissed.

*

The fact that manufacturers in this country are unaware of the economic significance of good design has been entirely subordinated to a Utopian discussion about exhibitions; and already we are provided with exhibitions that disclose our woeful ineptitude in the design of everyday articles. And in the near future, when tariff walls may be giving our manufacturers a greater sense of security, it will be harder than ever to carry out the work of educating industry, first as to what is meant by good design, and secondly to an understanding of its money value in the world market. Until this work of education is begun, an exhibition is a piece of dangerous futility. Until this work of education is planned, it cannot begin. And until we disperse the muddled atmosphere engendered by this talk of exhibitions, the need for a plan for improving industrial design will not be apparent to industrialists, nor to their self-and-government-appointed advisers.

CERAMIC MATERIALS

The very young building materials section of the Ceramic Society held a conference last week at Leicester, during which the remarkable advances, especially with regard to technical and artistic matters, were the subject of congratulation. It is very true that terra-cotta and faience has much improved within recent years, and will continue to improve in measure as it ceases to imitate stone forms, and assumes character of its own, using colour and pattern. And here some definite part of its progress lies with architects; modern architecture alone can carry forward these materials to new, logical and greatly extended uses.

HOUSING BY PRIVATE ENTERPRISE

The National Federation of House Builders are right to point to the need for housing the lower-paid working classes, as they do in a manifesto which they have sent to Members of Parliament, though it has never seemed to me that private enterprise has itself taken up this unprofitable task. I would like to be clear in my mind as to what class of building is represented by the figures showing houses completed by local authorities on the one hand and by private enterprise on the other, and what proportion of the latter are available at rents which the lower-paid workman can afford.

*

Nobody wants to go on paying a subsidy if it can be abundantly proved that the class which the subsidy is designed to help can be provided with accommodation without its help; but I, for one, have no knowledge that such is the case, unless it be taken for granted that this working class will be housed at lower standards than have so far obtained.

*

A great deal still seems to hinge upon the cost of building and the possibilities of still further reducing the cost of the small house, without sensible diminution of its accommodation. It has been pointed out by several writers to the Press, and it is evident, indeed, from one's knowledge of recent Trade Union negotiations, that wages are as low as they are likely to be in the future. Further reductions in the cost of small houses can come therefore either from a reduction in size, which is hardly possible; a closer density, or the building of longer connected blocks of houses, which has not been sufficiently explored; better management; or the substitution of cheaper and more easily handled materials for those now nearly universally employed. It might seem, after so many years of housing experience, that all these avenues had been thoroughly explored, but I am not so certain that a reorientation of our attitude to open "garden-city" development would not lead to further economies without loss of those very tangible benefits which this method has produced.

L.C.C. HOUSING

Interesting statistics have just come to hand showing that the number of tenants in London County Council houses now amounts to the formidable total of 213,000. The extent of the financial burden undertaken by the

ratepayers of London on behalf of better housing is indicated by the fact that, for the year ending March, 1930, there was a deficiency of £674,000, this figure of loss representing the difference between the rents actually received from the tenants and the economic rents which would be required to repay the interest on the money spent on the houses. A considerable item of expenditure is the work involved in the management of the new estates, entailing, in addition to the normal work of management, such as collection of rents and the execution of repairs, the handling of a great number of applications for tenancies, investigation of the circumstances of the applicants, the rationing of accommodation according to the applicants' needs. The L.C.C. is attempting to cut down to a minimum the cost of the bureaucratic staff necessary to administer the housing estates.

A CURIOUS FAÇADE

There is a curious façade in Leinster Gardens, Kensington. Not actually curious to look at, as was that stucco house in Oakley Street, Chelsea, which René Sphears, I think it was, covered with a hundred best examples of Italian detail, all in plaster, but for other reasons curious. It presents very much the appearance of its neighbours, has windows and doors, steps and porticos. Yet nobody goes in, nobody comes out. Tradesmen have called in vain, and a burglar one very dark night broke a jemmy on its unresisting door. It is, in fact, a sham façade.

★

Years ago, when the Metropolitan Railway cut through the square, in the way railways do, they left a culvert between the houses that was so unsightly, and looked so like a broken tooth in an otherwise perfect set, that the railway directors had to make some redress to stem the torrent of abuse with which the irate square dwellers overwhelmed them. They filled the gap with its appropriate scenery stuck on to a great wall, and retired to their holes in the ground. No. 23 Leinster Gardens is the best decoy address in London.

THE RETURN OF EROS

From time to time I hear rumours of the return of Eros to his former position in Piccadilly Circus, but surely we may now expect to have some definite information as to the date when this much-desired home-coming may be effected. If this enforced absence goes on much longer, there will arise a generation which knows not Eros, and this will, indeed, be a pity. For although the statue can now be seen in the Victoria Gardens on the Embankment, and we can make closer inspection of it there than would be possible at Piccadilly Circus, the fact remains that few people now look at it, whereas if it were restored to its old position of civic eminence it would once more become familiar to thousands. I have heard it said, of course, that Eros could only be seen to best advantage when set against the background of Nash's Quadrant, and while I agree that the scale of the latter accorded with the fountain better than do the more ponderous stone edifices now occupying the west side of Piccadilly Circus, that is not a reason for banishing from this unique site a statue which, in the opinion of many, is the most beautiful in all London.

★

A favourite view of Eros in the old days was one in which the form of this masculine divinity was seen silhouetted against the sky at a point midway between the converging curves of the cornices of the Quadrant, and while these latter are higher today than formerly, a not dissimilar picture would still be possible if Eros were restored to his original position. It may be hoped that the elaborate bronze base of the fountain, which provided exactly the right architectural preparation for it, will not be scrapped, nor in its place be erected some far too simple and undecorative pedestal of stone. I notice that this bronze base is not now to be seen in Victoria Gardens, but I hope, nevertheless, that it is in safe keeping for future use. There is another reason why we should all wish to hasten the return of Eros, because in that eventuality it may be assumed that the classic elegance of the statue will be a challenge to the unspeakable vulgarity of the east side of the Circus, and so hasten to banish from our sight the simian antics of the electric signs which now, to such a great extent, determine the spiritual atmosphere of the place.

PETERBOROUGH'S NEW TOWN HALL

The Peterborough Town Council, now that their new Town Hall is nearing completion, are staggered by its size, the rooms appearing so numerous and so vast that they, the councillors, cannot forbear to wonder at the magnificence of the programme they set before the competitors. Those who know the city may share the amazement of its rulers, mixing with amazement some little amusement at the grandiose attempts to balance the expense of an over-large town hall by building it above a string of shops. I like the idea of a deputation calling upon Messrs. Marks and Spencer for their support. Nothing wrong in it, of course, so long as you don't pretend that your town hall is something that it is not, or greater than it ought to be.

WHITE AND COLOUR WASHES

Why are people so frightened of using white and colour washes ? The land is sprinkled with the most abominable trash pretending to figure as domestic building. The materials, as many have not hesitated to remark, are both cheap and nasty, and the construction barely withstands the rigours of our variable climate. Decked out with white and other charming colours, renewable at will and with the least expense, these blemishes, which cause so much annoyance to all who set store by our inheritance of worthy building, would be given decent covering. Even converted railway carriages and old tram-cars, when washed with colour, become nearly charming, and their inhabitants, as the owners of whited sepulchres, would no longer suffer the execrations and sneers of their betters. It should be remembered that white, even though as whitewash it be humble, is the colour of aristocracy, of kings and presidents. In the East it is held in great esteem. " May thy face be whitewashed and thy head touch the sky," said Mirza Firoiez to Hajji Baba, prognosticating great fortune and social elevation. It should be good form to whitewash. Let us make it good form.

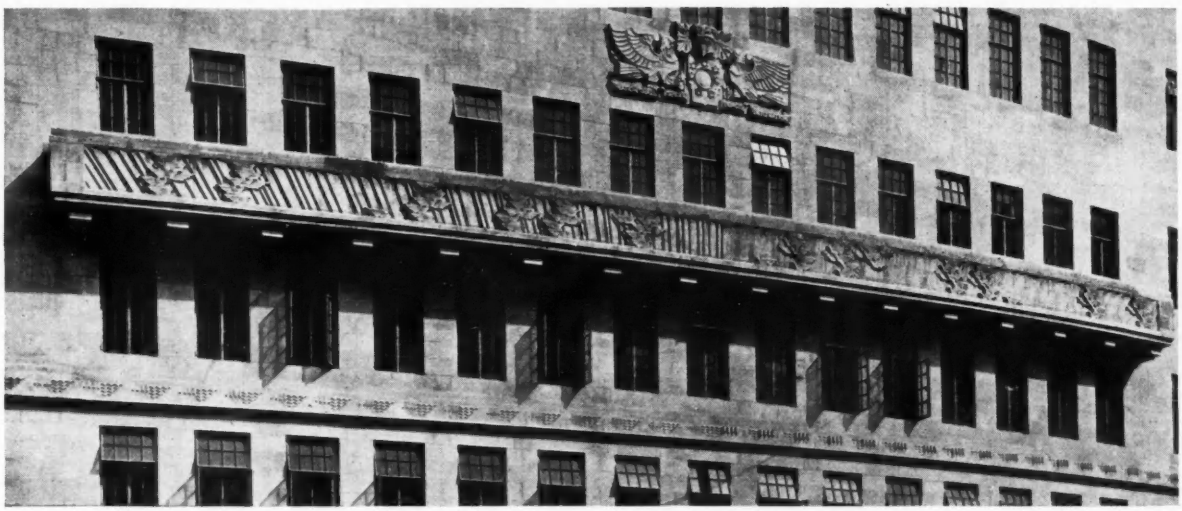
AN ARCHITECT IN RUSSIA

It was necessary that Mr. Clough Williams-Ellis should go himself to Russia before architects should be given an understandable picture of the five-year architectural plan. His series of articles, " An Architect in Russia," now appearing in *The Manchester Guardian*, are clearly the account by a sensible man of what is actually being done there—not only the big idea of the thing, about which there is no lack of news, but the detailed matters of craft by which we are used to judge the character of work.

ASTRAGAL

BROADCASTING HOUSE, PORTLAND PLACE, W.

DESIGNED BY G. VAL MYER



At fourth-floor level on the Portland Place façade are carved the B.B.C.'s coat-of-arms and the motto, "Nation shall speak unto Nation." Along the balcony the carving shows the "Birds of the Air" against a background of the "Rays of the Setting Sun." On the floor below is a running ornament of the "Waves of the Sea."

BROADCASTING HOUSE, from the planning and constructional point of view alone, is surely one of the most singular buildings ever erected in this country, if not in the world. It has been designed for a dual purpose, namely, to serve as a broadcasting station and to house the administrative staff of the B.B.C. The big problem encountered in a building of this exceptional character was to devise means to eliminate the possibility of extraneous noises penetrating from the street and of sound being transmitted from studio to studio.

This extraordinary riddle has been solved by an ingenious plan and special methods of construction. The building, in fact, is designed as *two* buildings, one within the other, and at first blush seems to bear close resemblance in the principles of its construction to a thermos flask.

The inner building, or core, reaches from the sub-basement to the roof, and forms a tower, in which all the studios, with their accompanying lounges and waiting rooms, are accommodated.

The main feature is the large concert hall, three stories in height, with separate entrances and exits from Portland Place and Langham Street. This hall will hold about a thousand people, and is provided with a waiting room for the artists and a large lounge for the public. Altogether, there will be twenty studios, ranging in size from the small "News" or "Talks" studio to the large concert hall. On the eighth, the top floor, is a large central room, equipped with the most modern apparatus, and effective for the entire range of studios.

The studio tower is surrounded completely by a corridor, which may be likened unto a "moat," serving all the administrative and executive offices in the outer ring or outside of the building. In addition to this lateral insulation of the tower, elaborate precautions were taken to ensure inter-studio silence, including the provision of "buffer" sections or states between one floor of studios and another. The walls of the tower are built in solid brick without stanchions as a further precaution against noise, and those of the outer ring are of steel-frame construction, faced with Portland stone. It was desired to make as much use of the site as possible. The building, therefore, sinks to a depth of three floors below ground level, and the elevation rises to the maximum permissible height.

In the foundation work special problems were encountered. First, complications arose by the presence of a hundred-year-old brick sewer which runs obliquely across the south-west corner of the site for about 160 ft. This had been laid in the chalk below the strata of the London blue clay and sand, and is still in use; its main function being that of taking the surface-

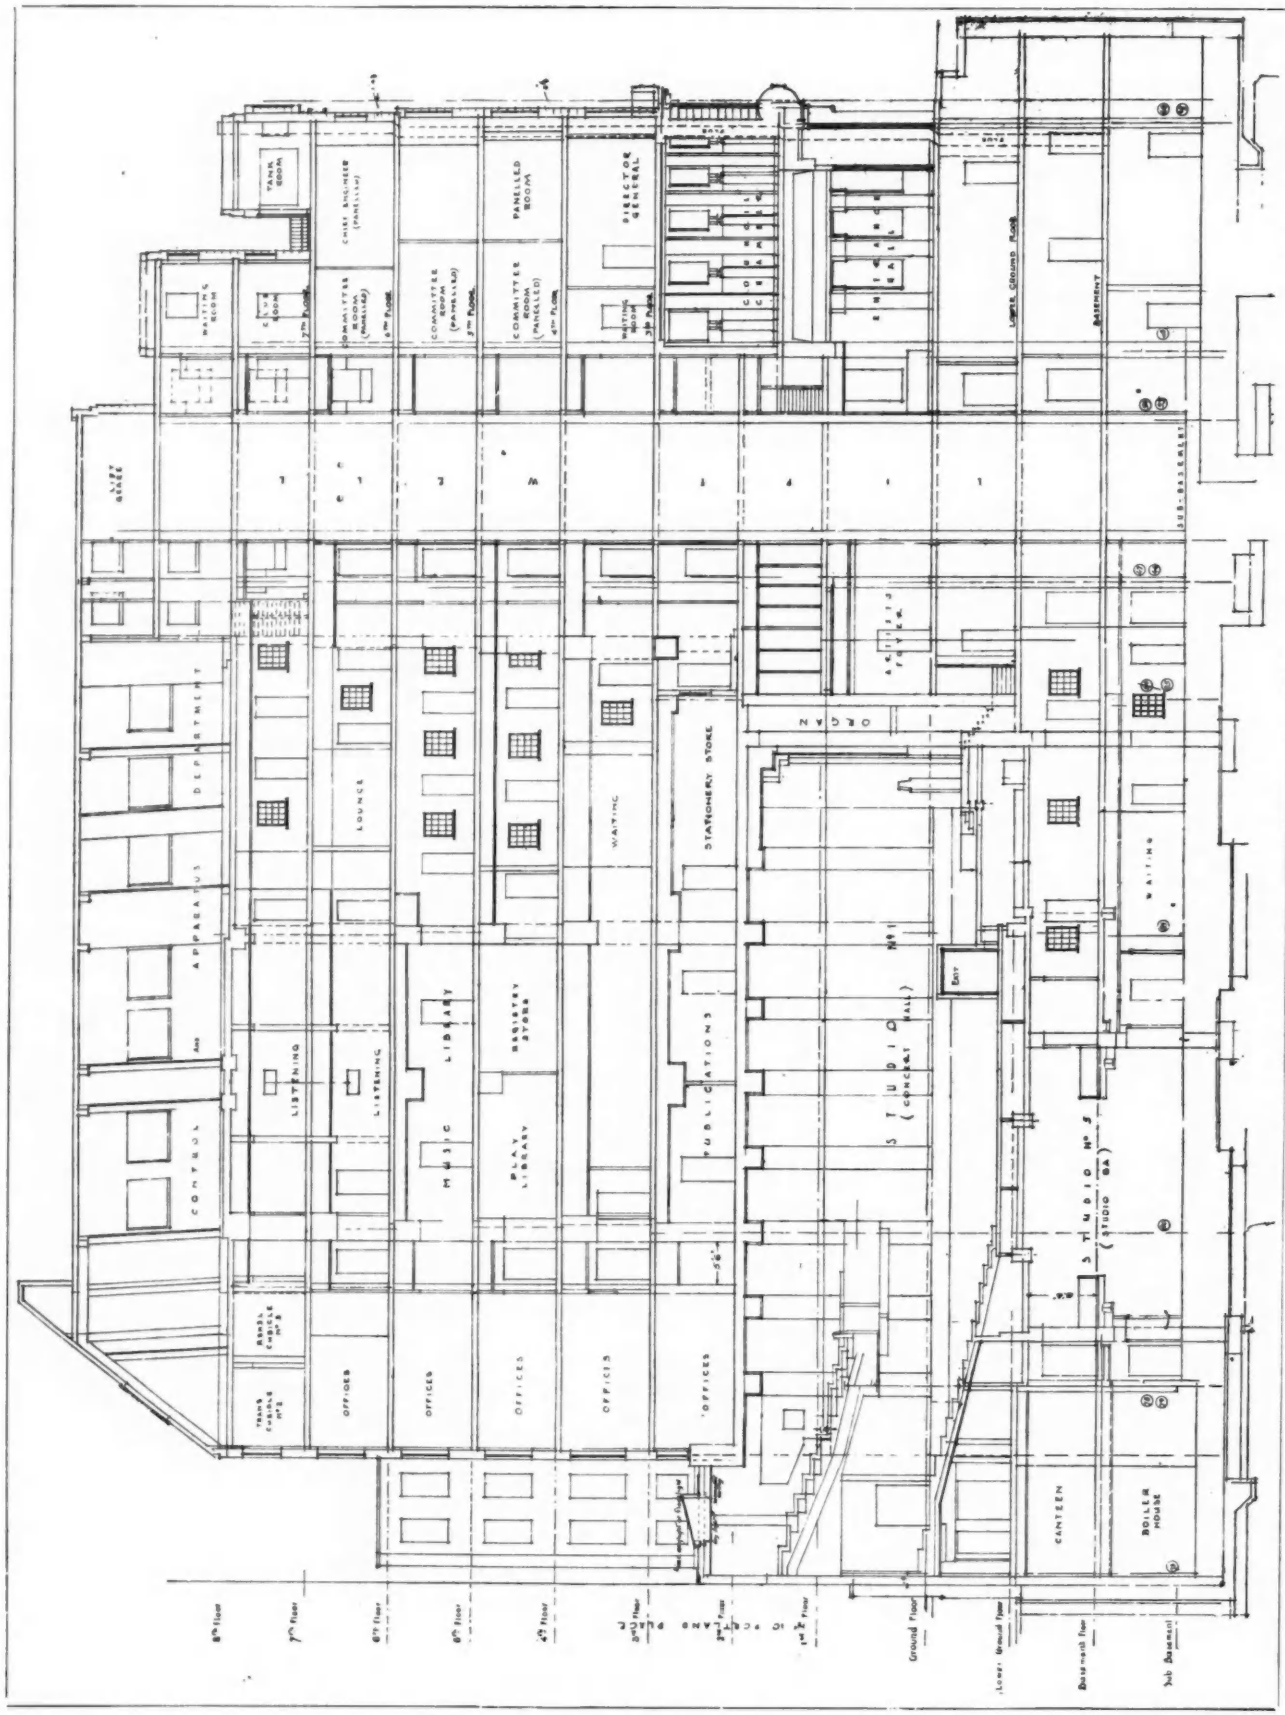
The entrance hall looking towards the main doors which are of bronze. The walls are of Hopton Wood marble, and the floor is of mosaic.

D



This section indicates the ingenious methods adopted for insulating the studio tower, both laterally and vertically. The former is obtained by surrounding the tower with a corridor and an outer ring of offices; the latter by the provision of "buffer" states between one studio floor and another. The concert hall accommodates about a thousand people.

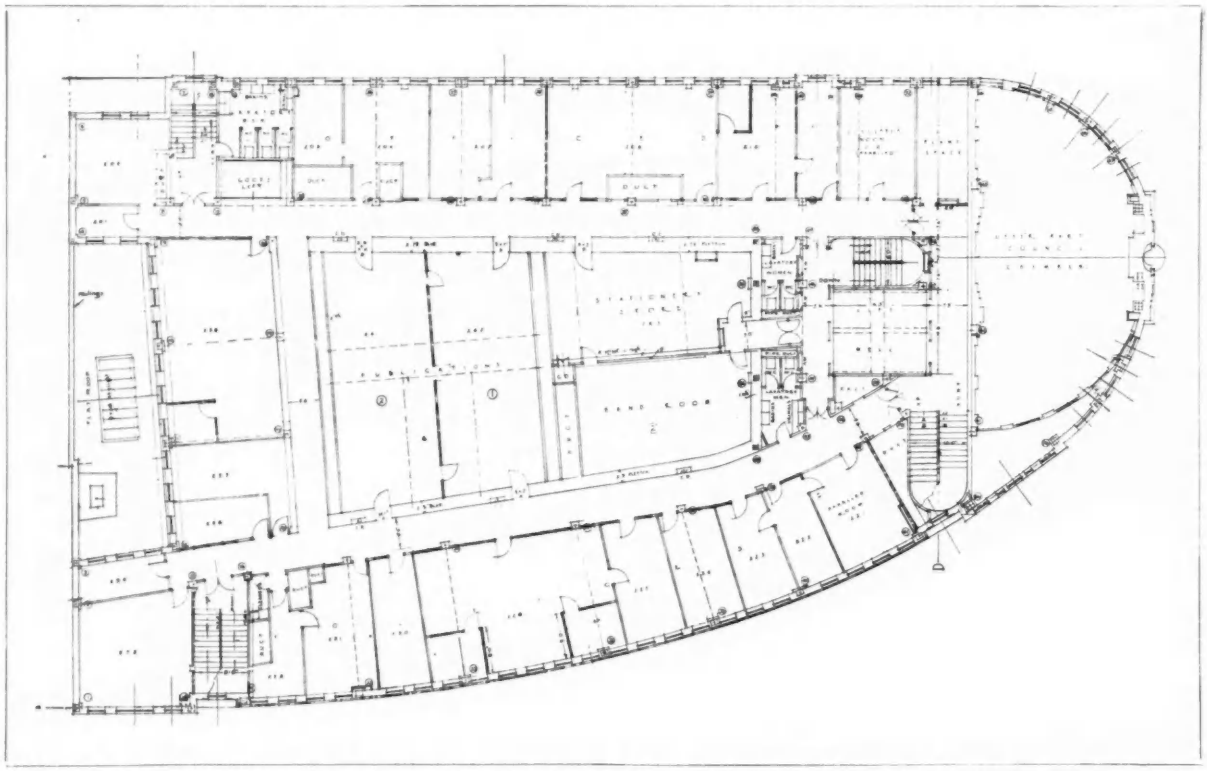
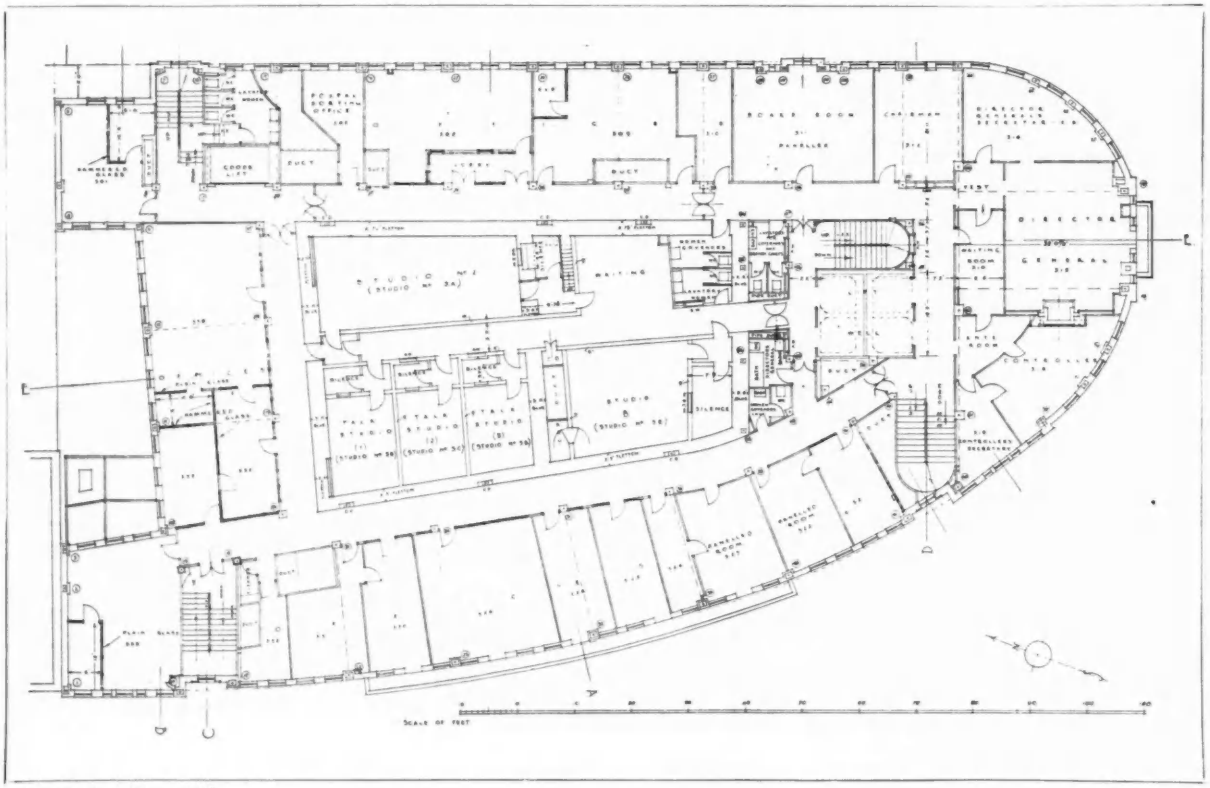
Ground-floor plan. The main entrance is at the southern apex of the site. In the entrance hall are a staircase and two lifts to serve the administration offices; in the same shaft are two more lifts for the artists and studio staff, entered from a foyer within the tower itself and approached by swing doors from the hall. A separate staircase is also provided.

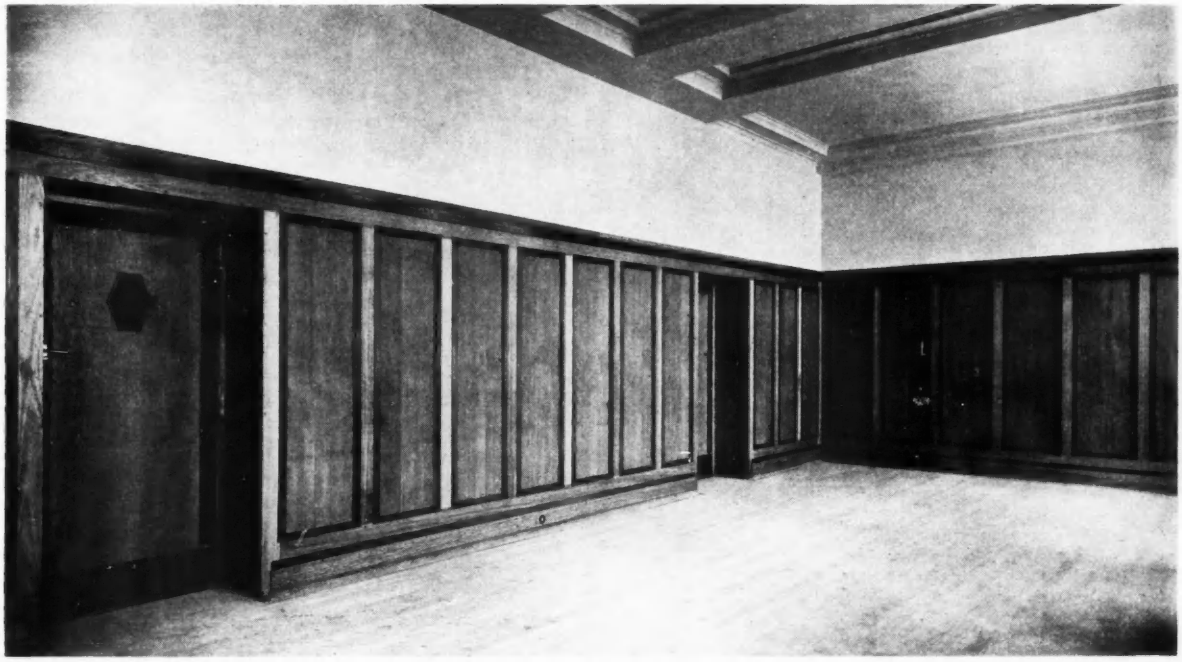


The second floor contains no studios whatsoever. It forms a "buffer" section between the studios on the floor above and the concert hall below, and will house the offices of the B.B.C. Publications Department.

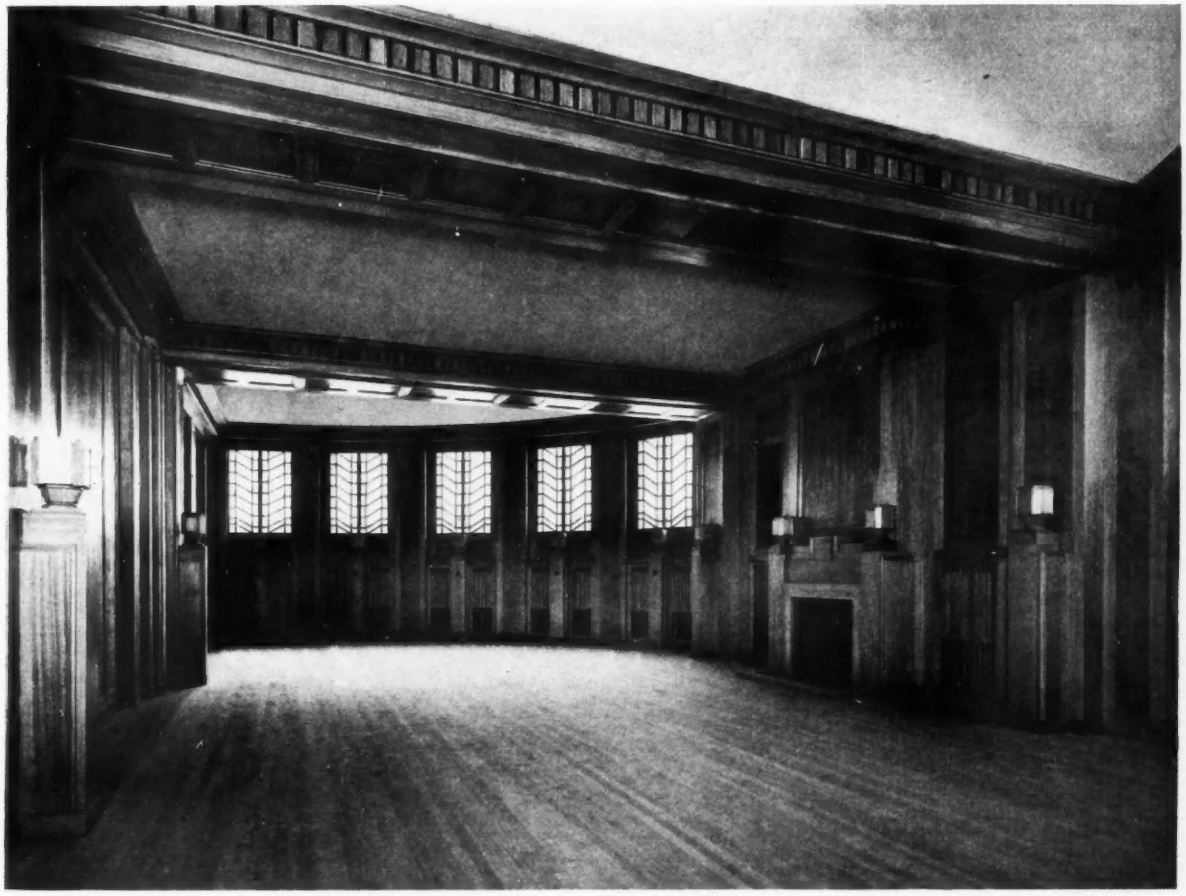


Broadcasting House, W.]

The third floor of the tower is devoted to studios. Two of them (3A and 3E) are two stories high. The first will be used for the children's hour and chamber music, and the second for the morning and Sunday services and the Epilogue.



The reception room is entered by swing doors from the main hall, and will be used by the more important " stars " whilst awaiting their turn to broadcast. The doors lead to the artists' foyer and lifts running to the studio floors.



[*By G. Val Myer.*

The council chamber on the second floor takes the form of a half-circle. The walls are lined in Tasmanian oak and all round are open wooden urns, which conceal the means of illumination. Novel methods of ventilating and heating are installed.

water away from the northern heights of London. The erection of the building with its enormous weight above this sewer was a risky project. The job, however, was accomplished by encasing the sewer in a reinforced concrete bridge. The sewer was uncovered and re-covered inch by inch in case the removal of pressure outside it, counteracting the pressure of water from within, might lead to bursting. A still further difficulty had to be overcome in this case owing to the treacherous water-logged subsoil.

The foundations and retaining walls are enclosed in a thick layer of asphalt. Within this asphalt at the bottom is a foundation of concrete, embedding enormous grillages of steel which distribute the weight of the superstructure over the site. Below the foundation, an artesian well has been sunk so that the building may have an independent supply of water.

The ventilation of the studios, which contain no windows, presented a unique problem. To ensure inter-studio silence elaborate precautions were taken to prevent sound being transmitted through the extensive range of ventilating ducting, over one hundred tons of which are installed. All the services —lighting, water supply, drainage, sanitary fittings, internal communication by telephones and bells, signal lights to studios, lifts, etc.—are of the most modern and efficient types.

The building has been designed by Lt.-Col. G. Val Myer, F.R.I.B.A. (of Val Myer and Watson Hart), in association with Mr. M. T. Tudsbery, A.M.I.C.E., civil engineer to the B.B.C.

NEW ELEMENTARY SCHOOL AT BIRKDALE, SOUTHPORT

DESIGNED BY GRAYSON AND BARNISH

General view of the school buildings already erected, as seen from the main entrance in Westdale Avenue.

THE designs for this senior elementary school won a competition assessed by Professor S. D. Adshead in 1928. The competition system has here justified itself to the full; the school authorities could scarcely have obtained a better or as good a design by any other method. Also, in this instance, nobody would venture to impugn the justice of the assessor's award, for the winning design was far and away the best submitted. Moreover, the circumstances connected with the competition were especially happy, inasmuch as ample ground was available on a flat site and the architects were able to tackle the problem presented under ideal conditions. Nevertheless, considerable skill was required to utilize the site to the best advantage and to satisfy a number of complex practical and æsthetic requirements.

This term "æsthetic" is emphasized because the time has long since passed when school buildings had no other merits than the strictly utilitarian. The very fact that the authorities organized

Ground plan, showing the first part of the scheme, just completed, and the layout of future extensions. Harmonious inter-relationship is secured, while what is already erected is an architectural entity.

a competition is in itself clear proof that they wanted not only a convenient and economical building but also one with a certain amount of dignity and even beauty.

While on restricted sites it is necessary to plan a school on two or more floors, it has now come to be recognized that the ideal arrangement, wherever possible, is to provide all the accommodation on the ground floor. It is a moot point whether such an arrangement is slightly more costly except where the cost of land is high. From the æsthetic point of view there is much to be said for arrangement on the quadrangular system, for such planning has a good tradition behind it and has in the past lent itself to most distinguished architectural treatment. A very low building covering a large area is, however, apt to be somewhat lacking in architectural dignity unless at one part of it it is permissible to raise the height in order to obtain a centre of interest. Sometimes this necessary focal point is provided in the assembly hall, but it can easily be imagined that unless this latter is made taller than it actually need be, it may fail to perform this artistic function. In the case of the Birkdale school the architects have quite obviously recognized the nature

[*By Grayson and Barnish.*

The main (staff) entrance. The bricks are hand-made, and of soft and subtle colours. The coat-of-arms, like the flagstaff base (see view on page 401), was carved by Tyson Smith.

of this problem, for opposite the entrance to the forecourt they have planned four lecture-rooms on the first floor, and although the floor area of this elevated portion cannot amount to a twentieth part of the whole, it yet suffices very greatly to increase the architectural importance of the group; moreover, it forms a necessary connecting link between this first quadrangle and the assembly hall behind it.

Another special merit in the design is that, although in the first instance only part of the group has been built, it is an artistic whole in itself. The completed scheme, which will include boys' and girls' courts, comprises a symmetrical composition with which the first portion to be built will be harmoniously associated.

The elevations show that a modern school building can be hygienically arranged without any sacrifice of architectural quality. Here, ample window space is provided and yet there is sufficient wallage to give the requisite appearance of solidity. The detail, in the English Renaissance convention, is scholarly. The bricks are hand-made of various delightfully soft and subtle colours. The roofs are covered with pantiles of a dun colour, with a few reds. A. T. E.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xviii

PROVINCIAL PRACTICE

BY KARSHISH

(H. B. CRESWELL)

THE account I have given of St. Michael's Church Bazaar will appear cynical—that is, contemptuous of human emotions and motives. Much that now follows will unavoidably appear coloured by a similar cynicism; yet I am no cynic. I have, in fact, so profound a faith in human nature, that my veneration for the great spirits that have lived in the past and for those that are now living, and my joy in the good men and true who are among my friends and acquaintances, would alone reconcile me to living in the world if nothing else did. To me, the hardest thing in life is its loneliness; but to recognize one's own dim aspirations in the work and in the lives of great thinkers, poets and artists, and to be warmed by their rays, is never to be lonely.

It must also be borne in mind that a man cannot assess himself, lacking a gauge and without a background to measure against; and that this picture of myself, observed from a distance of thirty years and from the vantage point of experience, does not represent any states of mind or feeling that then possessed me.

Thus, when I found myself launched in private practice in Nollingborough, I accepted the snobbery and mean rivalries of a small provincial town with perfect good faith; supposed mine to be the common lot of men; and imagined that the consequent strain and circumspection imposed on me were normal experiences. In my struggle for life I accordingly identified myself with the game everyone else was playing, and with complete simplicity, competed in machinations of which I only knew the significance after I had, in the course of years, got on terms with myself and learnt what was what. I was merely a simple-minded young man who, finding himself in Rome, did as Rome did, and for the excellent reason that, as an architect fighting for life, I had no knowledge of any place than Rome. If my picture of a small provincial town appears cynical, it is because a small provincial town is no more than a large village; because "God made the cities and the devil made the villages"; because Nollingborough was probably specially favoured by satanic ministrations; and because it is my purpose to tell of life as it is—and as everyone knows it to be; and not as it is supposed to be—and everyone pretends that it is.

Nollingborough was, of course, similar to every small provincial town of the same class, except that it had for its Rector the Venerable Archdeacon Brythwater. He was the central luminary about which the snobbish aspirations of Nollingborough and neighbourhood circulated in various orbits, far or near.

No one who did not arrestingly satisfy the conventional ideas of a Gentleman could have held sway as Brythwater did. He was connected with some of the oldest families in the country, so that he had pecking power over everyone; held a rich living and possessed a large private fortune; was good-looking and always exquisitely tailored; his carriage and pair was a joy to behold, as was the phaeton he sported. He was a childless widower of under forty, whose extreme eligibility, like that of Queen Elizabeth, served him well, as all his other worldly advantages did. The "Guide to Nollingborough", which gave tables of the numbers of pigs sold yearly in the market, recorded that he was the grandson of a Duke and a godchild of the Queen of the Netherlands; and the parish magazine gave particulars from time to time of the great houses at which he stayed and of the State functions he attended, and these bits of exciting news were duly recorded in the local weekly paper. He had a distinguished house party for the Hunt ball; held a wonderful garden party every summer; gave numerous dinner parties, and a conversazione in the Town Hall in the winter, at which his sister, the Countess of Verehaven, acted as hostess, and which everyone, from far and near, attended.

The Rectory circle—if I may so term it—was thus a kind of viceregal court to which everyone, who dared hope, aspired to have in some degree the entrée; and the rank attained by each, according to the nearness of their approach to the fount, established their social standing in the place, and settled whom each might snub and by whom be snubbed.

I never perfectly understood the subtleties of the game until I married, for my wife was a perfect mistress of it—as I shall have to tell; I merely knew it as a condition of discomfort. I found myself repulsed by those who were of my own kidney and to whom I was naturally drawn, but who felt their social position forbade them from discovering whether I was worth knowing or not; and I found myself besieged by people with whom I was entirely out of sympathy; who bored and embarrassed me; and who had no other use for my acquaintance than to wear me like a feather in their caps, or even use me as foothold for springing on to the back of some other more desirable acquaintance who would in turn serve as a stepping-stone to greater heights again.

There were, however, realms both below and above aspiration to the Rectory circle, each of which, although I was scarcely conscious of it, poisoned life. The first was the Town proper—the small professional men and tradespeople, and the whole body of Nonconformists who were beyond the fringe of Nollingborough society; and the other was the hunting people, who, being largely stockbrokers or manufacturers who often had also houses in London and who, during nine months of the year, lived in the neighbourhood and went up to town three or four days a week, aspired to intimacy with the few choice county families and small squires, and so engaged in the same fatuous rivalries as we did in the Town. The Rectory was also a rallying point for the hunting fraternity—many of whom did not hunt, but only pretended to hunt, and never wore pink except at the Hunt ball, because, in the field, it would draw attention to their "crooked going"—for Brythwater was on terms of intimacy with the great of the land, and everyone who had the chance was a guest at his dinner-parties and honoured the social functions with which he celebrated himself.

Until I married I saw nothing of the hunting people and the county families, except in my professional capacity and as a young man in request at lawn-tennis parties; I was never, as a bachelor, asked to dinner or to dances at their houses, though once or twice I took part in private theatricals among them; in fact, looking back, and until my marriage brought a complete change, my social activities consisted in being entertained at the houses of people with whom I was ill at ease, had nothing in common with and cared nothing about; and in *not* being included among guests at the houses of people to whom I was drawn for exactly the opposite reasons.
